ICV_BPR0, Interrupt Controller Virtual Binary Point Register 0

The ICV_BPR0 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 0 interrupt preemption.

Configuration

AArch32 System register ICV_BPR0 bits [31:0] are architecturally mapped to AArch64 System register [ICV_BPR0_EL1\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_BPR0 are UNDEFINED.

Attributes

ICV_BPR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | BinaryPoint | | | | | | | | | | | | | |

Bits [31:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

| Binary point value | Group priority field | Subpriority field | Field with binary point |
|--------------------|----------------------|-------------------|-------------------------|
| 0 | [7:1] | [0] | ggggggg.s |
| 1 | [7:2] | [1:0] | gggggg.ss |
| 2 | [7:3] | [2:0] | ggggg.sss |
| 3 | [7:4] | [3:0] | gggg.ssss |
| 4 | [7:5] | [4:0] | ggg.sssss |
| 5 | [7:6] | [5:0] | gg.ssssss |
| 6 | [7] | [6:0] | g.sssssss |
| 7 | No preemption | [7:0] | .ssssssss |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR0

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by [ICV_CTLR.PRIbits](#).

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b1000 | 0b011 |

Bits [31:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

An attempt to program this field to a value less than the minimum value sets the field to the minimum value.

If [ICV_CTLR](#).CBPR is set to 1, Non-secure EL1 reads return [ICV_BPR0](#) + 1 saturated to 0b111. Non-secure EL1 writes are ignored.

If [ICV_CTLR](#).CBPR is set to 1, Secure EL1 reads return [ICV_BPR0](#). Secure EL1 writes modify [ICV_BPR0](#)

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR1

The minimum value of this register is equal to the minimum value of [ICV_BPR0](#) plus one.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b1100 | 0b1100 | 0b011 |

```

ICV_CTLR, Interrupt Controller Virtual Control Register

The ICV_CTLR characteristics are:

Purpose

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

Configuration

AArch32 System register ICV_CTLR bits [31:0] are architecturally mapped to AArch64 System register [ICV_CTLR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_CTLR are UNDEFINED.

Attributes

ICV_CTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----------|-----|------|-----|------|--------|---------|------|----|----|---|---------|------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | ExtRange | RSS | RES0 | A3V | SEIS | IDbits | PRIbits | RES0 | | | | EOImode | CBPR | | | | | | | |

Bits [31:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

| ExtRange | Meaning |
|----------|---|
| 0b0 | <p>CPU interface does not support INTIDs in the range 1024..8191. Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</p> <hr/> <p>Note Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.</p> |
| 0b1 | <p>CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.</p> |

ICV_CTLR.ExtRange is an alias of [ICC_CTLR](#).ExtRange.

RSS, bit [18]

Range Selector Support. Possible values are:

| RSS | Meaning |
|------------|--|
| 0b0 | Targeted SGIs with affinity level 0 values of 0 - 15 are supported. |
| 0b1 | Targeted SGIs with affinity level 0 values of 0 - 255 are supported. |

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

| A3V | Meaning |
|------------|---|
| 0b0 | The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers. |
| 0b1 | The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers. |

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

| SEIS | Meaning |
|-------------|--|
| 0b0 | The virtual CPU interface logic does not support local generation of SEIs. |
| 0b1 | The virtual CPU interface logic supports local generation of SEIs. |

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

| IDbits | Meaning |
|---------------|----------------|
| 0b000 | 16 bits. |
| 0b001 | 24 bits. |

All other values are reserved.

PRbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation must implement at least 32 levels of physical priority (5 priority bits).

Note

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers [ICV_BPR0](#) and [ICV_BPR1](#).

Bits [7:2]

Reserved, RES0.

EOImode, bit [1]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

| EOImode | Meaning |
|---------|---|
| 0b0 | ICV_EOIR0 and ICV_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR are UNPREDICTABLE. |
| 0b1 | ICV_EOIR0 and ICV_EOIR1 provide priority drop functionality only. ICV_DIR provides interrupt deactivation functionality. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

| CBPR | Meaning |
|------|---|
| 0b0 | ICV_BPR0 determines the preemption group for virtual Group 0 interrupts only. ICV_BPR1 determines the preemption group for virtual Group 1 interrupts. |
| 0b1 | Non-secure reads of ICV_BPR1 return ICV_BPR0 plus one, saturated to 0b111. Non-secure writes to ICV_BPR1 are ignored. Secure reads of ICV_BPR1 return ICV_BPR0 . Secure writes of ICV_BPR1 modify ICV_BPR0 . |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_CTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b1100 | 0b100 |

ICV_DIR, Interrupt Controller Deactivate Virtual Interrupt Register

The ICV_DIR characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified virtual interrupt.

Configuration

AArch32 System register ICV_DIR bits [31:0] performs the same function as AArch64 System register [ICV_DIR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_DIR are UNDEFINED.

Attributes

ICV_DIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the virtual interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICV_CTLR.IDbits](#). If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_DIR

When EOImode == 0, writes are ignored. In systems supporting system error generation, an implementation might generate an SEI.

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b1011 | 0b001 |

```

```

ICV_EOIR0, Interrupt Controller Virtual End Of Interrupt Register 0

The ICV_EOIR0 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 0 interrupt.

Configuration

AArch32 System register ICV_EOIR0 performs the same function as AArch64 System register [ICV_EOIR0_EL1](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_EOIR0 are UNDEFINED.

Attributes

ICV_EOIR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding [ICV_IAR0](#) access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICV_CTLR](#).IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the [ICV_CTLR](#).EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the [ICV_CTLR](#).EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to [ICV_DIR](#) to deactivate the virtual interrupt.

Accessing ICV_EOIR0

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from [ICV_IAR0](#), otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b1000 | 0b001 |

ICV_HPPIR0, Interrupt Controller Virtual Highest Priority Pending Interrupt Register 0

The ICV_HPPIR0 characteristics are:

Purpose

Indicates the highest priority pending virtual Group 0 interrupt on the virtual CPU interface.

Configuration

AArch32 System register ICV_HPPIR0 performs the same function as AArch64 System register [ICV_HPPIR0_EL1](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_HPPIR0 are UNDEFINED.

Attributes

ICV_HPPIR0 is a 32-bit register.

ICV_IAR0, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV_IAR0 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch32 System register ICV_IAR0 performs the same function as AArch64 System register [ICV_IAR0_EL1](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_IAR0 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when $PSTATE.\{I,F\} == \{0,0\}$). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_IAR0 is a 32-bit register.

ICV_IGRPEN0, Interrupt Controller Virtual Interrupt Group 0 Enable register

The ICV_IGRPEN0 characteristics are:

Purpose

Controls whether virtual Group 0 interrupts are enabled or not.

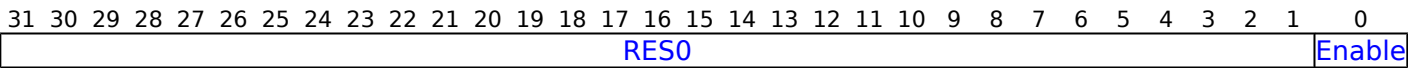

Configuration

AArch32 System register ICV_IGRPEN0 bits [31:0] are architecturally mapped to AArch64 System register [ICV_IGRPEN0_EL1\[31:0\]](#).
This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_IGRPEN0 are UNDEFINED.

Attributes

ICV_IGRPEN0 is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

Enable, bit [0]

Enables virtual Group 0 interrupts.

| Enable | Meaning |
|--------|--|
| 0b0 | Virtual Group 0 interrupts are disabled. |
| 0b1 | Virtual Group 0 interrupts are enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICV_IGRPEN0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b1100 | 0b110 |

```

ICV_PMR, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV_PMR characteristics are:

Purpose

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

Configuration

AArch32 System register ICV_PMR bits [31:0] are architecturally mapped to AArch64 System register [ICV_PMR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_PMR are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_PMR is a 32-bit register.

Field descriptions

| RES0 | | | | | | | | | | | | | | | | | | | | | | | | Priority | | | | | | | |

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

| Implemented priority bits | Possible priority field values | Number of priority levels |
|---------------------------|-------------------------------------|---------------------------|
| [7:0] | 0x00-0xFF (0-255), all values | 256 |
| [7:1] | 0x00-0xFE (0-254), even values only | 128 |
| [7:2] | 0x00-0xFC (0-252), in steps of 4 | 64 |
| [7:3] | 0x00-0xF8 (0-248), in steps of 8 | 32 |
| [7:4] | 0x00-0xF0 (0-240), in steps of 16 | 16 |

Unimplemented priority bits are RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICV_PMR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

ICV_RPR, Interrupt Controller Virtual Running Priority Register

The ICV_RPR characteristics are:

Purpose

Indicates the Running priority of the virtual CPU interface.

Configuration

AArch32 System register ICV_RPR performs the same function as AArch64 System register [ICV_RPR_EL1](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_RPR are UNDEFINED.

Attributes

ICV_RPR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|----------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | Priority | | | | | | | |

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

Accessing ICV_RPR

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| | | | | |
|--------|------|-----|-----|------|
| coproc | opc1 | CRn | CRm | opc2 |
|--------|------|-----|-----|------|

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TraceFilt | | | | PerfMon | | | | MProfDbg | | | | MMapTrc | | | | CopTrc | | | | MMapDbg | | | | CopSDBG | | | | CopDbg | | | |

TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

| TraceFilt | Meaning |
|-----------|--|
| 0b0000 | Armv8.4 Self-hosted Trace Extension not implemented. |
| 0b0001 | Armv8.4 Self-hosted Trace Extension implemented. |

All other values are reserved.

FEAT_TRF implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'.

Defined values are:

| PerfMon | Meaning |
|---------|---|
| 0b0000 | Performance Monitors Extension not implemented. |
| 0b0001 | Performance Monitors Extension, PMUv1 implemented. |
| 0b0010 | Performance Monitors Extension, PMUv2 implemented. |
| 0b0011 | Performance Monitors Extension, PMUv3 implemented. |
| 0b0100 | PMUv3 for Armv8.1. As 0b0011, and adds support for: <ul style="list-style-type: none"> Extended 16-bit PMEVTYPER<n>.evtCount field. If EL2 is implemented, the HDCR.HPMD control. |
| 0b0101 | PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR register. |
| 0b0110 | PMUv3 for Armv8.5. As 0b0101, and adds support for: <ul style="list-style-type: none"> 64-bit event counters. If EL2 is implemented, the HDCR.HCCD control. If EL3 is implemented, the SDCR.SCCD control. |
| 0b0111 | PMUv3 for Armv8.7. As 0b0110, and adds support for: <ul style="list-style-type: none"> The PMCR.FZO and, if EL2 is implemented, HDCR.HPMFZO controls. If EL3 is implemented and using AArch64, the MDCR_EL3.{MPMX,MCCD} controls. |
| 0b1000 | PMUv3 for Armv8.8. As 0b0111, and: <ul style="list-style-type: none"> Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected. |
| 0b1111 | IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations. |

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

Note

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

MProfDbg, bits [23:20]

M-profile Debug. Support for memory-mapped debug model for M-profile processors. Defined values are:

| MProfDbg | Meaning |
|----------|--|
| 0b0000 | Not supported. |
| 0b0001 | Support for M-profile Debug architecture, with memory-mapped access. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

MMapTrc, bits [19:16]

Memory-mapped Trace. Support for memory-mapped trace model. Defined values are:

| MMapTrc | Meaning |
|---------|--|
| 0b0000 | Not supported. |
| 0b0001 | Support for Arm trace architecture, with memory-mapped access. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

| CopTrc | Meaning |
|--------|---|
| 0b0000 | Not supported. |
| 0b0001 | Support for Arm trace architecture, with System registers access. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

MMapDbg, bits [11:8]

Memory-mapped Debug. Support for Armv7 memory-mapped debug model for A and R-profile processors. Defined values are:

| MMapDbg | Meaning |
|---------|--|
| 0b0000 | Not supported. |
| 0b0100 | Support for Armv7, v7 Debug architecture, with memory-mapped access. |
| 0b0101 | Support for Armv7, v7.1 Debug architecture, with memory-mapped access. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

The optional memory map defined by Armv8 is not compatible with Armv7.

CopSDBG, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A-profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDbg, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

| CopDbg | Meaning |
|--------|---|
| 0b0000 | Not supported. |
| 0b0010 | Armv6, v6 Debug architecture, with System registers access. |
| 0b0011 | Armv6, v6.1 Debug architecture, with System registers access. |
| 0b0100 | Armv7, v7 Debug architecture, with System registers access. |
| 0b0101 | Armv7, v7.1 Debug architecture, with System registers access. |
| 0b0110 | Armv8 debug architecture. |
| 0b0111 | Armv8 debug architecture with Virtualization Host Extensions. |
| 0b1000 | Armv8.2 debug architecture, FEAT_Debugv8p2. |
| 0b1001 | Armv8.4 debug architecture, FEAT_Debugv8p4. |
| 0b1010 | Armv8.8 debug architecture, FEAT_Debugv8p8. |

All other values are reserved.

The values 0b0000, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted in Armv8.

FEAT_VHE adds the functionality identified by the value 0b0111.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

FEAT_Debugv8p8 adds the functionality identified by the value 0b1010.

From Armv8.1, when FEAT_VHE is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

Accessing ID_DFR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0001 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_DFR0;
elsif PSTATE.EL == EL2 then
    return ID_DFR0;
elsif PSTATE.EL == EL3 then
    return ID_DFR0;

```

ID_DFR1, Debug Feature Register 1

The ID_DFR1 characteristics are:

Purpose

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_DFR1 bits [31:0] are architecturally mapped to AArch64 System register [ID_DFR1_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_DFR1 are UNDEFINED.

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_DFR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---|-------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | HPMNO | | | | MTPMU | | | |

Bits [31:8]

Reserved, RES0.

HPMNO, bits [7:4]

Zero PMU event counters for a Guest operating system. Defined values are:

| HPMNO | Meaning |
|--------|--|
| 0b0000 | Setting HDCR .HPMN to zero has CONSTRAINED UNPREDICTABLE behavior. |
| 0b0001 | Setting HDCR .HPMN to zero has defined behavior. |

All other values are reserved.

If FEAT_PMUv3 is not implemented, FEAT_FGT is not implemented, or EL2 is not implemented, the only permitted value is 0b0000.

FEAT_HPMNO implements the functionality identified by the value 0b0001.

From Armv8.8, in an implementation that includes FEAT_PMUv3, FEAT_FGT, and EL2, the value 0b0000 is not permitted.

MTPMU, bits [3:0]

Multi-threaded PMU extension. Defined values are:

| MTPMU | Meaning |
|--------|--|
| 0b0000 | FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>. are read/write or RES0. |
| 0b0001 | FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER<n>. are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<n>. are 0. |
| 0b1111 | FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER<n>. are RES0. |

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

Accessing ID_DFR1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0011 | 0b101 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!IsZero(ID_DFR1) || boolean
IMPLEMENTATION_DEFINED "ID_DFR1 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && (!IsZero(ID_DFR1) || boolean
IMPLEMENTATION_DEFINED "ID_DFR1 trapped by HCR.TID3") && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_DFR1;
elsif PSTATE.EL == EL2 then
    return ID_DFR1;
elsif PSTATE.EL == EL3 then
    return ID_DFR1;

```

ID_ISAR0, Instruction Set Attribute Register 0

The ID_ISAR0 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), [ID_ISAR4](#), and [ID_ISAR5](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR0 bits [31:0] are architecturally mapped to AArch64 System register [ID_ISAR0_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR0 are UNDEFINED.

Attributes

ID_ISAR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|--------|----|----|----|-------|----|----|----|---------|----|----|----|-----------|----|----|----|----------|----|---|---|----------|---|---|---|------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | Divide | | | | Debug | | | | Coprocc | | | | CmpBranch | | | | BitField | | | | BitCount | | | | Swap | | | |

Bits [31:28]

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

| Divide | Meaning |
|--------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds SDIV and UDIV in the T32 instruction set. |
| 0b0010 | As for 0b0001, and adds SDIV and UDIV in the A32 instruction set. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Debug, bits [23:20]

Indicates the implemented Debug instructions. Defined values are:

| Debug | Meaning |
|--------|-------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds BKPT. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Coproc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

| Coproc | Meaning |
|---------------|--|
| 0b0000 | None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions. |
| 0b0001 | Adds generic CDP, LDC, MCR, MRC, and STC. |
| 0b0010 | As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2. |
| 0b0011 | As for 0b0010, and adds generic MCRR and MRRC. |
| 0b0100 | As for 0b0011, and adds generic MCRR2 and MRRC2. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

| CmpBranch | Meaning |
|------------------|--------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds CBNZ and CBZ. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:

| BitField | Meaning |
|-----------------|--------------------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds BFC, BFI, SBFX, and UBFX. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:

| BitCount | Meaning |
|-----------------|-------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds CLZ. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

| Swap | Meaning |
|-------------|--------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds SWP and SWPB. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Accessing ID_ISAR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0010 | 0b000 |

```

ID_ISAR1, Instruction Set Attribute Register 1

The ID_ISAR1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0](#), [ID_ISAR2](#), [ID_ISAR3](#), [ID_ISAR4](#), and [ID_ISAR5](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR1 bits [31:0] are architecturally mapped to AArch64 System register [ID_ISAR1_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR1 are UNDEFINED.

Attributes

ID_ISAR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------|---------------------------|---------------------------|------------------------|------------------------|---------------------------|------------------------|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Jazelle | Interwork | Immediate | IfThen | Extend | Except_AR | Except | Endian | | | | | | | | | | | | | | | | | | | | | | | | |

Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

| Jazelle | Meaning |
|---------|--|
| 0b0000 | No support for Jazelle. |
| 0b0001 | Adds the BXJ instruction, and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Interwork, bits [27:24]

Indicates the implemented Interworking instructions. Defined values are:

| Interwork | Meaning |
|-----------|--|
| 0b0000 | None implemented. |
| 0b0001 | Adds the BX instruction, and the T bit in the PSR. |
| 0b0010 | As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior. |
| 0b0011 | As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

| Immediate | Meaning |
|-----------|--|
| 0b0000 | None implemented. |
| 0b0001 | Adds: <ul style="list-style-type: none"> • The MOVT instruction • The MOV instruction encodings with zero-extended 16-bit immediates. • The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

| IfThen | Meaning |
|--------|--|
| 0b0000 | None implemented. |
| 0b0001 | Adds the IT instructions, and the IT bits in the PSRs. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

| Extend | Meaning |
|--------|--|
| 0b0000 | No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions. |
| 0b0001 | Adds the SXTB, SXTB, UXTB, and UXTB instructions. |
| 0b0010 | As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Except_AR, bits [11:8]

Indicates the implemented A and R-profile exception-handling instructions. Defined values are:

| Except_AR | Meaning |
|-----------|--|
| 0b0000 | None implemented. |
| 0b0001 | Adds the SRS and RFE instructions, and the A and R-profile forms of the CPS instruction. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

| Except | Meaning |
|--------|--|
| 0b0000 | Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented. |
| 0b0001 | Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

| Endian | Meaning |
|--------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds the SETEND instruction, and the E bit in the PSRs. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Accessing ID_ISAR1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0010 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elseif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_ISAR1;
elseif PSTATE.EL == EL2 then
    return ID_ISAR1;
elseif PSTATE.EL == EL3 then
    return ID_ISAR1;

```

ID_ISAR2, Instruction Set Attribute Register 2

The ID_ISAR2 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR3](#), [ID_ISAR4](#), and [ID_ISAR5](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR2 bits [31:0] are architecturally mapped to AArch64 System register [ID_ISAR2_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR2 are UNDEFINED.

Attributes

ID_ISAR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|--------|-------|-------|------|----------------|---------|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Reversal | PSR_AR | MultU | MultS | Mult | MultiAccessInt | MemHint | LoadStore | | | | | | | | | | | | | | | | | | | | | | | | |

Reversal, bits [31:28]

Indicates the implemented Reversal instructions. Defined values are:

| Reversal | Meaning |
|----------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds the REV, REV16, and REVSH instructions. |
| 0b0010 | As for 0b0001, and adds the RBIT instruction. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

PSR_AR, bits [27:24]

Indicates the implemented A and R-profile instructions to manipulate the PSR. Defined values are:

| PSR_AR | Meaning |
|--------|--|
| 0b0000 | None implemented. |
| 0b0001 | Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

MultU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

| MultU | Meaning |
|--------------|--|
| 0b0000 | None implemented. |
| 0b0001 | Adds the UMULL and UMLAL instructions. |
| 0b0010 | As for 0b0001, and adds the UMAAL instruction. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

MultS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions. Defined values are:

| MultS | Meaning |
|--------------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds the SMULL and SMLAL instructions. |
| 0b0010 | As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs. |
| 0b0011 | As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSXD, SMLSXD, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Mult, bits [15:12]

Indicates the implemented additional Multiply instructions. Defined values are:

| Mult | Meaning |
|-------------|---|
| 0b0000 | No additional instructions implemented. This means only MUL is implemented. |
| 0b0001 | Adds the MLA instruction. |
| 0b0010 | As for 0b0001, and adds the MLS instruction. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions. Defined values are:

| MultiAccessInt | Meaning |
|-----------------------|--|
| 0b0000 | No support. This means the LDM and STM instructions are not interruptible. |
| 0b0001 | LDM and STM instructions are restartable. |
| 0b0010 | LDM and STM instructions are continuable. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

| MemHint | Meaning |
|---------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds the PLD instruction. |
| 0b0010 | Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.) |
| 0b0011 | As for 0b0001 (or 0b0010), and adds the PLI instruction. |
| 0b0100 | As for 0b0011, and adds the PLDW instruction. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

| LoadStore | Meaning |
|-----------|--|
| 0b0000 | No additional load/store instructions implemented. |
| 0b0001 | Adds the LDRD and STRD instructions. |
| 0b0010 | As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Accessing ID_ISAR2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0010 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_ISAR2;
elsif PSTATE.EL == EL2 then
    return ID_ISAR2;
elsif PSTATE.EL == EL3 then
    return ID_ISAR2;

```

ID_ISAR3, Instruction Set Attribute Register 3

The ID_ISAR3 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR4](#), and [ID_ISAR5](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR3 bits [31:0] are architecturally mapped to AArch64 System register [ID_ISAR3_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR3 are UNDEFINED.

Attributes

ID_ISAR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------|-------------------------|-------------------------|---------------------------|---------------------------|---------------------|----------------------|--------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| T32EE | TrueNOP | T32Copy | TabBranch | SynchPrim | SVC | SIMD | Saturate | | | | | | | | | | | | | | | | | | | | | | | | |

T32EE, bits [31:28]

Indicates the implemented T32EE instructions. Defined values are:

| T32EE | Meaning |
|--------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions. Defined values are:

| TrueNOP | Meaning |
|---------|---|
| 0b0000 | None implemented. This means there are no NOP instructions that do not have any register dependencies. |
| 0b0001 | Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

| T32Copy | Meaning |
|----------------|---|
| 0b0000 | Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register. |
| 0b0001 | Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

| TabBranch | Meaning |
|------------------|------------------------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds the TBB and TBH instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

| SynchPrim | Meaning |
|------------------|---|
| 0b0000 | If SynchPrim_frac == 0b000, no Synchronization Primitives implemented. |
| 0b0001 | If SynchPrim_frac == 0b000, adds the LDREX and STREX instructions. |
| 0b0010 | If SynchPrim_frac == 0b011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions. |
| 0b0011 | If SynchPrim_frac == 0b000, as for [0b001, 0b011] and also adds the LDREXD and STREXD instructions. |

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

| SVC | Meaning |
|------------|---------------------------|
| 0b0000 | Not implemented. |
| 0b0001 | Adds the SVC instruction. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

| SIMD | Meaning |
|--------|--|
| 0b0000 | None implemented. |
| 0b0001 | Adds the SSAT and USAT instructions, and the Q bit in the PSRs. |
| 0b0011 | As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports Advanced SIMD and floating-point instructions, [MVFR0](#), [MVFR1](#), and [MVFR2](#) give information about the implemented Advanced SIMD instructions.

Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

| Saturate | Meaning |
|----------|--|
| 0b0000 | None implemented. This means no non-Advanced SIMD saturate instructions are implemented. |
| 0b0001 | Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Accessing ID_ISAR3

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0010 | 0b011 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_ISAR3;
elsif PSTATE.EL == EL2 then
    return ID_ISAR3;
elsif PSTATE.EL == EL3 then
    return ID_ISAR3;

```

ID_ISAR4, Instruction Set Attribute Register 4

The ID_ISAR4 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), and [ID_ISAR5](#).

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR4 bits [31:0] are architecturally mapped to AArch64 System register [ID_ISAR4_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR4 are UNDEFINED.

Attributes

ID_ISAR4 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------------|----|----|----|-----------------------|----|----|----|--------------------------------|----|----|----|-------------------------|----|----|----|---------------------|----|----|----|---------------------------|----|---|---|----------------------------|---|---|---|------------------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SWP_frac | | | | PSR_M | | | | SynchPrim_frac | | | | Barrier | | | | SMC | | | | Writeback | | | | WithShifts | | | | Unpriv | | | |

SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

| SWP_frac | Meaning |
|----------|---|
| 0b0000 | SWP or SWPB instructions not implemented. |
| 0b0001 | SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB. |

All other values are reserved. This field is valid only if [ID_ISAR0](#).Swap is 0b0000.

In Armv8-A, the only permitted value is 0b0000.

PSR_M, bits [27:24]

Indicates the implemented M-profile instructions to modify the PSRs. Defined values are:

| PSR_M | Meaning |
|--------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds the M-profile forms of the CPS, MRS, and MSR instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

SynchPrim_frac, bits [23:20]

Used in conjunction with [ID_ISAR3.SynchPrim](#) to indicate the implemented Synchronization Primitive instructions. Possible values are:

| SynchPrim_frac | Meaning |
|-----------------------|---|
| 0b0000 | If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions. |
| 0b0011 | If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions. |

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

| Barrier | Meaning |
|----------------|---|
| 0b0000 | None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space. |
| 0b0001 | Adds the DMB, DSB, and ISB barrier instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SMC, bits [15:12]

Indicates the implemented SMC instructions. Defined values are:

| SMC | Meaning |
|------------|---------------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds the SMC instruction. |

All other values are reserved.

In Armv8-A, the permitted values are:

- If EL3 is implemented, the only permitted value is 0b0001.
- If neither EL3 nor EL2 is implemented, the only permitted value is 0b0000.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes. Defined values are:

| Writeback | Meaning |
|------------------|--|
| 0b0000 | Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes. |
| 0b0001 | Adds support for all of the writeback addressing modes. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

| WithShifts | Meaning |
|-------------------|--|
| 0b0000 | Nonzero shifts supported only in MOV and shift instructions. |
| 0b0001 | Adds support for shifts of loads and stores over the range LSL 0-3. |
| 0b0011 | As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions. |
| 0b0100 | As for 0b0011, and adds support for register-controlled shift options. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

| Unpriv | Meaning |
|---------------|--|
| 0b0000 | None implemented. No T variant instructions are implemented. |
| 0b0001 | Adds the LDRBT, LDRT, STRBT, and STRT instructions. |
| 0b0010 | As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Accessing ID_ISAR4

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b0000 | 0b0010 | 0b100 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

elsif PSTATE.EL == EL3 then
    return ID_ISAR4;

```

ID_ISAR5, Instruction Set Attribute Register 5

The ID_ISAR5 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), and [ID_ISAR4](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR5 bits [31:0] are architecturally mapped to AArch64 System register [ID_ISAR5_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR5 are UNDEFINED.

Attributes

ID_ISAR5 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-----|----|----|----|------|----|----|----|-------|----|----|----|------|----|----|----|------|----|---|---|-----|---|---|---|------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VCMA | | | | RDM | | | | RES0 | | | | CRC32 | | | | SHA2 | | | | SHA1 | | | | AES | | | | SEVL | | | |

VCMA, bits [31:28]

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

| VCMA | Meaning |
|--------|--|
| 0b0000 | The VCMLA and VCADD instructions are not implemented in AArch32. |
| 0b0001 | The VCMLA and VCADD instructions are implemented in AArch32. |

All other values are reserved.

FEAT_FCMA implements the functionality identified by 0b0001.

From Armv8.3, the only permitted value is 0b0001.

RDM, bits [27:24]

Indicates support for the VQRDMLAH and VQRDMLSH instructions in AArch32 state. Defined values are:

| RDM | Meaning |
|--------|--|
| 0b0000 | No VQRDMLAH and VQRDMLSH instructions implemented. |
| 0b0001 | VQRDMLAH and VQRDMLSH instructions implemented. |

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates support for the CRC32 instructions in AArch32 state. Defined values are:

| CRC32 | Meaning |
|--------------|---|
| 0b0000 | No CRC32 instructions implemented. |
| 0b0001 | CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented. |

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates support for the SHA2 instructions in AArch32 state.

| SHA2 | Meaning |
|-------------|--|
| 0b0000 | No SHA2 instructions implemented. |
| 0b0001 | SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SHA1, bits [11:8]

Indicates support for the SHA1 instructions are implemented in AArch32 state. Defined values are:

| SHA1 | Meaning |
|-------------|---|
| 0b0000 | No SHA1 instructions implemented. |
| 0b0001 | SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

AES, bits [7:4]

Indicates support for the AES instructions in AArch32 state. Defined values are:

| AES | Meaning |
|------------|--|
| 0b0000 | No AES instructions implemented. |
| 0b0001 | AESE, AESD, AESMC, and AESIMC implemented. |
| 0b0010 | As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

SEVL, bits [3:0]

Indicates support for the SEVL instruction in AArch32 state. Defined values are:

| SEVL | Meaning |
|--------|--|
| 0b0000 | SEVL is implemented as a NOP. |
| 0b0001 | SEVL is implemented as Send Event Local. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Accessing ID_ISAR5

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0010 | 0b101 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_ISAR5;
elsif PSTATE.EL == EL2 then
    return ID_ISAR5;
elsif PSTATE.EL == EL3 then
    return ID_ISAR5;

```

ID_ISAR6, Instruction Set Attribute Register 6

The ID_ISAR6 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), [ID_ISAR4](#), and [ID_ISAR5](#).

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR6 bits [31:0] are architecturally mapped to AArch64 System register [ID_ISAR6_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR6 are UNDEFINED.

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_ISAR6 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------|----|----|----|----------------------|----|----|----|----------------------|----|----|----|-------------------------|----|----|----|--------------------|----|----|----|---------------------|----|---|---|--------------------|---|---|---|-----------------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | I8MM | | | | BF16 | | | | SPECRES | | | | SB | | | | FHM | | | | DP | | | | JSCVT | | | |

Bits [31:28]

Reserved, RES0.

I8MM, bits [27:24]

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values are:

| I8MM | Meaning |
|-------------|---|
| 0b0000 | Int8 matrix multiplication instructions are not implemented. |
| 0b0001 | VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented. |

All other values are reserved.

FEAT_AA32I8MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

| BF16 | Meaning |
|-------------|---|
| 0b0000 | BFloat16 instructions are not implemented. |
| 0b0001 | VCVT, VCVTB, VCVTT, VDOT, VFMA, VFMA, and VMMLA instructions with BF16 operand or result types are implemented. |

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

SPECRES, bits [19:16]

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

| SPECRES | Meaning |
|----------------|---|
| 0b0000 | CFPRCTX, DVPRCTX, and CPPRCTX instructions are not implemented. |
| 0b0001 | CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented. |

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [15:12]

Indicates support for SB instruction in AArch32 state. Defined values are:

| SB | Meaning |
|-----------|------------------------------------|
| 0b0000 | SB instruction is not implemented. |
| 0b0001 | SB instruction is implemented. |

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point VFMA and VFMSL instructions in AArch32 state. Defined values are:

| FHM | Meaning |
|------------|--|
| 0b0000 | VFMA and VFMSL instructions not implemented. |
| 0b0001 | VFMA and VFMSL instructions implemented. |

FEAT_FHM implements the functionality identified by the value 0b0001.

DP, bits [7:4]

Indicates support for dot product instructions in AArch32 state. Defined values are:

| DP | Meaning |
|-----------|---|
| 0b0000 | No dot product instructions implemented. |
| 0b0001 | VUDOT and VSDOT instructions implemented. |

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value 0b0001.

JSCVT, bits [3:0]

Indicates support for the Javascript conversion instruction in AArch32 state. Defined values are:

| JSCVT | Meaning |
|--------------|---|
| 0b0000 | The VJCVT instruction is not implemented. |
| 0b0001 | The VJCVT instruction is implemented. |

All other values are reserved.

In Armv8.0, the only permitted value is 0b0000.

FEAT_JSCVT implements the functionality identified by 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

Accessing ID_ISAR6

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b0000 | 0b0010 | 0b111 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elseif EL2Enabled() && !ELUsingAArch32(EL2) && (!IsZero(ID_ISAR6) || boolean
IMPLEMENTATION_DEFINED "ID_ISAR6 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then

        AArch32.TakeHypTrapException(0x03);
    else
        return ID_ISAR6;
elseif PSTATE.EL == EL2 then
    return ID_ISAR6;
elseif PSTATE.EL == EL3 then
    return ID_ISAR6;

```

ID_MMFR0, Memory Model Feature Register 0

The ID_MMFR0 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_MMFR0 bits [31:0] are architecturally mapped to AArch64 System register [ID_MMFR0_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_MMFR0 are UNDEFINED.

Attributes

ID_MMFR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|------|----|----|----|--------|----|----|----|-----|----|----|----|----------|----|----|----|----------|----|---|---|------|---|---|---|------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| InnerShr | | | | FCSE | | | | AuxReg | | | | TCM | | | | ShareLvl | | | | OuterShr | | | | PMSA | | | | VMSA | | | |

InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

| InnerShr | Meaning |
|----------|--|
| 0b0000 | Implemented as Non-cacheable. |
| 0b0001 | Implemented with hardware coherency support. |
| 0b1111 | Shareability ignored. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0.ShareLvl having the value 0b0001.

When ID_MMFR0.ShareLvl is zero, this field is UNKNOWN.

FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE. Defined values are:

| FCSE | Meaning |
|--------|-------------------|
| 0b0000 | Not supported. |
| 0b0001 | Support for FCSE. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

| AuxReg | Meaning |
|---------------|--|
| 0b0000 | None supported. |
| 0b0001 | Support for Auxiliary Control Register only. |
| 0b0010 | Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

| TCM | Meaning |
|------------|---|
| 0b0000 | Not supported. |
| 0b0001 | Support is IMPLEMENTATION DEFINED. Armv7 requires this setting. |
| 0b0010 | Support for TCM only, Armv6 implementation. |
| 0b0011 | Support for TCM and DMA, Armv6 implementation. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

| ShareLvl | Meaning |
|-----------------|---|
| 0b0000 | One level of shareability implemented. |
| 0b0001 | Two levels of shareability implemented. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

| OuterShr | Meaning |
|-----------------|--|
| 0b0000 | Implemented as Non-cacheable. |
| 0b0001 | Implemented with hardware coherency support. |
| 0b1111 | Shareability ignored. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b1111.

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

| PMSA | Meaning |
|--------|---|
| 0b0000 | Not supported. |
| 0b0001 | Support for IMPLEMENTATION DEFINED PMSA. |
| 0b0010 | Support for PMSAv6, with a Cache Type Register implemented. |
| 0b0011 | Support for PMSAv7, with support for memory subsections. Armv7-R profile. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

| VMSA | Meaning |
|--------|---|
| 0b0000 | Not supported. |
| 0b0001 | Support for IMPLEMENTATION DEFINED VMSA. |
| 0b0010 | Support for VMSAv6, with Cache and TLB Type Registers implemented. |
| 0b0011 | Support for VMSAv7, with support for remapping and the Access flag. ARMv7-A profile. |
| 0b0100 | As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors. |
| 0b0101 | As for 0b0100, and adds support for the Long-descriptor translation table format. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0101.

Accessing ID_MMFR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0001 | 0b100 |

```

if PSTATE.EL == EL0 then

elsif PSTATE.EL == EL2 then
    return ID_MMFR0;
elsif PSTATE.EL == EL3 then
    return ID_MMFR0;

```

ID_MMFR1, Memory Model Feature Register 1

The ID_MMFR1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_MMFR1 bits [31:0] are architecturally mapped to AArch64 System register [ID_MMFR1_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_MMFR1 are UNDEFINED.

Attributes

ID_MMFR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------|----|----|----|--------------------------|----|----|----|-----------------------|----|----|----|-----------------------|----|----|----|-------------------------|----|----|----|-------------------------|----|---|---|-------------------------|---|---|---|-------------------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| BPred | | | | L1TstCln | | | | L1Uni | | | | L1Hvd | | | | L1UniSW | | | | L1HvdSW | | | | L1UniVA | | | | L1HvdVA | | | |

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

| BPred | Meaning |
|--------|--|
| 0b0000 | No branch predictor, or no MMU present. Implies a fixed MPU configuration. |
| 0b0001 | Branch predictor requires flushing on: <ul style="list-style-type: none"> Enabling or disabling a stage of address translation. Writing new data to instruction locations. Writing new mappings to the translation tables. Changes to the TTBR0, TTBR1, or TTBCR registers. Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported. |
| 0b0010 | Branch predictor requires flushing on: <ul style="list-style-type: none"> Enabling or disabling a stage of address translation. Writing new data to instruction locations. Writing new mappings to the translation tables. Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported. |
| 0b0011 | Branch predictor requires flushing only on writing new data to instruction locations. |
| 0b0100 | For execution correctness, branch predictor requires no flushing at any time. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0010, 0b0011, or 0b0100. For values other than 0b0000 and 0b0100, the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

| L1TstCln | Meaning |
|-----------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported Level 1 data cache test and clean operations are: <ul style="list-style-type: none"> • Test and clean data cache. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Test, clean, and invalidate data cache. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

| L1Uni | Meaning |
|--------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported entire Level 1 cache operations are: <ul style="list-style-type: none"> • Invalidate cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Clean cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate cache, using a recursive model that uses the cache dirty status bit. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

| L1Hvd | Meaning |
|--------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported entire Level 1 cache operations are: <ul style="list-style-type: none"> • Invalidate instruction cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate data cache. • Invalidate data cache and instruction cache, including branch predictor if appropriate. |
| 0b0011 | As for 0b0010, and adds: <ul style="list-style-type: none"> • Clean data cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

| L1UniSW | Meaning |
|----------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported Level 1 unified cache line maintenance operations by set/way are: <ul style="list-style-type: none"> • Clean cache line by set/way. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Clean and invalidate cache line by set/way. |
| 0b0011 | As for 0b0010, and adds: <ul style="list-style-type: none"> • Invalidate cache line by set/way. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

| L1HvdSW | Meaning |
|----------------|---|
| 0b0000 | None supported. |
| 0b0001 | Supported Level 1 Harvard cache line maintenance operations by set/way are: <ul style="list-style-type: none"> • Clean data cache line by set/way. • Clean and invalidate data cache line by set/way. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate data cache line by set/way. |
| 0b0011 | As for 0b0010, and adds: <ul style="list-style-type: none"> • Invalidate instruction cache line by set/way. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

| L1UniVA | Meaning |
|----------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported Level 1 unified cache line maintenance operations by VA are: <ul style="list-style-type: none"> • Clean cache line by VA. • Invalidate cache line by VA. • Clean and invalidate cache line by VA. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate branch predictor by VA, if branch predictor is implemented. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

| L1HvdVA | Meaning |
|---------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported Level 1 Harvard cache line maintenance operations by VA are: <ul style="list-style-type: none"> Clean data cache line by VA. Invalidate data cache line by VA. Clean and invalidate data cache line by VA. Clean instruction cache line by VA. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> Invalidate branch predictor by VA, if branch predictor is implemented. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Accessing ID_MMFR1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0001 | 0b101 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_MMFR1;
elsif PSTATE.EL == EL2 then
    return ID_MMFR1;
elsif PSTATE.EL == EL3 then
    return ID_MMFR1;

ID_MMFR2, Memory Model Feature Register 2

The ID_MMFR2 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_MMFR2 bits [31:0] are architecturally mapped to AArch64 System register [ID_MMFR2_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_MMFR2 are UNDEFINED.

Attributes

ID_MMFR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------------|----|----|----|--------------------------|----|----|----|-------------------------|----|----|----|------------------------|----|----|----|------------------------|----|----|----|--------------------------|----|---|---|-------------------------|---|---|---|-------------------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| HWAaccFlg | | | | WFIStall | | | | MemBarr | | | | UniTLB | | | | HvdTLB | | | | L1HvdRng | | | | L1HvdBG | | | | L1HvdFG | | | |

HWAaccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

| HWAaccFlg | Meaning |
|-----------|--|
| 0b0000 | Not supported. |
| 0b0001 | Support for VMSAv7 Access flag, updated in hardware. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

WFIStall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

| WFIStall | Meaning |
|----------|---------------------------|
| 0b0000 | Not supported. |
| 0b0001 | Support for WFI stalling. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc == 1111) encoding space. Defined values are:

| MemBarr | Meaning |
|---------|---|
| 0b0000 | None supported. |
| 0b0001 | Supported memory barrier System instructions are: <ul style="list-style-type: none"> • Data Synchronization Barrier (DSB). |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Instruction Synchronization Barrier (ISB). • Data Memory Barrier (DMB). |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Arm deprecates the use of these operations. [ID_ISAR4](#).Barrier_instrs indicates the level of support for the preferred barrier instructions.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

| UniTLB | Meaning |
|--------|---|
| 0b0000 | Not supported. |
| 0b0001 | Supported unified TLB maintenance operations are: <ul style="list-style-type: none"> • Invalidate all entries in the TLB. • Invalidate TLB entry by VA. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate TLB entries by ASID match. |
| 0b0011 | As for 0b0010, and adds: <ul style="list-style-type: none"> • Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation |
| 0b0100 | As for 0b0011, and adds: <ul style="list-style-type: none"> • Invalidate Hyp mode unified TLB entry by VA. • Invalidate entire Non-secure PL1&0 unified TLB. • Invalidate entire Hyp mode unified TLB. |
| 0b0101 | As for 0b0100, and adds the following operations: TLBIMVALIS , TLBIMVAALIS , TLBIMVALHIS , TLBIMVAL , TLBIMVAAL , TLBIMVALH . |
| 0b0110 | As for 0b0101, and adds the following operations: TLBIIPAS2IS , TLBIIPAS2LIS , TLBIIPAS2 , TLBIIPAS2L . |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

HvdTLB, bits [15:12]

If the value of ID_MMFR2.UniTLB is not 0b0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

| L1HvdRng | Meaning |
|----------|--|
| 0b0000 | Not supported. |
| 0b0001 | Supported Level 1 Harvard cache maintenance range operations are: <ul style="list-style-type: none"> • Invalidate data cache range by VA. • Invalidate instruction cache range by VA. • Clean data cache range by VA. • Clean and invalidate data cache range by VA. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

| L1HvdBG | Meaning |
|----------------|--|
| 0b0000 | Not supported. |
| 0b0001 | Supported Level 1 Harvard cache background fetch operations are: <ul style="list-style-type: none"> Fetch instruction cache range by VA. Fetch data cache range by VA. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

| L1HvdFG | Meaning |
|----------------|--|
| 0b0000 | Not supported. |
| 0b0001 | Supported Level 1 Harvard cache foreground fetch operations are: <ul style="list-style-type: none"> Fetch instruction cache range by VA. Fetch data cache range by VA. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Accessing ID_MMFR2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b0000 | 0b0001 | 0b110 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_MMFR2;
elsif PSTATE.EL == EL2 then
    return ID_MMFR2;

    return ID_MMFR2;

```

ID_MMFR3, Memory Model Feature Register 3

The ID_MMFR3 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_MMFR3 bits [31:0] are architecturally mapped to AArch64 System register [ID_MMFR3_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_MMFR3 are UNDEFINED.

Attributes

ID_MMFR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------------|----|----|----|------------------------|----|----|----|-------------------------|----|----|----|---------------------|----|----|----|---------------------------|----|----|----|-------------------------|----|---|---|--------------------------|---|---|---|--------------------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Supersec | | | | CMemSz | | | | CohWalk | | | | PAN | | | | MaintBcst | | | | BPMaint | | | | CMaintSW | | | | CMaintVA | | | |

Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

| Supersec | Meaning |
|----------|------------------------------|
| 0b0000 | Supersections supported. |
| 0b1111 | Supersections not supported. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b1111.

CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

| CMemSz | Meaning |
|--------|--|
| 0b0000 | 4GB, corresponding to a 32-bit physical address range. |
| 0b0001 | 64GB, corresponding to a 36-bit physical address range. |
| 0b0010 | 1TB or more, corresponding to a 40-bit or larger physical address range. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b0010.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

| CohWalk | Meaning |
|----------------|--|
| 0b0000 | Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks. |
| 0b0001 | Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

PAN, bits [19:16]

Privileged Access Never. Indicates support for the PAN bit in [CPSR](#), [SPSR](#), and [DPSR](#) in AArch32 state. Defined values are:

| PAN | Meaning |
|------------|---|
| 0b0000 | PAN not supported. |
| 0b0001 | PAN supported. |
| 0b0010 | PAN supported and ATS1CPRP and ATS1CPWP instructions supported. |

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

In Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

| MaintBcst | Meaning |
|------------------|--|
| 0b0000 | Cache, TLB, and branch predictor operations only affect local structures. |
| 0b0001 | Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures. |
| 0b0010 | Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

| BPMaint | Meaning |
|----------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported branch predictor maintenance operations are: <ul style="list-style-type: none"> • Invalidate all branch predictors. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate branch predictors by VA. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

| CMaintSW | Meaning |
|-----------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported hierarchical cache maintenance instructions by set/way are: <ul style="list-style-type: none"> • Invalidate data cache by set/way. • Clean data cache by set/way. • Clean and invalidate data cache by set/way. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

| CMaintVA | Meaning |
|-----------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported hierarchical cache maintenance operations by VA are: <ul style="list-style-type: none"> • Invalidate data cache by VA. • Clean data cache by VA. • Clean and invalidate data cache by VA. • Invalidate instruction cache by VA. • Invalidate all instruction cache entries. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Accessing ID_MMFR3

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b0000 | 0b0001 | 0b111 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_MMFR3;
elsif PSTATE.EL == EL2 then
    return ID_MMFR3;
elsif PSTATE.EL == EL3 then
    return ID_MMFR3;

```

ID_MMFR4, Memory Model Feature Register 4

The ID_MMFR4 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_MMFR4 bits [31:0] are architecturally mapped to AArch64 System register [ID_MMFR4_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_MMFR4 are UNDEFINED.

Attributes

ID_MMFR4 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|----|----|----|-------|----|----|----|-----|----|----|----|------|----|----|----|-----|----|----|----|-----|----|---|---|-----|---|---|---|---------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| EVT | | | | CCIDX | | | | LSM | | | | HPDS | | | | CnP | | | | XNX | | | | AC2 | | | | SpecSEI | | | |

EVT, bits [31:28]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the [HCR2](#).{TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

| EVT | Meaning |
|--------|--|
| 0b0000 | HCR2 .{TTLBIS, TOCU, TICAB, TID4} traps are not supported. |
| 0b0001 | HCR2 .{TOCU, TICAB, TID4} traps are supported. |
| | HCR2 .TTLBIS trap is not supported. |
| 0b0010 | HCR2 .{TTLBIS, TOCU, TICAB, TID4} traps are supported. |

All other values are reserved.

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented supporting AArch32, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented or does not support AArch32.
- 0b0010 when EL2 is implemented and supports AArch32.

CCIDX, bits [27:24]

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

| CCIDX | Meaning |
|--------|--|
| 0b0000 | 32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented. |
| 0b0001 | 64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented. |

All other values are reserved.

FEAT_CCIDX implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

LSM, bits [23:20]

Indicates support for LSMAOE and nTLSMD bits in [HSCTLR](#) and [SCTLR](#). Defined values are:

| LSM | Meaning |
|--------|---------------------------------------|
| 0b0000 | LSMAOE and nTLSMD bits not supported. |
| 0b0001 | LSMAOE and nTLSMD bits supported. |

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

HPDS, bits [19:16]

Hierarchical permission disables bits in translation tables. Defined values are:

| HPDS | Meaning |
|--------|--|
| 0b0000 | Disabling of hierarchical controls not supported. |
| 0b0001 | Supports disabling of hierarchical controls using the TTBCR2 .HPD0, TTBCR2 .HPD1, and HTCR .HPD bits. |
| 0b0010 | As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use. |

All other values are reserved.

FEAT_AA32HPD implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality added by the value 0b0010.

Note

The value 0b0000 implies that the encoding for [TTBCR2](#) is UNDEFINED.

CnP, bits [15:12]

Common not Private translations. Defined values are:

| CnP | Meaning |
|--------|--|
| 0b0000 | Common not Private translations not supported. |
| 0b0001 | Common not Private translations supported. |

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

XNX, bits [11:8]

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

| XNX | Meaning |
|------------|---|
| 0b0000 | Distinction between EL0 and EL1 execute-never control at stage 2 not supported. |
| 0b0001 | Distinction between EL0 and EL1 execute-never control at stage 2 supported. |

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

When FEAT_XNX is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4.XNX is 0b0000 or 0b0001:
 - [ID_AA64MMFR1_EL1.XNX](#) == 1.
 - EL2 cannot use AArch32.
 - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.

AC2, bits [7:4]

Indicates the extension of the [ACTLR](#) and [HACTLR](#) registers using [ACTLR2](#) and [HACTLR2](#). Defined values are:

| AC2 | Meaning |
|------------|---|
| 0b0000 | ACTLR2 and HACTLR2 are not implemented. |
| 0b0001 | ACTLR2 and HACTLR2 are implemented. |

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [3:0]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

| SpecSEI | Meaning |
|----------------|--|
| 0b0000 | The PE never generates an SError interrupt due to an External abort on a speculative read. |
| 0b0001 | The PE might generate an SError interrupt due to an External abort on a speculative read. |

All other values are reserved.

Accessing ID_MMFR4

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

ID_MMFR5, Memory Model Feature Register 5

The ID_MMFR5 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_MMFR5 bits [31:0] are architecturally mapped to AArch64 System register [ID_MMFR5_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_MMFR5 are UNDEFINED.

Attributes

ID_MMFR5 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|--------|---|---|-----|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | nTLBPA | | | ETS | | | | |

Bits [31:8]

Reserved, RES0.

nTLBPA, bits [7:4]

Indicates support for intermediate caching of translation table walks. Defined values are:

| nTLBPA | Meaning |
|--------|--|
| 0b0000 | The intermediate caching of translation table walks might include non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE where either: <ul style="list-style-type: none"> The caching is indexed by the physical address of the location holding the translation table entry. The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry. |
| 0b0001 | The intermediate caching of translation table walks does not include non-coherent caches of previous valid translation table entries since the last completed TLBI applicable to the PE where either: <ul style="list-style-type: none"> The caching is indexed by the physical address of the location holding the translation table entry. The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry. |

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

ETS, bits [3:0]

Indicates support for Enhanced Translation Synchronization. Defined values are:

| ETS | Meaning |
|--------|--|
| 0b0000 | Enhanced Translation Synchronization is not supported. |
| 0b0001 | Enhanced Translation Synchronization is supported. |

All other values are reserved.

FEAT_ETC implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

Accessing ID_MMFR5

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

ID_PFR0, Processor Feature Register 0

The ID_PFR0 characteristics are:

Purpose

Gives top-level information about the instruction sets and other features supported by the PE in AArch32 state.

Must be interpreted with [ID_PFR1](#).

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_PFR0 bits [31:0] are architecturally mapped to AArch64 System register [ID_PFR0_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_PFR0 are UNDEFINED.

Attributes

ID_PFR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|----|----|----|---------------------|----|----|----|---------------------|----|----|----|----------------------|----|----|----|------------------------|----|----|----|------------------------|----|---|---|------------------------|---|---|---|------------------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RAS | | | | DIT | | | | AMU | | | | CSV2 | | | | State3 | | | | State2 | | | | State1 | | | | State0 | | | |

RAS, bits [31:28]

RAS Extension version. Defined values are:

| RAS | Meaning |
|--------|---|
| 0b0000 | No RAS Extension. |
| 0b0001 | RAS Extension implemented. |
| 0b0010 | FEAT_RASv1p1 implemented. As 0b0001, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension. |

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT_DoubleFault is not implemented, and [ERRIDR.NUM](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

Note

When the value of this field is 0b0001, [ID_PFR2.RAS_frac](#) indicates whether FEAT_RASv1p1 is implemented.

DIT, bits [27:24]

Data Independent Timing. Defined values are:

| DIT | Meaning |
|--------|---|
| 0b0000 | AArch32 does not guarantee constant execution time of any instructions. |
| 0b0001 | AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions. |

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [23:20]

Indicates support for Activity Monitors Extension. Defined values are:

| AMU | Meaning |
|--------|--|
| 0b0000 | Activity Monitors Extension is not implemented. |
| 0b0001 | FEAT_AMUv1 is implemented. |
| 0b0010 | FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters. |

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

CSV2, bits [19:16]

Speculative use of out of context branch targets. Defined values are:

| CSV2 | Meaning |
|--------|--|
| 0b0000 | This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context. |
| 0b0001 | Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. |
| 0b0010 | Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way. |

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

State3, bits [15:12]

T32EE instruction set support. Defined values are:

| State3 | Meaning |
|--------|------------------------------------|
| 0b0000 | Not implemented. |
| 0b0001 | T32EE instruction set implemented. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

State2, bits [11:8]

Jazelle extension support. Defined values are:

| State2 | Meaning |
|--------|---|
| 0b0000 | Not implemented. |
| 0b0001 | Jazelle extension implemented, without clearing of JOSCR.CV on exception entry. |
| 0b0010 | Jazelle extension implemented, with clearing of JOSCR.CV on exception entry. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

State1, bits [7:4]

T32 instruction set support. Defined values are:

| State1 | Meaning |
|--------|--|
| 0b0000 | T32 instruction set not implemented. |
| 0b0001 | T32 encodings before the introduction of Thumb-2 technology implemented: <ul style="list-style-type: none"> • All instructions are 16-bit. • A BL or BLX is a pair of 16-bit instructions. • 32-bit instructions other than BL and BLX cannot be encoded. |
| 0b0011 | T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

State0, bits [3:0]

A32 instruction set support. Defined values are:

| State0 | Meaning |
|--------|--------------------------------------|
| 0b0000 | A32 instruction set not implemented. |
| 0b0001 | A32 instruction set implemented. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Accessing ID_PFR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0001 | 0b000 |

```

if PSTATE.EL == EL0 then

ID_PFR1, Processor Feature Register 1

The ID_PFR1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with [ID_PFR0](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_PFR1 bits [31:0] are architecturally mapped to AArch64 System register [ID_PFR1_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_PFR1 are UNDEFINED.

Attributes

ID_PFR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|----|----|----|---------------------------|----|----|----|--------------------------|----|----|----|--------------------------|----|----|----|--------------------------------|----|----|----|--------------------------|----|---|---|--------------------------|---|---|---|-------------------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| GIC | | | | Virt_frac | | | | Sec_frac | | | | GenTimer | | | | Virtualization | | | | MProgMod | | | | Security | | | | ProgMod | | | |

GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

| GIC | Meaning |
|--------|--|
| 0b0000 | GIC CPU interface system registers not implemented. |
| 0b0001 | System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported. |
| 0b0011 | System register interface to version 4.1 of the GIC CPU interface is supported. |

All other values are reserved.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for Virtualization Extensions. Defined values are:

| Virt_frac | Meaning |
|-----------|--|
| 0b0000 | No Virtualization Extensions are implemented. |
| 0b0001 | The following Virtualization Extensions are implemented: <ul style="list-style-type: none"> The SCR.SIF bit, if EL3 is implemented. The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented. The MSR (banked register) and MRS (banked register) instructions. The ERET instruction. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is valid only when the value of ID_PFR1.Virtualization is 0, otherwise it holds the value 0b0000.

Note

The ID_ISAR registers do not identify whether the instructions added by the Virtualization Extensions are implemented.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for Security Extensions. Defined values are:

| Sec_frac | Meaning |
|----------|--|
| 0b0000 | No Security Extensions are implemented. |
| 0b0001 | The following Security Extensions are implemented: <ul style="list-style-type: none"> • The VBAR register. • The TTBCR.PD0 and TTBCR.PD1 bits. |
| 0b0010 | As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is valid only when the value of ID_PFR1.Security is 0, otherwise it holds the value 0b0000.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:

| GenTimer | Meaning |
|----------|--|
| 0b0000 | Generic Timer is not implemented. |
| 0b0001 | Generic Timer is implemented. |
| 0b0010 | Generic Timer is implemented, and also includes support for CNTHCTL .EVNTIS and CNTKCTL .EVNTIS fields, and CNTPCTSS and CNTVCTSS counter views. |

All other values are reserved.

FEAT_ECV implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0001.

From Armv8.6, the only permitted value is 0b0010.

Virtualization, bits [15:12]

Virtualization support. Defined values are:

| Virtualization | Meaning |
|----------------|--|
| 0b0000 | EL2, Hyp mode, and the HVC instruction not implemented. |
| 0b0001 | EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

Note

The ID_ISARs do not identify whether the HVC instruction is implemented.

MProgMod, bits [11:8]

M-profile programmers' model support. Defined values are:

| MProgMod | Meaning |
|----------|---|
| 0b0000 | Not supported. |
| 0b0010 | Support for two-stack programmers' model. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Security, bits [7:4]

Security support. Defined values are:

| Security | Meaning |
|----------|--|
| 0b0000 | EL3, Monitor mode, and the SMC instruction not implemented. |
| 0b0001 | EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented. |
| 0b0010 | As for 0b0001, and adds the ability to set the NSACR .RFR bit. Not permitted in Armv8 as the NSACR .RFR bit is RES0. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

ProgMod, bits [3:0]

Support for the standard programmers' model for ARMv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

| ProgMod | Meaning |
|---------|----------------|
| 0b0000 | Not supported. |
| 0b0001 | Supported. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Accessing ID_PFR1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0001 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;

ID_PFR2, Processor Feature Register 2

The ID_PFR2 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with [ID_PFR0](#) and [ID_PFR1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_PFR2 bits [31:0] are architecturally mapped to AArch64 System register [ID_PFR2_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_PFR2 are UNDEFINED.

Attributes

ID_PFR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|------|----|----|----|------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | RAS_frac | | | | SSBS | | | | CSV3 | | | | | | | | | | | |

Bits [31:12]

Reserved, RES0.

RAS_frac, bits [11:8]

RAS Extension fractional field.

| RAS_frac | Meaning |
|----------|---|
| 0b0000 | If ID_PFR0 .RAS == 0b0001, RAS Extension implemented. |
| 0b0001 | If ID_PFR0 .RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension. |

All other values are reserved.

This field is valid only if [ID_PFR0](#).RAS == 0b0001.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

| SSBS | Meaning |
|--------|--|
| 0b0000 | AArch32 provides no mechanism to control the use of Speculative Store Bypassing. |
| 0b0001 | AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe. |

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

CSV3, bits [3:0]

Speculative use of faulting data. Defined values are:

| CSV3 | Meaning |
|--------|--|
| 0b0000 | This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence. |
| 0b0001 | Data loaded under speculation with a permission or domain fault cannot be used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence. The execution timing of any other instructions in the speculative sequence is not a function of the data loaded under speculation. |

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

Accessing ID_PFR2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0011 | 0b100 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then

    else
        return ID_PFR2;
elsif PSTATE.EL == EL2 then
    return ID_PFR2;
elsif PSTATE.EL == EL3 then
    return ID_PFR2;

```

IFAR, Instruction Fault Address Register

The IFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception.

Configuration

AArch32 System register IFAR bits [31:0] are architecturally mapped to AArch64 System register [FAR_EL1\[63:32\]](#).

AArch32 System register IFAR bits [31:0] (S) are architecturally mapped to AArch32 System register [HIFAR\[31:0\]](#) when EL2 is implemented, EL3 is implemented and the implementation only supports execution in AArch32 state.

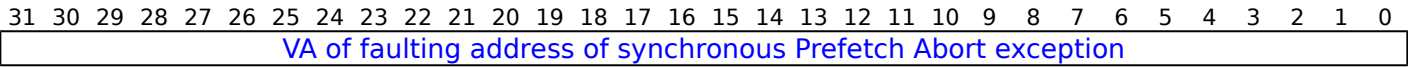

AArch32 System register IFAR bits [31:0] (S) are architecturally mapped to AArch64 System register [FAR_EL2\[63:32\]](#) when EL2 is implemented.

This register is present only when AArch32 is supported. Otherwise, direct accesses to IFAR are UNDEFINED.

Attributes

IFAR is a 32-bit register.

Field descriptions

Bits [31:0]

VA of faulting address of synchronous Prefetch Abort exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing IFAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

```

IFSR, Instruction Fault Status Register

The IFSR characteristics are:

Purpose

Holds status information about the last instruction fault.

Configuration

AArch32 System register IFSR bits [31:0] are architecturally mapped to AArch64 System register [IFSR32_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to IFSR are UNDEFINED.

The current translation table format determines which format of the register is used.

Attributes

IFSR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|------|-----|------|-------|------|------|---|---|---|---------|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | FnV | RES0 | ExT | RES0 | FS[4] | LPAE | RES0 | | | | FS[3:0] | | | | | | |

Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

| FnV | Meaning |
|-----|--|
| 0b0 | IFAR is valid. |
| 0b1 | IFAR is not valid, and holds an UNKNOWN value. |

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault Status bits. Bits [10] and [3:0] are interpreted together.

| FS | Meaning | Applies when |
|---------|--|----------------------------------|
| 0b00001 | PC alignment fault. | |
| 0b00010 | Debug exception. | |
| 0b00011 | Access flag fault, level 1. | |
| 0b00101 | Translation fault, level 1. | |
| 0b00110 | Access flag fault, level 2. | |
| 0b00111 | Translation fault, level 2. | |
| 0b01000 | Synchronous External abort, not on translation table walk. | |
| 0b01001 | Domain fault, level 1. | |
| 0b01011 | Domain fault, level 2. | |
| 0b01100 | Synchronous External abort, on translation table walk, level 1. | |
| 0b01101 | Permission fault, level 1. | |
| 0b01110 | Synchronous External abort, on translation table walk, level 2. | |
| 0b01111 | Permission fault, level 2. | |
| 0b10000 | TLB conflict abort. | |
| 0b10100 | IMPLEMENTATION DEFINED fault (Lockdown fault). | |
| 0b11001 | Synchronous parity or ECC error on memory access, not on translation table walk. | When FEAT_RAS is not implemented |
| 0b11100 | Synchronous parity or ECC error on translation table walk, level 1. | When FEAT_RAS is not implemented |
| 0b11110 | Synchronous parity or ECC error on translation table walk, level 2. | When FEAT_RAS is not implemented |

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is IFSR[10].
- FS[3:0] is IFSR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

| LPAE | Meaning |
|------|---|
| 0b0 | Using the Short-descriptor translation table formats. |
| 0b1 | Using the Long-descriptor translation table formats. |

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|------|-----|------|------|------|--------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | FnV | RES0 | ExT | RES0 | LPAE | RES0 | STATUS | | | | | | | | | |

Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

| FnV | Meaning |
|-----|--|
| 0b0 | IFAR is valid. |
| 0b1 | IFAR is not valid, and holds an UNKNOWN value. |

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

| LPAE | Meaning |
|------|---|
| 0b0 | Using the Short-descriptor translation table formats. |
| 0b1 | Using the Long-descriptor translation table formats. |

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

| STATUS | Meaning | Applies when |
|----------|--|----------------------------------|
| 0b000000 | Address size fault in translation table base register. | |
| 0b000001 | Address size fault, level 1. | |
| 0b000010 | Address size fault, level 2. | |
| 0b000011 | Address size fault, level 3. | |
| 0b000101 | Translation fault, level 1. | |
| 0b000110 | Translation fault, level 2. | |
| 0b000111 | Translation fault, level 3. | |
| 0b001001 | Access flag fault, level 1. | |
| 0b001010 | Access flag fault, level 2. | |
| 0b001011 | Access flag fault, level 3. | |
| 0b001101 | Permission fault, level 1. | |
| 0b001110 | Permission fault, level 2. | |
| 0b001111 | Permission fault, level 3. | |
| 0b010000 | Synchronous External abort, not on translation table walk. | |
| 0b010101 | Synchronous External abort on translation table walk, level 1. | |
| 0b010110 | Synchronous External abort on translation table walk, level 2. | |
| 0b010111 | Synchronous External abort on translation table walk, level 3. | |
| 0b011000 | Synchronous parity or ECC error on memory access, not on translation table walk. | When FEAT_RAS is not implemented |
| 0b011101 | Synchronous parity or ECC error on memory access on translation table walk, level 1. | When FEAT_RAS is not implemented |
| 0b011110 | Synchronous parity or ECC error on memory access on translation table walk, level 2. | When FEAT_RAS is not implemented |
| 0b011111 | Synchronous parity or ECC error on memory access on translation table walk, level 3. | When FEAT_RAS is not implemented |
| 0b100001 | PC alignment fault. | |
| 0b100010 | Debug exception. | |
| 0b110000 | TLB conflict abort. | |

All other values are reserved.

When FEAT_RAS is implemented, 0b011000, 0b011101, 0b011110, and 0b011111 are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing IFSR

ISR, Interrupt Status Register

The ISR characteristics are:

Purpose

Shows the pending status of the IRQ, FIQ, or SError.

When executing at EL2, EL3, or Secure EL1, when [SCR_EL3.EEL2](#) == 0b0, this shows the pending status of the physical interrupts.

When executing at Non-secure EL1, or at Secure EL1, when [SCR_EL3.EEL2](#) == 0b01:

- If the [HCR](#).{IMO,FMO,AMO} bit has a value of 1, the corresponding ISR.{I,F,A} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the [HCR](#).{IMO,FMO,AMO} bit has a value of 0, the corresponding ISR.{I,F,A} bit shows the pending status of the physical IRQ, FIQ, or SError.

Configuration

AArch32 System register ISR bits [31:0] are architecturally mapped to AArch64 System register [ISR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ISR are UNDEFINED.

Attributes

ISR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|------|---|---|---|---|

| RES0 | | | | | | | | | | | | | | | | | | | | | | | | A | I | F | RES0 | | | | |

Bits [31:9]

Reserved, RES0.

A, bit [8]

SError interrupt pending bit:

| A | Meaning |
|-----|---------------------------------|
| 0b0 | No pending SError interrupt. |
| 0b1 | An SError interrupt is pending. |

If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending:

| I | Meaning |
|-----|------------------------------|
| 0b0 | No pending IRQ. |
| 0b1 | An IRQ interrupt is pending. |

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

| F | Meaning |
|-----|------------------------------|
| 0b0 | No pending FIQ. |
| 0b1 | An FIQ interrupt is pending. |

Bits [5:0]

Reserved, RES0.

Accessing ISR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

elsif PSTATE.EL == EL2 then
    return ISR;
elsif PSTATE.EL == EL3 then
    return ISR;
```

ITLBIALL, Instruction TLB Invalidate All

The ITLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
 - Would be required for the EL1&0 translation regime.
 - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ITLBIALL are UNDEFINED.

Attributes

ITLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the ITLBIALL instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1000 | 0b0101 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then

ITLBIASID, Instruction TLB Invalidate by ASID match

The ITLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ITLBIASID are UNDEFINED.

Attributes

ITLBIASID is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ITLBIMVA, Instruction TLB Invalidate by VA

The ITLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ITLBIMVA are UNDEFINED.

Attributes

ITLBIMVA is a 32-bit System instruction.

MAIR0, Memory Attribute Indirection Register 0

The MAIR0 characteristics are:

Purpose

Along with [MAIR1](#), provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIdx[2] indicates the MAIR register to be used:

- When AttrIdx[2] is 0, MAIR0 is used.
- When AttrIdx[2] is 1, [MAIR1](#) is used.

Configuration

AArch32 System register MAIR0 bits [31:0] are architecturally mapped to AArch64 System register [MAIR_EL1\[31:0\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR0 bits [31:0] are architecturally mapped to AArch32 System register [PRRR\[31:0\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR0 bits [31:0] (MAIR0_NS) are architecturally mapped to AArch32 System register [PRRR\[31:0\]](#) (PRRR_NS) when EL3 is using AArch32.

AArch32 System register MAIR0 bits [31:0] (MAIR0_S) are architecturally mapped to AArch32 System register [PRRR\[31:0\]](#) (PRRR_S) when EL3 is using AArch32.

This register is present only when AArch32 is supported. Otherwise, direct accesses to MAIR0 are UNDEFINED.

MAIR0 and [PRRR](#) are the same register, with a different view depending on the value of [TTBCR.EAE](#):

- When it is set to 0, the register is as described in [PRRR](#).
- When it is set to 1, the register is as described in MAIR0.

When EL3 is using AArch32, write access to MAIR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Attributes

MAIR0 is a 32-bit register.

Field descriptions

When TTBCR.EAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------|----|----|----|----|----|----|----|-----------------------|----|----|----|----|----|----|----|-----------------------|----|----|----|----|----|---|---|-----------------------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Attr3 | | | | | | | | Attr2 | | | | | | | | Attr1 | | | | | | | | Attr0 | | | | | | | |

Attr<n>, bits [8n+7:8n], for n = 3 to 0

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIdx[2:0] gives the value of <n> in Attr<n>.
- AttrIdx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

| Attr<n>[7:4] | Meaning |
|------------------------|--|
| 0b0000 | Device memory. See encoding of Attr<n>[3:0] for the type of Device memory. |
| 0b00RW, RW not 0b00 | Normal memory, Outer Write-Through Transient. |
| 0b0100 | Normal memory, Outer Non-cacheable. |
| 0b01RW, RW not 0b00 | Normal memory, Outer Write-Back Transient. |
| 0b10RW | Normal memory, Outer Write-Through Non-transient. |
| 0b11RW | Normal memory, Outer Write-Back Non-transient. |

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

| Attr<n>[3:0] | Meaning when Attr<n>[7:4] is 0b0000 | Meaning when Attr<n>[7:4] is not 0b0000 |
|------------------------|---|---|
| 0b0000 | Device-nGnRnE memory | UNPREDICTABLE |
| 0b00RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Through Transient |
| 0b0100 | Device-nGnRE memory | Normal memory, Inner Non-cacheable |
| 0b01RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Back Transient |
| 0b1000 | Device-nGRE memory | Normal memory, Inner Write-Through Non-transient (RW=0b00) |
| 0b10RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Through Non-transient |
| 0b1100 | Device-GRE memory | Normal memory, Inner Write-Back Non-transient (RW=0b00) |
| 0b11RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Back Non-transient |

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

| R or W | Meaning |
|--------|-------------|
| 0b0 | No Allocate |
| 0b1 | Allocate |

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1010 | 0b0010 | 0b000 |

```

if PSTATE.EL == EL0 then

MAIR1, Memory Attribute Indirection Register 1

The MAIR1 characteristics are:

Purpose

Along with [MAIR0](#), provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIdx[2] indicates the MAIR register to be used:

- When AttrIdx[2] is 0, [MAIR0](#) is used.
- When AttrIdx[2] is 1, MAIR1 is used.

Configuration

AArch32 System register MAIR1 bits [31:0] are architecturally mapped to AArch64 System register [MAIR_EL1\[63:32\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR1 bits [31:0] are architecturally mapped to AArch32 System register [NMRR\[31:0\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR1 bits [31:0] (MAIR1_NS) are architecturally mapped to AArch32 System register [NMRR\[31:0\]](#) (NMRR_NS) when EL3 is using AArch32.

AArch32 System register MAIR1 bits [31:0] (MAIR1_S) are architecturally mapped to AArch32 System register [NMRR\[31:0\]](#) (NMRR_S) when EL3 is using AArch32.

This register is present only when AArch32 is supported. Otherwise, direct accesses to MAIR1 are UNDEFINED.

MAIR1 and [NMRR](#) are the same register, with a different view depending on the value of [TTBCR.EAE](#):

- When it is set to 0, the register is as described in [NMRR](#).
- When it is set to 1, the register is as described in MAIR1.

When EL3 is using AArch32, write access to MAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Attributes

MAIR1 is a 32-bit register.

Field descriptions

When TTBCR.EAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------|----|----|----|----|----|----|----|-----------------------|----|----|----|----|----|----|----|-----------------------|----|----|----|----|----|---|---|-----------------------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Attr7 | | | | | | | | Attr6 | | | | | | | | Attr5 | | | | | | | | Attr4 | | | | | | | |

Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 7 to 4

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIdx[2:0] gives the value of <n> in Attr<n>.
- AttrIdx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

| Attr<n>[7:4] | Meaning |
|------------------------|--|
| 0b0000 | Device memory. See encoding of Attr<n>[3:0] for the type of Device memory. |
| 0b00RW, RW not 0b00 | Normal memory, Outer Write-Through Transient. |
| 0b0100 | Normal memory, Outer Non-cacheable. |
| 0b01RW, RW not 0b00 | Normal memory, Outer Write-Back Transient. |
| 0b10RW | Normal memory, Outer Write-Through Non-transient. |
| 0b11RW | Normal memory, Outer Write-Back Non-transient. |

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

| Attr<n>[3:0] | Meaning when Attr<n>[7:4] is 0b0000 | Meaning when Attr<n>[7:4] is not 0b0000 |
|------------------------|---|---|
| 0b0000 | Device-nGnRnE memory | UNPREDICTABLE |
| 0b00RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Through Transient |
| 0b0100 | Device-nGnRE memory | Normal memory, Inner Non-cacheable |
| 0b01RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Back Transient |
| 0b1000 | Device-nGRE memory | Normal memory, Inner Write-Through Non-transient (RW=0b00) |
| 0b10RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Through Non-transient |
| 0b1100 | Device-GRE memory | Normal memory, Inner Write-Back Non-transient (RW=0b00) |
| 0b11RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Back Non-transient |

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

| R or W | Meaning |
|--------|-------------|
| 0b0 | No Allocate |
| 0b1 | Allocate |

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1010 | 0b0010 | 0b001 |

MIDR, Main ID Register

The MIDR characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

AArch32 System register MIDR bits [31:0] are architecturally mapped to AArch64 System register [MIDR_EL1\[31:0\]](#).

AArch32 System register MIDR bits [31:0] are architecturally mapped to External register [MIDR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to MIDR are UNDEFINED.

Some fields of the MIDR are IMPLEMENTATION DEFINED. For more information about the values of these fields for a particular Armv8 implementation, and any implementation-specific significance of these values, see the product documentation.

Attributes

MIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------------|----|----|----|----|----|----|----|-------------------------|----|----|----|------------------------------|----|----|----|----|----|----|----|-------------------------|----|---|---|---|---|---|---|--------------------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Implementer | | | | | | | | Variant | | | | Architecture | | | | | | | | PartNum | | | | | | | | Revision | | | |

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

| Implementer | Meaning |
|-------------|--|
| 0x00 | Reserved for software use. |
| 0x41 | Arm Limited. |
| 0x42 | Broadcom Corporation. |
| 0x43 | Cavium Inc. |
| 0x44 | Digital Equipment Corporation. |
| 0x46 | Fujitsu Ltd. |
| 0x49 | Infineon Technologies AG. |
| 0x4D | Motorola or Freescale Semiconductor Inc. |
| 0x4E | NVIDIA Corporation. |
| 0x50 | Applied Micro Circuits Corporation. |
| 0x51 | Qualcomm Inc. |
| 0x56 | Marvell International Ltd. |
| 0x69 | Intel Corporation. |
| 0xC0 | Ampere Computing. |

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is **RO**.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture, bits [19:16]

Architecture version. Defined values are:

| Architecture | Meaning |
|--------------|---|
| 0b0001 | Armv4. |
| 0b0010 | Armv4T. |
| 0b0011 | Armv5 (obsolete). |
| 0b0100 | Armv5T. |
| 0b0101 | Armv5TE. |
| 0b0110 | Armv5TEJ. |
| 0b0111 | Armv6. |
| 0b1111 | Architectural features are individually identified in the ID_* registers. |

All other values are reserved.

Access to this field is **RO**.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing MIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0000 | 0b000 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) then
        return VPIDR_EL2<31:0>;
    elsif EL2Enabled() && ELUsingAArch32(EL2) then

MPIDR, Multiprocessor Affinity Register

The MPIDR characteristics are:

Purpose

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

Configuration

AArch32 System register MPIDR bits [31:0] are architecturally mapped to AArch64 System register [MPIDR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to MPIDR are UNDEFINED.

In a uniprocessor system, Arm recommends that each Aff<n> field of this register returns a value of 0.

Attributes

MPIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|------|----|----|----|----|----|------|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| M | U | RES0 | | | | | MT | Aff2 | | | | | | | | Aff1 | | | | | | | | Aff0 | | | | | | | |

M, bit [31]

Indicates whether this implementation includes the functionality introduced by the Armv7 Multiprocessing Extensions.

| M | Meaning |
|-----|--|
| 0b0 | This implementation does not include the Armv7 Multiprocessing Extensions functionality. |
| 0b1 | This implementation includes the Armv7 Multiprocessing Extensions functionality. |

Access to this field is **RAO/WI**.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

| U | Meaning |
|-----|---|
| 0b0 | Processor is part of a multiprocessor system. |
| 0b1 | Processor is part of a uniprocessor system. |

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels.

| MT | Meaning |
|-----|---|
| 0b0 | Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent. |
| 0b1 | Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent. |

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

Accessing MPIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0000 | 0b101 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elseif EL2Enabled() && !ELUsingAArch32(EL2) then
        return VMPIDR_EL2<31:0>;
    elseif EL2Enabled() && ELUsingAArch32(EL2) then
        return VMPIDR;
    else
        return MPIDR;
elseif PSTATE.EL == EL2 then
    return MPIDR;
elseif PSTATE.EL == EL3 then
    return MPIDR;

```

MVBAR, Monitor Vector Base Address Register

The MVBAR characteristics are:

Purpose

When EL3 is implemented and can use AArch32, holds the vector base address for any exception that is taken to Monitor mode.

Secure software must program the MVBAR with the required initial value as part of the PE boot sequence.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to MVBAR are UNDEFINED.

It is IMPLEMENTATION DEFINED whether MVBAR[0] has a fixed value and ignored writes, or takes the last value written to it.

On a Warm reset into EL3 using AArch32, the reset value of MVBAR is an IMPLEMENTATION DEFINED choice between the following:

- MVBAR[31:5] = an IMPLEMENTATION DEFINED value, which might be UNKNOWN, MVBAR[4:1] = RES0, and MVBAR[0] = 0.
- MVBAR[31:1] = an IMPLEMENTATION DEFINED value that is bits[31:1] of the AArch32 reset address, and MVBAR[0] = 1.

Attributes

MVBAR is a 32-bit register.

Field descriptions

When programmed with a vector base address:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|----------|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Vector Base Address | | | | | | | | | | | | | | | | | | | | | | | | | Reserved | | | | | | |

Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

Reserved, bits [4:0]

Reserved, see Configurations.

Accessing MVBAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

MVFR0, Media and VFP Feature Register 0

The MVFR0 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR1](#) and [MVFR2](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register MVFR0 bits [31:0] are architecturally mapped to AArch64 System register [MVFR0_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to MVFR0 are UNDEFINED.

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

Attributes

MVFR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------|----|----|----|-------------------------|----|----|----|------------------------|----|----|----|--------------------------|----|----|----|------------------------|----|----|----|----------------------|----|---|---|----------------------|---|---|---|-------------------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| FPRound | | | | FPShVec | | | | FPSqrt | | | | FPDivide | | | | FPTrap | | | | FPDP | | | | FPSP | | | | SIMDReg | | | |

FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

| FPRound | Meaning |
|---------|--|
| 0b0000 | Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting. |
| 0b0001 | All rounding modes supported. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

FPShVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

| FPShVec | Meaning |
|---------|-----------------------------------|
| 0b0000 | Short vectors not supported. |
| 0b0001 | Short vector operation supported. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

| FPSqrt | Meaning |
|---------------|----------------------------|
| 0b0000 | Not supported in hardware. |
| 0b0001 | Supported. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

| FPDivide | Meaning |
|-----------------|----------------------------|
| 0b0000 | Not supported in hardware. |
| 0b0001 | Supported. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

| FPTrap | Meaning |
|---------------|----------------|
| 0b0000 | Not supported. |
| 0b0001 | Supported. |

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

FPDP, bits [11:8]

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:

| FPDP | Meaning |
|-------------|--|
| 0b0000 | Not supported in hardware. |
| 0b0001 | Supported, VFPv2. |
| 0b0010 | Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.

- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

| FPSP | Meaning |
|--------|---|
| 0b0000 | Not supported in hardware. |
| 0b0001 | Supported, VFPv2. |
| 0b0010 | Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

| SIMDReg | Meaning |
|---------|--|
| 0b0000 | The implementation has no Advanced SIMD and floating-point support. |
| 0b0001 | The implementation includes floating-point support with 16 x 64-bit registers. |
| 0b0010 | The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

Accessing MVFR0

Accesses to this register use the following encodings in the System register encoding space:

VMRS{<c>}{<q>} <Rt>, <spec_reg>

| reg |
|--------|
| 0b0111 |

```

if PSTATE.EL == EL0 then

MVFR1, Media and VFP Feature Register 1

The MVFR1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0](#) and [MVFR2](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register MVFR1 bits [31:0] are architecturally mapped to AArch64 System register [MVFR1_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to MVFR1 are UNDEFINED.

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

Attributes

MVFR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------------|----|----|----|----------------------|----|----|----|------------------------|----|----|----|------------------------|----|----|----|-------------------------|----|----|----|------------------------|----|---|---|------------------------|---|---|---|-----------------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SIMDFMAC | | | | FPHP | | | | SIMDHP | | | | SIMDSP | | | | SIMDInt | | | | SIMDLS | | | | FPDNaN | | | | FPFtZ | | | |

SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

| SIMDFMAC | Meaning |
|----------|------------------|
| 0b0000 | Not implemented. |
| 0b0001 | Implemented. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

FPHP, bits [27:24]

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

| FPHP | Meaning |
|-------------|---|
| 0b0000 | Not supported. |
| 0b0001 | Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision. |
| 0b0010 | As for 0b0001, and adds instructions for conversion between double-precision and half-precision. |
| 0b0011 | As for 0b0010, and adds support for half-precision floating-point arithmetic. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0011 in an implementation with floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

| Half Precision instructions supported | FPHP | SIMDHP |
|--|-------------|---------------|
| No support | 0b0000 | 0b0000 |
| Conversions only | 0b0010 | 0b0001 |
| Conversions and arithmetic | 0b0011 | 0b0010 |

SIMDHP, bits [23:20]

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

| SIMDHP | Meaning |
|---------------|---|
| 0b0000 | Not supported. |
| 0b0001 | SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision. |
| 0b0010 | As for 0b0001, and adds support for half-precision floating-point arithmetic. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0001 in an implementation with SIMD floating-point support that does not include the FEAT_FP16 extension.
- 0b0010 in an implementation with SIMD floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

| Half Precision instructions supported | FPHP | SIMDHP |
|--|-------------|---------------|
| No support | 0b0000 | 0b0000 |
| Conversions only | 0b0010 | 0b0001 |
| Conversions and arithmetic | 0b0011 | 0b0010 |

SIMDSP, bits [19:16]

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

| SIMDSP | Meaning |
|---------------|---|
| 0b0000 | Not implemented. |
| 0b0001 | Implemented. This value is permitted only if the SIMDInt field is 0b0001. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SIMDInt, bits [15:12]

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

| SIMDInt | Meaning |
|----------------|------------------|
| 0b0000 | Not implemented. |
| 0b0001 | Implemented. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SIMDLS, bits [11:8]

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

| SIMDLS | Meaning |
|---------------|------------------|
| 0b0000 | Not implemented. |
| 0b0001 | Implemented. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

FPDNaN, bits [7:4]

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

| FPDNaN | Meaning |
|---------------|--|
| 0b0000 | Not implemented, or hardware supports only the Default NaN mode. |
| 0b0001 | Hardware supports propagation of NaN values. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

FPFtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

| FPFtZ | Meaning |
|--------------|---|
| 0b0000 | Not implemented, or hardware supports only the Flush-to-Zero mode of operation. |
| 0b0001 | Hardware supports full denormalized number arithmetic. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Accessing MVFR1

Accesses to this register use the following encodings in the System register encoding space:

VMRS{<c>}{<q>} <Rt>, <spec_reg>

| reg |
|------------|
| 0b0110 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && !ELUsingAArch32(EL3) && CPTR_EL3.TFP == '1' then
        UNDEFINED;
    elsif (ELUsingAArch32(EL3) && SCR.NS == '1' && NSACR.cp10 == '0') || CPACR.cp10 == '00' then
        UNDEFINED;

MVFR2, Media and VFP Feature Register 2

The MVFR2 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0](#) and [MVFR1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register MVFR2 bits [31:0] are architecturally mapped to AArch64 System register [MVFR2_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to MVFR2 are UNDEFINED.

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

Attributes

MVFR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|--------|---|---|---|----------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | FPMisc | | | | SIMDMisc | | | |

Bits [31:8]

Reserved, RES0.

FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

| FPMisc | Meaning |
|--------|---|
| 0b0000 | Not implemented, or no support for miscellaneous features. |
| 0b0001 | Support for Floating-point selection. |
| 0b0010 | As 0b0001, and Floating-point Conversion to Integer with Directed Rounding modes. |
| 0b0011 | As 0b0010, and Floating-point Round to Integer Floating-point. |
| 0b0100 | As 0b0011, and Floating-point MaxNum and MinNum. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0100.

SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

| SIMDMisc | Meaning |
|-----------------|--|
| 0b0000 | Not implemented, or no support for miscellaneous features. |
| 0b0001 | Floating-point Conversion to Integer with Directed Rounding modes. |
| 0b0010 | As 0b0001, and Floating-point Round to Integer Floating-point. |
| 0b0011 | As 0b0010, and Floating-point MaxNum and MinNum. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0011.

Accessing MVFR2

Accesses to this register use the following encodings in the System register encoding space:

VMRS{<c>}{<q>} <Rt>, <spec_reg>

| reg |
|------------|
| 0b0101 |

```

NMRR, Normal Memory Remap Register

The NMRR characteristics are:

Purpose

Provides additional mapping controls for memory regions that are mapped as Normal memory by their entry in the [PRRR](#).

Used in conjunction with the [PRRR](#).

Configuration

AArch32 System register NMRR bits [31:0] are architecturally mapped to AArch64 System register [MAIR_EL1\[63:32\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register NMRR bits [31:0] are architecturally mapped to AArch32 System register [MAIR1\[31:0\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register NMRR bits [31:0] (NMRR_S) are architecturally mapped to AArch32 System register [MAIR1\[31:0\]](#) (MAIR1_S) when EL3 is using AArch32.

AArch32 System register NMRR bits [31:0] (NMRR_NS) are architecturally mapped to AArch32 System register [MAIR1\[31:0\]](#) (MAIR1_NS) when EL3 is using AArch32.

This register is present only when AArch32 is supported. Otherwise, direct accesses to NMRR are UNDEFINED.

[MAIR1](#) and NMRR are the same register, with a different view depending on the value of [TTBCR.EAE](#):

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in [MAIR1](#).

Attributes

NMRR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| OR7 | OR6 | OR5 | OR4 | OR3 | OR2 | OR1 | OR0 | IR7 | IR6 | IR5 | IR4 | IR3 | IR2 | IR1 | IR0 | | | | | | | | | | | | | | | | |

OR<n>, bits [2n+17:2n+16], for n = 7 to 0

Outer Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the PRRR.TR<n> entry. n is the value of the TEX[0], C, and B bits concatenated.

| OR<n> | Meaning |
|-------|---|
| 0b00 | Region is Non-cacheable. |
| 0b01 | Region is Write-Back, Write-Allocate. |
| 0b10 | Region is Write-Through, no Write-Allocate. |
| 0b11 | Region is Write-Back, no Write-Allocate. |

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

When FEAT_XS is implemented, stage 1 Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IR<n>, bits [2n+1:2n], for n = 7 to 0

Inner Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the PRRR.TR<n> entry. n is the value of the TEX[0], C, and B bits concatenated.

| IR<n> | Meaning |
|-------|---|
| 0b00 | Region is Non-cacheable. |
| 0b01 | Region is Write-Back, Write-Allocate. |
| 0b10 | Region is Write-Through, no Write-Allocate. |
| 0b11 | Region is Write-Back, no Write-Allocate. |

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing NMRR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

NSACR, Non-Secure Access Control Register

The NSACR characteristics are:

Purpose

When EL3 is implemented and can use AArch32, defines the Non-secure access permissions to Trace, Advanced SIMD and floating-point functionality. Also includes IMPLEMENTATION DEFINED bits that can define Non-secure access permissions for IMPLEMENTATION DEFINED functionality.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to NSACR are UNDEFINED.

Note

In AArch64 state, the NSACR controls are replaced by controls in [CPTR_EL3](#).

Attributes

NSACR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----------|------|---------------------------|----|----------|------|------|------|------|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | NSTRCDIS | RES0 | IMPLEMENTATION DEFINED | | NSASEDIS | RES0 | cp11 | cp10 | RES0 | | | | | | | | | | | | |

If EL3 is implemented and is using AArch64 then:

- Any read of the NSACR from Non-secure EL2 or Non-secure EL1 returns a value of 0x00000C00.
- Any read or write to NSACR from Secure EL1 is trapped as an exception to EL3.

If EL3 is not implemented, then any read of the NSACR from EL2 or EL1 returns a value of 0x00000C00.

Bits [31:21]

Reserved, RES0.

NSTRCDIS, bit [20]

Disables Non-secure System register accesses to all implemented trace registers.

| NSTRCDIS | Meaning |
|----------|---|
| 0b0 | This control has no effect on: <ul style="list-style-type: none"> System register access to implemented trace registers. The behavior of CPACR.TRCDIS and HCPTR.TTA. |
| 0b1 | Non-secure System register accesses to all implemented trace registers are disabled, meaning: <ul style="list-style-type: none"> CPACR.TRCDIS behaves as RAO/WI in Non-secure state, regardless of its actual value. HCPTR.TTA behaves as RAO/WI, regardless of its actual value. |

The implementation of this field must correspond to the implementation of the [CPACR](#).TRCDIS field:

- If [CPACR](#).TRCDIS is RAZ/WI, this field is RAZ/WI.

- If [CPACR](#).TRCDIS is RW, this field is RW.

Note

- The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED.
- The Arm architecture does not provide Non-secure access controls on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Bit [19]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [18:16]

IMPLEMENTATION DEFINED.

NSASEDIS, bit [15]

Disables Non-secure access to the Advanced SIMD functionality.

| NSASEDIS | Meaning |
|----------|---|
| 0b0 | This control has no effect on: <ul style="list-style-type: none"> • Non-secure access to Advanced SIMD functionality. • The behavior of CPACR.ASEDIS and HCPTR.TASE. |
| 0b1 | Non-secure access to the Advanced SIMD functionality is disabled, meaning: <ul style="list-style-type: none"> • CPACR.ASEDIS behaves as RAO/WI in Non-secure state, regardless of its actual value. • HCPTR.TASE behaves as RAO/WI, regardless of its actual value. |

The implementation of this field must correspond to the implementation of the [CPACR](#).ASEDIS field:

- If [CPACR](#).ASEDIS is RES0, this field is RES0. If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.
- If [CPACR](#).ASEDIS is RAZ/WI, this field is RAZ/WI.
- If [CPACR](#).ASEDIS is RW, this field is RW.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Bits [14:12]

Reserved, RES0.

cp11, bit [11]

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the NSACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

cp10, bit [10]

Enable Non-secure access to the Advanced SIMD and floating-point features. Possible values of the fields are:

| cp10 | Meaning |
|------|---|
| 0b0 | Advanced SIMD and floating-point features can be accessed only from Secure state. Any attempt to access this functionality from Non-secure state is UNDEFINED. When the PE is in Non-secure state: <ul style="list-style-type: none">The CPACR.{cp11, cp10} fields ignore writes and read as 0b00, access denied.The HCPTR.{TCP11, TCP10} fields behave as RAO/WI, regardless of their actual values. |
| 0b1 | Advanced SIMD and floating-point features can be accessed from both Security states. |

If Non-secure access to the Advanced SIMD and floating-point functionality is enabled, the CPACR must be checked to determine the level of access that is permitted.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing NSACR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0001 | 0b0001 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif !ELUsingAArch32(EL2) && SCR_EL3.<NS,EEL2> == '01' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif !ELUsingAArch32(EL3) && SCR_EL3.NS == '0' then
        AArch64.AArch32SystemAccessTrap(EL3, 0x03);
    elsif !HaveEL(EL3) || (!ELUsingAArch32(EL3) && SCR_EL3.NS == '1') then
        return Zeros(20):'1100':Zeros(8);
    else
        return NSACR;

PAR, Physical Address Register

The PAR characteristics are:

Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

Configuration

AArch32 System register PAR bits [63:0] are architecturally mapped to AArch64 System register [PAR_EL1\[63:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to PAR are UNDEFINED.

PAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits[31:0] and do not modify bits[63:32].

The Configurations section specifies the cases where each PAR format is used.

PAR is accessed as a 32-bit value:

- When the PE is not in Hyp mode and is using the Short-descriptor translation table format.
- When the PE is in Hyp mode and executes an [ATS12NSOPR](#), [ATS12NSOPW](#), [ATS12NSOUR](#), or [ATS12NSOUW](#) instruction and the value of [HCR.VM](#) is 0 and the value of [TTBCR.EAE](#) is 0.

In these cases, PAR[63:32] is RES0.

Otherwise, the PAR is accessed as a 64-bit value, if any of the following is true:

- When using the Long-descriptor translation table format.
- If the stage 1 address translation is disabled and [TTBCR.EAE](#) is set to 1.
- In an implementation that includes EL2, for the result of an ATS1Cxx instruction performed from Hyp mode.

For PL1&0 stage 1 translations, [TTBCR.EAE](#) selects the translation table format.

Attributes

PAR is a 64-bit register.

Field descriptions

When the instruction returned a 32-bit value to the PAR, PAR.F==0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|-----|----|----|----|---------------------------|----|----|----|----|------------|--|--|------------|--|----|---|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| PA | | | | | | | | | | | | | | | | | | | | LPAEN | | NOS | | NS | | IMPLEMENTATION DEFINED | | | | SH | Inner[2:0] | | | Outer[1:0] | | SS | F |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | | |

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the NOS, SH, Inner, and Outer fields.
- See the NS bit description for constraints on the value it returns.

Bits [63:32]

Reserved, RES0.

PA, bits [31:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[31:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

| LPAE | Meaning |
|------|---|
| 0b0 | Short-descriptor translation table format used. This means the PAR returned a 32-bit value. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [10]

Not Outer Shareable. When the returned value of PAR.SH is 1, indicates the Shareability attribute for the physical memory region:

| NOS | Meaning |
|-----|-----------------------------------|
| 0b0 | Memory region is Outer Shareable. |
| 0b1 | Memory region is Inner Shareable. |

When the returned value of PAR.SH is 0 the value returned to this field is UNKNOWN.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bit [8]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bit [7]

Shareability. Indicates whether the physical memory region is Non-shareable:

| SH | Meaning |
|-----------|--|
| 0b0 | Memory is Non-shareable. |
| 0b1 | Memory is shareable, and PAR.NOS indicates whether the region is Outer Shareable or Inner Shareable. |

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Inner[2:0], bits [6:4]

Inner cacheability attribute for the region. Permitted values are:

| Inner[2:0] | Meaning |
|-------------------|--------------------------------|
| 0b000 | Non-cacheable. |
| 0b001 | Device-nGnRnE. |
| 0b011 | Device-nGnRE. |
| 0b101 | Write-Back, Write-Allocate. |
| 0b110 | Write-Through. |
| 0b111 | Write-Back, no Write-Allocate. |

The values 0b010 and 0b100 are reserved.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Outer[1:0], bits [3:2]

Outer cacheability attribute for the region. Permitted values are:

| Outer[1:0] | Meaning |
|-------------------|-----------------------------------|
| 0b00 | Non-cacheable. |
| 0b01 | Write-Back, Write-Allocate. |
| 0b10 | Write-Through, no Write-Allocate. |
| 0b11 | Write-Back, no Write-Allocate. |

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [1]

Supersection. Used to indicate if the result is a Supersection:

| SS | Meaning |
|-----------|--|
| 0b0 | Result is not a Supersection. PAR[31:12] contains OA[31:12]. |
| 0b1 | Result is a Supersection, and: <ul style="list-style-type: none"> PAR[31:24] contains OA[31:24]. PAR[23:16] contains OA[39:32]. PAR[15:12] contains 0b0000. If an implementation supports less than 40 bits of physical address, the bits in the PAR field that correspond to physical address bits that are not implemented are UNKNOWN. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

| F | Meaning |
|-----|---|
| 0b0 | Address translation completed successfully. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the instruction returned a 32-bit value to the PAR, PAR.F==1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|------|----|------|----|----|----|-------|----|---------|----|----|----|---|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | RES0 | | | | LPAE | | RES0 | | | | FS[5] | | FS[4:0] | | | | F |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:16]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

| LPAE | Meaning |
|------|---|
| 0b0 | Short-descriptor translation table format used. This means the PAR returned a 32-bit value. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:7]

Reserved, RES0.

FS[5], bit [6]

Fault status bits, External abort type. Provides an IMPLEMENTATION DEFINED classification of an External abort. Values are as in the [DESR.ExT](#) field when using the Short-descriptor translation table format.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FS[4:0], bits [5:1]

Fault status bits. Values are as in the [DEFSR.FS](#) field when using the Short-descriptor translation table format.

| FS[4:0] | Meaning | Applies when |
|---------|--|----------------------------------|
| 0b00001 | Alignment fault. | |
| 0b00011 | Access flag fault, level 1. | |
| 0b00100 | Fault on instruction cache maintenance. | |
| 0b00101 | Translation fault, level 1. | |
| 0b00110 | Access flag fault, level 2. | |
| 0b00111 | Translation fault, level 2. | |
| 0b01001 | Domain fault, level 1. | |
| 0b01011 | Domain fault, level 2. | |
| 0b01100 | Synchronous External abort, on translation table walk, level 1. | |
| 0b01101 | Permission fault, level 1. | |
| 0b01110 | Synchronous External abort, on translation table walk, level 2. | |
| 0b01111 | Permission fault, level 2. | |
| 0b10000 | TLB conflict abort. | |
| 0b11001 | Synchronous parity or ECC error on memory access, not on translation table walk. | When FEAT_RAS is not implemented |
| 0b11100 | Synchronous parity or ECC error on translation table walk, level 1. | When FEAT_RAS is not implemented |
| 0b11110 | Synchronous parity or ECC error on translation table walk, level 2. | When FEAT_RAS is not implemented |

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

| F | Meaning |
|-----|------------------------------|
| 0b1 | Address translation aborted. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the instruction returned a 64-bit value to the PAR, PAR.F==0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|------|----|----|----|------|---------------------------|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ATTR | | | | | | | | RES0 | | | | | | | | | | | | | | | | PA | | | | | | | |
| PA | | | | | | | | | | | | LPAE | IMPLEMENTATION DEFINED | | | | NS | SH | RES0 | | | | | | F | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the ATTR and SH fields.
- See the NS bit description for constraints on the value it returns.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in [MAIR0](#) and [MAIR1](#).

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [55:40]

Reserved, RES0.

PA, bits [39:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[39:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

| LPAE | Meaning |
|------|--|
| 0b1 | Long-descriptor translation table format used. This means the PAR returned a 64-bit value. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address. Permitted values are:

| SH | Meaning |
|------|------------------|
| 0b00 | Non-shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

| F | Meaning |
|-----|---|
| 0b0 | Address translation completed successfully. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the instruction returned a 64-bit value to the PAR, PAR.F==1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|------------------------|----|----|----|----|----|----|----|------------------------|----|------|----|--------|----|-------|----|------|----|-----|----|----|----|----|----|--|--|--|--|--|--|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | | | | | | |
| IMPLEMENTATION DEFINED | | | | | | | | IMPLEMENTATION DEFINED | | | | | | | | IMPLEMENTATION DEFINED | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | LPAE | | RES0 | | FSTAGE | | S2WLK | | RES0 | | FST | | | F | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | | | | |

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:12]

Reserved, RES0.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

| LPAE | Meaning |
|------|--|
| 0b1 | Long-descriptor translation table format used. This means the PAR returned a 64-bit value. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [10]

Reserved, RES0.

FSTAGE, bit [9]

Indicates the translation stage at which the translation aborted:

| FSTAGE | Meaning |
|--------|--|
| 0b0 | Translation aborted because of a fault in the stage 1 translation. |
| 0b1 | Translation aborted because of a fault in the stage 2 translation. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S2WLK, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status field. Values are as in the [DFSR.STATUS](#) and [IFSR.STATUS](#) fields when using the Long-descriptor translation table format.

| FST | Meaning | Applies when |
|------------|--|----------------------------------|
| 0b000000 | Address size fault in translation table base register. | |
| 0b000001 | Address size fault, level 1. | |
| 0b000010 | Address size fault, level 2. | |
| 0b000011 | Address size fault, level 3. | |

| 0b110000 | TLB conflict abort. | |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

| F | Meaning |
|----------|------------------------------|
| 0b1 | Address translation aborted. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PAR

Accesses to this register use the following encodings in the System register encoding space:

PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR](#), increments.

Configuration

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to AArch64 System register [PMCCFILTR_EL0\[31:0\]](#).

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to External register [PMCCFILTR_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR are UNDEFINED.

Attributes

PMCCFILTR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|-----|-----|-----|------|----|----|----|----|-----|------|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| P | U | NSK | NSU | NSH | RES0 | | | | | RLU | RES0 | | | | | | | | | | | | | | | | | | | | |

P, bit [31]

Privileged filtering bit. Controls counting in EL1.
If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR.NSK bit.

| P | Meaning |
|-----|-----------------------------|
| 0b0 | Count cycles in EL1. |
| 0b1 | Do not count cycles in EL1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

U, bit [30]

User filtering bit. Controls counting in EL0.
If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR.NSU bit.
If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMCCFILTR.RLU bit.

| U | Meaning |
|-----|-----------------------------|
| 0b0 | Count cycles in EL0. |
| 0b1 | Do not count cycles in EL0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMCCFILTR.P, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMCCFILTR.U, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 (Hyp mode) filtering bit. Controls counting in EL2.

| NSH | Meaning |
|-----|-----------------------------|
| 0b0 | Do not count cycles in EL2. |
| 0b1 | Count cycles in EL2. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [26:22]

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMCCFILTR.U bit, cycles in Realm EL0 are counted.
Otherwise, cycles in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [20:0]

Reserved, RES0.

Accessing PMCCFILTR

PMCCFILTR can also be accessed by using [PMXEVTYPER](#) with [PMSELR](#).SEL set to 0b11111.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' for more information.

[PMCCFILTER](#) determines the modes and states in which the PMCCNTR can increment.

Configuration

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to AArch64 System register [PMCCNTR_EL0\[63:0\]](#).

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to External register [PMCCNTR_EL0\[63:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR are UNDEFINED.

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

Attributes

PMCCNTR is a 64-bit register.

Field descriptions

CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR](#).{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR](#).C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b1001 | 0b1101 | 0b000 |

```

PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Configuration

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0_EL0\[31:0\]](#).

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to External register [PMCEID0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0 are UNDEFINED.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|---------------------|---------------------|---------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 |
| ID31 | ID30 | ID29 | ID28 | ID27 | ID26 | ID25 | ID24 | ID23 | ID22 | ID21 | ID20 | ID19 | ID18 | ID17 | ID16 | ID15 | ID14 | ID13 | ID12 | ID11 | ID10 | ID9 | ID8 | ID7 |

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

| ID<n> | Meaning |
|-------|--|
| 0b0 | The Common event is not implemented, or not counted. |
| 0b1 | The Common event is implemented. |

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU

features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1001 | 0b1100 | 0b110 |

PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x0020 to 0x003F.

For more information about the Common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

Configuration

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID1_EL0\[31:0\]](#).

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to External register [PMCEID1\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1 are UNDEFINED.

Attributes

PMCEID1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|---------------------|---------------------|---------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 |
| ID31 | ID30 | ID29 | ID28 | ID27 | ID26 | ID25 | ID24 | ID23 | ID22 | ID21 | ID20 | ID19 | ID18 | ID17 | ID16 | ID15 | ID14 | ID13 | ID12 | ID11 | ID10 | ID9 | ID8 | ID7 |

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event (0x0020 + n).

For each bit:

| ID<n> | Meaning |
|-------|--|
| 0b0 | The Common event is not implemented, or not counted. |
| 0b1 | The Common event is implemented. |

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU

features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1001 | 0b1100 | 0b111 |

PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

Purpose

Disables the Cycle Count Register, [PMCCNTR](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

PMCNTENCLR is used in conjunction with the [PMCNTENSET](#) register.

Configuration

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENCLR_ELO\[31:0\]](#).

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to External register [PMCNTENCLR_ELO\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR are UNDEFINED.

Attributes

PMCNTENCLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| C | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

C, bit [31]

[PMCCNTR](#) disable bit. Disables the cycle counter register.

| C | Meaning |
|-----|--|
| 0b0 | When read, means the cycle counter is disabled. When written, has no effect. |
| 0b1 | When read, means the cycle counter is enabled. When written, disables the cycle counter. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

| P<n> | Meaning |
|-------------------|--|
| 0b0 | When read, means that PMEVCNTR<n> is disabled. When written, has no effect. |
| 0b1 | When read, means that PMEVCNTR<n> is enabled. When written, disables PMEVCNTR<n> . |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENCLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b1001 | 0b1100 | 0b010 |

PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

Purpose

Enables the Cycle Count Register, [PMCCNTR](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

PMCNTENSET is used in conjunction with the [PMCNTENCLR](#) register.

Configuration

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENSET_EL0\[31:0\]](#).

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to External register [PMCNTENSET_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET are UNDEFINED.

Attributes

PMCNTENSET is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| C | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

C, bit [31]

[PMCCNTR](#) enable bit. Enables the cycle counter register.

| C | Meaning |
|-----|---|
| 0b0 | When read, means the cycle counter is disabled. When written, has no effect. |
| 0b1 | When read, means the cycle counter is enabled. When written, enables the cycle counter. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter enable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

| P<n> | Meaning |
|-------------------|---|
| 0b0 | When read, means that PMEVCNTR<n> is disabled. When written, has no effect. |
| 0b1 | When read, means that PMEVCNTR<n> event counter is enabled. When written, enables PMEVCNTR<n> . |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENSET

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|

```

PMCR, Performance Monitors Control Register

The PMCR characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

AArch32 System register PMCR bits [31:0] are architecturally mapped to AArch64 System register [PMCR_EL0\[31:0\]](#).

AArch32 System register PMCR bits [7:0] are architecturally mapped to External register [PMCR_EL0\[7:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR are UNDEFINED.

Attributes

PMCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|----|----|----|----|------|----|------|----|----|----|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IMP | | | | | | | | IDCODE | | | | | | | | N | | | | RES0 | FZ | RES0 | LP | LC | DP | X | D | C | P | E | |

IMP, bits [31:24]

When FEAT_PMUv3p7 is not implemented:

Implementer code.

If this field is zero, then PMCR.IDCODE is RES0 and software must use [MIDR](#) to identify the PE.

Otherwise, this field and PMCR.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as [MIDR](#).Implementer.

Use of this field is deprecated.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

IDCODE, bits [23:16]

When PMCR.IMP != 0b00000000:

Identification code. Use of this field is deprecated.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of 0b000000-0b11111. If the value is 0b000000, then only [PMCCNTR](#) is implemented. If the value is 0b11111, then [PMCCNTR](#) and 31 event counters are implemented.

In an implementation that includes EL2:

- If EL2 is using AArch32, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of [HDCR](#).HPMN.
- If EL2 is using AArch64 and is enabled in the current Security state, reads of this field from EL1 and EL0 return the value of [MDCR_EL2](#).HPMN.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

| FZO | Meaning |
|-----|--|
| 0b0 | Do not freeze on overflow. |
| 0b1 | Event counter PMEVCNTR<n> does not count when PMOVSr[(PMN-1):0] is nonzero and n is in the range of affected event counters. |

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and [PMCCNTR](#)

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]**When FEAT_PMUv3p5 is implemented:**

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

| LP | Meaning |
|-----|--|
| 0b0 | Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n> [31:0]. |
| 0b1 | Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n> [63:0]. |

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

If PMN is not 0, this bit affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and [PMCCNTR](#).

[PMEVCNTR<n>](#)[63:32] cannot be accessed directly in AArch32 state.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

LC, bit [6]

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

| LC | Meaning |
|-----|--|
| 0b0 | Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR [31:0]. |
| 0b1 | Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR [63:0]. |

Arm deprecates use of [PMCR](#).LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DP, bit [5]**When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):**

Disable cycle counter when event counting is prohibited.

| DP | Meaning |
|-----|---|
| 0b0 | Cycle counting by PMCCNTR is not affected by this mechanism. |
| 0b1 | Cycle counting by PMCCNTR is disabled in prohibited regions: <ul style="list-style-type: none"> If FEAT_PMUv3p1 is implemented, EL2 is implemented, and HDCR.HPMD is 1, then cycle counting by PMCCNTR is disabled at EL2. If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR is disabled at EL3. If EL3 is implemented, MDCR_EL3.SPME or SDCR.SPME is 0, and either FEAT_PMUv3p7 is not implemented, EL3 is using AArch32, or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR is disabled at EL3 and in Secure state. <p>If HDCR.HPMN is not 0, this is when event counting by event counters in the range [0..HDCR.HPMN-1] is prohibited.</p> |

For more information see 'Prohibiting event counting'

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

| X | Meaning |
|-----|-------------------------------------|
| 0b0 | Do not export events. |
| 0b1 | Export events where not prohibited. |

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

Clock divider.

| D | Meaning |
|-----|--|
| 0b0 | When enabled, PMCCNTR counts every clock cycle. |
| 0b1 | When enabled, PMCCNTR counts once every 64 clock cycles. |

If PMCR.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR.D = 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

| C | Meaning |
|-----|--|
| 0b0 | No action. |
| 0b1 | Reset PMCCNTR to zero. |

Note

Resetting [PMCCNTR](#) does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

| P | Meaning |
|-----|---|
| 0b0 | No action. |
| 0b1 | If n is in the range of affected event counters, resets each event counter PMEVCNTR<n> to zero. |

The effects of writing to this bit are:

- If EL2 is implemented and enabled in the current Security state, in EL0 and EL1, if PMN is not 0, a write of 1 to this bit resets event counters in the range [0 .. (PMN-1)].
- If EL2 is disabled in the current Security state, a write of 1 to this bit resets all the event counters.
- In EL2 and EL3, a write of 1 to this bit resets all the event counters.
- This field does not affect the operation of other event counters and [PMCCNTR](#).

Note

Resetting the event counters does not change the event counter overflow bits.

If FEAT_PMUv3p5 is implemented, the values of [HDCR](#).HLP and PMCR.LP are ignored and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

| E | Meaning |
|----------|--|
| 0b0 | PMCCNTR is disabled and event counters PMEVCNTR<n> , where n is in the range of affected event counters, are disabled. |
| 0b1 | PMCCNTR and event counters PMEVCNTR<n> where n is in the range of affected event counters, are enabled by PMCNTENSET . |

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b1001 | 0b1100 | 0b000 |

PMEVCNTR<n>, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n> characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to AArch64 System register [PMEVCNTR<n>_EL0\[31:0\]](#).

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to External register [PMEVCNTR<n>_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n> are UNDEFINED.

Attributes

PMEVCNTR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Event counter n | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMEVCNTR<n> return bits [31:0] of the counter.
- Writes to PMEVCNTR<n> update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64, bits [63:32] are not required to be implemented.

If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>

PMEVCNTR<n> can also be accessed by using [PMXEVCNTR](#) with [PMSEL](#).SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMEVCNTR<n>](#) is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of [PMEVCNTR<n>](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR](#).{ER,EN} or [PMUSERENR_EL0](#).{ER,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, [HDCR](#).HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, [MDCR_EL2](#).HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [HDCR](#).HPMN and [MDCR_EL2](#).HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|-------------|--------|
| 0b1111 | 0b000 | 0b1110 | 0b10:n[4:3] | n[2:0] |

```

PMEVTYPER<n>, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n> characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to AArch64 System register [PMEVTYPER<n>_EL0\[31:0\]](#).

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to External register [PMEVTYPER<n>_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n> are UNDEFINED.

Attributes

PMEVTYPER<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|-----|-----|-----|------|----|------|-----|------|----|----|-----------------|----|----|---------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| P | U | NSK | NSU | NSH | RES0 | MT | RES0 | RLU | RES0 | | | evtCount[15:10] | | | evtCount[9:0] | | | | | | | | | | | | | | | | |

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>.NSK bit.

| P | Meaning |
|-----|-----------------------------|
| 0b0 | Count events in EL1. |
| 0b1 | Do not count events in EL1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMEVTYPER<n>.RLU bit.

| U | Meaning |
|-----|-----------------------------|
| 0b0 | Count events in EL0. |
| 0b1 | Do not count events in EL0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMEVTYPER<n>.P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMEVTYPER<n>.U, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 (Hyp mode) filtering bit. Controls counting in EL2.

| NSH | Meaning |
|-----|-----------------------------|
| 0b0 | Do not count events in EL2. |
| 0b1 | Count events in EL2. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

MT, bit [25]

When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

Multithreading.

| MT | Meaning |
|-----|--|
| 0b0 | Count events only on controlling PE. |
| 0b1 | Count events from any PE with the same affinity at level 1 and above as this PE. |

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this bit is RES0. See [ID_DFR1](#).MTPMU.

This bit is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and Disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:22]

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>.U bit, events in Realm EL0 are counted.

Otherwise, events in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [20:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter [PMEVCNTR<n>](#).

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<n>.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.

Otherwise, if PMEVTYPER<n>.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that for all values that represent reserved or unsupported events, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>

PMEVTYPER<n> can also be accessed by using [PMXEVTYPER](#) with [PMSCLR](#).SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMEVTYPER<n>](#) is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of [PMEVTYPER<n>](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR](#).EN or [PMUSERENR_EL0](#).EN.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, [HDCR](#).HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, [MDCR_EL2](#).HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [HDCR](#).HPMN and [MDCR_EL2](#).HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|-------------|--------|
| 0b1111 | 0b000 | 0b1110 | 0b11:n[4:3] | n[2:0] |

```

PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR](#), and the event counters [PMEVCNTR<n>](#). Reading the register shows which overflow interrupt requests are enabled.

PMINTENCLR is used in conjunction with the [PMINTENSET](#) register.

Configuration

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch64 System register [PMINTENCLR_EL1\[31:0\]](#).

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register [PMINTENCLR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR are UNDEFINED.

Attributes

PMINTENCLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

C, bit [31]

[PMCCNTR](#) overflow interrupt request disable bit.

| C | Meaning |
|-----|--|
| 0b0 | When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect. |
| 0b1 | When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

| P<n> | Meaning |
|------|---|
| 0b0 | When read, means that the PMEVCNTR<n> event counter interrupt request is disabled. When written, has no effect. |
| 0b1 | When read, means that the PMEVCNTR<n> event counter interrupt request is enabled. When written, disables the PMEVCNTR<n> interrupt request. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMINTENSET, Performance Monitors Interrupt Enable Set register

The PMINTENSET characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR](#), and the event counters [PMEVCNTR<n>](#). Reading the register shows which overflow interrupt requests are enabled.

PMINTENSET is used in conjunction with the [PMINTENCLR](#) register.

Configuration

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to AArch64 System register [PMINTENSET_EL1\[31:0\]](#).

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to External register [PMINTENSET_EL1\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENSET are UNDEFINED.

Attributes

PMINTENSET is a 32-bit register.

C, bit [31]

[PMCCNTR](#) overflow interrupt request enable bit.

| C | Meaning |
|-----|---|
| 0b0 | When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect. |
| 0b1 | When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

| P<n> | Meaning |
|------|--|
| 0b0 | When read, means that the PMEVCNTR<n> event counter interrupt request is disabled. When written, has no effect. |
| 0b1 | When read, means that the PMEVCNTR<n> event counter interrupt request is enabled. When written, enables the PMEVCNTR<n> interrupt request. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENSET

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation to software.

Configuration

This register is present only when AArch32 is supported and FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are UNDEFINED.

Attributes

PMMIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|---------|----|----|----|-----------|----|----|----|-----------|----|----|----|----|----|-------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | THWIDTH | | | | BUS_WIDTH | | | | BUS_SLOTS | | | | | | SLOTS | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

THWIDTH, bits [23:20]

[PMEVTYPER<n>_EL0](#).TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the [PMEVTYPER<n>_EL0](#).TH field.

| THWIDTH | Meaning |
|---------|--|
| 0b0000 | FEAT_PMUv3_TH is not implemented. |
| 0b0001 | 1 bit. PMEVTYPER<n>_EL0 .TH[11:1] are RES0. |
| 0b0010 | 2 bits. PMEVTYPER<n>_EL0 .TH[11:2] are RES0. |
| 0b0011 | 3 bits. PMEVTYPER<n>_EL0 .TH[11:3] are RES0. |
| 0b0100 | 4 bits. PMEVTYPER<n>_EL0 .TH[11:4] are RES0. |
| 0b0101 | 5 bits. PMEVTYPER<n>_EL0 .TH[11:5] are RES0. |
| 0b0110 | 6 bits. PMEVTYPER<n>_EL0 .TH[11:6] are RES0. |
| 0b0111 | 7 bits. PMEVTYPER<n>_EL0 .TH[11:7] are RES0. |
| 0b1000 | 8 bits. PMEVTYPER<n>_EL0 .TH[11:8] are RES0. |
| 0b1001 | 9 bits. PMEVTYPER<n>_EL0 .TH[11:9] are RES0. |
| 0b1010 | 10 bits. PMEVTYPER<n>_EL0 .TH[11:10] are RES0. |
| 0b1011 | 11 bits. PMEVTYPER<n>_EL0 .TH[11] is RES0. |
| 0b1100 | 12 bits. |

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to [PMEVTYPER<n>_EL0](#).TH is $2^{(\text{PMMIR.THWIDTH})}$ minus one.

Note

[PMEVTYPER<n>_EL0](#).TH cannot be accessed through [PMEVTYPER<n>](#).

Access to this field is **RO**.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as $\text{Log}_2(\text{number of bytes})$, plus one. Defined values are:

| BUS_WIDTH | Meaning |
|------------------|-----------------------------------|
| 0b0000 | The information is not available. |
| 0b0011 | Four bytes. |
| 0b0100 | 8 bytes. |
| 0b0101 | 16 bytes. |
| 0b0110 | 32 bytes. |
| 0b0111 | 64 bytes. |
| 0b1000 | 128 bytes. |
| 0b1001 | 256 bytes. |
| 0b1010 | 512 bytes. |
| 0b1011 | 1024 bytes. |
| 0b1100 | 2048 bytes. |

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

Access to this field is **RO**.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment by in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMMIR

Accesses to this register use the following encodings in the System register encoding space:

$\text{MRC}\{\langle c \rangle\}\{\langle q \rangle\} \langle \text{coproc} \rangle, \{ \# \} \langle \text{opc1} \rangle, \langle \text{Rt} \rangle, \langle \text{CRn} \rangle, \langle \text{CRm} \rangle \{, \{ \# \} \langle \text{opc2} \rangle \}$

| coproc | opc1 | CRn | CRm | opc2 |

PMOVSr, Performance Monitors Overflow Flag Status Register

The PMOVSr characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

Configuration

AArch32 System register PMOVSr bits [31:0] are architecturally mapped to AArch64 System register [PMOVSCLR_EL0\[31:0\]](#).

AArch32 System register PMOVSr bits [31:0] are architecturally mapped to External register [PMOVSCLR_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMOVSr are UNDEFINED.

Attributes

PMOVSr is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| C | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

C, bit [31]

Cycle counter overflow clear bit. Possible values are:

| C | Meaning |
|-----|--|
| 0b0 | When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect. |
| 0b1 | When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0. |

[PMCR](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR](#)[31:0] or unsigned overflow of [PMCCNTR](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

| P<n> | Meaning |
|-------------------|---|
| 0b0 | When read, means that PMEVCNTR<n> has not overflowed since this bit was last cleared. When written, has no effect. |
| 0b1 | When read, means that PMEVCNTR<n> has overflowed since this bit was last cleared. When written, clears the PMEVCNTR<n> overflow bit to 0. |

If FEAT_PMUv3p5 is implemented, [MDCR_EL2.HLP](#), [HDCR.HLP](#), and [PMCR.LP](#) control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>](#)[31:0] or unsigned overflow of [PMEVCNTR<n>](#)[63:0]. [PMEVCNTR<n>](#)[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSr

PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR](#), and each of the implemented event counters [PMEVCNTR<n>](#).

Configuration

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch64 System register [PMOVSSET_EL0\[31:0\]](#).

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register [PMOVSSET_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET are UNDEFINED.

Attributes

PMOVSSET is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| C | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

C, bit [31]

Cycle counter overflow set bit.

| C | Meaning |
|-----|--|
| 0b0 | When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect. |
| 0b1 | When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1. |

[PMCR.LC](#) controls whether an overflow is detected from unsigned overflow of [PMCCNTR](#)[31:0] or unsigned overflow of [PMCCNTR](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow set bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#) if EL2 is using AArch64, or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

| P<n> | Meaning |
|-------------------|--|
| 0b0 | When read, means that PMEVCNTR<n> has not overflowed since this bit was last cleared. When written, has no effect. |
| 0b1 | When read, means that PMEVCNTR<n> has overflowed since this bit was last . When written, sets the PMEVCNTR<n> overflow bit to 1. |

If FEAT_PMUv3p5 is implemented, [MDCR_EL2.HLP](#), [HDCR.HLP](#), and [PMCR.LP](#) control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>](#)[31:0] or unsigned overflow of [PMEVCNTR<n>](#)[63:0]. [PMEVCNTR<n>](#)[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

```

PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

Purpose

Selects the current event counter [PMEVCNTR<n>](#) or the cycle counter, CCNT.

PMSELR is used in conjunction with [PMXEVTYPER](#) to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with [PMXEVNTR](#), to determine the value of a selected event counter.

Configuration

AArch32 System register PMSELR bits [31:0] are architecturally mapped to AArch64 System register [PMSELR_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMSELR are UNDEFINED.

Attributes

PMSELR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | SEL | | | | | | | | | | | | | |

Bits [31:5]

Reserved, RES0.

SEL, bits [4:0]

Selects event counter, [PMEVCNTR<n>](#), where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to [PMXEVTYPER](#) or [PMXEVNTR](#) occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR.SEL is 0b11111, it selects the cycle counter and:

- A read of the [PMXEVTYPER](#) returns the value of [PMCCFILTR](#).
- A write of the [PMXEVTYPER](#) writes to [PMCCFILTR](#).
- A read or write of [PMXEVNTR](#) has CONSTRAINED UNPREDICTABLE effects. For more information, see [PMXEVNTR](#).

For more information about the results of accesses to event counters, see [PMXEVTYPER](#) and [PMXEVNTR](#).

For more information about the number of counters accessible at each Exception level, see [HDCR.HPMN](#) and [MDCR_EL2.HPMN](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSELR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1001 | 0b1100 | 0b101 |

PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see 'SW_INCR'.

Configuration

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to AArch64 System register [PMSWINC_EL0\[31:0\]](#).

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to External register [PMSWINC_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC are UNDEFINED.

Attributes

PMSWINC is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

Bit [31]

Reserved, RES0.

P<n>, bit [n], for n = 30 to 0

Event counter software increment bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

| P<n> | Meaning |
|------|--|
| 0b0 | No action. The write to this bit is ignored. |
| 0b1 | If PMEVCNTR<n> is enabled and configured to count the software increment event, increments PMEVCNTR<n> by 1. If PMEVCNTR<n> is disabled, or not configured to count the software increment event, the write to this bit is ignored. |

Accessing PMSWINC

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| | | | | |
|--------|------|-----|-----|------|
| coproc | opc1 | CRn | CRm | opc2 |
|--------|------|-----|-----|------|

| | | | | |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1001 | 0b1100 | 0b100 |
|--------|-------|--------|--------|-------|

PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

Purpose

Enables or disables User mode access to the Performance Monitors.

Configuration

AArch32 System register PMUSERENR bits [31:0] are architecturally mapped to AArch64 System register [PMUSERENR_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR are UNDEFINED.

Attributes

PMUSERENR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | ER | | | | CR | SW | EN | | | | | | | |

Bits [31:4]

Reserved, RES0.

ER, bit [3]

Event counter read trap control:

| ER | Meaning |
|-----|--|
| 0b0 | EL0 reads of the PMXVCNTR and PMEVCNTR<n> , and EL0 RW access to the PMSELR , are trapped to Undefined mode if PMUSERENR.EN is also 0. |
| 0b1 | Overrides PMUSERENR.EN and enables RO access to PMXVCNTR and PMEVCNTR<n> , and RW access to PMSELR . |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

CR, bit [2]

Cycle counter read trap control:

| CR | Meaning |
|-----|---|
| 0b0 | EL0 reads of the PMCCNTR are trapped to Undefined mode if PMUSERENR.EN is also 0. |
| 0b1 | Overrides PMUSERENR.EN and enables access to PMCCNTR . |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SW, bit [1]

Software increment write trap control:

| SW | Meaning |
|-----|--|
| 0b0 | EL0 writes to the PMSWINC are trapped to Undefined mode if PMUSERENR.EN is also 0. |
| 0b1 | Overrides PMUSERENR.EN and enables access to PMSWINC . |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EN, bit [0]

Traps EL0 accesses to the Performance Monitors registers to Undefined mode, as follows:

- [PMCR](#), [PMOVSr](#), [PMSELR](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXVCNTR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVSSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#), [PMSWINC](#).
- If FEAT_PMUv3p1 is implemented, [PMCEID2](#), and [PMCEID3](#).
- If FEAT_PMUv3p4 is implemented, [PMMIR](#).

| EN | Meaning |
|-----|---|
| 0b0 | While at EL0, accesses to the specified registers at EL0 are trapped to Undefined mode, unless overridden by one of PMUSERENR.{ER, CR, SW}. |
| 0b1 | While at EL0, software can access all of the specified registers. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMUSERENR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1001 | 0b1110 | 0b000 |

PMXEVNTR, Performance Monitors Selected Event Count Register

The PMXEVNTR characteristics are:

Purpose

Reads or writes the value of the selected event counter, [PMEVCNTR<n>](#). [PMSELR](#).SEL determines which event counter is selected.

Configuration

AArch32 System register PMXEVNTR bits [31:0] are architecturally mapped to AArch64 System register [PMXEVNTR_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVNTR are UNDEFINED.

Attributes

PMXEVNTR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PMEVCNTR<n> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, [PMEVCNTR<n>](#), where n is the value stored in [PMSELR](#).SEL.

If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMXEVNTR return bits [31:0] of the counter.
- Writes to PMXEVNTR update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64, bits [63:32] are not required to be implemented.

If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVNTR

If FEAT_FGT is implemented and [PMSELR](#).SEL is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMXEVNTR](#) is as follows:

- If [PMSELR](#).SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and [PMSELR](#).SEL is greater than or equal to the number of accessible event counters, then reads and writes of [PMXEVNTR](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if [PMSELR.SEL](#) has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and [PMSELR.SEL](#) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR.{ER,EN}](#) or [PMUSERENR_EL0.{ER,EN}](#).

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, [HDCR.HPMN](#) identifies the number of accessible event counters.
- If EL2 is using AArch64, [MDCR_EL2.HPMN](#) identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [HDCR.HPMN](#) and [MDCR_EL2.HPMN](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

Purpose

When [PMSELR.SEL](#) selects an event counter, this accesses a [PMEVTYPER<n>](#) register. When [PMSELR.SEL](#) selects the cycle counter, this accesses [PMCCFILTR](#).

Configuration

AArch32 System register PMXEVTYPER bits [31:0] are architecturally mapped to AArch64 System register [PMXEVTYPER_ELO\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER are UNDEFINED.

Attributes

PMXEVTYPER is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Event type register or PMCCFILTR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Event type register or [PMCCFILTR](#).

When [PMSELR.SEL](#) == 31, this register accesses [PMCCFILTR](#).

Otherwise, this register accesses [PMEVTYPER<n>](#) where n is the value in [PMSELR.SEL](#).

Accessing PMXEVTYPER

If FEAT_FGT is implemented, and [PMSELR.SEL](#) is not 31 and is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMXEVTYPER](#) is as follows:

- If [PMSELR.SEL](#) selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented, and [PMSELR.SEL](#) is not 31 and is greater than or equal to the number of accessible event counters, then reads and writes of [PMXEVTYPER](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if [PMSELR.SEL](#) has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if [PMSELR.SEL](#) is 31.
- If EL2 is implemented and enabled in the current Security state, and [PMSELR.SEL](#) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR](#).EN or [PMUSERENR_EL0](#).EN.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, [HDCR](#).HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, [MDCR_EL2](#).HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [HDCR](#).HPMN and [MDCR_EL2](#).HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

PRRR, Primary Region Remap Register

The PRRR characteristics are:

Purpose

Controls the top level mapping of the TEX[0], C, and B memory region attributes.

Configuration

AArch32 System register PRRR bits [31:0] are architecturally mapped to AArch64 System register [MAIR_EL1\[31:0\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register PRRR bits [31:0] are architecturally mapped to AArch32 System register [MAIR0\[31:0\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register PRRR bits [31:0] (PRRR_S) are architecturally mapped to AArch32 System register [MAIR0\[31:0\]](#) (MAIR0_S) when EL3 is using AArch32.

AArch32 System register PRRR bits [31:0] (PRRR_NS) are architecturally mapped to AArch32 System register [MAIR0\[31:0\]](#) (MAIR0_NS) when EL3 is using AArch32.

This register is present only when AArch32 is supported. Otherwise, direct accesses to PRRR are UNDEFINED.

[MAIR0](#) and PRRR are the same register, with a different view depending on the value of [TTBCR.EAE](#):

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in [MAIR0](#).

Attributes

PRRR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NOS7 | NOS6 | NOS5 | NOS4 | NOS3 | NOS2 | NOS1 | NOS0 | RES0 | NS1 | NS0 | DS1 | DS0 | TR7 | TR6 | TR5 | TR4 | TR3 | TR2 | TR1 | TR0 | | | | | | | | | | | |

NOS<n>, bit [n+24], for n = 7 to 0

Not Outer Shareable. NOS<n> is the Outer Shareable property for memory attributes n, if the region is mapped as Normal memory that is not Inner Non-cacheable, Outer Non-cacheable, and the appropriate PRRR.{NS0, NS1} field identifies the region as shareable. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values of each NOS<n> field other than NOS6 are:

| NOS<n> | Meaning |
|--------|-----------------------------------|
| 0b0 | Memory region is Outer Shareable. |
| 0b1 | Memory region is Inner Shareable. |

The value of this bit is ignored if the region is:

- Device memory
- Normal memory that is at least one of:
 - Inner Non-cacheable, Outer Non-cacheable.
 - Identified by the appropriate PRRR.{NS0, NS1} field as Non-shareable.

The meaning of the NOS6 field is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:20]

Reserved, RES0.

NS1, bit [19]

Mapping of S = 1 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 1.

| NS1 | Meaning |
|-----|--|
| 0b0 | Region is Non-shareable. |
| 0b1 | Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS0, bit [18]

Mapping of S = 0 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 0.

| NS0 | Meaning |
|-----|--|
| 0b0 | Region is Non-shareable. |
| 0b1 | Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DS1, bit [17]

Mapping of S = 1 attribute for Device memory. From Armv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DS0, bit [16]

Mapping of S = 0 attribute for Device memory. From Armv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TR<n>, bits [2n+1:2n], for n = 7 to 0

TR<n> is the primary TEX mapping for memory attributes n, and defines the mapped memory type for a region with attributes n. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values for each field other than TR6 are:

| TR<n> | Meaning |
|--------------------|----------------------|
| 0b00 | Device-nGnRnE memory |
| 0b01 | Device-nGnRE memory |
| 0b10 | Normal memory |

The value 0b11 is reserved. The effect of programming a field to 0b11 is CONSTRAINED UNPREDICTABLE.

The meaning of the TR6 field is IMPLEMENTATION DEFINED.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PRRR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

REVIDR, Revision ID Register

The REVIDR characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configuration

AArch32 System register REVIDR bits [31:0] are architecturally mapped to AArch64 System register [REVIDR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to REVIDR are UNDEFINED.

If REVIDR has the same value as [MIDR](#), then its contents have no significance.

Attributes

REVIDR is a 32-bit register.

        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return REVIDR;
elsif PSTATE.EL == EL2 then
    return REVIDR;
elsif PSTATE.EL == EL3 then
    return REVIDR;

```

RMR, Reset Management Register

The RMR characteristics are:

Purpose

If EL1 or EL3 is the highest implemented Exception level and this register is implemented:

- A write to the register at the highest implemented Exception level can request a Warm reset.
- If the highest implemented Exception level can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register [RMR_EL1\[31:0\]](#) when the highest implemented Exception level is EL1.

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register [RMR_EL3\[31:0\]](#) when EL3 is implemented.

This register is present only when AArch32 is supported. Otherwise, direct accesses to RMR are UNDEFINED.

Only implemented if EL1 or EL3 is the highest implemented Exception level. In this case:

- If the highest implemented Exception level can use AArch32 and AArch64 then this register must be implemented.
- If the highest implemented Exception level cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Attributes

RMR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | RR | | AA64 | | | | | | | | | | | | | |

Bits [31:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

AA64, bit [0]

When the highest implemented Exception level can use AArch64, determines which Execution state the PE boots into after a Warm reset:

| AA64 | Meaning |
|------|----------|
| 0b0 | AArch32. |
| 0b1 | AArch64. |

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If the highest implemented Exception level cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.

Accessing RMR

When EL3 is implemented, Arm deprecates accessing this register from any PE mode other than Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

`MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}`

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b0000 | 0b010 |

```
if PSTATE.EL IN {EL1, EL3} && IsHighestEL(PSTATE.EL) then
    return RMR;
else
    UNDEFINED;
```

`MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}`

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b0000 | 0b010 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if IsHighestEL(EL1) then
        RMR = R[t];
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    UNDEFINED;
elseif PSTATE.EL == EL3 then
    if CP15SDISABLE == HIGH then
        UNDEFINED;
    elseif CP15SDISABLE2 == HIGH then
        UNDEFINED;
    else
        RMR = R[t];
```

RVBAR, Reset Vector Base Address Register

The RVBAR characteristics are:

Purpose

If EL3 is not implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch32 state.

Configuration

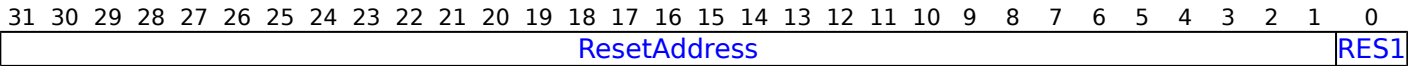

This register is present only when AArch32 is supported. Otherwise, direct accesses to RVBAR are UNDEFINED.

This register is only implemented if the highest Exception level implemented is capable of using AArch32, and is not EL3.

Attributes

RVBAR is a 32-bit register.

Field descriptions

ResetAddress, bits [31:1]

Bits [31:1] of the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 32-bit state.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [0]

Reserved, RES1.

Accessing RVBAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b0000 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if IsHighestEL(EL1) then
        return RVBAR;
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif !ELUsingAArch32(EL2) && SCR_EL3.<NS,EEL2> == '01' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif !ELUsingAArch32(EL3) && SCR_EL3.NS == '0' then
        AArch64.AArch32SystemAccessTrap(EL3, 0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if IsHighestEL(EL2) then
        return RVBAR;
    else
        UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MVBAR;

```

SCR, Secure Configuration Register

The SCR characteristics are:

Purpose

When EL3 is implemented and can use AArch32, defines the configuration of the current Security state. It specifies:

- The Security state, either Secure or Non-secure.
- What mode the PE branches to if an IRQ, FIQ, or External abort occurs.
- Whether the PSTATE.F or PSTATE.A bits can be modified when SCR.NS==1.

Configuration

AArch32 System register SCR bits [31:0] can be mapped to AArch64 System register [SCR_EL3\[31:0\]](#), but this is not architecturally mandated.

This register is present only when AArch32 is supported. Otherwise, direct accesses to SCR are UNDEFINED.

Attributes

SCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|------|-----|-----|------|-----|-----|-----|-----|----|----|----|-----|-----|----|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | TERR | RES0 | TWE | TWI | RES0 | SIF | HCE | SCD | nET | AW | FW | EA | FIQ | IRQ | NS | |

Bits [31:16]

Reserved, RES0.

TERR, bit [15]

When FEAT_RAS is implemented:

Trap Error record accesses. Generate a Monitor Trap exception on accesses to the following registers from modes other than Monitor mode:

[ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#). When FEAT_RASv1p1 is implemented, [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), [ERXMISC7](#).

| TERR | Meaning |
|------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Accesses to the specified registers from modes other than Monitor mode generate a Monitor Trap exception. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [14]

Reserved, RES0.

TWE, bit [13]

Traps WFE instructions to Monitor mode.

| TWE | Meaning |
|------------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Any attempt to execute a WFE instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by SCTLR.nTWE or HCR.TWE . Any exception that is taken to EL1 or to EL2 has priority over this trap. |

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

TWI, bit [12]

Traps WFI instructions to Monitor mode.

| TWI | Meaning |
|------------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Any attempt to execute a WFI instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by SCTLR.nTWI or HCR.TWI . Any exception that is taken to EL1 or to EL2 has priority over this trap. |

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Bits [11:10]

Reserved, RES0.

SIF, bit [9]

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory.

| SIF | Meaning |
|------------|--|
| 0b0 | Secure state instruction fetches from Non-secure memory are permitted. |
| 0b1 | Secure state instruction fetches from Non-secure memory are not permitted. |

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

HCE, bit [8]

Hypervisor Call instruction enable. If EL2 is implemented, enables execution of HVC instructions at Non-secure EL1 and EL2.

| HCE | Meaning |
|------------|--|
| 0b0 | HVC instructions are: <ul style="list-style-type: none"> UNDEFINED at Non-secure EL1. The Undefined Instruction exception is taken from PL1 to PL1. UNPREDICTABLE at EL2. Behavior is one of the following: <ul style="list-style-type: none"> The instruction is UNDEFINED. The instruction executes as a NOP. |
| 0b1 | HVC instructions are enabled at Non-secure EL1 and EL2. |

Note

HVC instructions are always UNDEFINED at EL0 and in Secure state.

If EL2 is not implemented, this bit is RES0 and HVC is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

SCD, bit [7]

Secure Monitor Call disable. Disables SMC instructions.

| SCD | Meaning |
|------------|--|
| 0b0 | SMC instructions are enabled. |
| 0b1 | In Non-secure state, SMC instructions are UNDEFINED. The Undefined Instruction exception is taken from the current Exception level to the current Exception level. In Secure state, behavior is one of the following: <ul style="list-style-type: none"> The instruction is UNDEFINED. The instruction executes as a NOP. |

Note

SMC instructions are always UNDEFINED at PL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

nET, bit [6]

Not Early Termination. This bit disables early termination.

| nET | Meaning |
|------------|--|
| 0b0 | Early termination permitted. Execution time of data operations can depend on the data values. |
| 0b1 | Disable early termination. The number of cycles required for data operations is forced to be independent of the data values. |

This IMPLEMENTATION DEFINED mechanism can disable data dependent timing optimizations from multiplies and data operations. It can provide system support against information leakage that might be exploited by timing correlation types of attack.

On implementations that do not support early termination or do not support disabling early termination, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

AW, bit [5]

When the value of SCR.EA is 1 and the value of [HCR](#).AMO is 0, this bit controls whether PSTATE.A masks an External abort taken from Non-secure state.

| AW | Meaning |
|-----------|--|
| 0b0 | External aborts taken from Non-secure state are not masked by PSTATE.A, and are taken to EL3. External aborts taken from Secure state are masked by PSTATE.A. |
| 0b1 | External aborts taken from either Security state are masked by PSTATE.A. When PSTATE.A is 0, the abort is taken to EL3. |

When SCR.EA is 0 or [HCR](#).AMO is 1, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

FW, bit [4]

When the value of SCR.FIQ is 1 and the value of [HCR](#).FMO is 0, this bit controls whether PSTATE.F masks an FIQ interrupt taken from Non-secure state.

| FW | Meaning |
|-----------|---|
| 0b0 | An FIQ taken from Non-secure state is not masked by PSTATE.F, and is taken to EL3. An FIQ taken from Secure state is masked by PSTATE.F. |
| 0b1 | An FIQ taken from either Security state is masked by PSTATE.F. When PSTATE.F is 0, the FIQ is taken to EL3. |

When SCR.FIQ is 0 or [HCR](#).FMO is 1, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

EA, bit [3]

External Abort handler. This bit controls which mode takes External aborts and SError interrupt exceptions.

| EA | Meaning |
|-----------|--|
| 0b0 | External aborts taken to Abort mode. |
| 0b1 | External aborts taken to Monitor mode. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

FIQ, bit [2]

FIQ handler. This bit controls which mode takes FIQ exceptions.

| FIQ | Meaning |
|-----|-----------------------------|
| 0b0 | FIQs taken to FIQ mode. |
| 0b1 | FIQs taken to Monitor mode. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

IRQ, bit [1]

IRQ handler. This bit controls which mode takes IRQ exceptions.

| IRQ | Meaning |
|-----|-----------------------------|
| 0b0 | IRQs taken to IRQ mode. |
| 0b1 | IRQs taken to Monitor mode. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

NS, bit [0]

Non-secure bit. Except when the PE is in Monitor mode, this bit determines the Security state of the PE:

| NS | Meaning |
|-----|----------------------------|
| 0b0 | PE is in Secure state. |
| 0b1 | PE is in Non-secure state. |

If the [HCR.TGE](#) bit is set, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing the SCR.NS bit from 0 to 1 results in the SCR.NS bit remaining as 0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Accessing SCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0001 | 0b0001 | 0b000 |

```

if PSTATE.EL == EL0 then

SCTLR, System Control Register

The SCTLR characteristics are:

Purpose

Provides the top level control of the system, including its memory system.

Configuration

AArch32 System register SCTLR bits [31:0] are architecturally mapped to AArch64 System register [SCTLR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to SCTLR are UNDEFINED.

Some bits in the register are read-only. These bits relate to non-configurable features of an implementation, and are provided for compatibility with previous versions of the architecture.

Attributes

SCTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|-----|-----|------|----|------|------|------|------|------|-----|------|------|------|------|----|----|------|--------|------|------|-------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 |
| DSSBS | TE | AFE | TRE | RES0 | EE | RES0 | SPAN | RES1 | RES0 | UWXN | WXN | nTWE | RES0 | nTWI | RES0 | V | I | RES1 | EnRCTX | RES0 | SEDI | TDUNK | | | |

DSSBS, bit [31]

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

| DSSBS | Meaning |
|-------|--|
| 0b0 | PSTATE.SSBS is set to 0 on an exception to any mode in this security state except Hyp mode |
| 0b1 | PSTATE.SSBS is set to 1 on an exception to any mode in this security state except Hyp mode |

Note

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to an Exception level that is executing at PL1 are taken to A32 or T32 state:

| TE | Meaning |
|-----|--|
| 0b0 | Exceptions, including reset, taken to A32 state. |
| 0b1 | Exceptions, including reset, taken to T32 state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

AFE, bit [29]

Access Flag Enable. When using the Short-descriptor translation table format for the PL1&0 translation regime, this bit enables use of the AP[0] bit in the translation descriptors as the Access flag, and restricts access permissions in the translation descriptors to the simplified model.

| AFE | Meaning |
|-----|---|
| 0b0 | In the translation table descriptors, AP[0] is an access permissions bit. The full range of access permissions is supported. No Access flag is implemented. |
| 0b1 | In the translation table descriptors, AP[0] is the Access flag. Only the simplified model for access permissions is supported. |

When using the Long-descriptor translation table format, the VMSA behaves as if this bit is set to 1, regardless of the value of this bit.

The AFE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TRE, bit [28]

TEX remap enable. This bit enables remapping of the TEX[2:1] bits in the PL1&0 translation regime for use as two translation table bits that can be managed by the operating system. Enabling this remapping also changes the scheme used to describe the memory region attributes in the VMSA.

| TRE | Meaning |
|-----|--|
| 0b0 | TEX remap disabled. TEX[2:0] are used, with the C and B bits, to describe the memory region attributes. |
| 0b1 | TEX remap enabled. TEX[2:1] are reassigned for use as bits managed by the operating system. The TEX[0], C, and B bits are used to describe the memory region attributes, with the MMU remap registers. |

When the value of [TTBCR.EAE](#) is 1, this bit is RES1.

The TRE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset, and the endianness of stage 1 translation table walks in the PL1&0 translation regime.

| EE | Meaning |
|-----|---|
| 0b0 | Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are little-endian. |
| 0b1 | Big-endian. PSTATE.E is set to 1 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are big-endian. |

If an implementation does not provide Big-endian support for data accesses at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception levels higher than EL0, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

SPAN, bit [23]

When FEAT_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1 from either Secure or Non-secure state, or to EL3 from Secure state when EL3 is using AArch32.

| SPAN | Meaning |
|------|---|
| 0b0 | PSTATE.PAN is set to 1 in the following situations: <ul style="list-style-type: none"> In Non-secure state, on taking an exception to EL1. In Secure state, when EL3 is using AArch64, on taking an exception to EL1. In Secure state, when EL3 is using AArch32, on taking an exception to EL3. |
| 0b1 | The value of PSTATE.PAN is left unchanged on taking an exception to EL1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [22]

Reserved, RES1.

Bit [21]

Reserved, RES0.

UWXN, bit [20]

Unprivileged write permission implies PL1 XN (Execute-never). This bit can force all memory regions that are writable at PL0 to be treated as XN for accesses from software executing at PL1.

| UWXN | Meaning |
|------|--|
| 0b0 | This control has no effect on memory access permissions. |
| 0b1 | Any region that is writable at PL0 forced to XN for accesses from software executing at PL1. |

The UWXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the PL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

| WXN | Meaning |
|-----|---|
| 0b0 | This control has no effect on memory access permissions. |
| 0b1 | Any region that is writable in the PL1&0 translation regime is forced to XN for accesses from software executing at PL1 or PL0. |

This bit applies only when SCTLR.M bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to Undefined mode.

| nTWE | Meaning |
|------|---|
| 0b0 | Any attempt to execute a WFE instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state. |
| 0b1 | This control does not cause any instructions to be trapped. |

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to Undefined mode.

| nTWI | Meaning |
|------|---|
| 0b0 | Any attempt to execute a WFI instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state. |
| 0b1 | This control does not cause any instructions to be trapped. |

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Bits [15:14]

Reserved, RES0.

V, bit [13]

Vectors bit. This bit selects the base address of the exception vectors for exceptions taken to a PE mode other than Monitor mode or Hyp mode:

| V | Meaning |
|-----|---|
| 0b0 | Normal exception vectors. Base address is held in VBAR . |
| 0b1 | High exception vectors (Hivecs), base address 0xFFFF0000. This base address cannot be remapped. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

I, bit [12]

Instruction access Cacheability control, for accesses at EL1 and EL0:

| I | Meaning |
|-----|---|
| 0b0 | All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory. |
| 0b1 | All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory. |

Instruction accesses to Normal memory from EL1 and EL0 are Cacheable regardless of the value of the SCTLR.I bit if either:

- EL2 is using AArch32 and the value of [HCR.DC](#) is 1.
- EL2 is using AArch64 and the value of [HCR_EL2.DC](#) is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bit [11]

Reserved, RES1.

EnRCTX, bit [10]
When FEAT_SPECPRES is implemented:

Enable EL0 access to the AArch32 CFPRCTX, DVPRCTX, and CPPRCTX instructions.

| EnRCTX | Meaning |
|--------|--|
| 0b0 | EL0 access to these instructions is disabled, and these instructions are trapped to EL1. |
| 0b1 | EL0 access to these instructions is enabled. |

Note

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

| SED | Meaning |
|-----|---|
| 0b0 | SETEND instruction execution is enabled at PL0 and PL1. |
| 0b1 | SETEND instructions are UNDEFINED at PL0 and PL1. |

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

| ITD | Meaning |
|-----|---|
| 0b0 | All IT instruction functionality is enabled at PL1 and PL0. |
| 0b1 | Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED: <ul style="list-style-type: none"> All encodings of the IT instruction with hw1[3:0]!=1000. All encodings of the subsequent instruction with the following values for hw1: <ul style="list-style-type: none"> 11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. 1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'. 10100xxxxxxxxxxx: ADD Rd, PC, #imm 01001xxxxxxxxxxx: LDR Rd, [PC, #imm] 0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. 010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. <p>These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.</p> <p>It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:</p> <ul style="list-style-type: none"> A 16-bit instruction, that can only be followed by another 16-bit instruction. The first half of a 32-bit instruction. <p>This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.</p> <p>An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</p> |

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the [SCTLR_EL1](#), [SCTLR_EL2](#), and [HSCTLR](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

UNK, bit [6]

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from PL1 and PL0:

| CP15BEN | Meaning |
|---------|---|
| 0b0 | PL0 and PL1 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is UNDEFINED. |
| 0b1 | PL0 and PL1 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is enabled. |

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the [SCTLR_EL1](#), [SCTLR_EL2](#), and [HSCTLR](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

When an implementation does not implement CP15BEN, access to this field is **RAO/WI**.

LSMAOE, bit [4]

When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

| LSMAOE | Meaning |
|--------|--|
| 0b0 | For all memory accesses at EL1 or EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered. |
| 0b1 | The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 is as defined for Armv8.0. |

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Otherwise:

Reserved, RES1.

nTLSMD, bit [3]

When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

| nTLSMD | Meaning |
|--------|---|
| 0b0 | All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault. |
| 0b1 | All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped. |

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Otherwise:

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL1 and EL0:

| C | Meaning |
|-----|--|
| 0b0 | All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache. |
| 0b1 | All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, can be cached at all levels of data and unified cache. |

The PE ignores SCTLR.C for Non-secure state and data accesses to Normal memory from EL1 and EL0 are Cacheable if either:

- EL2 is using AArch32 and the value of [HCR.DC](#) is 1.
- EL2 is using AArch64 and the value of [HCR_EL2.DC](#) is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

| A | Meaning |
|-----|---|
| 0b0 | Alignment fault checking disabled when executing at PL1 or PL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed. |
| 0b1 | Alignment fault checking enabled when executing at PL1 or PL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception. |

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

| M | Meaning |
|-----|---|
| 0b0 | EL1 and EL0 stage 1 address translation disabled. See the SCTLR.I field for the behavior of instruction accesses to Normal memory. |
| 0b1 | EL1 and EL0 stage 1 address translation enabled. |

In the Non-secure state the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of the field if either:

- EL2 is using AArch32 and the value of [HCR.{DC, TGE}](#) is not {0, 0}.
- EL2 is using AArch64 and the value of [HCR_EL2.{DC, TGE}](#) is not {0, 0}.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing SCTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0001 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);

SDCR, Secure Debug Control Register

The SDCR characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug, trace, and the Performance Monitors Extension.

Configuration

AArch32 System register SDCR bits [31:0] can be mapped to AArch64 System register [MDCR_EL3\[31:0\]](#), but this is not architecturally mandated.

This register is present only when AArch32 is supported. Otherwise, direct accesses to SDCR are UNDEFINED.

Attributes

SDCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|-------|------|------|------|------|------|------|------|-----|------|------|-----|------|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | MTPME | TDCC | RES0 | SCCD | RES0 | EPMA | EDAD | TTRF | STE | SPME | RES0 | SPD | RES0 | | | | | | | | | | | | | | | | | | |

Bits [31:29]

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>](#).MT bits.

| MTPME | Meaning |
|-------|---|
| 0b0 | FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n> .MT is 0. |
| 0b1 | PMEVTYPER<n> .MT bits not affected by this bit. |

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

The reset behavior of this field is:

- On a Cold reset, in a system where the PE resets into EL3, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel in modes other than Monitor mode to Monitor mode.

| TDCC | Meaning |
|-------------|--|
| 0b0 | This control does not cause any register accesses to be trapped. |
| 0b1 | Accesses to the DCC registers in modes other than Monitor mode generate a Monitor Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state. |

The DCC registers trapped by this control are:

- [DBGDTRRXext](#), [DBGDTRTXext](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

When the PE is in Debug state, SDCR.TDCC does not trap any accesses to:

- [DBGDTRRXint](#) and [DBGDTRTXint](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [26:24]

Reserved, RES0.

SCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

Secure Cycle Counter Disable. Prohibits [PMCCNTR](#) from counting in Secure state.

| SCCD | Meaning |
|-------------|--|
| 0b0 | Cycle counting by PMCCNTR is not affected by this mechanism. |
| 0b1 | Cycle counting by PMCCNTR is prohibited in Secure state. |

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

EPMAD, bit [21]

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Non-secure access disable. Controls Non-secure access to Performance Monitors registers by an external debugger.

| EPMAD | Meaning |
|--------------|---|
| 0b0 | Non-secure access to the Performance Monitors registers from an external debugger is permitted. |
| 0b1 | Non-secure access to the Performance Monitors registers from an external debugger is not permitted. |

If the Performance Monitors Extension does not support external debug interface accesses, this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

When FEAT_PMuV3 is implemented:

External Performance Monitors access disable. Controls access to Performance Monitors registers by an external debugger.

| EPMAD | Meaning |
|--------------|--|
| 0b0 | Access to Performance Monitors registers from an external debugger is permitted. |
| 0b1 | Access to Performance Monitors registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. |

If the Performance Monitors Extension does not support external debug interface accesses, this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

EDAD, bit [20]

When FEAT_Debugv8p4 is implemented:

External debug Non-secure access disable. Controls Non-secure access to breakpoint, watchpoint, and [OSLAR_EL1](#) registers by an external debugger.

| EDAD | Meaning |
|-------------|--|
| 0b0 | Non-secure access to debug registers from an external debugger is permitted. |
| 0b1 | Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 from an external debugger is not permitted. |

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

When FEAT_Debugv8p2 is implemented:

External debug access disable. Controls access to breakpoint, watchpoint, and [OSLAR_EL1](#) registers by an external debugger.

| EDAD | Meaning |
|------|---|
| 0b0 | Access to debug registers from an external debugger is permitted. |
| 0b1 | Access to breakpoint registers, watchpoint registers, and OSLAR_EL1 from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. |

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

External debug access disable. Controls access to breakpoint, watchpoint, and optionally [OSLAR_EL1](#) registers by an external debugger.

| EDAD | Meaning |
|------|--|
| 0b0 | Access to debug registers from an external debugger is permitted. |
| 0b1 | Access to breakpoint registers and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted. |

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

TTRF, bit [19]

When FEAT_TRF is implemented:

Trap Trace Filter controls. Controls whether accesses in modes other than Monitor mode to the trace filter control registers generate a Monitor Trap exception.

| TTRF | Meaning |
|------|--|
| 0b0 | Accesses to HTRECR and TRECR are not affected by this control bit. |
| 0b1 | When not in Monitor mode, accesses to HTRECR and TRECR generate a Monitor Trap exception, unless the access generates a higher priority exception. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

STE, bit [18]

When FEAT_TRF is implemented:

Secure Trace Enable. This bit enables tracing in Secure state and controls the level of authentication required by an external debugger to enable external tracing.

| STE | Meaning |
|-----|---|
| 0b0 | Trace is prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface. |
| 0b1 | Trace in Secure state is not affected by this bit. |

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, the PE behaves as if this bit is set to 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

SPME, bit [17]

When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

| SPME | Meaning |
|------|---|
| 0b0 | Event counting is prohibited in Secure state. If PMCR.DP is 1, PMCCNTR is disabled in Secure state. Otherwise, PMCCNTR is not affected by this mechanism. |
| 0b1 | Event counting and PMCCNTR are not affected by this mechanism. |

This field affects the operation of all event counters in Secure state, and if [PMCR.DP](#) is 1, the operation of [PMCCNTR](#) in Secure state. When [PMCR.DP](#) is 0, [PMCCNTR](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

When FEAT_PMUv3 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

| SPME | Meaning |
|------|--|
| 0b0 | If ExternalSecureNoninvasiveDebugEnabled() is FALSE, event counting is prohibited in Secure state, and if PMCR.DP is 1, PMCCNTR is disabled in Secure state. |
| 0b1 | Event counting and PMCCNTR are not affected by this mechanism. |

If ExternalSecureNoninvasiveDebugEnabled() is TRUE, the event counters and [PMCCNTR](#) are not affected by this field.

Otherwise, this field affects the operation of all event counters in Secure state, and if [PMCR.DP](#) is 1, the operation of [PMCCNTR](#) in Secure state. When [PMCR.DP](#) is 0, [PMCCNTR](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [16]

Reserved, RES0.

SPD, bits [15:14]

AArch32 Secure self-hosted Privileged Debug. Enables or disables debug exceptions from EL3, other than Breakpoint Instruction exceptions.

| SPD | Meaning |
|------|---|
| 0b00 | Legacy mode. Debug exceptions from EL3 are enabled by the authentication interface. |
| 0b10 | Secure privileged debug disabled. Debug exceptions from EL3 are disabled. |
| 0b11 | Secure privileged debug enabled. Debug exceptions from EL3 are enabled. |

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored in Non-secure state.

If debug exceptions from EL3 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if the value of [SDER.SUIDEN](#) is 1.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Bits [13:0]

Reserved, RES0.

Accessing SDCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0001 | 0b0011 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;

SDER, Secure Debug Enable Register

The SDER characteristics are:

Purpose

Controls invasive and non-invasive debug in the Secure EL0 mode.

Configuration

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register [SDER32_EL2\[31:0\]](#) when EL2 is implemented and FEAT_SEL2 is implemented.

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register [SDER32_EL3\[31:0\]](#) when EL3 is implemented.

This register is present only when (EL3 is implemented and EL3 is capable of using AArch32) or (EL1 is capable of using AArch32 and Secure EL1 is implemented). Otherwise, direct accesses to SDER are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

Attributes

SDER is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|--------|----|----|----|---|---|---|---|---|---|---|---|---|---|

Bits [31:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable.

| SUNIDEN | Meaning |
|---------|---|
| 0b0 | This bit does not affect Performance Monitors event counting at Secure EL0 |
| 0b1 | If EL3 or EL1 is using AArch32, Performance Monitors event counting is allowed in Secure EL0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SUIDEN, bit [0]

Secure User Invasive Debug Enable.

| SUIDEN | Meaning |
|--------|---|
| 0b0 | This bit does not affect the generation of debug exceptions at Secure EL0. |
| 0b1 | If EL3 or EL1 is using AArch32, debug exceptions from Secure EL0 are enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SPSR, Saved Program Status Register

The SPSR characteristics are:

Purpose

Holds the saved process state for the current mode.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR are UNDEFINED.

Attributes

SPSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|---------|----|------|-----|-----|----|----|----|----|----|----|----|----|---------|----|----|----|---|---|---|---|---|---|---|--------|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| N | Z | C | V | Q | IT[1:0] | J | SSBS | PAN | DIT | IL | | GE | | | | | | IT[7:2] | | | | E | A | I | F | T | | | M[4:0] | | |

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to the current mode, and copied to PSTATE.N on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to the current mode, and copied to PSTATE.Z on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to the current mode, and copied to PSTATE.C on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to the current mode, and copied to PSTATE.V on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to the current mode, and copied to PSTATE.Q on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to the current mode, and copied to PSTATE.IT on executing an exception return operation in the current mode.

SPSR.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR[26:25].
- IT[7:2] is SPSR[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to the current mode, and copied to PSTATE.SSBS on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to the current mode, and copied to PSTATE.PAN on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to the current mode, and copied to PSTATE.DIT on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to the current mode, and copied to PSTATE.IL on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to the current mode, and copied to PSTATE.GE on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to the current mode, and copied to PSTATE.E on executing an exception return operation in the current mode.

If the implementation does not support big-endian operation, SPSR.E is RES0. If the implementation does not support little-endian operation, SPSR.E is RES1. On executing an exception return operation in the current mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to the current mode, and copied to PSTATE.A on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to the current mode, and copied to PSTATE.I on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to the current mode, and copied to PSTATE.F on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to the current mode, and copied to PSTATE.T on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to the current mode, and copied to PSTATE.M[4:0] on executing an exception return operation in the current mode.

| M[4:0] | Meaning |
|---------------|----------------|
| 0b10000 | User. |
| 0b10001 | FIQ. |
| 0b10010 | IRQ. |
| 0b10011 | Supervisor. |
| 0b10110 | Monitor. |
| 0b10111 | Abort. |
| 0b11010 | Hyp. |
| 0b11011 | Undefined. |
| 0b11111 | System. |

Other values are reserved. If SPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in the current mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR

SPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.

SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

Purpose

Holds the saved process state when an exception is taken to Abort mode.

Configuration

AArch32 System register SPSR_abt bits [31:0] are architecturally mapped to AArch64 System register [SPSR_abt\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_abt are UNDEFINED.

Attributes

SPSR_abt is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|---------|----|------|-----|-----|----|----|----|----|---------|----|----|----|----|----|----|----|--------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| N | Z | C | V | Q | IT[1:0] | J | SSBS | PAN | DIT | IL | | GE | | IT[7:2] | | E | A | I | F | T | | M[4:0] | | | | | | | | | |

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Abort mode, and copied to PSTATE.IT on executing an exception return operation in Abort mode.

SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_abt[26:25].
- IT[7:2] is SPSR_abt[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

| M[4:0] | Meaning |
|---------------|----------------|
| 0b10000 | User. |
| 0b10001 | FIQ. |
| 0b10010 | IRQ. |
| 0b10011 | Supervisor. |
| 0b10111 | Abort. |
| 0b11011 | Undefined. |
| 0b11111 | System. |

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_abt

SPSR_abt is accessible in all modes other than User mode and Abort mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_abt

| R | M | M1 |
|----------|----------|-----------|
| 0b1 | 0b1 | 0b0100 |

MSR{<c>}{<q>} SPSR_abt, <Rn>

| R | M | M1 |
|----------|----------|-----------|
| 0b1 | 0b1 | 0b0100 |

SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

Purpose

Holds the saved process state when an exception is taken to FIQ mode.

Configuration

AArch32 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch64 System register [SPSR_fiq\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_fiq are UNDEFINED.

Attributes

SPSR_fiq is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|---------|----|------|-----|-----|----|----|----|----|----|----|----|---------|----|----|----|----|---|---|---|---|---|--------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| N | Z | C | V | Q | IT[1:0] | J | SSBS | PAN | DIT | IL | | GE | | | | | IT[7:2] | | | | E | A | I | F | T | | M[4:0] | | | | |

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to FIQ mode, and copied to PSTATE.IT on executing an exception return operation in FIQ mode.

SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_fiq[26:25].
- IT[7:2] is SPSR_fiq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

| M[4:0] | Meaning |
|---------------|----------------|
| 0b10000 | User. |
| 0b10001 | FIQ. |
| 0b10010 | IRQ. |
| 0b10011 | Supervisor. |
| 0b10111 | Abort. |
| 0b11011 | Undefined. |
| 0b11111 | System. |

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_fiq

SPSR_fiq is accessible in all modes other than User mode and FIQ mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_fiq

| R | M | M1 |
|----------|----------|-----------|
| 0b1 | 0b0 | 0b1110 |

MSR{<c>}{<q>} SPSR_fiq, <Rn>

| R | M | M1 |
|----------|----------|-----------|
| 0b1 | 0b0 | 0b1110 |

SPSR_hyp, Saved Program Status Register (Hyp mode)

The SPSR_hyp characteristics are:

Purpose

Holds the saved process state when an exception is taken to Hyp mode.

Configuration

AArch32 System register SPSR_hyp bits [31:0] are architecturally mapped to AArch64 System register [SPSR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_hyp are UNDEFINED.

Attributes

SPSR_hyp is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|---------|----|------|-----|-----|----|----|----|----|----|----|----|----|---------|----|----|----|---|---|---|---|---|---|---|--------|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| N | Z | C | V | Q | IT[1:0] | J | SSBS | PAN | DIT | IL | | GE | | | | | | IT[7:2] | | | | E | A | I | F | T | | | M[4:0] | | |

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Hyp mode, and copied to PSTATE.N on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Hyp mode, and copied to PSTATE.Z on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Hyp mode, and copied to PSTATE.C on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Hyp mode, and copied to PSTATE.V on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Hyp mode, and copied to PSTATE.Q on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Hyp mode, and copied to PSTATE.IT on executing an exception return operation in Hyp mode.

SPSR_hyp.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_hyp[26:25].
- IT[7:2] is SPSR_hyp[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Hyp mode, and copied to PSTATE.SSBS on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Hyp mode, and copied to PSTATE.PAN on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Hyp mode, and copied to PSTATE.DIT on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Hyp mode, and copied to PSTATE.IL on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Hyp mode, and copied to PSTATE.GE on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Hyp mode, and copied to PSTATE.E on executing an exception return operation in Hyp mode.

If the implementation does not support big-endian operation, SPSR_hyp.E is RES0. If the implementation does not support little-endian operation, SPSR_hyp.E is RES1. On executing an exception return operation in Hyp mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_hyp.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_hyp.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Hyp mode, and copied to PSTATE.A on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Hyp mode, and copied to PSTATE.I on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Hyp mode, and copied to PSTATE.F on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Hyp mode, and copied to PSTATE.T on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Hyp mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Hyp mode.

| M[4:0] | Meaning |
|---------------|----------------|
| 0b10000 | User. |
| 0b10001 | FIQ. |
| 0b10010 | IRQ. |
| 0b10011 | Supervisor. |
| 0b10111 | Abort. |
| 0b11010 | Hyp. |
| 0b11011 | Undefined. |
| 0b11111 | System. |

Other values are reserved. If SPSR_hyp.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Hyp mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_hyp

SPSR_hyp is accessible only in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_hyp

| R | M | M1 |
|----------|----------|-----------|
| 0b1 | 0b1 | 0b1110 |

SPSR_hyp, Saved Program Status Register (Hyp mode)

MSR{<c>}{<q>} SPSR_hyp, <Rn>

| R | M | M1 |
|----------|----------|-----------|
| 0b1 | 0b1 | 0b1110 |

SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

Purpose

Holds the saved process state when an exception is taken to IRQ mode.

Configuration

AArch32 System register SPSR_irq bits [31:0] are architecturally mapped to AArch64 System register [SPSR_irq\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_irq are UNDEFINED.

Attributes

SPSR_irq is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|---------|----|------|-----|-----|----|----|----|----|----|----|----|----|---------|----|----|----|---|---|---|---|---|---|--------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| N | Z | C | V | Q | IT[1:0] | J | SSBS | PAN | DIT | IL | | GE | | | | | | IT[7:2] | | | | E | A | I | F | T | | M[4:0] | | | |

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to IRQ mode, and copied to PSTATE.IT on executing an exception return operation in IRQ mode.

SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_irq[26:25].
- IT[7:2] is SPSR_irq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]**When FEAT_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

| M[4:0] | Meaning |
|---------------|----------------|
| 0b10000 | User. |
| 0b10001 | FIQ. |
| 0b10010 | IRQ. |
| 0b10011 | Supervisor. |
| 0b10111 | Abort. |
| 0b11011 | Undefined. |
| 0b11111 | System. |

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_irq

SPSR_irq is accessible in all modes other than User mode and IRQ mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_irq

| R | M | M1 |
|----------|----------|-----------|
| 0b1 | 0b1 | 0b0000 |

MSR{<c>}{<q>} SPSR_irq, <Rn>

| R | M | M1 |
|----------|----------|-----------|
| 0b1 | 0b1 | 0b0000 |

SPSR_mon, Saved Program Status Register (Monitor mode)

The SPSR_mon characteristics are:

Purpose

Holds the saved process state when an exception is taken to Monitor mode.

Configuration

AArch32 System register SPSR_mon bits [31:0] can be mapped to AArch64 System register [SPSR_EL3\[31:0\]](#), but this is not architecturally mandated.

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_mon are UNDEFINED.

Attributes

SPSR_mon is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|---------|----|------|-----|-----|----|----|----|----|----|----|----|----|---------|----|----|----|---|---|---|---|---|---|---|--------|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| N | Z | C | V | Q | IT[1:0] | J | SSBS | PAN | DIT | IL | | GE | | | | | | IT[7:2] | | | | E | A | I | F | T | | | M[4:0] | | |

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Monitor mode, and copied to PSTATE.N on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Monitor mode, and copied to PSTATE.Z on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Monitor mode, and copied to PSTATE.C on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Monitor mode, and copied to PSTATE.V on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Monitor mode, and copied to PSTATE.Q on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Monitor mode, and copied to PSTATE.IT on executing an exception return operation in Monitor mode.

SPSR_mon.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_mon[26:25].
- IT[7:2] is SPSR_mon[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Monitor mode, and copied to PSTATE.SSBS on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Monitor mode, and copied to PSTATE.PAN on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Monitor mode, and copied to PSTATE.DIT on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Monitor mode, and copied to PSTATE.IL on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Monitor mode, and copied to PSTATE.GE on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Monitor mode, and copied to PSTATE.E on executing an exception return operation in Monitor mode.

If the implementation does not support big-endian operation, SPSR_mon.E is RES0. If the implementation does not support little-endian operation, SPSR_mon.E is RES1. On executing an exception return operation in Monitor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_mon.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_mon.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Monitor mode, and copied to PSTATE.A on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Monitor mode, and copied to PSTATE.I on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Monitor mode, and copied to PSTATE.F on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Monitor mode, and copied to PSTATE.T on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Monitor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Monitor mode.

| M[4:0] | Meaning |
|---------------|----------------|
| 0b10000 | User. |
| 0b10001 | FIQ. |
| 0b10010 | IRQ. |
| 0b10011 | Supervisor. |
| 0b10110 | Monitor. |
| 0b10111 | Abort. |
| 0b11010 | Hyp. |
| 0b11011 | Undefined. |
| 0b11111 | System. |

Other values are reserved. If SPSR_mon.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Monitor mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_mon

SPSR_mon is only accessible in EL3 modes other than Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_mon

| R | M | M1 |
|----------|----------|-----------|
| 0b1 | 0b1 | 0b1100 |

SPSR_mon, Saved Program Status Register (Monitor mode)

MSR{<c>}{<q>} SPSR_mon, <Rn>

| R | M | M1 |
|----------|----------|-----------|
| 0b1 | 0b1 | 0b1100 |

SPSR_svc, Saved Program Status Register (Supervisor mode)

The SPSR_svc characteristics are:

Purpose

Holds the saved process state when an exception is taken to Supervisor mode.

Configuration

AArch32 System register SPSR_svc bits [31:0] are architecturally mapped to AArch64 System register [SPSR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_svc are UNDEFINED.

Attributes

SPSR_svc is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|---------|----|------|-----|-----|----|----|----|----|----|----|----|----|---------|----|----|----|---|---|---|---|---|---|---|--------|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| N | Z | C | V | Q | IT[1:0] | J | SSBS | PAN | DIT | IL | | GE | | | | | | IT[7:2] | | | | E | A | I | F | T | | | M[4:0] | | |

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Supervisor mode, and copied to PSTATE.N on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Supervisor mode, and copied to PSTATE.Z on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Supervisor mode, and copied to PSTATE.C on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Supervisor mode, and copied to PSTATE.V on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Supervisor mode, and copied to PSTATE.Q on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Supervisor mode, and copied to PSTATE.IT on executing an exception return operation in Supervisor mode.

SPSR_svc.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_svc[26:25].
- IT[7:2] is SPSR_svc[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Supervisor mode, and copied to PSTATE.SSBS on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Supervisor mode, and copied to PSTATE.PAN on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Supervisor mode, and copied to PSTATE.DIT on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Supervisor mode, and copied to PSTATE.IL on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Supervisor mode, and copied to PSTATE.GE on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Supervisor mode, and copied to PSTATE.E on executing an exception return operation in Supervisor mode.

If the implementation does not support big-endian operation, SPSR_svc.E is RES0. If the implementation does not support little-endian operation, SPSR_svc.E is RES1. On executing an exception return operation in Supervisor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_svc.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_svc.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Supervisor mode, and copied to PSTATE.A on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Supervisor mode, and copied to PSTATE.I on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Supervisor mode, and copied to PSTATE.F on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Supervisor mode, and copied to PSTATE.T on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Supervisor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Supervisor mode.

| M[4:0] | Meaning |
|---------|-------------|
| 0b10000 | User. |
| 0b10001 | FIQ. |
| 0b10010 | IRQ. |
| 0b10011 | Supervisor. |
| 0b10111 | Abort. |
| 0b11011 | Undefined. |
| 0b11111 | System. |

Other values are reserved. If SPSR_svc.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Supervisor mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_svc

SPSR_svc is accessible in all modes other than User mode and Supervisor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_svc

| R | M | M1 |
|-----|-----|--------|
| 0b1 | 0b1 | 0b0010 |

SPSR_svc, Saved Program Status Register (Supervisor mode)

MSR{<c>}{<q>} SPSR_svc, <Rn>

| R | M | M1 |

SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

Purpose

Holds the saved process state when an exception is taken to Undefined mode.

Configuration

AArch32 System register SPSR_und bits [31:0] are architecturally mapped to AArch64 System register [SPSR_und\[31:0\]](#).
This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_und are UNDEFINED.

Attributes

SPSR_und is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|---------|----|------|-----|-----|----|----|----|----|----|---------|----|----|----|----|----|----|---|---|---|--------|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| N | Z | C | V | Q | IT[1:0] | J | SSBS | PAN | DIT | IL | | GE | | | IT[7:2] | | E | A | I | F | T | | | | M[4:0] | | | | | | |

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Undefined mode, and copied to PSTATE.IT on executing an exception return operation in Undefined mode.

SPSR_und.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_und[26:25].
- IT[7:2] is SPSR_und[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

| M[4:0] | Meaning |
|---------|-------------|
| 0b10000 | User. |
| 0b10001 | FIQ. |
| 0b10010 | IRQ. |
| 0b10011 | Supervisor. |
| 0b10111 | Abort. |
| 0b11011 | Undefined. |
| 0b11111 | System. |

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_und

SPSR_und is accessible in all modes other than User mode and Undefined mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_und

| R | M | M1 |
|-----|-----|--------|
| 0b1 | 0b1 | 0b0110 |

MSR{<c>}{<q>} SPSR_und, <Rn>

| R | M | M1 |
|-----|-----|--------|
| 0b1 | 0b1 | 0b0110 |

TCMTR, TCM Type Register

The TCMTR characteristics are:

Purpose

Provides information about the implementation of the TCM.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to TCMTR are UNDEFINED.

If EL1 or above can use AArch32 then this register must be implemented.

Attributes

TCMTR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing TCMTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0000 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return TCMTR;
elsif PSTATE.EL == EL2 then
    return TCMTR;
elsif PSTATE.EL == EL3 then
    return TCMTR;

```

TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
 - Would be required for the EL1&0 translation regime.
 - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIALL are UNDEFINED.

Attributes

TLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the TLBIALL instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

TLBIALLH, TLB Invalidate All, Hyp mode

The TLBIALLH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIALLH are UNDEFINED.

Attributes

TLBIALLH is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the TLBIALLH instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b1000 | 0b0111 | 0b000 |

```

if PSTATE.EL == EL0 then

        UNDEFINED;
    else
        AArch32.TLBI_ALL(SS_NonSecure, Regime_EL2, Shareability_NSH, TLBI_AllAttr);

```

TLBIALLHIS, TLB Invalidate All, Hyp mode, Inner Shareable

The TLBIALLHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIALLHIS are UNDEFINED.

Attributes

TLBIALLHIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the TLBIALLHIS instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

TLBIALLIS, TLB Invalidate All, Inner Shareable

The TLBIALLIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
 - Would be required for the EL1&0 translation regime.
 - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIALLIS are UNDEFINED.

Attributes

TLBIALLIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the TLBIALLIS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

TLBIALLSNH, TLB Invalidate All, Non-Secure Non-Hyp

The TLBIALLSNH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIALLSNH are UNDEFINED.

Attributes

TLBIALLSNH is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the TLBIALLSNH instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIASID are UNDEFINED.

Attributes

TLBIASID is a 32-bit System instruction.

Field descriptions

TLBIASIDIS, TLB Invalidate by ASID match, Inner Shareable

The TLBIASIDIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIASIDIS are UNDEFINED.

Attributes

TLBIASIDIS is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

TLBIIPAS2, TLB Invalidate by Intermediate Physical Address, Stage 2

The TLBIIPAS2 characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- [SCR.NS](#) is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIIPAS2 are UNDEFINED.

Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIIPAS2 is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| RES0 | | | | IPA[39:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing the TLBIIPAS2 instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b1000 | 0b0100 | 0b001 |

```

if PSTATE.EL == EL0 then

TLBIIPAS2IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable

The TLBIIPAS2IS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- [SCR.NS](#) is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIIPAS2IS are UNDEFINED.

Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIIPAS2IS is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVA are UNDEFINED.

Attributes

TLBIMVA is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

TLBIMVAA, TLB Invalidate by VA, All ASID

The TLBIMVAA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVAA are UNDEFINED.

Attributes

TLBIMVAA is a 32-bit System instruction.

TLBIMVAAIS, TLB Invalidate by VA, All ASID, Inner Shareable

The TLBIMVAAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVAAIS are UNDEFINED.

Attributes

TLBIMVAAIS is a 32-bit System instruction.

TLBIMVAAL, TLB Invalidate by VA, All ASID, Last level

The TLBIMVAAL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVAAL are UNDEFINED.

Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVAAL is a 32-bit System instruction.

TLBIMVAH, TLB Invalidate by VA, Hyp mode

The TLBIMVAH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVAH are UNDEFINED.

Attributes

TLBIMVAH is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VA | | | | | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | |

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVAH instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b1000 | 0b0111 | 0b001 |

```

if PSTATE.EL == EL0 then

TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVAIS are UNDEFINED.

Attributes

TLBIMVAIS is a 32-bit System instruction.

TLBIMVALH, TLB Invalidate by VA, Last level, Hyp mode

The TLBIMVALH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from the final level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this System instruction.

Configuration

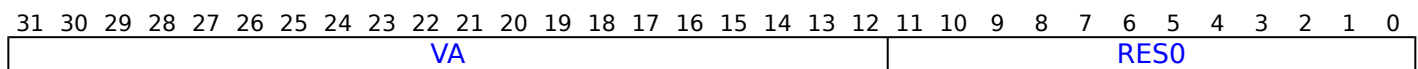

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVALH are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVALH is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVALH instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

TLBIMVALIS, TLB Invalidate by VA, Last level, Inner Shareable

The TLBIMVALIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVALIS are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVALIS is a 32-bit System instruction.

TLBTR, TLB Type Register

The TLBTR characteristics are:

Purpose

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

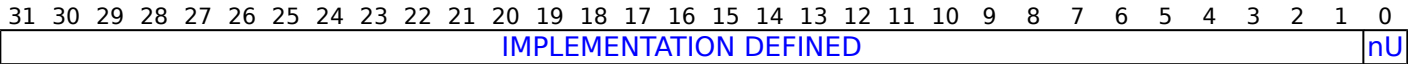

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to TLBTR are UNDEFINED.

Attributes

TLBTR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:1]

IMPLEMENTATION DEFINED.

nU, bit [0]

Not Unified TLB. Indicates whether the implementation has a unified TLB:

| nU | Meaning |
|-----|-------------------------------------|
| 0b0 | Unified TLB. |
| 0b1 | Separate Instruction and Data TLBs. |

Accessing TLBTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0000 | 0b011 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then

TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configuration

AArch32 System register TPIDRPRW bits [31:0] are architecturally mapped to AArch64 System register [TPIDR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to TPIDRPRW are UNDEFINED.

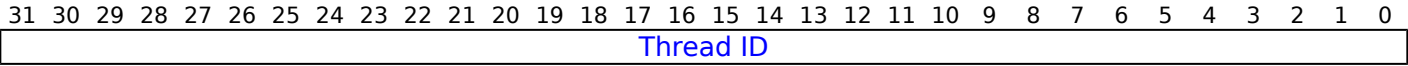

Note

The PE never updates this register.

Attributes

TPIDRPRW is a 32-bit register.

Field descriptions

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRPRW

Accesses to this register use the following encodings in the System register encoding space:

TPIDRURO, PL0 Read-Only Software Thread ID Register

The TPIDRURO characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configuration

AArch32 System register TPIDRURO bits [31:0] are architecturally mapped to AArch64 System register [TPIDRRO_EL0\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to TPIDRURO are UNDEFINED.

Note

The PE never updates this register.

Attributes

TPIDRURO is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

TRFCR, Trace Filter Control Register

The TRFCR characteristics are:

Purpose

Provides EL1 controls for Trace.

Configuration

AArch32 System register TRFCR bits [31:0] are architecturally mapped to AArch64 System register [TRFCR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR are UNDEFINED.

Attributes

TRFCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

| TS | Meaning | Applies when |
|------|--|------------------------------|
| 0b01 | Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF . | |
| 0b10 | Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2 : <ul style="list-style-type: none"> EL3 is implemented and is using AArch32. EL3 is implemented, using AArch64, and SCR_EL3.ECVEn == 0b0. EL2 is using AArch32. EL2 is using AArch64 and CNTHCTL_EL2.ECV == 0b0. | When FEAT_ECV is implemented |
| 0b11 | Physical timestamp. The traced timestamp is the physical counter value. | |

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- EL2 is implemented and [HTRFCR.TS](#) != 0b00.
- SelfHostedTraceEnabled() == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

| E1TRE | Meaning |
|-------|-------------------------------------|
| 0b0 | Tracing is prohibited in PL1 modes. |
| 0b1 | Tracing is allowed in PL1 modes. |

This field is ignored if SelfHostedTraceEnabled() == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

E0TRE, bit [0]

EL0 Trace Enable.

| E0TRE | Meaning |
|-------|-------------------------------|
| 0b0 | Tracing is prohibited at EL0. |
| 0b1 | Tracing is allowed at EL0. |

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current security state and [HCR](#).TGE == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing TRFCR

```

TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

Purpose

The control register for stage 1 of the PL1&0 translation regime. Its controls include:

- Where the VA range is split between addresses translated using [TTBR0](#) and addresses translated using [TTBR1](#).
- The translation table format used by this stage of translation.

From Armv8.2, when the value of TTBCR.{EAE, T2E} is {1, 1}, TTBCR is used with [TTBCR2](#).

Configuration

AArch32 System register TTBCR bits [31:0] are architecturally mapped to AArch64 System register [TCR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to TTBCR are UNDEFINED.

The current translation table format determines which format of the register is used.

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

Attributes

TTBCR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| EAE | | RES0 | | | | | | | | | | | | | | | | | | PD1PD0 | | RES0 | | N | | | | | | | |

EAE, bit [31]

Extended Address Enable.

| EAE | Meaning |
|-----|--|
| 0b0 | Use the VMSAv8-32 translation system with the Short-descriptor translation table format. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [30:6]

Reserved, RES0.

PD1, bit [5]

Translation table walk disable for translations using [TTBR1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1](#).

| PD1 | Meaning |
|-----|--|
| 0b0 | Perform translation table walks using TTBR1 . |
| 0b1 | A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

PD0, bit [4]

Translation table walk disable for translations using [TTBR0](#). This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using [TTBR0](#).

| PD0 | Meaning |
|-----|--|
| 0b0 | Perform translation table walks using TTBR0 . |
| 0b1 | A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bit [3]

Reserved, RES0.

N, bits [2:0]

Indicate the width of the base address held in [TTBR0](#). In [TTBR0](#), the base address field is bits[31:14-N]. The value of N also determines:

- Whether [TTBR0](#) or [TTBR1](#) is used as the base address for translation table walks.
- The size of the translation table pointed to by [TTBR0](#).

N can take any value from 0 to 7, that is, from 0b000 to 0b111.

When N has its reset value of 0, the translation table base is compatible with Armv5 and Armv6.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When TTBCR.EAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|---------------------------|----|-----|-------|-------|------|----|------|------|------|-----|-------|-------|------|------|------|------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| EAE | IMPLEMENTATION DEFINED | | SH1 | ORGN1 | IRGN1 | EPD1 | A1 | RES0 | T1SZ | RES0 | SH0 | ORGN0 | IRGN0 | EPD0 | T2SZ | RES0 | T0SZ | | | | | | | | | | | | | | |

EAE, bit [31]

Extended Address Enable.

| EAE | Meaning |
|-----|---|
| 0b1 | Use the VMSAv8-32 translation system with the Long-descriptor translation table format. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1](#).

| SH1 | Meaning |
|------|------------------|
| 0b00 | Non-shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1](#).

| ORGN1 | Meaning |
|-------|---|
| 0b00 | Normal memory, Outer Non-cacheable. |
| 0b01 | Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1](#).

| IRGN1 | Meaning |
|-------|---|
| 0b00 | Normal memory, Inner Non-cacheable. |
| 0b01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1](#).

| EPD1 | Meaning |
|------|--|
| 0b0 | Perform translation table walks using TTBR1 . |
| 0b1 | A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

A1, bit [22]

Selects whether [TTBR0](#) or [TTBR1](#) defines the ASID.

| A1 | Meaning |
|-----|---|
| 0b0 | TTBR0 .ASID defines the ASID. |
| 0b1 | TTBR1 .ASID defines the ASID. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [21:19]

Reserved, RES0.

T1SZ, bits [18:16]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using [TTBR0](#) and [TTBR1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [15:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0](#).

| SH0 | Meaning |
|------|-----------------|
| 0b00 | Non-shareable |
| 0b10 | Outer Shareable |
| 0b11 | Inner Shareable |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0](#).

| ORGNO | Meaning |
|-------|---|
| 0b00 | Normal memory, Outer Non-cacheable. |
| 0b01 | Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0](#).

| IRGN0 | Meaning |
|-------|---|
| 0b00 | Normal memory, Inner Non-cacheable. |
| 0b01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0](#).

| EPD0 | Meaning |
|------|--|
| 0b0 | Perform translation table walks using TTBR0 . |
| 0b1 | A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

T2E, bit [6]

When FEAT_AA32HPD is implemented:

TTBCR2 Enable.

| T2E | Meaning |
|-----|--|
| 0b0 | TTBCR2 is disabled. The contents of TTBCR2 are treated as 0 for all purposes other than reading or writing the register. |
| 0b1 | TTBCR2 is enabled. |

If TTBCR.EAE==0, then the behavior is as if the bit is 0.

Otherwise:

Reserved, RAZ/WI.

Bits [5:3]

Reserved, RES0.

T0SZ, bits [2:0]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using [TTBR0](#) and [TTBR1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing TTBCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0010 | 0b0000 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T2 == '1' then

TTBCR2, Translation Table Base Control Register 2

The TTBCR2 characteristics are:

Purpose

The second control register for stage 1 of the PL1&0 translation regime.

If FEAT_AA32HPD is not implemented then this register is not implemented and its encoding is UNDEFINED. Otherwise:

- When the value of [TTBCR](#).{EAE, T2E} is not {1, 1} the contents of TTBCR2 are treated as zero for all purposes other than reading or writing the register.
- When the value of [TTBCR](#).{EAE, T2E} is {1, 1} TTBCR2 is used with [TTBCR](#).

Configuration

AArch32 System register TTBCR2 bits [31:0] are architecturally mapped to AArch64 System register [TCR_EL1\[63:32\]](#).

This register is present only when AArch32 is supported and FEAT_AA32HPD is implemented. Otherwise, direct accesses to TTBCR2 are UNDEFINED.

Attributes

TTBCR2 is a 32-bit register.

Bits [31:19]

Reserved, RES0.

HWU162, bit [18] When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

| HWU162 | Meaning |
|--------|--|
| 0b0 | For translations using TTBR1 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR1 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1. |

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU161, bit [17]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

| HWU161 | Meaning |
|--------|--|
| 0b0 | For translations using TTBR1 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR1 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1. |

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU160, bit [16]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

| HWU160 | Meaning |
|--------|--|
| 0b0 | For translations using TTBR1 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR1 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1. |

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU159, bit [15]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

| HWU159 | Meaning |
|--------|--|
| 0b0 | For translations using TTBR1 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR1 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1. |

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU062, bit [14]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

| HWU062 | Meaning |
|--------|--|
| 0b0 | For translations using TTBR0 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR0 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1. |

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU061, bit [13]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

| HWU061 | Meaning |
|--------|--|
| 0b0 | For translations using TTBR0 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR0 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1. |

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU060, bit [12]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

| HWU060 | Meaning |
|--------|--|
| 0b0 | For translations using TTBR0 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR0 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1. |

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU059, bit [11]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

| HWU059 | Meaning |
|--------|--|
| 0b0 | For translations using TTBR0 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR0 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1. |

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD1, bit [10]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR1](#).

| HPD1 | Meaning |
|------|---|
| 0b0 | Hierarchical permissions are enabled. |
| 0b1 | Hierarchical permissions are disabled if TTBCR .T2E == 1. |

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of [TTBCR.T2E](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPD0, bit [9]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR0](#).

| HPD0 | Meaning |
|------|--|
| 0b0 | Hierarchical permissions are enabled. |
| 0b1 | Hierarchical permissions are disabled if TTBCR.T2E == 1. |

When disabled, the permissions are treated is as if the bits are 0.

The Effective value of this field is 0 if the value of [TTBCR.T2E](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:0]

Reserved, RES0.

Accessing TTBCR2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0010 | 0b0000 | 0b011 |

```

TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register TTBR0 bits [63:0] are architecturally mapped to AArch64 System register [TTBR0_EL1\[63:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to TTBR0 are UNDEFINED.

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

[TTBCR](#).EAE determines which TTBR0 format is used:

- [TTBCR](#).EAE == 0b0: 32-bit format is used. TTBR0[63:32] are ignored.
- [TTBCR](#).EAE == 0b1: 64-bit format is used.

When EL3 is using AArch32, write access to TTBR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Used in conjunction with the [TTBCR](#). When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the [TTBCR](#), not in TTBR0.

Attributes

TTBR0 is a 64-bit register.

Field descriptions

When TTBCR.EAE == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|-----|----|-----|----|-----|----|---|--|---------|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| TTB0 | | | | | | | | | | | | | | | | | | | | | | | | IRGN[0] | | NOS | | RGN | | IMP | | S | | IRGN[1] | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | |

Bits [63:32]

Reserved, RES0.

TTB0, bits [31:7]

Translation table base address, bits[31:x], where x is 14-(TTBCR.N). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [0, 6]

Inner region bits. Bits [0,6] of this register together indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

| IRGN | Meaning |
|------|--|
| 0b00 | Normal memory, Inner Non-cacheable. |
| 0b01 | Normal memory, Inner Write-Back Write-Allocate Cacheable. |
| 0b10 | Normal memory, Inner Write-Through Cacheable. |
| 0b11 | Normal memory, Inner Write-Back no Write-Allocate Cacheable. |

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[0] is TTBR0[6].
- IRGN[1] is TTBR0[0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

| NOS | Meaning |
|-----|----------------------------|
| 0b0 | Memory is Outer Shareable. |
| 0b1 | Memory is Inner Shareable. |

This bit is ignored when the value of TTBR0.S is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

| RGN | Meaning |
|------|--|
| 0b00 | Normal memory, Outer Non-cacheable. |
| 0b01 | Normal memory, Outer Write-Back Write-Allocate Cacheable. |
| 0b10 | Normal memory, Outer Write-Through Cacheable. |
| 0b11 | Normal memory, Outer Write-Back no Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Shareable:

| S | Meaning |
|-----|--|
| 0b0 | Memory is Non-shareable. |
| 0b1 | Memory is Shareable. The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | ASID | | | | | | | | BADDR | | | | | | | | | | | | | | | |
| BADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | CnP |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The [TTBCR.A1](#) field selects either TTBR0.ASID or [TTBR1.ASID](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [TTBCR.T0SZ](#) as follows:

- If [TTBCR.T0SZ](#) is 0 or 1, $x = 5 - \text{TTBCR.T0SZ}$.
- If [TTBCR.T0SZ](#) is greater than 1, $x = 14 - \text{TTBCR.T0SZ}$.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. When [TTBCR.EAE](#) ==1, this bit indicates whether each entry that is pointed to by TTBR0 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1.

| CnP | Meaning |
|-----|--|
| 0b0 | <p>The translation table entries pointed to by this instance of TTBR0, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR0 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> • The value of TTBR0.CnP on those other PEs. • The value of TTBCR.EAE on those other PEs. • The value of the current ASID or, for the Non-secure instance of TTBR0, the value of the current VMID. |
| 0b1 | <p>The translation table entries pointed to by this instance of TTBR0 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1 for this instance of TTBR0 and all of the following apply:</p> <ul style="list-style-type: none"> • The translation table entries are pointed to by this instance of TTBR0. • The value of the applicable TTBCR.EAE field is 1. • The ASID is the same as the current ASID. • For the Non-secure instance of TTBR0, the VMID is the same as the current VMID. |

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

```

TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register TTBR1 bits [63:0] are architecturally mapped to AArch64 System register [TTBR1_EL1\[63:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to TTBR1 are UNDEFINED.

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

[TTBCR](#).EAE determines which TTBR1 format is used:

- [TTBCR](#).EAE == 0b0: 32-bit format is used. TTBR1[63:32] are ignored.
- [TTBCR](#).EAE == 0b1: 64-bit format is used.

Used in conjunction with the [TTBCR](#). When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the [TTBCR](#), not in TTBR1.

Attributes

TTBR1 is a 64-bit register.

Field descriptions

When TTBCR.EAE == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|-----|-----|----|-----|----|---------|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| TTB1 | | | | | | | | | | | | | | | | | | | | | | | | IRGN[1] | | NOS | RGN | | IMP | S | IRGN[0] | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:32]

Reserved, RES0.

TTB1, bits [31:7]

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [6, 0]

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

| IRGN | Meaning |
|------|--|
| 0b00 | Normal memory, Inner Non-cacheable. |
| 0b01 | Normal memory, Inner Write-Back Write-Allocate Cacheable. |
| 0b10 | Normal memory, Inner Write-Through Cacheable. |
| 0b11 | Normal memory, Inner Write-Back no Write-Allocate Cacheable. |

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for Armv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[1] is TTBR1[6].
- IRGN[0] is TTBR1[0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

| NOS | Meaning |
|-----|----------------------------|
| 0b0 | Memory is Outer Shareable. |
| 0b1 | Memory is Inner Shareable. |

This bit is ignored when the value of TTBR1.S is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

| RGN | Meaning |
|------|--|
| 0b00 | Normal memory, Outer Non-cacheable. |
| 0b01 | Normal memory, Outer Write-Back Write-Allocate Cacheable. |
| 0b10 | Normal memory, Outer Write-Through Cacheable. |
| 0b11 | Normal memory, Outer Write-Back no Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Shareable:

| S | Meaning |
|-----|--|
| 0b0 | Memory is Non-shareable. |
| 0b1 | Memory is Shareable. The TTBR1.NOS field indicates whether the memory is Inner Shareable or Outer Shareable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | ASID | | | | | | | | BADDR | | | | | | | | | | | | | | | | |
| BADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | CnP | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The [TTBCR.A1](#) field selects either [TTBR0.ASID](#) or [TTBR1.ASID](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [TTBCR.T1SZ](#) as follows:

- If [TTBCR.T1SZ](#) is 0 or 1, $x = 5 - \text{TTBCR.T1SZ}$.
- If [TTBCR.T1SZ](#) is greater than 1, $x = 14 - \text{TTBCR.T1SZ}$.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. When [TTBCR.EAE](#) == 1, this bit indicates whether each entry that is pointed to by TTBR1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1.

| CnP | Meaning |
|-----|--|
| 0b0 | <p>The translation table entries pointed to by this instance of TTBR1, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR1 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> • The value of TTBR1.CnP on those other PEs. • The value of TTBCR.EAE on those other PEs. • The value of the current ASID or, for the Non-secure instance of TTBR1, the value of the current VMID. |
| 0b1 | <p>The translation table entries pointed to by this instance of TTBR1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1 for this instance of TTBR1 and all of the following apply:</p> <ul style="list-style-type: none"> • The translation table entries are pointed to by this instance of TTBR1. • The value of the applicable TTBCR.EAE field is 1. • The ASID is the same as the current ASID. • For the Non-secure instance of TTBR1, the VMID is the same as the current VMID. |

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VBAR, Vector Base Address Register

The VBAR characteristics are:

Purpose

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

Configuration

AArch32 System register VBAR bits [31:0] are architecturally mapped to AArch64 System register [VBAR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to VBAR are UNDEFINED.

Attributes

VBAR is a 32-bit register.

VDFSR, Virtual SError Exception Syndrome Register

The VDFSR characteristics are:

Purpose

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError interrupt injected using [HCR.VA](#) is taken to EL1 using AArch32, then the syndrome value is reported in [DFSR](#).{AET, ExT} and the remainder of [DFSR](#) is set as defined by VMSAv8-32. For more information, see The AArch32 Virtual Memory System Architecture.

If the virtual SError interrupt injected using [HCR.VA](#) is deferred by an ESB instruction, then the syndrome value is written to [VDISR](#).

Configuration

AArch32 System register VDFSR bits [31:0] are architecturally mapped to AArch64 System register [VSESR_EL2\[31:0\]](#) when the highest implemented Exception level is using AArch64.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDFSR are UNDEFINED.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when [SCR.NS](#) == 1.

Attributes

VDFSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|---------|----|------|----|---|---|---|---|---|---|---|---|---|---|

| RES0 | | | | | | | | | | | | | | | | AET | | RES0ExT | | RES0 | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

AET, bits [15:14]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[15:4] is set to VDFSR.AET.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR](#)[15:4] is set to VDFSR.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[12] is set to VDFSR.ExT.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR](#)[12] is set to VDFSR.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing VDFSR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when [SCR.NS](#) == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b0101 | 0b0010 | 0b011 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T5 == '1' then

    else
        VDFSR = R[t];

```

VDISR, Virtual Deferred Interrupt Status Register

The VDISR characteristics are:

Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

Configuration

AArch32 System register VDISR bits [31:0] are architecturally mapped to AArch64 System register [VDISR_EL2\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDISR are UNDEFINED.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Attributes

VDISR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|------|----|----|----|----|----|----|----|----|----|-----|------|-----|------|-------|------|------|----|----|----|----|---------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| A | RES0 | | | | | | | | | | AET | RES0 | ExT | RES0 | FS[4] | LPAE | RES0 | | | | | FS[3:0] | | | | | | | | | |

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VDFSR.AET](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VDFSR.ExT](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt.

| FS | Meaning |
|---------|--------------------------------|
| 0b10110 | Asynchronous SError interrupt. |

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR[10].
- FS[3:0] is VDISR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to [TTBCR.EAE](#) when an ESB instruction defers a virtual SError interrupt.

| LPAE | Meaning |
|------|--|
| 0b0 | Using the Short-descriptor translation table format. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|------|----|----|----|----|----|----|----|----|----|-----|------|-----|------|------|------|--------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| A | RES0 | | | | | | | | | | AET | RES0 | EXT | RES0 | LPAE | RES0 | STATUS | | | | | | | | | | | | | | |

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VDESR.AET](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VDFSR.ExT](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

Set to [TTBCR.EAE](#) when an ESB instruction defers a virtual SError interrupt.

| LPAE | Meaning |
|------|---|
| 0b1 | Using the Long-descriptor translation table format. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

| STATUS | Meaning |
|----------|--------------------------------|
| 0b010001 | Asynchronous SError interrupt. |

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VDISR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

An indirect write to VDISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of [DISR](#) occurring in program order after the ESB instruction.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when [SCR.NS](#) == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of [MPIDR](#).

Configuration

AArch32 System register VMPIDR bits [31:0] are architecturally mapped to AArch64 System register [VMPIDR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to VMPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the [MPIDR](#).

Attributes

VMPIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|------|----|----|----|----|----|------|----|----|----|----|------|----|----|----|----|------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| M | U | RES0 | | | | | MT | Aff2 | | | | | Aff1 | | | | | Aff0 | | | | | | | | | | | | | |

M, bit [31]

Indicates whether this implementation includes the functionality introduced by the Armv7 Multiprocessing Extensions.

| M | Meaning |
|-----|--|
| 0b0 | This implementation does not include the Armv7 Multiprocessing Extensions functionality. |
| 0b1 | This implementation includes the Armv7 Multiprocessing Extensions functionality. |

Access to this field is **RES1**.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

| U | Meaning |
|-----|---|
| 0b0 | Processor is part of a multiprocessor system. |
| 0b1 | Processor is part of a uniprocessor system. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.U](#).

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels.

| MT | Meaning |
|-----|---|
| 0b0 | Performance of PEs at the lowest affinity level is largely independent. |
| 0b1 | Performance of PEs at the lowest affinity level is very interdependent. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.MT](#).

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff2](#).

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff1](#).

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff0](#).

Accessing VMPIDR

Accesses to this register use the following encodings in the System register encoding space:

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR](#).Implementer.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Variant](#).

Architecture, bits [19:16]

Architecture version. Defined values are:

| Architecture | Meaning |
|--------------|---|
| 0b0001 | Armv4. |
| 0b0010 | Armv4T. |
| 0b0011 | Armv5 (obsolete). |
| 0b0100 | Armv5T. |
| 0b0101 | Armv5TE. |
| 0b0110 | Armv5TEJ. |
| 0b0111 | Armv6. |
| 0b1111 | Architectural features are individually identified in the ID_* registers. |

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Architecture](#).

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.PartNum](#).

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Revision](#).

Accessing VPIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

Purpose

The control register for stage 2 of the Non-secure PL1&0 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configuration

AArch32 System register VTCR bits [31:0] are architecturally mapped to AArch64 System register [VTCR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to VTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|------|-------|-------|-------|-------|------|----|----|----|----|-----|-------|-------|-----|------|----|------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES1 | RES0 | HWU62 | HWU61 | HWU60 | HWU59 | RES0 | | | | | SH0 | ORGN0 | IRGN0 | SLO | RES0 | S | TOSZ | | | | | | | | | | | | | | |

Bit [31]

Reserved, RES1.

Bits [30:29]

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

| HWU62 | Meaning |
|-------|---|
| 0b0 | Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU61, bit [27]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

| HWU61 | Meaning |
|-------|---|
| 0b0 | Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU60, bit [26]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

| HWU60 | Meaning |
|-------|---|
| 0b0 | Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU59, bit [25]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

| HWU59 | Meaning |
|-------|---|
| 0b0 | Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [24:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [VTTBR](#).

| SH0 | Meaning |
|------|------------------|
| 0b00 | Non-shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [VTTBR](#).

| ORGN0 | Meaning |
|-------|---|
| 0b00 | Normal memory, Outer Non-cacheable. |
| 0b01 | Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [VTTBR](#).

| IRGN0 | Meaning |
|-------|---|
| 0b00 | Normal memory, Inner Non-cacheable. |
| 0b01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

Starting level for translation table walks using [VTTBR](#).

| SL0 | Meaning |
|------|------------------|
| 0b00 | Start at level 2 |
| 0b01 | Start at level 1 |

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 1 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

S, bit [4]

Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the stage 2 T0SZ value is treated as an UNKNOWN value

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [3:0]

The size offset of the memory region addressed by [VTTBR](#). The region size is $2^{(32-T0SZ)}$ bytes.

This field holds a four-bit signed integer value, meaning it supports values from -8 to 7.

Note

This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 1 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VTCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b0010 | 0b0001 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T2 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T2 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else

VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register VTTBR bits [63:0] are architecturally mapped to AArch64 System register [VTTBR_EL2\[63:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to VTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTTBR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | VMID | | | | | | | | BADDR | | | | | | | | | | | | | | | |
| BADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | CnP |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:56]

Reserved, RES0.

VMID, bits [55:48]

The VMID for the translation table.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [VTCR.SL0](#) and [VTCR.T0SZ](#) as follows:

- If [VTCR.SL0](#) is 0b00, meaning that lookup starts at level 2, then x is 14 - [VTCR.T0SZ](#).
- If [VTCR.SL0](#) is 0b01, meaning that lookup starts at level 1, then x is 5 - [VTCR.T0SZ](#).
- If [VTCR.SL0](#) is either 0b10 or 0b11 then a stage 2 level 1 Translation fault is generated.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1.

| CnP | Meaning |
|-----|--|
| 0b0 | The translation table entries pointed to by VTTBR are permitted to differ from the entries for VTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID. |
| 0b1 | The translation table entries pointed to by VTTBR are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1 and the VMID is the same as the current VMID. |

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the VTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBRs do not point to the same translation table entries when the VMID value is the same as the current VMID, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing VTTBR

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

System Register index by functional group

Below are indexes for registers with the following main functional groups:

- [ID](#)
- [Memory](#)
- [Other](#)
- [Exception](#)
- [Special](#)
- [PSTATE](#)
- [Cache](#)
- [Address](#)
- [TLB](#)
- [PMU](#)
- [Reset](#)
- [Thread](#)
- [IMP DEF](#)
- [Timer](#)
- [Debug](#)
- [CTI](#)
- [Virt](#)
- [Secure](#)
- [Float](#)
- [Legacy](#)
- [Trace](#)
- [GIC](#)
- [GICD](#)
- [GICR](#)
- [GICC](#)
- [GICV](#)
- [GICH](#)
- [GITS](#)
- [RAS](#)
- [MPAM](#)
- [Pointer authentication](#)
- [AMU](#)
- [Root](#)
- [GIC ITS registers](#)

In the ID functional group:

| Exec state | Name | Description |

| AArch64 | FAR_EL3 | Fault Address Register (EL3) |
| AArch64 | HPFAR_EL2 | Hypervisor IPA Fault Address Register |
| AArch64 | IFSR32_EL2 | Instruction Fault Status Register (EL2) |
| AArch64 | ISR_EL1 | Interrupt Status Register |
| AArch64 | MFAR_EL3 | PA Fault Address Register |
| AArch64 | VBAR_EL1 | Vector Base Address Register (EL1) |
| AArch64 | VBAR_EL2 | Vector Base Address Register (EL2) |
| AArch64 | VBAR_EL3 | Vector Base Address Register (EL3) |

In the Special functional group:

| Exec state | Name | Description |
|------------|--------------------------|---|
| AArch32 | DLR | Debug Link Register |
| AArch32 | DSPSR | Debug Saved Program Status Register |
| AArch32 | ELR_hyp | Exception Link Register (Hyp mode) |
| AArch32 | SPSR | Saved Program Status Register |
| AArch32 | SPSR_abt | Saved Program Status Register (Abort mode) |
| AArch32 | SPSR_fiq | Saved Program Status Register (FIQ mode) |
| AArch32 | SPSR_hyp | Saved Program Status Register (Hyp mode) |
| AArch32 | SPSR_irq | Saved Program Status Register (IRQ mode) |
| AArch32 | SPSR_mon | Saved Program Status Register (Monitor mode) |
| AArch32 | SPSR_svc | Saved Program Status Register (Supervisor mode) |
| AArch32 | SPSR_und | Saved Program Status Register (Undefined mode) |
| AArch64 | ELR_EL1 | Exception Link Register (EL1) |
| AArch64 | ELR_EL2 | Exception Link Register (EL2) |
| AArch64 | ELR_EL3 | Exception Link Register (EL3) |
| AArch64 | SPSR_EL1 | Saved Program Status Register (EL1) |
| AArch64 | SPSR_EL2 | Saved Program Status Register (EL2) |
| AArch64 | SPSR_EL3 | Saved Program Status Register (EL3) |
| AArch64 | SPSR_abt | Saved Program Status Register (Abort mode) |
| AArch64 | SPSR_fiq | Saved Program Status Register (FIQ mode) |
| AArch64 | SPSR_irq | Saved Program Status Register (IRQ mode) |
| AArch64 | SPSR_und | Saved Program Status Register (Undefined mode) |
| AArch64 | SP_ELO | Stack Pointer (EL0) |

| Exec state | Name | Description |
|------------|------------------------|---------------------|
| AArch64 | SP_EL1 | Stack Pointer (EL1) |
| AArch64 | SP_EL2 | Stack Pointer (EL2) |
| AArch64 | SP_EL3 | Stack Pointer (EL3) |

In the PSTATE functional group:

| Exec state | Name | Description |
|------------|---------------------------|-------------------------------------|
| AArch32 | APSR | Application Program Status Register |
| AArch32 | CPSR | Current Program Status Register |
| AArch64 | ALLINT | All Interrupt Mask Bit |
| AArch64 | CurrentEL | Current Exception Level |
| AArch64 | DAIF | Interrupt Mask Bits |
| AArch64 | DIT | Data Independent Timing |
| AArch64 | NZCV | Condition Flags |
| AArch64 | PAN | Privileged Access Never |
| AArch64 | SPSel | Stack Pointer Select |
| AArch64 | SSBS | Speculative Store Bypass Safe |
| AArch64 | SVCR | Streaming Vector Control Register |
| AArch64 | TCO | Tag Check Override |
| AArch64 | UAO | User Access Override |

In the Cache functional group:

| Exec state | Name | Description |
|------------|-----------------------------|--|
| AArch32 | BPIALL | Branch Predictor Invalidate All |
| AArch32 | BPIALLIS | Branch Predictor Invalidate All, Inner Shareable |
| AArch32 | BPIMVA | Branch Predictor Invalidate by VA |
| AArch32 | DCCIMVAC | Data Cache line Clean and Invalidate by VA to PoC |
| AArch32 | DCCISW | Data Cache line Clean and Invalidate by Set/Way |
| AArch32 | DCCMVAC | Data Cache line Clean by VA to PoC |
| AArch32 | DCCMVAU | Data Cache line Clean by VA to PoU |
| AArch32 | DCCSW | Data Cache line Clean by Set/Way |
| AArch32 | DCIMVAC | Data Cache line Invalidate by VA to PoC |
| AArch32 | DCISW | Data Cache line Invalidate by Set/Way |
| AArch32 | ICIALLU | Instruction Cache Invalidate All to PoU |
| AArch32 | ICIALLUIS | Instruction Cache Invalidate All to PoU, Inner Shareable |
| AArch32 | ICIMVAU | Instruction Cache line Invalidate by VA to PoU |
| AArch64 | DC CGDSW | Clean of Data and Allocation Tags by Set/Way |
| AArch64 | DC CGDVAC | Clean of Data and Allocation Tags by VA to PoC |
| AArch64 | DC CGDVADP | Clean of Data and Allocation Tags by VA to PoDP |
| AArch64 | DC CGDVAP | Clean of Data and Allocation Tags by VA to PoP |
| AArch64 | DC CGSW | Clean of Allocation Tags by Set/Way |
| AArch64 | DC CGVAC | Clean of Allocation Tags by VA to PoC |
| AArch64 | DC CGVADP | Clean of Allocation Tags by VA to PoDP |
| AArch64 | DC CGVAP | Clean of Allocation Tags by VA to PoP |
| AArch64 | DC CIGDPAPA | Clean and Invalidate of Data and Allocation Tags by PA to PoPA |
| AArch64 | DC CIGDSW | Clean and Invalidate of Data and Allocation Tags by Set/Way |
| AArch64 | DC CIGDVAC | Clean and Invalidate of Data and Allocation Tags by VA to PoC |
| AArch64 | DC CIGSW | Clean and Invalidate of Allocation Tags by Set/Way |
| AArch64 | DC CIGVAC | Clean and Invalidate of Allocation Tags by VA to PoC |
| AArch64 | DC CIPAPA | Data or unified Cache line Clean and Invalidate by PA to PoPA |
| AArch64 | DC CISW | Data or unified Cache line Clean and Invalidate by Set/Way |
| AArch64 | DC CIVAC | Data or unified Cache line Clean and Invalidate by VA to PoC |
| AArch64 | DC CSW | Data or unified Cache line Clean by Set/Way |
| AArch64 | DC CVAC | Data or unified Cache line Clean by VA to PoC |
| AArch64 | DC CVADP | Data or unified Cache line Clean by VA to PoDP |
| AArch64 | DC CVAP | Data or unified Cache line Clean by VA to PoP |
| AArch64 | DC CVAU | Data or unified Cache line Clean by VA to PoU |
| AArch64 | DC GVA | Data Cache set Allocation Tag by VA |
| AArch64 | DC GZVA | Data Cache set Allocation Tags and Zero by VA |
| AArch64 | DC IGDSW | Invalidate of Data and Allocation Tags by Set/Way |
| AArch64 | DC IGDVAC | Invalidate of Data and Allocation Tags by VA to PoC |

| Exec state | Name | Description |
|------------|----------------------------|--|
| AArch64 | DC IGSW | Invalidate of Allocation Tags by Set/Way |
| AArch64 | DC IGVAC | Invalidate of Allocation Tags by VA to PoC |
| AArch64 | DC ISW | Data or unified Cache line Invalidate by Set/Way |
| AArch64 | DC IVAC | Data or unified Cache line Invalidate by VA to PoC |
| AArch64 | DC ZVA | Data Cache Zero by VA |
| AArch64 | IC IALLU | Instruction Cache Invalidate All to PoU |
| AArch64 | IC IALLUIS | Instruction Cache Invalidate All to PoU, Inner Shareable |
| AArch64 | IC IVAU | Instruction Cache line Invalidate by VA to PoU |

In the Address functional group:

| Exec state | Name | Description |
|------------|----------------------------|---|
| AArch32 | ATS12NSOPR | Address Translate Stages 1 and 2 Non-secure Only PL1 Read |
| AArch32 | ATS12NSOPW | Address Translate Stages 1 and 2 Non-secure Only PL1 Write |
| AArch32 | ATS12NSOUR | Address Translate Stages 1 and 2 Non-secure Only Unprivileged Read |
| AArch32 | ATS12NSOUW | Address Translate Stages 1 and 2 Non-secure Only Unprivileged Write |
| AArch32 | ATS1CPR | Address Translate Stage 1 Current state PL1 Read |
| AArch32 | ATS1CPRP | Address Translate Stage 1 Current state PL1 Read PAN |
| AArch32 | ATS1CPW | Address Translate Stage 1 Current state PL1 Write |
| AArch32 | ATS1CPWP | Address Translate Stage 1 Current state PL1 Write PAN |
| AArch32 | ATS1CUR | Address Translate Stage 1 Current state Unprivileged Read |
| AArch32 | ATS1CUW | Address Translate Stage 1 Current state Unprivileged Write |
| AArch32 | ATS1HR | Address Translate Stage 1 Hyp mode Read |
| AArch32 | ATS1HW | Address Translate Stage 1 Hyp mode Write |
| AArch32 | PAR | Physical Address Register |
| AArch64 | AT S12E0R | Address Translate Stages 1 and 2 EL0 Read |
| AArch64 | AT S12E0W | Address Translate Stages 1 and 2 EL0 Write |
| AArch64 | AT S12E1R | Address Translate Stages 1 and 2 EL1 Read |
| AArch64 | AT S12E1W | Address Translate Stages 1 and 2 EL1 Write |
| AArch64 | AT S1E0R | Address Translate Stage 1 EL0 Read |
| AArch64 | AT S1E0W | Address Translate Stage 1 EL0 Write |
| AArch64 | AT S1E1R | Address Translate Stage 1 EL1 Read |
| AArch64 | AT S1E1RP | Address Translate Stage 1 EL1 Read PAN |
| AArch64 | AT S1E1W | Address Translate Stage 1 EL1 Write |
| AArch64 | AT S1E1WP | Address Translate Stage 1 EL1 Write PAN |
| AArch64 | AT S1E2R | Address Translate Stage 1 EL2 Read |
| AArch64 | AT S1E2W | Address Translate Stage 1 EL2 Write |
| AArch64 | AT S1E3R | Address Translate Stage 1 EL3 Read |
| AArch64 | AT S1E3W | Address Translate Stage 1 EL3 Write |
| AArch64 | PAR_EL1 | Physical Address Register |

In the TLB functional group:

| Exec state | Name | Description |
|------------|-------------------------------|---|
| AArch32 | CFPRCTX | Control Flow Prediction Restriction by Context |
| AArch32 | CPPRCTX | Cache Prefetch Prediction Restriction by Context |
| AArch32 | DTLBIALL | Data TLB Invalidate All |
| AArch32 | DTLBIASID | Data TLB Invalidate by ASID match |
| AArch32 | DTLBIMVA | Data TLB Invalidate by VA |
| AArch32 | DVPRCTX | Data Value Prediction Restriction by Context |
| AArch32 | ITLBIALL | Instruction TLB Invalidate All |

| External | AMPIDR4 | Activity Monitors Peripheral Identification Register 4 |

In the Root functional group:

| Exec state | Name | Description |
|------------|---------------------------|---|
| AArch64 | GPCCR_EL3 | Granule Protection Check Control Register (EL3) |
| AArch64 | GPTBR_EL3 | Granule Protection Table Base Register |
| AArch64 | MFAR_EL3 | PA Fault Address Register |

In the GIC ITS registers functional group:

| Exec state | Name | Description |
|------------|-------------------------------------|--|
| External | GITS_BASER<n> | ITS Translation Table Descriptors |
| External | GITS_CBASER | ITS Command Queue Descriptor |
| External | GITS_CREADR | ITS Read Register |
| External | GITS_CTLR | ITS Control Register |
| External | GITS_CWRITER | ITS Write Register |
| External | GITS_IIDR | ITS Identification Register |
| External | GITS_MPAMIDR | Report maximum PARTID and PMG Register |
| External | GITS_MPIDR | Report ITS's affinity. |
| External | GITS_PARTIDR | Set PARTID and PMG Register |
| External | GITS_SGIR | ITS SGI Register |
| External | GITS_STATUSR | ITS Error Reporting Status Register |
| External | GITS_TRANSLATER | ITS Translation Register |
| External | GITS_TYPER | ITS Type Register |
| External | GITS_UMSIR | ITS Unmapped MSI register |

| Dist_base | 0x0200 + (4 * n) | GICD_ISPENDR<n> | Interrupt Set-Pending Registers |
| Dist_base | 0x0280 + (4 * n) | GICD_ICPENDR<n> | Interrupt Clear-Pending Registers |
| Dist_base | 0x0300 + (4 * n) | GICD_ISACTIVER<n> | Interrupt Set-Active Registers |
| Dist_base | 0x0380 + (4 * n) | GICD_ICACTIVER<n> | Interrupt Clear-Active Registers |
| Dist_base | 0x0400 + (4 * n) | GICD_IPRIORITYR<n> | Interrupt Priority Registers |
| Dist_base | 0x0800 + (4 * n) | GICD_ITARGETSR<n> | Interrupt Processor Targets Registers |
| Dist_base | 0x0C00 + (4 * n) | GICD_ICFGR<n> | Interrupt Configuration Registers |
| Dist_base | 0x0D00 + (4 * n) | GICD_IGRPMODR<n> | Interrupt Group Modifier Registers |
| Dist_base | 0x0E00 + (4 * n) | GICD_NSACR<n> | Non-secure Access Control Registers |
| Dist_base | 0x0F00 | GICD_SGIR | Software Generated Interrupt Register |
| Dist_base | 0x0F10 + (4 * n) | GICD_CPENDSGIR<n> | SGI Clear-Pending Registers |
| Dist_base | 0x0F20 + (4 * n) | GICD_SPENDSGIR<n> | SGI Set-Pending Registers |
| Dist_base | 0x0F80 + (4 * n) | GICD_INMIR<n> | Non-maskable Interrupt Registers, x = 0 to 31 |
| Dist_base | 0x1000 + (4 * n) | GICD_IGROUPR<n>E | Interrupt Group Registers (extended SPI range) |
| Dist_base | 0x1200 + (4 * n) | GICD_ISENABLER<n>E | Interrupt Set-Enable Registers |

| Frame | Offset | Name | Description |
|-----------|------------------|---|---|
| Dist_base | 0x1400 + (4 * n) | GICD_ICENABLER<n>E | Interrupt Clear-Enable Registers |
| Dist_base | 0x1600 + (4 * n) | GICD_ISPENDR<n>E | Interrupt Set-Pending Registers (extended SPI range) |
| Dist_base | 0x1800 + (4 * n) | GICD_ICPENDR<n>E | Interrupt Clear-Pending Registers (extended SPI range) |
| Dist_base | 0x1A00 + (4 * n) | GICD_ISACTIVER<n>E | Interrupt Set-Active Registers (extended SPI range) |
| Dist_base | 0x1C00 + (4 * n) | GICD_ICACTIVER<n>E | Interrupt Clear-Active Registers (extended SPI range) |
| Dist_base | 0x2000 + (4 * n) | GICD_IPRIORITYR<n>E | Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC. |
| Dist_base | 0x3000 + (4 * n) | GICD_ICFGR<n>E | Interrupt Configuration Registers (Extended SPI Range) |
| Dist_base | 0x3400 + (4 * n) | GICD_IGRPMODR<n>E | Interrupt Group Modifier Registers (extended SPI range) |
| Dist_base | 0x3600 + (4 * n) | GICD_NSACR<n>E | Non-secure Access Control Registers |
| Dist_base | 0x3B00 + (4 * n) | GICD_INMIR<n>E | Non-maskable Interrupt Registers for Extended SPIs, x = 0 to 31 |
| Dist_base | 0x6000 + (8 * n) | GICD_IROUTER<n> | Interrupt Routing Registers |
| Dist_base | 0x8000 + (8 * n) | GICD_IROUTER<n>E | Interrupt Routing Registers (Extended SPI Range) |
| MSI_base | 0x0004 | GICM_TYPER | Distributor MSI Type Register |
| MSI_base | 0x0040 | GICM_SETSPI_NSR | Set Non-secure SPI Pending Register |
| MSI_base | 0x0048 | GICM_CLRSPI_NSR | Clear Non-secure SPI Pending Register |
| MSI_base | 0x0050 | GICM_SETSPI_SR | Set Secure SPI Pending Register |
| MSI_base | 0x0058 | GICM_CLRSPI_SR | Clear Secure SPI Pending Register |
| MSI_base | 0x0FCC | GICM_IIDR | Distributor Implementer Identification Register |

In the Debug block:

| Offset | Name | Description |
|------------------|---|---|
| 0x020 | EDES | External Debug Event Status Register |
| 0x024 | EDECR | External Debug Execution Control Register |
| 0x030 | EDWAR[31:0] | External Debug Watchpoint Address Register |
| 0x034 | EDWAR[63:32] | External Debug Watchpoint Address Register |
| 0x080 | DBGDTRRX_EL0 | Debug Data Transfer Register, Receive |
| 0x084 | EDITR | External Debug Instruction Transfer Register |
| 0x088 | EDSCR | External Debug Status and Control Register |
| 0x08C | DBGDTRTX_EL0 | Debug Data Transfer Register, Transmit |
| 0x090 | EDRCR | External Debug Reserve Control Register |
| 0x094 | EDACR | External Debug Auxiliary Control Register |
| 0x098 | EDECCR | External Debug Exception Catch Control Register |
| 0x0A0 | EDPCSR[31:0] | External Debug Program Counter Sample Register |
| 0x0A4 | EDCIDS | External Debug Context ID Sample Register |
| 0x0A8 | EDVIDSR | External Debug Virtual Context Sample Register |
| 0x0AC | EDPCSR[63:32] | External Debug Program Counter Sample Register |
| 0x300 | OSLAR_EL1 | OS Lock Access Register |
| 0x310 | EDPRCR | External Debug Power/Reset Control Register |
| 0x314 | EDPRSR | External Debug Processor Status Register |
| 0x400 + (16 * n) | DBGBVR<n>_EL1[63:0] | Debug Breakpoint Value Registers |
| 0x408 + (16 * n) | DBGBCR<n>_EL1 | Debug Breakpoint Control Registers |

| Offset | Name | Description |
|------------------|---|---|
| 0x800 + (16 * n) | DBGWVR<n>_EL1[63:0] | Debug Watchpoint Value Registers |
| 0x808 + (16 * n) | DBGWCR<n>_EL1 | Debug Watchpoint Control Registers |
| 0xD00 | MIDR_EL1 | Main ID Register |
| 0xD20 | EDPFR[31:0] | External Debug Processor Feature Register |
| 0xD24 | EDPFR[63:32] | External Debug Processor Feature Register |
| 0xD28 | EDDFR[31:0] | External Debug Feature Register |
| 0xD2C | EDDFR[63:32] | External Debug Feature Register |
| 0xD60 | EDAA32PFR | External Debug Auxiliary Processor Feature Register |
| 0xF00 | EDITCTRL | External Debug Integration mode Control register |
| 0xFA0 | DBGCLAIMSET_EL1 | Debug CLAIM Tag Set register |
| 0xFA4 | DBGCLAIMCLR_EL1 | Debug CLAIM Tag Clear register |
| 0xFA8 | EDDEVAFF0 | External Debug Device Affinity register 0 |
| 0xFAC | EDDEVAFF1 | External Debug Device Affinity register 1 |
| 0xFB0 | EDLAR | External Debug Lock Access Register |
| 0xFB4 | EDLSR | External Debug Lock Status Register |
| 0xFB8 | DBGAUTHSTATUS_EL1 | Debug Authentication Status register |
| 0xFBC | EDDEVARCH | External Debug Device Architecture register |
| 0xFC0 | EDDEVID2 | External Debug Device ID register 2 |
| 0xFC4 | EDDEVID1 | External Debug Device ID register 1 |
| 0xFC8 | EDDEVID | External Debug Device ID register 0 |
| 0xFCC | EDDEVTYPE | External Debug Device Type register |
| 0xFD0 | EDPIDR4 | External Debug Peripheral Identification Register 4 |
| 0xFE0 | EDPIDR0 | External Debug Peripheral Identification Register 0 |
| 0xFE4 | EDPIDR1 | External Debug Peripheral Identification Register 1 |
| 0xFE8 | EDPIDR2 | External Debug Peripheral Identification Register 2 |
| 0xFEC | EDPIDR3 | External Debug Peripheral Identification Register 3 |
| 0xFF0 | EDCIDR0 | External Debug Component Identification Register 0 |
| 0xFF4 | EDCIDR1 | External Debug Component Identification Register 1 |
| 0xFF8 | EDCIDR2 | External Debug Component Identification Register 2 |
| 0xFFC | EDCIDR3 | External Debug Component Identification Register 3 |

In the GIC Virtual interface control block:

| Offset | Name | Description |
|------------------|-----------------------------------|---------------------------------------|
| 0x0000 | GICH_HCR | Hypervisor Control Register |
| 0x0004 | GICH_VTR | Virtual Type Register |
| 0x0008 | GICH_VMCR | Virtual Machine Control Register |
| 0x0010 | GICH_MISR | Maintenance Interrupt Status Register |
| 0x0020 | GICH_EISR | End Interrupt Status Register |
| 0x0030 | GICH_ELRSR | Empty List Register Status Register |
| 0x00F0 + (4 * n) | GICH_APR<n> | Active Priorities Registers |
| 0x0100 + (4 * n) | GICH_LR<n> | List Registers |

In the PMU block:

| Offset | Name | Description |
|-----------------|---------------------------------------|--|
| 0x000 + (8 * n) | PMEVCNTR<n>_EL0 | Performance Monitors Event Count Registers |
| 0x0F8 | PMCCNTR_EL0[31:0] | Performance Monitors Cycle Counter |
| 0x0FC | PMCCNTR_EL0[63:32] | Performance Monitors Cycle Counter |

| Offset | Name | Description |
|-----------------|--|---|
| 0x200 | PMPCSR[31:0] | Program Counter Sample Register |
| 0x204 | PMPCSR[63:32] | Program Counter Sample Register |
| 0x208 | PMCID1SR | CONTEXTIDR_EL1 Sample Register |
| 0x20C | PMVIDSR | VMID Sample Register |
| 0x220 | PMPCSR[31:0] | Program Counter Sample Register |
| 0x224 | PMPCSR[63:32] | Program Counter Sample Register |
| 0x228 | PMCID1SR | CONTEXTIDR_EL1 Sample Register |
| 0x22C | PMCID2SR | CONTEXTIDR_EL2 Sample Register |
| 0x400 + (4 * n) | PMEVTYPER<n>_EL0 | Performance Monitors Event Type Registers |
| 0x47C | PMCCFILTR_EL0 | Performance Monitors Cycle Counter Filter Register |
| 0xA00 + (4 * n) | PMEVFILTR<n> | Performance Monitors Event Type Select Register <n>; |
| 0xC00 | PMCNTENSET_EL0 | Performance Monitors Count Enable Set register |
| 0xC20 | PMCNTENCLR_EL0 | Performance Monitors Count Enable Clear register |
| 0xC40 | PMINTENSET_EL1 | Performance Monitors Interrupt Enable Set register |
| 0xC60 | PMINTENCLR_EL1 | Performance Monitors Interrupt Enable Clear register |
| 0xC80 | PMOVSCLR_EL0 | Performance Monitors Overflow Flag Status Clear register |
| 0xCA0 | PMSWINC_EL0 | Performance Monitors Software Increment register |
| 0xCC0 | PMOVSSET_EL0 | Performance Monitors Overflow Flag Status Set register |
| 0xE00 | PMCFGR | Performance Monitors Configuration Register |
| 0xE04 | PMCR_EL0 | Performance Monitors Control Register |
| 0xE20 | PMCEID0 | Performance Monitors Common Event Identification register 0 |
| 0xE24 | PMCEID1 | Performance Monitors Common Event Identification register 1 |
| 0xE28 | PMCEID2 | Performance Monitors Common Event Identification register 2 |
| 0xE2C | PMCEID3 | Performance Monitors Common Event Identification register 3 |
| 0xE40 | PMMIR | Performance Monitors Machine Identification Register |
| 0xF00 | PMTCTRL | Performance Monitors Integration mode Control register |
| 0xFA8 | PMDEVAFF0 | Performance Monitors Device Affinity register 0 |
| 0xFAC | PMDEVAFF1 | Performance Monitors Device Affinity register 1 |
| 0xFB0 | PMLAR | Performance Monitors Lock Access Register |
| 0xFB4 | PMLSR | Performance Monitors Lock Status Register |
| 0xFB8 | PMAUTHSTATUS | Performance Monitors Authentication Status register |
| 0xFBC | PMDEVARCH | Performance Monitors Device Architecture register |
| 0xFC8 | PMDEVID | Performance Monitors Device ID register |
| 0xFCC | PMDEVTYPE | Performance Monitors Device Type register |
| 0xFD0 | PMPIDR4 | Performance Monitors Peripheral Identification Register 4 |
| 0xFE0 | PMPIDR0 | Performance Monitors Peripheral Identification Register 0 |
| 0xFE4 | PMPIDR1 | Performance Monitors Peripheral Identification Register 1 |
| 0xFE8 | PMPIDR2 | Performance Monitors Peripheral Identification Register 2 |
| 0xFEC | PMPIDR3 | Performance Monitors Peripheral Identification Register 3 |
| 0xFF0 | PMCIDR0 | Performance Monitors Component Identification Register 0 |
| 0xFF4 | PMCIDR1 | Performance Monitors Component Identification Register 1 |
| 0xFF8 | PMCIDR2 | Performance Monitors Component Identification Register 2 |
| 0xFFC | PMCIDR3 | Performance Monitors Component Identification Register 3 |

In the GIC Redistributor block:

| Frame | Offset | Name | Description |
|-----------|------------------|---|---|
| RD_base | 0x0000 | GICR_CTLR | Redistributor Control Register |
| RD_base | 0x0004 | GICR_IIDR | Redistributor Implementer Identification Register |
| RD_base | 0x0008 | GICR_TYPER | Redistributor Type Register |
| RD_base | 0x0010 | GICR_STATUSR | Error Reporting Status Register |
| RD_base | 0x0010 | GICR_STATUSR | Error Reporting Status Register |
| RD_base | 0x0014 | GICR_WAKER | Redistributor Wake Register |
| RD_base | 0x0018 | GICR_MPAMIDR | Report maximum PARTID and PMG Register |
| RD_base | 0x001C | GICR_PARTIDR | Set PARTID and PMG Register |
| RD_base | 0x0040 | GICR_SETLPIR | Set LPI Pending Register |
| RD_base | 0x0048 | GICR_CLRLPIR | Clear LPI Pending Register |
| RD_base | 0x0070 | GICR_PROPBASER | Redistributor Properties Base Address Register |
| RD_base | 0x0078 | GICR_PENDBASER | Redistributor LPI Pending Table Base Address Register |
| RD_base | 0x00A0 | GICR_INVLPIR | Redistributor Invalidate LPI Register |
| RD_base | 0x00B0 | GICR_INVALIDLR | Redistributor Invalidate All Register |
| RD_base | 0x00C0 | GICR_SYNCR | Redistributor Synchronize Register |
| SGI_base | 0x0080 | GICR_IGROUPR0 | Interrupt Group Register 0 |
| SGI_base | 0x0080 + (4 * n) | GICR_IGROUPR<n>E | Interrupt Group Registers |
| SGI_base | 0x0100 | GICR_ISENBALER0 | Interrupt Set-Enable Register 0 |
| SGI_base | 0x0100 + (4 * n) | GICR_ISENBALER<n>E | Interrupt Set-Enable Registers |
| SGI_base | 0x0180 | GICR_ICENABLER0 | Interrupt Clear-Enable Register 0 |
| SGI_base | 0x0180 + (4 * n) | GICR_ICENABLER<n>E | Interrupt Clear-Enable Registers |
| SGI_base | 0x0200 | GICR_ISPENDR0 | Interrupt Set-Pending Register 0 |
| SGI_base | 0x0200 + (4 * n) | GICR_ISPENDR<n>E | Interrupt Set-Pending Registers |
| SGI_base | 0x0280 | GICR_ICPENDR0 | Interrupt Clear-Pending Register 0 |
| SGI_base | 0x0280 + (4 * n) | GICR_ICPENDR<n>E | Interrupt Clear-Pending Registers |
| SGI_base | 0x0300 | GICR_ISACTIVER0 | Interrupt Set-Active Register 0 |
| SGI_base | 0x0300 + (4 * n) | GICR_ISACTIVER<n>E | Interrupt Set-Active Registers |
| SGI_base | 0x0380 | GICR_ICACTIVER0 | Interrupt Clear-Active Register 0 |
| SGI_base | 0x0380 + (4 * n) | GICR_ICACTIVER<n>E | Interrupt Clear-Active Registers |
| SGI_base | 0x0400 + (4 * n) | GICR_IPRIORITYR<n>E | Interrupt Priority Registers (extended PPI range) |
| SGI_base | 0x0400 + (4 * n) | GICR_IPRIORITYR<n> | Interrupt Priority Registers |
| SGI_base | 0x0C00 | GICR_ICFGR0 | Interrupt Configuration Register 0 |
| SGI_base | 0x0C00 + (4 * n) | GICR_ICFGR<n>E | Interrupt configuration registers |
| SGI_base | 0x0C04 | GICR_ICFGR1 | Interrupt Configuration Register 1 |
| SGI_base | 0x0D00 | GICR_IGRPMODR0 | Interrupt Group Modifier Register 0 |
| SGI_base | 0x0D00 + (4 * n) | GICR_IGRPMODR<n>E | Interrupt Group Modifier Registers |
| SGI_base | 0x0E00 | GICR_NSACR | Non-secure Access Control Register |
| SGI_base | 0x0F80 | GICR_INMIR0 | Non-maskable Interrupt Register for PPIs. |
| SGI_base | 0x0F80 + (4 * n) | GICR_INMIR<n>E | Non-maskable Interrupt Registers for Extended PPIs, x = 1 to 2. |
| VLPI_base | 0x0070 | GICR_VPROPBASER | Virtual Redistributor Properties Base Address Register |
| VLPI_base | 0x0078 | GICR_VPENDBASER | Virtual Redistributor LPI Pending Table Base Address Register |

| Frame | Offset | Name | Description |
|-----------|--------|--------------------------------|--|
| VLPI_base | 0x0080 | GICR_VSGIR | Redistributor virtual SGI pending state request register |
| VLPI_base | 0x0088 | GICR_VSGIPENDR | Redistributor virtual SGI pending state register |

In the GIC Virtual CPU interface block:

| Offset | Name | Description |
|------------------|-----------------------------------|---|
| 0x0000 | GICV_CTLR | Virtual Machine Control Register |
| 0x0004 | GICV_PMR | Virtual Machine Priority Mask Register |
| 0x0008 | GICV_BPR | Virtual Machine Binary Point Register |
| 0x000C | GICV_IAR | Virtual Machine Interrupt Acknowledge Register |
| 0x0010 | GICV_EOIR | Virtual Machine End Of Interrupt Register |
| 0x0014 | GICV_RPR | Virtual Machine Running Priority Register |
| 0x0018 | GICV_HPPIR | Virtual Machine Highest Priority Pending Interrupt Register |
| 0x001C | GICV_ABPR | Virtual Machine Aliased Binary Point Register |
| 0x0020 | GICV_AIAR | Virtual Machine Aliased Interrupt Acknowledge Register |
| 0x0024 | GICV_AEOIR | Virtual Machine Aliased End Of Interrupt Register |
| 0x0028 | GICV_AHPPIR | Virtual Machine Aliased Highest Priority Pending Interrupt Register |
| 0x002C | GICV_STATUSR | Virtual Machine Error Reporting Status Register |
| 0x00D0 + (4 * n) | GICV_APR<n> | Virtual Machine Active Priorities Registers |
| 0x00FC | GICV_IIDR | Virtual Machine CPU Interface Identification Register |
| 0x1000 | GICV_DIR | Virtual Machine Deactivate Interrupt Register |

In the CTI block:

| Offset | Name | Description |
|-----------------|-----------------------------------|--|
| 0x000 | CTICONTROL | CTI Control register |
| 0x010 | CTIINTACK | CTI Output Trigger Acknowledge register |
| 0x014 | CTIAPPSET | CTI Application Trigger Set register |
| 0x018 | CTIAPPCLEAR | CTI Application Trigger Clear register |
| 0x01C | CTIAPPPULSE | CTI Application Pulse register |
| 0x020 + (4 * n) | CTIINEN<n> | CTI Input Trigger to Output Channel Enable registers |
| 0x0A0 + (4 * n) | CTIOUTEN<n> | CTI Input Channel to Output Trigger Enable registers |
| 0x130 | CTITRIGINSTATUS | CTI Trigger In Status register |
| 0x134 | CTITRIGOUTSTATUS | CTI Trigger Out Status register |
| 0x138 | CTICHINSTATUS | CTI Channel In Status register |
| 0x13C | CTICHOUTSTATUS | CTI Channel Out Status register |
| 0x140 | CTIGATE | CTI Channel Gate Enable register |
| 0x144 | ASICCTL | CTI External Multiplexer Control register |
| 0x150 | CTIDEVCTL | CTI Device Control register |
| 0xF00 | CTIITCTRL | CTI Integration mode Control register |
| 0xFA0 | CTICLAIMSET | CTI CLAIM Tag Set register |
| 0xFA4 | CTICLAIMCLR | CTI CLAIM Tag Clear register |
| 0xFA8 | CTIDEVAFF0 | CTI Device Affinity register 0 |
| 0xFAC | CTIDEVAFF1 | CTI Device Affinity register 1 |
| 0xFB0 | CTILAR | CTI Lock Access Register |
| 0xFB4 | CTILSR | CTI Lock Status Register |
| 0xFB8 | CTIAUTHSTATUS | CTI Authentication Status register |

| Offset | Name | Description |
|--------|----------------------------|--|
| 0xFBC | CTIDEVARCH | CTI Device Architecture register |
| 0xFC0 | CTIDEVID2 | CTI Device ID register 2 |
| 0xFC4 | CTIDEVID1 | CTI Device ID register 1 |
| 0xFC8 | CTIDEVID | CTI Device ID register 0 |
| 0xFCC | CTIDEVTYPE | CTI Device Type register |
| 0xFD0 | CTIPIDR4 | CTI Peripheral Identification Register 4 |
| 0xFE0 | CTIPIDR0 | CTI Peripheral Identification Register 0 |
| 0xFE4 | CTIPIDR1 | CTI Peripheral Identification Register 1 |
| 0xFE8 | CTIPIDR2 | CTI Peripheral Identification Register 2 |
| 0xFEC | CTIPIDR3 | CTI Peripheral Identification Register 3 |
| 0xFF0 | CTICIDR0 | CTI Component Identification Register 0 |
| 0xFF4 | CTICIDR1 | CTI Component Identification Register 1 |
| 0xFF8 | CTICIDR2 | CTI Component Identification Register 2 |
| 0xFFC | CTICIDR3 | CTI Component Identification Register 3 |

In the GIC ITS control block:

| Offset | Name | Description |
|------------------|-------------------------------------|--|
| 0x0000 | GITS_CTLR | ITS Control Register |
| 0x0004 | GITS_IIDR | ITS Identification Register |
| 0x0008 | GITS_TYPER | ITS Type Register |
| 0x0010 | GITS_MPAMIDR | Report maximum PARTID and PMG Register |
| 0x0014 | GITS_PARTIDR | Set PARTID and PMG Register |
| 0x0018 | GITS_MPIDR | Report ITS's affinity. |
| 0x0040 | GITS_STATUSR | ITS Error Reporting Status Register |
| 0x0048 | GITS_UMSIR | ITS Unmapped MSI register |
| 0x0080 | GITS_CBASER | ITS Command Queue Descriptor |
| 0x0088 | GITS_CWRITER | ITS Write Register |
| 0x0090 | GITS_CREADR | ITS Read Register |
| 0x0100 + (8 * n) | GITS_BASER<n> | ITS Translation Table Descriptors |
| 0x20020 | GITS_SGIR | ITS SGI Register |

In the GIC CPU interface block:

| Offset | Name | Description |
|------------------|-----------------------------------|---|
| 0x0000 | GICC_CTLR | CPU Interface Control Register |
| 0x0004 | GICC_PMR | CPU Interface Priority Mask Register |
| 0x0008 | GICC_BPR | CPU Interface Binary Point Register |
| 0x000C | GICC_IAR | CPU Interface Interrupt Acknowledge Register |
| 0x0010 | GICC_EOIR | CPU Interface End Of Interrupt Register |
| 0x0014 | GICC_RPR | CPU Interface Running Priority Register |
| 0x0018 | GICC_HPPIR | CPU Interface Highest Priority Pending Interrupt Register |
| 0x001C | GICC_ABPR | CPU Interface Aliased Binary Point Register |
| 0x0020 | GICC_AIAR | CPU Interface Aliased Interrupt Acknowledge Register |
| 0x0024 | GICC_AEOIR | CPU Interface Aliased End Of Interrupt Register |
| 0x0028 | GICC_AHPPIR | CPU Interface Aliased Highest Priority Pending Interrupt Register |
| 0x002C | GICC_STATUSR | CPU Interface Status Register |
| 0x002C | GICC_STATUSR | CPU Interface Status Register |
| 0x00D0 + (4 * n) | GICC_APR<n> | CPU Interface Active Priorities Registers |

| Offset | Name | Description |

AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

Configuration

External register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register [AMCFGR_EL0\[31:0\]](#).

External register AMCFGR bits [31:0] are architecturally mapped to AArch32 System register [AMCFGR\[31:0\]](#).

The power domain of AMCFGR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are RES0.

Attributes

AMCFGR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|----|----|----|------|----|----|------|-----|----|----|----|----|----|------|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NCG | | | | RES0 | | | HDBG | RAZ | | | | | | SIZE | | | | N | | | | | | | | | | | | | |

NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is [AMCFGR.NCG + 1].

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

This feature must be supported, and so this bit is 0b1.

| HDBG | Meaning |
|------|--|
| 0b0 | AMCR.HDBG is RES0. |
| 0b1 | AMCR.HDBG is read/write. |

Access to this field is **RO**.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is [AMCFGR.SIZE + 1].

The counters are 64-bit.

Note

Software also uses this field to determine the spacing of counters in the memory-map. The counters are at doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is **RO**.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is [AMCFGR.N + 1].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMCFGR

AMCFGR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| AMU | 0xE00 | AMCFGR |

Accesses on this interface are **RO**.

AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configuration

External register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register [AMCGCR_EL0\[31:0\]](#).

External register AMCGCR bits [31:0] are architecturally mapped to AArch32 System register [AMCGCR\[31:0\]](#).

The power domain of AMCGCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are RES0.

Attributes

AMCGCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|---|---|-------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | CG1NC | | | | | | | | CG0NC | | | | | | | |

Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as 0x04.

Access to this field is **RO**.

Accessing AMCGCR

AMCGCR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
|-----------|--------|----------|

AMCGCR, Activity Monitors Counter Group Configuration Register

| | | |
|-----|-------|--------|
| AMU | 0xCE0 | AMCGCR |
|-----|-------|--------|

Accesses on this interface are **RO**.

AMCIDR0, Activity Monitors Component Identification Register 0

The AMCIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

The power domain of AMCIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL_0 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is **RO**.

Accessing AMCIDR0

AMCIDR0 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| AMU | 0xFF0 | AMCIDR0 |

Accesses on this interface are **RO**.

AMCIDR1, Activity Monitors Component Identification Register 1

The AMCIDR1 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

The power domain of AMCIDR1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | CLASS | | | PRMBL 1 | | | | |

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

| CLASS | Meaning |
|--------|----------------------|
| 0b1001 | CoreSight component. |

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000.

Access to this field is **RO**.

Accessing AMCIDR1

AMCIDR1 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| AMU | 0xFF4 | AMCIDR1 |

Accesses on this interface are **RO**.

AMCIDR2, Activity Monitors Component Identification Register 2

The AMCIDR2 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

The power domain of AMCIDR2 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL_2 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is **RO**.

Accessing AMCIDR2

AMCIDR2 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| AMU | 0xFF8 | AMCIDR2 |

Accesses on this interface are **RO**.

AMCIDR3, Activity Monitors Component Identification Register 3

The AMCIDR3 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

The power domain of AMCIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL_3 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is **RO**.

Accessing AMCIDR3

AMCIDR3 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| AMU | 0xFFC | AMCIDR3 |

Accesses on this interface are **RO**.

AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

Purpose

Disable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Configuration

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR0_ELO\[31:0\]](#).

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENCLR0\[31:0\]](#).

The power domain of AMCNTENCLR0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are RES0.

Attributes

AMCNTENCLR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|----|----|----|----|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | RAZ/WI | | | | | | | | | | P3 | P2 | P1 | P0 | | |

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for [AMEVCNTR0<n>](#).

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

| P<n> | Meaning |
|-------------------|---|
| 0b0 | When read, means that AMEVCNTR0<n> is disabled. |
| 0b1 | When read, means that AMEVCNTR0<n> is enabled. |

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENCLR0

AMCNTENCLR0 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|------------------|---------------|-----------------|
| AMU | 0xC20 | AMCNTENCLR0 |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configuration

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR1_ELO\[31:0\]](#).

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENCLR1\[31:0\]](#).

The power domain of AMCNTENCLR1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are RES0.

Attributes

AMCNTENCLR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter disable bit for [AMEVCNTR1<n>](#).

When N is less than 16, bits [15:N] are RAZ, where N is the value in [AMCGCR.CG1NC](#).

Possible values of each bit are:

| P<n> | Meaning |
|------|---|
| 0b0 | When read, means that AMEVCNTR1<n> is disabled. |
| 0b1 | When read, means that AMEVCNTR1<n> is enabled. |

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENCLR1

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENCLR1 are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

The number of auxiliary activity monitor event counters implemented is zero exactly when [AMCFGR](#).NCG == 0b0000.

AMCNTENCLR1 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-------------|
| AMU | 0xC24 | AMCNTENCLR1 |

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

Purpose

Enable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Configuration

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENSET0_ELO\[31:0\]](#).

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENSET0\[31:0\]](#).

The power domain of AMCNTENSET0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are RES0.

Attributes

AMCNTENSET0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|----|----|----|----|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | RAZ/WI | | | | | | | | | | P3 | P2 | P1 | P0 | | |

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter enable bit for [AMEVCNTR0<n>](#).

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

| P<n> | Meaning |
|-------------------|---|
| 0b0 | When read, means that AMEVCNTR0<n> is disabled. |
| 0b1 | When read, means that AMEVCNTR0<n> is enabled. |

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENSET0

AMCNTENSET0 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|------------------|---------------|-----------------|
| AMU | 0xC00 | AMCNTENSET0 |

Accesses on this interface are **RO**.

AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

Purpose

Enable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configuration

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENSET1_ELO\[31:0\]](#).

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENSET1\[31:0\]](#).

The power domain of AMCNTENSET1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are RES0.

Attributes

AMCNTENSET1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter enable bit for [AMEVCNTR1<n>](#).

When N is less than 16, bits [15:N] are RAZ, where N is the value in [AMCGCR.CG1NC](#).

Possible values of each bit are:

| P<n> | Meaning |
|------|---|
| 0b0 | When read, means that AMEVCNTR1<n> is disabled. |
| 0b1 | When read, means that AMEVCNTR1<n> is enabled. |

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENSET1

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENSET1 are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

The number of auxiliary activity monitor counters implemented is zero exactly when [AMCFGR](#).NCG == 0b0000.

AMCNTENSET1 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-------------|
| AMU | 0xC04 | AMCNTENSET1 |

Accesses on this interface are **RO**.

AMCR, Activity Monitors Control Register

The AMCR characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

Configuration

External register AMCR bits [31:0] are architecturally mapped to AArch64 System register [AMCR_EL0\[31:0\]](#).

External register AMCR bits [31:0] are architecturally mapped to AArch32 System register [AMCR\[31:0\]](#).

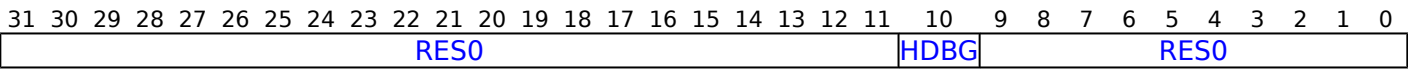

The power domain of AMCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR are RES0.

Attributes

AMCR is a 32-bit register.

Field descriptions

Bits [31:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

| HDBG | Meaning |
|------|--|
| 0b0 | Activity monitors do not halt counting when the PE is halted in Debug state. |
| 0b1 | Activity monitors halt counting when the PE is halted in Debug state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing AMCR

AMCR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| AMU | 0xE04 | AMCR |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMDEVAFF0, Activity Monitors Device Affinity Register 0

The AMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Configuration

The power domain of AMDEVAFF0 is IMPLEMENTATION DEFINED.

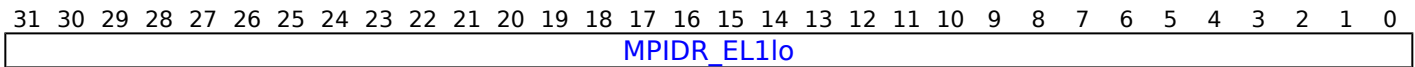

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVAFF0 is a 32-bit register.

Field descriptions

MPIDR_EL1lo, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing AMDEVAFF0

AMDEVAFF0 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-----------|
| AMU | 0xFA8 | AMDEVAFF0 |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMDEVAFF1, Activity Monitors Device Affinity Register 1

The AMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Configuration

The power domain of AMDEVAFF1 is IMPLEMENTATION DEFINED.

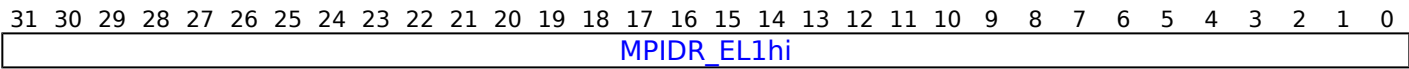

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVAFF1 is a 32-bit register.

Field descriptions

MPIDR_EL1hi, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing AMDEVAFF1

AMDEVAFF1 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-----------|
| AMU | 0xFAC | AMDEVAFF1 |

Accesses on this interface are **RO**.

AMDEVARCH, Activity Monitors Device Architecture Register

The AMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the AMU component.

Configuration

The power domain of AMDEVARCH is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVARCH is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|---------|----------|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ARCHITECT | | | | | | | | | | | PRESENT | REVISION | | | | ARCHID | | | | | | | | | | | | | | | |

ARCHITECT, bits [31:21]

Defines the architecture of the component. For AMU, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is **RO**.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

All other values are reserved.

Reads as 0b0000.

Access to this field is **RO**.

ARCHID, bits [15:0]

Defines this part to be an AMU component. For architectures defined by Arm this is further subdivided.

For AMU:

- Bits [15:12] are the architecture version, 0x0.
- Bits [11:0] are the architecture part number, 0xA66.

This corresponds to AMU architecture version AMUv1.

Reads as 0x0A66.

Access to this field is **RO**.

Accessing AMDEVARCH

AMDEVARCH can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-----------|
| AMU | 0xFBC | AMDEVARCH |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMDEVTTYPE, Activity Monitors Device Type Register

The AMDEVTTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Configuration

The power domain of AMDEVTTYPE is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVTTYPE is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|-----|---|---|-------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | SUB | | | MAJOR | | | | |

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype.

Reads as 0b0001.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type.

Reads as 0b0110.

Access to this field is **RO**.

Accessing AMDEVTTYPE

AMDEVTTYPE can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|------------|
| AMU | 0xFCC | AMDEVTTYPE |

Accesses on this interface are **RO**.

AMEVCNTR0<n>, Activity Monitors Event Counter Registers 0, n = 0 - 3

The AMEVCNTR0<n> characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configuration

External register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch64 System register [AMEVCNTR0<n>_ELO\[63:0\]](#).

External register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch32 System register [AMEVCNTR0<n>\[63:0\]](#).

The power domain of AMEVCNTR0<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n> are RES0.

Attributes

AMEVCNTR0<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | ACNT | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | ACNT | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 3.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMEVCNTR0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads of AMEVCNTR0<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

AMEVCNTR0<n> can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance | Range |
|-----------|--------------------|--------------|-------|
| AMU | 0x000 + (8 * n) | AMEVCNTR0<n> | 31:0 |

Accesses on this interface are **RO**.

| Component | Offset | Instance | Range |
|-----------|--------------------|--------------|-------|
| AMU | 0x004 + (8 * n) | AMEVCNTR0<n> | 63:32 |

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configuration

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch64 System register [AMEVCNTR1<n>_ELO\[63:0\]](#).

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch32 System register [AMEVCNTR1<n>\[63:0\]](#).

The power domain of AMEVCNTR1<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are RES0.

Attributes

AMEVCNTR1<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | ACNT | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | ACNT | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMEVCNTR1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVCNTR1<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

AMEVCNTR1<n> can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance | Range |
|-----------|--------------------------|--------------|-------|
| AMU | $0 \times 100 + (8 * n)$ | AMEVCNTR1<n> | 31:0 |

Accesses on this interface are **RO**.

| Component | Offset | Instance | Range |
|-----------|--------------------------|--------------|-------|
| AMU | $0 \times 104 + (8 * n)$ | AMEVCNTR1<n> | 63:32 |

Accesses on this interface are **RO**.

AMEVTYPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 3

The AMEVTYPER0<n> characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter [AMEVCNTR0<n>](#) counts.

Configuration

External register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch64 System register [AMEVTYPER0<n>_EL0\[31:0\]](#).

External register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch32 System register [AMEVTYPER0<n>\[31:0\]](#).

The power domain of AMEVTYPER0<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are RES0.

Attributes

AMEVTYPER0<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | evtCount | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter [AMEVCNTR0<n>](#). The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

| evtCount | Meaning | Applies when |
|----------|----------------------------|--------------|
| 0x0011 | Processor frequency cycles | When n == 0 |
| 0x4004 | Constant frequency cycles | When n == 1 |
| 0x0008 | Instructions retired | When n == 2 |
| 0x4005 | Memory stall cycles | When n == 3 |

Accessing AMEVTYPER0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads of AMEVTYPER0<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

AMEVTYPER0<n> can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|-------------------|---------------|
| AMU | $0x400 + (4 * n)$ | AMEVTYPER0<n> |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

AMEVTYPER1<n>, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n> characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter [AMEVCNTR1<n>](#) counts.

Configuration

External register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch64 System register [AMEVTYPER1<n>_EL0\[31:0\]](#).

External register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch32 System register [AMEVTYPER1<n>\[31:0\]](#).

The power domain of AMEVTYPER1<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n> are RES0.

Attributes

AMEVTYPER1<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | evtCount | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter [AMEVCNTR1<n>](#).

It is IMPLEMENTATION DEFINED what values are supported by each counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVTYPER1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVTYPER1<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

AMEVTYPER1<n> can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|-------------------|---------------|
| AMU | $0x480 + (4 * n)$ | AMEVTYPER1<n> |

Accesses on this interface are **RO**.

AMIIDR, Activity Monitors Implementation Identification Register

The AMIIDR characteristics are:

Purpose

Defines the implementer and revisions of the AMU.

Configuration

The power domain of AMIIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMIIDR are RES0.

Attributes

AMIIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----------|----|----|-------------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ProductID | | | | | | | | | | | | Variant | | | Revision | | | Implementer | | | | | | | | | | | | | |

ProductID, bits [31:20]

This field is an AMU part identifier.

If [AMPIDR0](#) is implemented, [AMPIDR0.PART_0](#) matches bits [27:20] of this field.

If [AMPIDR1](#) is implemented, [AMPIDR1.PART_1](#) matches bits [31:28] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [19:16]

This field distinguishes product variants or major revisions of the product.

If [AMPIDR2](#) is implemented, [AMPIDR2.REVISION](#) matches AMIIDR.Variant.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

This field distinguishes minor revisions of the product.

If [AMPIDR3](#) is implemented, [AMPIDR3.REVAND](#) matches AMIIDR.Revision.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the AMU.

For an Arm implementation, this field reads as 0x43B.

Bits [11:8] contain the JEP106 continuation code of the implementer.

Bit 7 is RES0

Bits [6:0] contain the JEP106 identity code of the implementer.

If [AMPIDR4](#) is implemented, [AMPIDR4](#).DES_2 matches bits [11:8] of this field.

If [AMPIDR2](#) is implemented, [AMPIDR2](#).DES_1 matches bits [6:4] of this field.

If [AMPIDR1](#) is implemented, [AMPIDR1](#).DES_0 matches bits [3:0] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMIIDR

AMIIDR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| AMU | 0xE08 | AMIIDR |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

AMPIDR0, Activity Monitors Peripheral Identification Register 0

The AMPIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|--------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PART_0 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMPIDR0

AMPIDR0 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| AMU | 0xFE0 | AMPIDR0 |

Accesses on this interface are **RO**.

AMPIDR1, Activity Monitors Peripheral Identification Register 1

The AMPIDR1 characteristics are:

Purpose

Provides information to identify an activity monitors component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR1 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---|--------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | DES_0 | | | | PART_1 | | | |

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code.
For Arm Limited, this field is 0b1011.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

Accessing AMPIDR1

AMPIDR1 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
|-----------|--------|----------|

| | | |
|-----|-------|---------|
| AMU | 0xFE4 | AMPIDR1 |
|-----|-------|---------|

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMPIDR2, Activity Monitors Peripheral Identification Register 2

The AMPIDR2 characteristics are:

Purpose

Provides information to identify an activity monitors component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR2 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|----------|---|---|-------|-------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | REVISION | | | JEDEC | DES_1 | | | |

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.
Reads as 0b1.
Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code.
For Arm Limited, this field is 0b011.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

Accessing AMPIDR2

AMPIDR2 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| AMU | 0xFE8 | AMPIDR2 |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMPIDR3, Activity Monitors Peripheral Identification Register 3

The AMPIDR3 characteristics are:

Purpose

Provides information to identify an activity monitors component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR3 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|--------|---|---|---|------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | REVAND | | | | CMOD | | | |

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using [AMPIDR2](#).REVISION as an extension to the Part number must use this field as a major revision number.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

Accessing AMPIDR3

AMPIDR3 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| AMU | 0xFEC | AMPIDR3 |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMPIDR4, Activity Monitors Peripheral Identification Register 4

The AMPIDR4 characteristics are:

Purpose

Provides information to identify an activity monitors component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR4 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR4 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|------|---|---|---|-------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | SIZE | | | | DES_2 | | | |

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.
Reads as 0b0000.
Access to this field is **RO**.

DES_2, bits [3:0]

Designer. JEP106 continuation code, least significant nibble.
For Arm Limited, this field is 0b0100.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

Accessing AMPIDR4

AMPIDR4 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| AMU | 0xFD0 | AMPIDR4 |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

Purpose

Can be used to provide IMPLEMENTATION DEFINED controls for the CTI. For example, the register might be used to control multiplexors for additional IMPLEMENTATION DEFINED triggers. The IMPLEMENTATION DEFINED controls provided by this register might modify the architecturally defined behavior of the CTI.

Note

The architecturally-defined triggers must not be multiplexed.

Configuration

It is IMPLEMENTATION DEFINED whether ASICCTL is implemented in the Core power domain or in the Debug power domain.

If it is implemented in the Core power domain then it is IMPLEMENTATION DEFINED whether it is in the Cold reset domain or the Warm reset domain.

This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes IMPLEMENTATION DEFINED behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are IMPLEMENTATION DEFINED.

Attributes

ASICCTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ASICCTL

ASICCTL can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| CTI | 0x144 | ASICCTL |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

Purpose

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- [CNTNSAR](#) controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the [CNTEL0ACR](#) in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

Configuration

The power domain of CNTACR<n> is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Implemented only if the value of [CNTTIDR](#).Frame<n> is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

Attributes

CNTACR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|------|------|-------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | RWPT | RWVT | RVOFF | RFRQ | RVCT | RPCT |

Bits [31:6]

Reserved, RES0.

RWPT, bit [5]

Read/write access to the EL1 Physical Timer registers [CNTP_CVAL](#), [CNTP_TVAL](#), and [CNTP_CTL](#), in frame <n>.

| RWPT | Meaning |
|------|---|
| 0b0 | No access to the EL1 Physical Timer registers in frame <n>. The registers are RES0. |
| 0b1 | Read/write access to the EL1 Physical Timer registers in frame <n>. |

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RWVT, bit [4]

Read/write access to the Virtual Timer register [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTV_CTL](#), in frame <n>.

| RWVT | Meaning |
|-------------|--|
| 0b0 | No access to the Virtual Timer registers in frame <n>. The registers are RES0. |
| 0b1 | Read/write access to the Virtual Timer registers in frame <n>. |

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVOFF, bit [3]

Read-only access to [CNTVOFF](#), in frame <n>.

| RVOFF | Meaning |
|--------------|--|
| 0b0 | No access to CNTVOFF in frame <n>. The register is RES0. |
| 0b1 | Read-only access to CNTVOFF in frame <n>. |

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RFRQ, bit [2]

Read-only access to [CNTFRQ](#), in frame <n>.

| RFRQ | Meaning |
|-------------|---|
| 0b0 | No access to CNTFRQ in frame <n>. The register is RES0. |
| 0b1 | Read-only access to CNTFRQ in frame <n>. |

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVCT, bit [1]

Read-only access to [CNTVCT](#), in frame <n>.

| RVCT | Meaning |
|-------------|---|
| 0b0 | No access to CNTVCT in frame <n>. The register is RES0. |
| 0b1 | Read-only access to CNTVCT in frame <n>. |

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RPCT, bit [0]

Read-only access to [CNTPCT](#), in frame <n>.

| RPCT | Meaning |
|-------------|---|
| 0b0 | No access to CNTPCT in frame <n>. The register is RES0. |
| 0b1 | Read-only access to CNTPCT in frame <n>. |

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTACR<n>

In a system that recognizes two Security states:

- CNTACR<n> is always accessible by Secure accesses.
- [CNTNSAR](#).NS<n> determines whether CNTACR<n> is accessible by Non-secure accesses.

CNTACR<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|------------|-----------------|-----------|
| Timer | CNTCTLBase | 0x040 + (4 * n) | CNTACR<n> |

Accesses on this interface are **RW**.

CNTCR, Counter Control Register

The CNTCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Configuration

The power domain of CNTCR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|------|---|---|------|------|----|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | FCREQ | | | | | | | RES0 | | | SCEN | HDBG | EN | | | | | |

Bits [31:18]

Reserved, RES0.

FCREQ, bits [17:8]

Frequency change request. Indicates the number of the entry in the Frequency modes table to select.

Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see 'The Frequency modes table'. An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

The reset behavior of this field is:

- On a Timer reset, this field resets to 0.

Bits [7:3]

Reserved, RES0.

SCEN, bit [2]

When FEAT_CNTSC is implemented:

Scale Enable.

| SCEN | Meaning |
|------|--|
| 0b0 | Scaling is not enabled. The counter value is incremented by 0x1.00000000 for each counter tick. |
| 0b1 | Scaling is enabled. The counter is incremented by CNTSCR.ScaleVal for each counter tick. |

The SCEN bit can only be changed when the counter is disabled, when CNTCR.EN == 0.

If the value of CNTCR.SCEN changes when CNTCR.EN == 1 then:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

When the [CNTCV](#) register in the CNTControlBase frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HDBG, bit [1]

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

| HDBG | Meaning |
|------|--|
| 0b0 | System counter ignores Halt-on-debug. |
| 0b1 | Asserted Halt-on-debug signal halts system counter update. |

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enables the counter:

| EN | Meaning |
|-----|--------------------------|
| 0b0 | System counter disabled. |
| 0b1 | System counter enabled. |

The reset behavior of this field is:

- On a Timer reset, this field resets to 0.

Accessing CNTCR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTCR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|----------------|--------|----------|
| Timer | CNTControlBase | 0x000 | CNTCR |

Accesses on this interface are **RW**.

CNTCV, Counter Count Value register

The CNTCV characteristics are:

Purpose

Indicates the current count value.

Configuration

The power domain of CNTCV is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTCV is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | CountValue | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | CountValue | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

CountValue, bits [63:0]

Indicates the counter value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTCV

| Frame | Accessibility |
|----------------|---------------|
| CNTControlBase | RW |
| CNTReadBase | RO |

A write to CNTCV must be visible in the [CNTPCT](#) register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports Secure and Non-secure memory maps, the CNTControlBase frame, and therefore this register instance, is implemented only in the Secure memory map.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

CNTCV can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance | Range |
|-----------|----------------|--------|----------|-------|
| Timer | CNTControlBase | 0x008 | CNTCV | 63:0 |

Accesses on this interface are **RW**.

CNTCV, Counter Count Value register

| Component | Frame | Offset | Instance | Range |
|-----------|-------------|--------|----------|-------|
| Timer | CNTReadBase | 0x000 | CNTCV | 63:0 |

Accesses on this interface are **RO**.

CNTELOACR, Counter-timer EL0 Access Control Register

The CNTELOACR characteristics are:

Purpose

An implementation of CNTELOACR in the frame at CNTBaseN controls whether the [CNTPTCT](#), [CNTVCT](#), [CNTFRQ](#), EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTELOBaseN.

Configuration

The power domain of CNTELOACR is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTELOACR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---------|----|---|---|---|---------|---|---|---|---|------|---|--|--|--|----------|--|--|--|--|----------|--|--|--|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | | | | | | | | | |
| | | | | | | | | | | RES0 | | | | | | | | | | ELOPTEN | | | | | ELOVTEN | | | | | RES0 | | | | | ELOVCTEN | | | | | ELOPCTEN | | | | |

Bits [31:10]

Reserved, RES0.

ELOPTEN, bit [9]

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the [CNTPT_CVAL](#), [CNTPT_TVAL](#), and [CNTPT_CTL](#) registers in the current CNTBaseN frame are also accessible in the corresponding CNTELOBaseN frame.

| ELOPTEN | Meaning |
|----------------|---|
| 0b0 | No access. Registers are RES0 in the second view. |
| 0b1 | Access permitted. If the registers are accessible in the current frame then they are accessible in the second view. |

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ELOVTEN, bit [8]

Second view read/write access control for the Virtual Timer registers. This bit controls whether the [CNTVT_CVAL](#), [CNTVT_TVAL](#), and [CNTVT_CTL](#) registers in the current CNTBaseN frame are also accessible in the corresponding CNTELOBaseN frame.

| EL0VTEN | Meaning |
|---------|---|
| 0b0 | No access. Registers are RES0 in the second view. |
| 0b1 | Access permitted. If the registers are accessible in the current frame then they are accessible in the second view. |

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL0VCTEN, bit [1]

Second view read access control for [CNTVCT](#) and [CNTERQ](#).

| EL0VCTEN | Meaning |
|----------|---|
| 0b0 | CNTVCT is not visible in the second view. If EL0PCTEN is set to 0, CNTERQ is not visible in the second view. |
| 0b1 | Access permitted. If CNTVCT and CNTERQ are visible in the current frame then they are visible in the second view. |

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Second view read access control for [CNTPCT](#) and [CNTERQ](#).

| EL0PCTEN | Meaning |
|----------|---|
| 0b0 | CNTPCT is not visible in the second view. If EL0VCTEN is set to 0, CNTERQ is not visible in the second view. |
| 0b1 | Access permitted. If CNTPCT and CNTERQ are visible in the current frame then they are visible in the second view. |

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTEL0ACR

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

- The register location in that frame is RAZ/WI.

- If the corresponding CNTEL0BaseN frame is implemented, the registers [CNTERQ](#), [CNTP_CTL](#), [CNTP_CVAL](#), [CNTP_TVAL](#), [CNTPCT](#), [CNTV_CTL](#), [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTVCT](#) are not visible in that frame.

CNTEL0ACR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|----------|--------|-----------|
| Timer | CNTBaseN | 0x014 | CNTEL0ACR |

Accesses on this interface are **RW**.

CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

Purpose

Indicates the base frequency of the system counter.

Configuration

The power domain of CNTFID0 is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information, see 'The Frequency modes table'.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

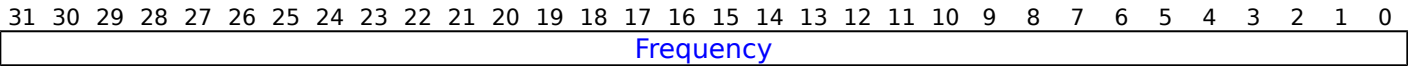

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID0 is a 32-bit register.

Field descriptions

Frequency, bits [31:0]

- The base frequency of the system counter, in Hz.
- The reset behavior of this field is:
- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID0

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTFID0 can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|----------------|--------|----------|
| Timer | CNTControlBase | 0x020 | CNTFID0 |

Accesses on this interface are **RO or RW**.

CNTFID<n>, Counter Frequency IDs, n > 0, n = 1 - 1003

The CNTFID<n> characteristics are:

Purpose

Indicates alternative system counter update frequencies.

Configuration

The power domain of CNTFID<n> is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, [CNTFID0](#), see 'The Frequency modes table'.

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is [CNTFID0](#).

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED up to this limit. For an implementation that includes registers in the IMPLEMENTATION DEFINED register space 0x0C0-0x0FC, the maximum number of entries in the Frequency modes table is 40, including the zero-word end marker.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | Frequency | | | | | | | | | | | | | | | |

Frequency, bits [31:0]

A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

increment = (base frequency) / (selected frequency)

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID<n>

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes these registers, is implemented only in the Secure memory map.

CNTFID<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|----------------|--------------------|-----------|
| Timer | CNTControlBase | 0x020 + (4 * n) | CNTFID<n> |

Accesses on this interface are **RO or RW**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. The instance of the register in the CNTCTLBase frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configuration

The power domain of CNTFRQ is IMPLEMENTATION DEFINED.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Clock frequency | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ

CNTFRQ must be implemented as an RW register in the CNTCTLBase frame.

In a system that recognizes two Security states, the instance of the register in the CNTCTLBase frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTELOBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTELOBaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTELOBaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTELOBaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RFRQ](#) is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTELOBaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:
 - CNTFRQ is accessible in the corresponding CNTBaseN frame.

- Either the value of [CNTELOACR.EL0VCTEN](#) is 1 or the value of [CNTELOACR.EL0PCTEN](#) is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

CNTFRQ can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|----------|--------|----------|
| Timer | CNTBaseN | 0x010 | CNTFRQ |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|-------------|--------|----------|
| Timer | CNTELOBaseN | 0x010 | CNTFRQ |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|------------|--------|----------|
| Timer | CNTCTLBase | 0x000 | CNTFRQ |

Accesses on this interface are **RO**.

CNTID, Counter Identification Register

The CNTID characteristics are:

Purpose

Indicates whether counter scaling is implemented.

Configuration

The power domain of CNTID is IMPLEMENTATION DEFINED.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTID are RES0.

Attributes

CNTID is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | CNTSC | | | | | | | | | | | | | |

Bits [31:4]

Reserved, RES0.

CNTSC, bits [3:0]

Indicates whether Counter Scaling is implemented

| CNTSC | Meaning |
|--------|-------------------------------------|
| 0b0000 | Counter scaling is not implemented. |
| 0b0001 | Counter scaling is implemented. |

All other values are reserved.

Accessing CNTID

In a system that supports Secure and Non-secure memory maps, the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTID can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|----------------|--------|----------|
| Timer | CNTControlBase | 0x1C | CNTID |

Accesses on this interface are **RO**.

CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

Purpose

Provides the highest-level control of whether frames CNTBaseN and CNTELOBaseN are accessible by Non-secure accesses.

Configuration

The power domain of CNTNSAR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTNSAR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-----|-----|-----|-----|-----|-----|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | NS7 | NS6 | NS5 | NS4 | NS3 | NS2 | NS1 | NS0 |

Bits [31:8]

Reserved, RES0.

NS<n>, bit [n], for n = 7 to 0

Non-secure access to frame n.

| NS<n> | Meaning |
|-------|---|
| 0b0 | Secure access only. Behaves as RES0 to Non-secure accesses. |
| 0b1 | Secure and Non-secure accesses permitted. |

This bit also determines whether, in the CNTCTLBase frame, [CNTACR<n>](#) and [CNTVOFF<n>](#) are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTNSAR

In a system that recognizes two Security states, this register is only accessible by Secure accesses.

CNTNSAR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|------------|--------|----------|
| Timer | CNTCTLBase | 0x004 | CNTNSAR |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

The power domain of CNTP_CTL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_CTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|-------|----|--------|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | ISTATUS | | | IMASK | | ENABLE | | | | | | | | | | |

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

| ISTATUS | Meaning |
|---------|-----------------------------|
| 0b0 | Timer condition is not met. |
| 0b1 | Timer condition is met. |

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

| IMASK | Meaning |
|-------|---|
| 0b0 | Timer interrupt is not masked by the IMASK bit. |
| 0b1 | Timer interrupt is masked by the IMASK bit. |

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

| ENABLE | Meaning |
|--------|-----------------|
| 0b0 | Timer disabled. |
| 0b1 | Timer enabled. |

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CTL

CNTP_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CTL is accessible in that frame if the value of [CNTACR<n>.RWPT](#) is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CTL is accessible in that frame if both:
 - CNTP_CTL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR.EL0PTEN](#) is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

CNTP_CTL can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|----------|--------|----------|
| Timer | CNTBaseN | 0x02C | CNTP_CTL |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|-------------|--------|----------|
| Timer | CNTEL0BaseN | 0x02C | CNTP_CTL |

Accesses on this interface are **RW**.

CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the EL1 physical timer.

Configuration

The power domain of CNTP_CVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_CVAL is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| CompareValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CompareValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- An interrupt is generated if [CNTP_CTL.IMASK](#) is 0.

When [CNTP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL

CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTELOBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTELOBaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTELOBaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTELOBaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CVAL is accessible in that frame if the value of [CNTACR<n>.RWPT](#) is 1.

- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CVAL is accessible in that frame if both:
 - CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR.EL0PTEN](#) is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

CNTP_CVAL can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance | Range |
|-----------|----------|--------|-----------|-------|
| Timer | CNTBaseN | 0x020 | CNTP_CVAL | 31:0 |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance | Range |
|-----------|----------|--------|-----------|-------|
| Timer | CNTBaseN | 0x024 | CNTP_CVAL | 63:32 |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance | Range |
|-----------|-------------|--------|-----------|-------|
| Timer | CNTEL0BaseN | 0x020 | CNTP_CVAL | 31:0 |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance | Range |
|-----------|-------------|--------|-----------|-------|
| Timer | CNTEL0BaseN | 0x024 | CNTP_CVAL | 63:32 |

Accesses on this interface are **RW**.

CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configuration

The power domain of CNTP_TVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | TimerValue | | | | | | | | | | | | | | | |

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTP_CTL.ENABLE](#) is 1, the value returned is (CompareValue - [CNTPCT](#)).

On a write of this register, CompareValue is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- If [CNTP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_TVAL

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_TVAL is accessible in that frame if the value of [CNTACR<n>.RWPT](#) is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_TVAL is accessible in that frame if both:
 - CNTP_TVAL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR.EL0PTEN](#) is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

CNTP_TVAL can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|----------|--------|-----------|
| Timer | CNTBaseN | 0x028 | CNTP_TVAL |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|-------------|--------|-----------|
| Timer | CNTEL0BaseN | 0x028 | CNTP_TVAL |

Accesses on this interface are **RW**.

CNPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

The power domain of CNTPCT is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNPCT is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| Physical count value | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Physical count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCT

CNPCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNPCT is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RPCT](#) is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNPCT is accessible in that frame if both:
 - CNPCT is accessible in the corresponding CNTBaseN frame.
 - The value of [CNTEL0ACR.EL0PCTEN](#) is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

CNPCT can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance | Range |
|-----------|----------|--------|----------|-------|
| Timer | CNTBaseN | 0x000 | CNPCT | 31:0 |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance | Range |
|-----------|----------|--------|----------|-------|
| Timer | CNTBaseN | 0x004 | CNPCT | 63:32 |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance | Range |
|-----------|-------------|--------|----------|-------|
| Timer | CNTELOBaseN | 0x000 | CNPCT | 31:0 |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance | Range |
|-----------|-------------|--------|----------|-------|
| Timer | CNTELOBaseN | 0x004 | CNPCT | 63:32 |

Accesses on this interface are **RO**.

CNTSCR, Counter Scale Register

The CNTSCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Configuration

The power domain of CNTSCR is IMPLEMENTATION DEFINED.

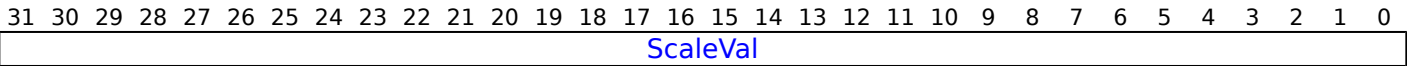

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTSCR is a 32-bit register.

Field descriptions

ScaleVal, bits [31:0]

Scale Value

When counter scaling is enabled, ScaleVal is the amount added to the counter value for every counter tick.

Counter tick is defined as one period of the current operating frequency of the Generic counter.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when [CNTCR.EN](#) == 0. If the value of this field is changed when [CNTCR.EN](#) == 1:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTSCR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSCR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|----------------|--------|----------|
| Timer | CNTControlBase | 0x10 | CNTSCR |

Accesses on this interface are **RW**.

CNTSR, Counter Status Register

The CNTSR characteristics are:

Purpose

Provides counter frequency status information.

Configuration

The power domain of CNTSR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|------|---|---|---|------|------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | FACK | | | | | | | | RES0 | | | | DBGH | RES0 | | | | |

Bits [31:18]

Reserved, RES0.

FACK, bits [17:8]

Frequency Change Acknowledge. Indicates the currently selected entry in the Frequency modes table, see 'The Frequency modes table'.

The reset behavior of this field is:

- On a Timer reset, this field resets to 0.

Bits [7:2]

Reserved, RES0.

DBGH, bit [1]

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

| DBGH | Meaning |
|------|------------------------|
| 0b0 | Counter is not halted. |
| 0b1 | Counter is halted. |

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing CNTR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|----------------|--------|----------|
| Timer | CNTControlBase | 0x004 | CNTR |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

Purpose

Indicates the implemented timers in the memory map, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTELOBaseN.
- Frame CNTBaseN has a virtual timer capability.

Configuration

The power domain of CNTTIDR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTTIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|--------|----|----|----|--------|----|----|----|--------|----|----|----|--------|----|----|----|--------|----|---|---|--------|---|---|---|--------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Frame7 | | | | Frame6 | | | | Frame5 | | | | Frame4 | | | | Frame3 | | | | Frame2 | | | | Frame1 | | | | Frame0 | | | |

Frame<n>, bits [4n+3:4n], for n = 7 to 0

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTELOBase<n>. The possible values of this bit are:

| Bit[2] | Meaning |
|--------|--|
| 0b0 | Frame<n> does not have a second view. The CNTELOACR register in the first view of the frame is RES0. |
| 0b1 | Frame<n> has a second view, CNTELOBase<n>. |

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTV_CTL](#).
- This CNTCTLBase frame implements the virtual timer offset register [CNTVOFF<n>](#).

The possible values of bit[1] are:

| Bit[1] | Meaning |
|--------|--|
| 0b0 | Frame<n> does not have virtual capability. The virtual time and offset registers are RES0. |
| 0b1 | Frame<n> has virtual capability. The virtual time and offset registers are implemented. |

If bit[0] is 0, bit[1] is RES0.

Bit[0], the FI subfield, indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

| Bit[0] | Meaning |
|--------|--|
| 0b0 | Frame<n> is not implemented. All registers associated with the frame are RES0. |
| 0b1 | Frame<n> is implemented |

Accessing CNTTIDR

In a system that recognizes two Security states this register is accessible by both Secure and Non-secure accesses.

CNTTIDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|------------|--------|----------|
| Timer | CNTCTLBase | 0x008 | CNTTIDR |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configuration

The power domain of CNTV_CTL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|-------|----|--------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | ISTATUS | | IMASK | | ENABLE | | | | | | | | | |

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

| ISTATUS | Meaning |
|---------|-----------------------------|
| 0b0 | Timer condition is not met. |
| 0b1 | Timer condition is met. |

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

| IMASK | Meaning |
|-------|---|
| 0b0 | Timer interrupt is not masked by the IMASK bit. |
| 0b1 | Timer interrupt is masked by the IMASK bit. |

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

| ENABLE | Meaning |
|--------|-----------------|
| 0b0 | Timer disabled. |
| 0b1 | Timer enabled. |

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CTL

CNTV_CTL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CTL is accessible in that frame if the value of [CNTACR<n>.RWVT](#) is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CTL is accessible in that frame if both:
 - CNTV_CTL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR.EL0VTEN](#) is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

CNTV_CTL can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|----------|--------|----------|
| Timer | CNTBaseN | 0x03C | CNTV_CTL |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|-------------|--------|----------|
| Timer | CNTEL0BaseN | 0x03C | CNTV_CTL |

Accesses on this interface are **RW**.

CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the virtual timer.

Configuration

The power domain of CNTV_CVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| CompareValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CompareValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

CompareValue, bits [63:0]

Holds the virtual timer CompareValue.

When [CNTV_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTV_CTL.ISTATUS](#) is set to 1.
- An interrupt is generated if [CNTV_CTL.IMASK](#) is 0.

When [CNTV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL

CNTV_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CVAL is accessible in that frame if the value of [CNTACR<n>.RWVT](#) is 1.

- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CVAL is accessible in that frame if both:
 - CNTV_CVAL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR.EL0VTEN](#) is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

CNTV_CVAL can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance | Range |
|-----------|----------|--------|-----------|-------|
| Timer | CNTBaseN | 0x030 | CNTV_CVAL | 31:0 |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance | Range |
|-----------|----------|--------|-----------|-------|
| Timer | CNTBaseN | 0x034 | CNTV_CVAL | 63:32 |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance | Range |
|-----------|-------------|--------|-----------|-------|
| Timer | CNTEL0BaseN | 0x030 | CNTV_CVAL | 31:0 |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance | Range |
|-----------|-------------|--------|-----------|-------|
| Timer | CNTEL0BaseN | 0x034 | CNTV_CVAL | 63:32 |

Accesses on this interface are **RW**.

CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configuration

The power domain of CNTV_TVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | TimerValue | | | | | | | | | | | | | | | |

TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If [CNTV_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV_CTL.ENABLE](#) is 1, the value returned is (CompareValue - [CNTVCT](#)).

On a write of this register, CompareValue is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTV_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTV_CTL.ISTATUS](#) is set to 1.
- If [CNTV_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_TVAL is accessible in that frame if the value of [CNTACR<n>](#).RWVT is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_TVAL is accessible in that frame if both:
 - CNTV_TVAL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR](#).EL0VTEN is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

CNTV_TVAL can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|----------|--------|-----------|
| Timer | CNTBaseN | 0x038 | CNTV_TVAL |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|-------------|--------|-----------|
| Timer | CNTEL0BaseN | 0x038 | CNTV_TVAL |

Accesses on this interface are **RW**.

CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value.

Configuration

The power domain of CNTVCT is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVCT is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| Virtual count value | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Virtual count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCT

CNTVCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTVCT is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RVCT](#) is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTVCT is accessible in that frame if both:
 - CNTVCT is accessible in the corresponding CNTBaseN frame.
 - The value of [CNTEL0ACR.EL0VCTEN](#) is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.

CNTVCT can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance | Range |
|-----------|----------|--------|----------|-------|
| Timer | CNTBaseN | 0x008 | CNTVCT | 31:0 |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance | Range |
|-----------|----------|--------|----------|-------|
| Timer | CNTBaseN | 0x00C | CNTVCT | 63:32 |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance | Range |
|-----------|-------------|--------|----------|-------|
| Timer | CNTELOBaseN | 0x008 | CNTVCT | 31:0 |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance | Range |
|-----------|-------------|--------|----------|-------|
| Timer | CNTELOBaseN | 0x00C | CNTVCT | 63:32 |

Accesses on this interface are **RO**.

CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset for a CNTBaseN frame that has virtual timer capability. This is the offset between real time and virtual time.

Configuration

The power domain of CNTVOFF is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| Virtual offset | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Virtual offset | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF

CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RVOFF](#) is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

Note

CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, a CNTVOFF{<n>} register must be accessible as an atomic 64-bit value.

CNTVOFF can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Range |
|-----------|----------|--------|-------|
| Timer | CNTBaseN | 0x018 | 31:0 |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Range |
|-----------|----------|--------|-------|
| Timer | CNTBaseN | 0x01C | 63:32 |

Accesses on this interface are **RO**.

CNTVOFF<n>, Counter-timer Virtual Offsets, n = 0 - 7

The CNTVOFF<n> characteristics are:

Purpose

Holds the 64-bit virtual offset for frame CNTBase<n>. This is the offset between real time and virtual time.

Configuration

The power domain of CNTVOFF<n> is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVOFF<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| Virtual offset | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Virtual offset | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF<n>

In the CNTCTLBase frame a CNTVOFF<n> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability. For more information, see 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames'.

Note

The value of <n> in an instance of CNTVOFF<n> specifies the value of N for the associated CNTBaseN frame.

In a system that recognizes two Security states, for any CNTVOFF<n> register in the CNTCTLBase frame:

- CNTVOFF<n> is always accessible by Secure accesses.
- [CNTNSAR.NS<n>](#) determines whether CNTVOFF<n> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<n> register in the CNTCTLBase frame is RAZ/WI.

The CNTVOFF<n> register is accessible in the CNTBaseN frame using [CNTVOFF](#).

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF<n> registers must be accessible as atomic 64-bit values.

CNTVOFF<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Range |
|-----------|------------|-------------------|-------|
| Timer | CNTCTLBase | $0x080 + (8 * n)$ | 31:0 |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Range |
|-----------|------------|-------------------|-------|
| Timer | CNTCTLBase | $0x084 + (8 * n)$ | 63:32 |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

Configuration

The power domain of CounterID<n> is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

These registers are implemented independently in each of the implemented Generic Timer memory-mapped frames.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the Arm Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of 0xF.

Attributes

CounterID<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing CounterID<n>

These registers must be implemented, as RO registers, in every implemented Generic Timer memory-mapped frame.

For the CNTCTLBase frame, in a system that recognizes two Security states these registers are accessible by both Secure and Non-secure accesses.

For the CNTControlBase frame, in a system that supports Secure and Non-secure memory maps the frame is implemented only in the Secure memory map, meaning these registers are implemented only in the Secure memory map.

For the CNTBaseN frames, 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

CounterID<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|-------|--------|----------|
|-----------|-------|--------|----------|

| | | | |
|-------|----------------|-----------------------|--------------|
| Timer | CNTControlBase | 0xFD0 + (4 * n) | CounterID<n> |
|-------|----------------|-----------------------|--------------|

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|-------------|--------------------|--------------|
| Timer | CNTReadBase | 0xFD0 + (4 * n) | CounterID<n> |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|----------|--------------------|--------------|
| Timer | CNTBaseN | 0xFD0 + (4 * n) | CounterID<n> |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|-------------|--------------------|--------------|
| Timer | CNTELOBaseN | 0xFD0 + (4 * n) | CounterID<n> |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|------------|--------------------|--------------|
| Timer | CNTCTLBase | 0xFD0 + (4 * n) | CounterID<n> |

Accesses on this interface are **RO**.

CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

Purpose

Clears bits of the Application Trigger register.

Configuration

CTIAPPCLEAR is in the Debug power domain.

Attributes

CTIAPPCLEAR is a 32-bit register.

Field descriptions

| | | | | | | | | |
|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 |
| APPCLEAR31 | APPCLEAR30 | APPCLEAR29 | APPCLEAR28 | APPCLEAR27 | APPCLEAR26 | APPCLEAR25 | APPCLEAR24 | APPCLEAR23 |

APPCLEAR<x>, bit [x], for x = 31 to 0

Application trigger <x> disable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

Writing to this bit has the following effect:

| APPCLEAR<x> | Meaning |
|-------------|---|
| 0b0 | No effect. |
| 0b1 | Clear corresponding bit in CTIAPPTRIG to 0 and clear the corresponding channel event. |

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use [CTIAPPULSE](#).

Accessing CTIAPPCLEAR

CTIAPPCLEAR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-------------|
| CTI | 0x018 | CTIAPPCLEAR |

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.

CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

Purpose

Causes event pulses to be generated on ECT channels.

Configuration

CTIAPPPULSE is in the Debug power domain.

Attributes

CTIAPPPULSE is a 32-bit register.

Field descriptions

| | | | | | | | | |
|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 |
| APPPULSE31 | APPPULSE30 | APPPULSE29 | APPPULSE28 | APPPULSE27 | APPPULSE26 | APPPULSE25 | APPPULSE24 | APPPULSE23 |

APPPULSE<x>, bit [x], for x = 31 to 0

Generate event pulse on ECT channel <x>.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

Writing to this bit has the following effect:

| APPPULSE<x> | Meaning |
|-------------|------------------------------------|
| 0b0 | No effect. |
| 0b1 | Channel <x> event pulse generated. |

Note

- The CTIAPPPULSE operation does not affect the state of the Application Trigger register, CTIAPPTRIG. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

Accessing CTIAPPPULSE

It is CONSTRAINED UNPREDICTABLE whether a write to CTIAPPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.

CTIAPPPULSE can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-------------|
| CTI | 0x01C | CTIAPPPULSE |

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.

CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

Purpose

Sets bits of the Application Trigger register.

Configuration

CTIAPPSET is in the Debug power domain.

Attributes

CTIAPPSET is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| APPSET31 | APPSET30 | APPSET29 | APPSET28 | APPSET27 | APPSET26 | APPSET25 | APPSET24 | APPSET23 | APPSET22 | APPSET21 | APPSET20 | APPSET19 | APPSET18 | APPSET17 | APPSET16 | APPSET15 | APPSET14 | APPSET13 | APPSET12 | APPSET11 | APPSET10 | APPSET9 | APPSET8 | APPSET7 | APPSET6 | APPSET5 | APPSET4 | APPSET3 | APPSET2 | APPSET1 | APPSET0 |

APPSET<x>, bit [x], for x = 31 to 0

Application trigger <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

| APPSET<x> | Meaning |
|-----------|--|
| 0b0 | Reading this means the application trigger is inactive. Writing this has no effect. |
| 0b1 | Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPPTRIG to 1 and generates a channel event. |

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use [CTIAPPULSE](#).

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing CTIAPPSET

CTIAPPSET can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| CTI | 0x014 | CTIAPPSET |

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

Configuration

CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance.

Attributes

CTIAUTHSTATUS is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-----|----|----|----|------|----|----|----|-----|----|----|----|------|----|----|----|-----|----|---|---|-------|---|------|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | RAZ | | | | RES0 | | | | RAZ | | | | RES0 | | | | RAZ | | | | NSNID | | NSID | | | | | |

Bits [31:28]

Reserved, RES0.

Bits [27:24]

Reserved, RAZ.

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RAZ.

Bits [11:8]

Reserved, RES0.

Bits [7:4]

Reserved, RAZ.

NSNID, bits [3:2]

If EL3 is implemented, this field holds the same value as [DBGAUTHSTATUS_EL1](#).NSNID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as [DBGAUTHSTATUS_EL1](#).SNID.

NSID, bits [1:0]

If EL3 is implemented, this field holds the same value as [DBGAUTHSTATUS_EL1](#).NSID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as [DBGAUTHSTATUS_EL1](#).SID.

Accessing CTIAUTHSTATUS

CTIAUTHSTATUS can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|---------------|
| CTI | 0xFB8 | CTIAUTHSTATUS |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

Purpose

Provides the raw status of the ECT channel inputs to the CTI.

Configuration

CTICHINSTATUS is in the Debug power domain.

Attributes

CTICHINSTATUS is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 |
| CHIN31 | CHIN30 | CHIN29 | CHIN28 | CHIN27 | CHIN26 | CHIN25 | CHIN24 | CHIN23 | CHIN22 | CHIN21 | CHIN20 | CHIN19 | CHIN18 | CHIN17 |

CHIN<n>, bit [n], for n = 31 to 0

Input channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

| CHIN<n> | Meaning |
|---------|--------------------------------|
| 0b0 | Input channel <n> is inactive. |
| 0b1 | Input channel <n> is active. |

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

Accessing CTICHINSTATUS

CTICHINSTATUS can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|---------------|
| CTI | 0x138 | CTICHINSTATUS |

Accesses on this interface are **RO**.

CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

Purpose

Provides the status of the ECT channel outputs from the CTI.

Configuration

CTICHOUTSTATUS is in the Debug power domain.

Attributes

CTICHOUTSTATUS is a 32-bit register.

Field descriptions

| | | | | | | | | | | | |
|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 |
| CHOUT31 | CHOUT30 | CHOUT29 | CHOUT28 | CHOUT27 | CHOUT26 | CHOUT25 | CHOUT24 | CHOUT23 | CHOUT22 | CHOUT21 | CHOUT20 |

CHOUT<n>, bit [n], for n = 31 to 0

Output channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

Possible values of this bit are:

| CHOUT<n> | Meaning |
|----------|---------------------------------|
| 0b0 | Output channel <n> is inactive. |
| 0b1 | Output channel <n> is active. |

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

Note

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see [CTIGATE](#).

Accessing CTICHOUTSTATUS

CTICHOUTSTATUS can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------------|
| CTI | 0x13C | CTICHOUTSTATUS |

Accesses on this interface are **RO**.

CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL 0 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is **RO**.

Accessing CTICIDR0

CTICIDR0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| CTI | 0xFF0 | CTICIDR0 |

Accesses on this interface are **RO**.

CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---|---------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | CLASS | | | | PRMBL_1 | | | |

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

| CLASS | Meaning |
|--------|----------------------|
| 0b1001 | CoreSight component. |

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Reads as 0b0000.

Access to this field is **RO**.

Accessing CTICIDR1

CTICIDR1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| CTI | 0xFF4 | CTICIDR1 |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL 2 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is **RO**.

Accessing CTICIDR2

CTICIDR2 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| CTI | 0xFF8 | CTICIDR2 |

Accesses on this interface are **RO**.

CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL 3 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is **RO**.

Accessing CTICIDR3

CTICIDR3 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| CTI | 0xFFC | CTICIDR3 |

Accesses on this interface are **RO**.

CTICLAIMCLR, CTI CLAIM Tag Clear register

The CTICLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

Configuration

CTICLAIMCLR is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMCLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | |
|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 |
| CLAIM31 | CLAIM30 | CLAIM29 | CLAIM28 | CLAIM27 | CLAIM26 | CLAIM25 | CLAIM24 | CLAIM23 | CLAIM22 | CLAIM21 | CLAIM20 | CLAIM19 |

CLAIM<x>, bit [x], for x = 31 to 0

CLAIM tag clear bit.

Reads return the value of CLAIM<x>, writes have the following behavior:

| CLAIM<x> | Meaning |
|----------|---------------------------------|
| 0b0 | No action. |
| 0b1 | Indirectly clear CLAIM<x> to 0. |

A single write to CTICLAIMCLR can clear multiple tags to 0.

If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/WI.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing CTICLAIMCLR

CTICLAIMCLR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-------------|
| CTI | 0xFA4 | CTICLAIMCLR |

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

CTICLAIMSET, CTI CLAIM Tag Set register

The CTICLAIMSET characteristics are:

Purpose

Used by software to set CLAIM bits to 1.

Configuration

CTICLAIMSET is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMSET is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | |
|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 |
| CLAIM31 | CLAIM30 | CLAIM29 | CLAIM28 | CLAIM27 | CLAIM26 | CLAIM25 | CLAIM24 | CLAIM23 | CLAIM22 | CLAIM21 | CLAIM20 | CLAIM19 |

CLAIM<x>, bit [x], for x = 31 to 0

CLAIM tag set bit.

If x is less than the IMPLEMENTATION DEFINED number of CLAIM tags, this field is RAO and the behavior on writes is:

| CLAIM<x> | Meaning |
|----------|-----------------------------------|
| 0b0 | No action. |
| 0b1 | Indirectly set CLAIM<x> tag to 1. |

A single write to CTICLAIMSET can set multiple tags to 1.

If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/WI.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing CTICLAIMSET

CTICLAIMSET can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-------------|
| CTI | 0xFA0 | CTICLAIMSET |

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

Purpose

Controls whether the CTI is enabled.

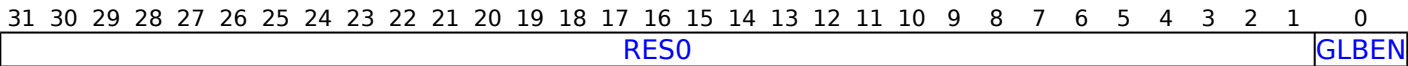

Configuration

CTICONTROL is in the Debug power domain.

Attributes

CTICONTROL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

| GLBEN | Meaning |
|-------|---|
| 0b0 | CTI mapping functions and application trigger disabled. |
| 0b1 | CTI mapping functions and application trigger enabled. |

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it is CONSTRAINED UNPREDICTABLE which of the following occurs:

- The output trigger remains asserted after the mapping functions are disabled.
- The output trigger is deasserted after the mapping functions are disabled.

All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Accessing CTICONTROL

CTICONTROL can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|------------|
| CTI | 0x000 | CTICONTROL |

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF0 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then [CTIDEVAFF1](#) must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MPIDR_EL1lo | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

MPIDR_EL1lo, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVAFF0

CTIDEVAFF0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|------------|
| CTI | 0xFA8 | CTIDEVAFF0 |

Accesses on this interface are **RO**.

CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF1 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then [CTIDEVAFF0](#) must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | MPIDR_EL1hi | | | | | | | | | | | | | | | |

MPIDR_EL1hi, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVAFF1

CTIDEVAFF1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|------------|
| CTI | 0xFAC | CTIDEVAFF1 |

Accesses on this interface are **RO**.

CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the CTI component.

Configuration

CTIDEVARCH is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is not implemented, [CTIDEVAFF0](#) and [CTIDEVAFF1](#) are also not implemented.

Attributes

CTIDEVARCH is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|---------|----------|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ARCHITECT | | | | | | | | | | | PRESENT | REVISION | | | | ARCHID | | | | | | | | | | | | | | | |

ARCHITECT, bits [31:21]

Defines the architecture of the component. For CTI, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is **RO**.

REVISION, bits [19:16]

When FEAT_DoPD is implemented:

Revision.

Defines the architecture revision of the component.

| REVISION | Meaning |
|----------|--|
| 0b0000 | First revision. |
| 0b0001 | As 0b0000, and also adds support for CTIDEVCTL . |

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Revision.

Defines the architecture revision of the component.

All other values are reserved.

Reads as 0b0000.

Access to this field is **RO**.

ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, 0x1.
- Bits [11:0] are the architecture part number, 0xA14.

This corresponds to CTI architecture version CTIv2.

Reads as 0x1A14.

Access to this field is **RO**.

Accessing CTIDEVARCH

CTIDEVARCH can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|------------|
| CTI | 0xFBC | CTIDEVARCH |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

CTIDEVCTL, CTI Device Control register

The CTIDEVCTL characteristics are:

Purpose

Provides target-specific device controls

Configuration

CTIDEVCTL is in the Debug power domain.

This register is present only when FEAT_DoPD is implemented. Otherwise, direct accesses to CTIDEVCTL are RES0.

Attributes

CTIDEVCTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|-------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | RCE | | OSUCE | | | | | | | | | | | | | |

Bits [31:2]

Reserved, RES0.

RCE, bit [1]

Reset Catch Enable.

| RCE | Meaning |
|-----|-----------------------------------|
| 0b0 | Reset Catch debug event disabled. |
| 0b1 | Reset Catch debug event enabled. |

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

OSUCE, bit [0]

OS Unlock Catch Enable

| OSUCE | Meaning |
|-------|---------------------------------------|
| 0b0 | OS Unlock Catch debug event disabled. |
| 0b1 | OS Unlock Catch debug event enabled. |

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Accessing CTIDEVCTL

CTIDEVCTL can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
|-----------|--------|----------|

| | | |
|-----|-------|-----------|
| CTI | 0x150 | CTIDEVCTL |
|-----|-------|-----------|

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

Purpose

Describes the CTI component to the debugger.

Configuration

CTIDEVID is in the Debug power domain.

Attributes

CTIDEVID is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|-------|------|----|----|----|---------|----|----|----|------|---------|----|----|----|------|-----------|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | INOUT | RES0 | | | | NUMCHAN | | | | RES0 | NUMTRIG | | | | RES0 | EXTMUXNUM | | | | | | | | | | |

Bits [31:26]

Reserved, RES0.

INOUT, bits [25:24]

Input/output options. Indicates presence of the input gate. If the CTM is not implemented or CTIv2 is not implemented, this field is RAZ.

| INOUT | Meaning |
|-------|---|
| 0b00 | CTIGATE does not mask propagation of input events from external channels. |
| 0b01 | CTIGATE masks propagation of input events from external channels. |

All other values are reserved.

Bits [23:22]

Reserved, RES0.

NUMCHAN, bits [21:16]

Number of ECT channels implemented. For Armv8, valid values are:

- 0b000011 3 channels (0..2) implemented.
- 0b000100 4 channels (0..3) implemented.
- 0b000101 5 channels (0..4) implemented.
- 0b000110 6 channels (0..5) implemented.

and so on up to 0b100000, 32 channels (0..31) implemented.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [15:14]

Reserved, RES0.

NUMTRIG, bits [13:8]

Number of triggers implemented. This is one more than the index of the largest trigger, rather than the actual number of triggers. For Armv8, valid values are:

- 0b000011 Up to 3 triggers (0..2) implemented.
- 0b001000 Up to 8 triggers (0..7) implemented.
- 0b001001 Up to 9 triggers (0..8) implemented.
- 0b001010 Up to 10 triggers (0..9) implemented.

and so on up to 0b100000, 32 triggers (0..31) implemented.

All other values are reserved. If the PE contains a Trace extension, this field must be at least 0b001000. There is no guarantee that any of the implemented triggers, including the highest numbered, are connected to any components.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [7:5]

Reserved, RES0.

EXTMUXNUM, bits [4:0]

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, [ASICCTL](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVID

CTIDEVID can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| CTI | 0xFC8 | CTIDEVID |

Accesses on this interface are **RO**.

CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Configuration

CTIDEVID1 is in the Debug power domain.

Attributes

CTIDEVID1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |

Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID1

CTIDEVID1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| CTI | 0xFC4 | CTIDEVID1 |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Configuration

CTIDEVID2 is in the Debug power domain.

Attributes

CTIDEVID2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |

Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID2

CTIDEVID2 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| CTI | 0xFC0 | CTIDEVID2 |

Accesses on this interface are **RO**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PEs cross-trigger interface.

Configuration

CTIDEVTYPE is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIDEVTYPE is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|---|---|---|-----|---|---|-------|---|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | SUB | | | MAJOR | | |

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as 0b0001.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type. Indicates this is a cross-trigger component.

Reads as 0b0100.

Access to this field is **RO**.

Accessing CTIDEVTYPE

CTIDEVTYPE can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|------------|
| CTI | 0xFCC | CTIDEVTYPE |

Accesses on this interface are **RO**.

CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

Purpose

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

Configuration

CTIGATE is in the Debug power domain.

Attributes

CTIGATE is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| GATE31 | GATE30 | GATE29 | GATE28 | GATE27 | GATE26 | GATE25 | GATE24 | GATE23 | GATE22 | GATE21 | GATE20 | GATE19 | GATE18 | GATE17 | GATE16 | GATE15 | GATE14 | GATE13 | GATE12 | GATE11 | GATE10 | GATE9 | GATE8 | GATE7 | GATE6 | GATE5 | GATE4 | GATE3 | GATE2 | GATE1 | GATE0 |

GATE<x>, bit [x], for x = 31 to 0

Channel <x> gate enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

| GATE<x> | Meaning |
|---------|--|
| 0b0 | Disable output and, if CTIDEVID .INOUT == 0b01, input channel <x> propagation. |
| 0b1 | Enable output and, if CTIDEVID .INOUT == 0b01, input channel <x> propagation. |

If GATE<x> is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing CTIGATE

CTIGATE can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| CTI | 0x140 | CTIGATE |

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

Purpose

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

Configuration

CTIINEN<n> is in the Debug power domain.

If input trigger n is not connected, the behavior of CTIINEN<n> is IMPLEMENTATION DEFINED.

Attributes

CTIINEN<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 |
| INEN31 | INEN30 | INEN29 | INEN28 | INEN27 | INEN26 | INEN25 | INEN24 | INEN23 | INEN22 | INEN21 | INEN20 | INEN19 | INEN18 | INEN17 |

INEN<x>, bit [x], for x = 31 to 0

Input trigger <n> to output channel <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

| INEN<x> | Meaning |
|---------|---|
| 0b0 | Input trigger <n> will not generate an event on output channel <x>. |
| 0b1 | Input trigger <n> will generate an event on output channel <x>. |

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing CTIINEN<n>

CTIINEN<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|------------|
| CTI | 0x020 + (4 * n) | CTIINEN<n> |

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

Purpose

Can be used to deactivate the output triggers.

Configuration

CTIINTACK is in the Debug power domain.

Attributes

CTIINTACK is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 |
| ACK31 | ACK30 | ACK29 | ACK28 | ACK27 | ACK26 | ACK25 | ACK24 | ACK23 | ACK22 | ACK21 | ACK20 | ACK19 | ACK18 | ACK17 | ACK16 | ACK15 |

ACK<n>, bit [n], for n = 31 to 0

Acknowledge for output trigger <n>.

Bits [31:N] are RAZ/WI. N is the number of CTI triggers implemented as defined by the [CTIDEVID](#).NUMTRIG field.

If any of the following is true, writes to ACK<n> are ignored:

- $n \geq$ [CTIDEVID](#).NUMTRIG, the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by [CTIOUTEN<n>](#), is still active.

Otherwise, if any of the following are true, it is IMPLEMENTATION DEFINED whether writes to ACK<n> are ignored:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

| ACK<n> | Meaning |
|--------|-------------------------|
| 0b0 | No effect |
| 0b1 | Deactivate the trigger. |

Accessing CTIINTACK

A debugger must read [CTITRIGOUTSTATUS](#) to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPPULSE to activate another trigger.

CTIINTACK can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| CTI | 0x010 | CTIINTACK |

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

Purpose

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

It is IMPLEMENTATION DEFINED whether CTIITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIITCTRL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | IME | | | | | | | | | | | | | | | |

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

| IME | Meaning |
|-----|---------------------------|
| 0b0 | Normal operation. |
| 0b1 | Integration mode enabled. |

The following resets apply:

- If the register is implemented in the Core power domain:
 - On a Cold reset, this field resets to 0.
 - On an External debug reset, the value of this field is unchanged.
 - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
 - On a Cold reset, the value of this field is unchanged.
 - On an External debug reset, this field resets to 0.
 - On a Warm reset, the value of this field is unchanged.

Accessing CTIITCTRL

CTIITCTRL can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| CTI | 0xF00 | CTIITCTRL |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

Purpose

Allows or disallows access to the CTI registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILAR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and [CTILSR](#) to check the current status of the lock.

Attributes

CTILAR is a 32-bit register.

Field descriptions

When Software Lock is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | KEY | | | | | | | | | | | | | | | |

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing CTILAR

CTILAR can be accessed through a memory-mapped access to the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
|-----------|--------|----------|

CTILAR, CTI Lock Access Register

| | | |
|-----|-------|--------|
| CTI | 0xFB0 | CTILAR |
|-----|-------|--------|

Accesses on this interface are **WO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

Purpose

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILSR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses [CTILAR](#) to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|-----|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | nTT | SLK | SLI |

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

| SLK | Meaning |
|-----|---|
| 0b0 | Lock clear. Writes are permitted to this component's registers. |
| 0b1 | Lock set. Writes to this component's registers are ignored, and reads have no side effects. |

The reset behavior of this field is:

- On an External debug reset, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

| SLI | Meaning |
|-----|--|
| 0b0 | Software Lock not implemented or not memory-mapped access. |
| 0b1 | Software Lock implemented and memory-mapped access. |

Accessing CTILSR

CTILSR can be accessed through a memory-mapped access to the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| CTI | 0xFB4 | CTILSR |

Accesses on this interface are **RO**.

CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

Purpose

Defines which input channels generate output trigger n.

Configuration

CTIOUTEN<n> is in the Debug power domain.

If output trigger n is not connected, the behavior of CTIOUTEN<n> is IMPLEMENTATION DEFINED.

Attributes

CTIOUTEN<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | |
|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 |
| OUTEN31 | OUTEN30 | OUTEN29 | OUTEN28 | OUTEN27 | OUTEN26 | OUTEN25 | OUTEN24 | OUTEN23 | OUTEN22 | OUTEN21 | OUTEN20 |

OUTEN<x>, bit [x], for x = 31 to 0

Input channel <x> to output trigger <n> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

Possible values of this bit are:

| OUTEN<x> | Meaning |
|----------|---|
| 0b0 | An event on input channel <x> will not cause output trigger <n> to be asserted. |
| 0b1 | An event on input channel <x> will cause output trigger <n> to be asserted. |

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing CTIOUTEN<n>

CTIOUTEN<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|-------------|
| CTI | 0x0A0 + (4 * n) | CTIOUTEN<n> |

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|--------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PART 0 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR0

CTIPIDR0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| CTI | 0xFE0 | CTIPIDR0 |

Accesses on this interface are **RO**.

CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---|--------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | DES_0 | | | | PART_1 | | | |

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR1

CTIPIDR1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| CTI | 0xFE4 | CTIPIDR1 |

Accesses on this interface are **RO**.

CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|-------|----|-------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | REVISION | | | | JEDEC | | DES_1 | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR2

CTIPIDR2 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| CTI | 0xFE8 | CTIPIDR2 |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | REVAND | | | | CMOD | | | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using [CTIPIDR2](#).REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR3

CTIPIDR3 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| CTI | 0xFEC | CTIPIDR3 |

Accesses on this interface are **RO**.

CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

Purpose

Provides information to identify a CTI component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR4 is in the Debug power domain.
Implementation of this register is OPTIONAL.
This register is required for CoreSight compliance.

Attributes

CTIPIDR4 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|------|---|---|---|-------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | SIZE | | | | DES_2 | | | |

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log2 of the number of 4KB pages from the start of the component to the end of the component ID registers.
Reads as 0b0000.
Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

Accessing CTIPIDR4

CTIPIDR4 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| CTI | 0xFD0 | CTIPIDR4 |

Accesses on this interface are **RO**.

CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

Purpose

Provides the status of the trigger inputs.

Configuration

CTITRIGINSTATUS is in the Debug power domain.

Attributes

CTITRIGINSTATUS is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| TRIN31 | TRIN30 | TRIN29 | TRIN28 | TRIN27 | TRIN26 | TRIN25 | TRIN24 | TRIN23 | TRIN22 | TRIN21 | TRIN20 | TRIN19 | TRIN18 | TRIN17 | TRIN16 |

TRIN<n>, bit [n], for n = 31 to 0

Trigger input <n> status.

Bits [31:N] are RAZ. N is the number of CTI triggers implemented as defined by the [CTIDEVID](#).NUMTRIG field.

| TRIN<n> | Meaning |
|---------|------------------------------|
| 0b0 | Input trigger n is inactive. |
| 0b1 | Input trigger n is active. |

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicycle events can be observed as active.

Accessing CTITRIGINSTATUS

CTITRIGINSTATUS can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------------|
| CTI | 0x130 | CTITRIGINSTATUS |

Accesses on this interface are **RO**.

CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

Purpose

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

Configuration

CTITRIGOUTSTATUS is in the Debug power domain.

Attributes

CTITRIGOUTSTATUS is a 32-bit register.

Field descriptions

| | | | | | | | | | | | |
|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 |
| TROUT31 | TROUT30 | TROUT29 | TROUT28 | TROUT27 | TROUT26 | TROUT25 | TROUT24 | TROUT23 | TROUT22 | TROUT21 | TROUT20 |

TROUT<n>, bit [n], for n = 31 to 0

Trigger output <n> status.

Bits [31:N] are RAZ. N is the value in [CTIDEVID.NUMTRIG](#).

If $n < N$, and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT<n> are:

| TROUT<n> | Meaning |
|----------|-------------------------------|
| 0b0 | Output trigger n is inactive. |
| 0b1 | Output trigger n is active. |

Otherwise when $n < N$ it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

Accessing CTITRIGOUTSTATUS

CTITRIGOUTSTATUS can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|------------------|
| CTI | 0x134 | CTITRIGOUTSTATUS |

Accesses on this interface are **RO**.

DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGAUTHSTATUS_EL1\[31:0\]](#).

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGAUTHSTATUS\[31:0\]](#).

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

DBGAUTHSTATUS_EL1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-------|----|------|----|------|----|----|----|-------|----|----|----|------|----|------|----|----|----|------|---|-----|---|-------|---|------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | RTNID | | RTID | | RES0 | | | | RLNID | | | | RLID | | RES0 | | | | SNID | | SID | | NSNID | | NSID | | | |

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTID.

RTID, bits [25:24]

Root invasive debug.

| RTID | Meaning |
|------|---|
| 0b00 | Not implemented. |
| 0b10 | Implemented and disabled. ExternalRootInvasiveDebugEnabled() == FALSE. |
| 0b11 | Implemented and enabled. ExternalRootInvasiveDebugEnabled() == TRUE. |

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 00.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLID.

RLID, bits [13:12]

Realm invasive debug.

| RLID | Meaning |
|------|--|
| 0b00 | Not implemented. |
| 0b10 | Implemented and disabled. ExternalRealmInvasiveDebugEnabled() == FALSE. |
| 0b11 | Implemented and enabled. ExternalRealmInvasiveDebugEnabled() == TRUE. |

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 00.

Bits [11:8]

Reserved, RES0.

SNID, bits [7:6]

When FEAT_Debugv8p4 is implemented:

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

Secure non-invasive debug.

| SNID | Meaning |
|------|---|
| 0b00 | Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1. |
| 0b10 | Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE. |
| 0b11 | Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE. |

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

| SID | Meaning |
|------|---|
| 0b00 | Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1. |
| 0b10 | Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE. |
| 0b11 | Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE. |

All other values are reserved.

NSNID, bits [3:2]**When FEAT_Debugv8p4 is implemented:**

Non-secure non-invasive debug.

| NSNID | Meaning |
|-------|---|
| 0b00 | Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0. |
| 0b11 | Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE. |

If the Effective value of [SCR_EL3.NS](#) is 1, or if EL3 is implemented and EL2 is not implemented, this field reads as 0b11.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

| NSNID | Meaning |
|-------|---|
| 0b00 | Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0. |
| 0b10 | Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE. |
| 0b11 | Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE. |

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

| NSID | Meaning |
|------|---|
| 0b00 | Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0. |
| 0b10 | Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE. |
| 0b11 | Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE. |

All other values are reserved.

Accessing DBGAUTHSTATUS_EL1**DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:**

| Component | Offset | Instance |
|-----------|--------|-------------------|
| Debug | 0xFB8 | DBGAUTHSTATUS_EL1 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>_EL1](#).

Configuration

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGBCR<n>_EL1\[31:0\]](#).

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBCR<n>\[31:0\]](#).

DBGBCR<n>_EL1 is in the Core power domain.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBCR<n>_EL1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|-----|----|-----|------|----|----|---|-----|---|---|------|-----|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | BT | | | | LBN | | | | SSC | | HMC | RES0 | | | | BAS | | | RES0 | PMC | E | | | |

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

| BT | Meaning |
|--------|---|
| 0b0000 | Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction. |
| 0b0001 | As 0b0000 but linked to a Context matching breakpoint. |
| 0b0010 | Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value. |
| 0b0011 | As 0b0010, with linking enabled. |
| 0b0100 | Unlinked instruction address mismatch. DBGBVR<n>_EL1 is the address of an instruction to be stepped. |
| 0b0101 | As 0b0100, with linking enabled. |
| 0b0110 | Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1 . |
| 0b0111 | As 0b0110, with linking enabled. |
| 0b1000 | Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID . |
| 0b1001 | As 0b1000, with linking enabled. |
| 0b1010 | Unlinked VMID and Context ID match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1 , and DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID . |
| 0b1011 | As 0b1010, with linking enabled. |
| 0b1100 | Unlinked CONTEXTIDR_EL2 match. DBGBVR<n>_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2 . |
| 0b1101 | As 0b1100, with linking enabled. |
| 0b1110 | Unlinked Full Context ID match. DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1 , and DBGBVR<n>_EL1.ContextID2 is compared against CONTEXTIDR_EL2 . |
| 0b1111 | As 0b1110, with linking enabled. |

Constraints on breakpoint programming mean some values are reserved under certain conditions.

For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>_EL1.BT values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see [DBGBCR<n>_EL1](#).SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When AArch32 is supported:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

| BAS | Match instruction at | Constraint for debuggers |
|--------|---|----------------------------------|
| 0b0011 | DBGBVR<n>_EL1 | Use for T32 instructions |
| 0b1100 | DBGBVR<n>_EL1 + 2 | Use for T32 instructions |
| 0b1111 | DBGBVR<n>_EL1 | Use for A64 and A32 instructions |

All other values are reserved.

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

| BAS | Match instruction at | Constraint for debuggers |
|--------|--|---|
| 0b0000 | - | Use for a match anywhere breakpoint |
| 0b0011 | DBGBVR<n>_EL1 | Use for stepping T32 instructions |
| 0b1100 | DBGBVR<n>_EL1 + 2 | Use for stepping T32 instructions |
| 0b1111 | DBGBVR<n>_EL1 | Use for stepping A64 and A32 instructions |

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the [DBGBCR<n>_EL1.SSC](#) description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint [DBGVCR<n>_EL1](#). Possible values are:

| E | Meaning |
|-----|----------------------|
| 0b0 | Breakpoint disabled. |
| 0b1 | Breakpoint enabled. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBCR<n>_EL1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|------------------|---------------|
| Debug | 0x408 + (16 * n) | DBGBCR<n>_EL1 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register [DBGBCR<n>_EL1](#).

Configuration

External register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register [DBGBVR<n>_EL1\[63:0\]](#).

External register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBVR<n>\[31:0\]](#).

External register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register [DBGBXVR<n>\[31:0\]](#).

DBGBVR<n>_EL1 is in the Core power domain.

How this register is interpreted depends on the value of [DBGBCR<n>_EL1](#).BT.

- When [DBGBCR<n>_EL1](#).BT is 0b0x0x, this register holds a virtual address.
- When [DBGBCR<n>_EL1](#).BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When [DBGBCR<n>_EL1](#).BT is 0b100x, this register holds a VMID.
- When [DBGBCR<n>_EL1](#).BT is 0b101x, this register holds a VMID and a Context ID.
- When [DBGBCR<n>_EL1](#).BT is 0b111x, this register holds two Context ID values.

For other values of [DBGBCR<n>_EL1](#).BT, this register is RES0.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBVR<n>_EL1 is a 64-bit register.

Field descriptions

When DBGBCR<n>_EL1.BT == 0b0x0x:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|-------------|----|----|----|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RESS[14:4] | | | | | | | | | | | Bits[52:49] | | | | VA[48:2] | | | | | | | | | | | | | | | | | |
| VA[48:2] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | RES0 | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. For more information, see RESS[14:4].

VA[48:2], bits [48:2]

If the address is being matched in an AArch64 stage 1 translation regime:

- This field contains bits[48:2] of the address for comparison.
- When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b001x:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | ContextID | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR_EL2](#) when (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented), EL2 is using AArch64, [HCR_EL2.E2H](#) is 1, and either:

- The PE is executing at EL2.
- [HCR_EL2.TGE](#) is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against the following:

- [CONTEXTIDR](#) when the PE is executing at AArch32.
- [CONTEXTIDR_EL1](#) when the PE is executing at AArch64.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b011x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | ContextID | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b100x and EL2 is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|-----------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | VMID[15:8] | | | | | | | | VMID[7:0] | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VHE is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. For more information, see DBGVVR<n>_EL1.VMID[7:0].

If EL2 is using AArch32, this field is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR_EL2.VS](#) is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b101x and EL2 is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|-----------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | VMID[15:8] | | | | | | | | VMID[7:0] | | | | | | | |
| ContextID | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. For more information, see DBGBCR<n>_EL1.VMID[7:0].

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b110x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ContextID2 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR_EL2](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b111x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| | | | | | | | | | | | | | | | | | ContextID2 | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | ContextID | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR_EL2](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBVR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBVR<n>_EL1 can be accessed through the external debug interface:

| Component | Offset | Instance | Range |
|-----------|------------------|---------------|-------|
| Debug | 0x400 + (16 * n) | DBGBVR<n>_EL1 | 63:0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET_EL1](#) register.

Configuration

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGCLAIMCLR_EL1\[31:0\]](#).

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMCLR\[31:0\]](#).

DBGCLAIMCLR_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR_EL1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RAZ/WI | | | | | | | | | | | | | | | | | | | | | | | | CLAIM | | | | | | | |

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing DBGCLAIMCLR_EL1

DBGCLAIMCLR_EL1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------------|
| Debug | 0xFA4 | DBGCLAIMCLR_EL1 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

DBGCLAIMSET_EL1, Debug CLAIM Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMCLR_EL1](#) register.

Configuration

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGCLAIMSET_EL1\[31:0\]](#).

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMSET\[31:0\]](#).

DBGCLAIMSET_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMSET_EL1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RAZ/WI | | | | | | | | | | | | | | | | | | | | | | | | CLAIM | | | | | | | |

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Set CLAIM tag bits.

This field is RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

Accessing DBGCLAIMSET_EL1

DBGCLAIMSET_EL1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------------|
| Debug | 0xFA0 | DBGCLAIMSET_EL1 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communications Channel.

Configuration

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRRX_EL0\[31:0\]](#).

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRRXint\[31:0\]](#).

DBGDTRRX_EL0 is in the Core power domain.

Attributes

DBGDTRRX_EL0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Update DTRRX | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Update DTRRX.

Writes to this register:

- If RXfull is set to 1, set DTRRX to UNKNOWN.
- If RXfull is set to 0, update the value in DTRRX.

After the write, RXfull is set to 1.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRX_EL0

If [EDSCR](#).ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is **CONSTRAINED UNPREDICTABLE**, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRRX_EL0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|--------------|
| Debug | 0x080 | DBGDTRRX_EL0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communication Channel.

Configuration

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRTX_EL0\[31:0\]](#).

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRTXint\[31:0\]](#).

DBGDTRTX_EL0 is in the Core power domain.

Attributes

DBGDTRTX_EL0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Return DTRTX | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Return DTRTX.

Reads of this register:

- If TXfull is set to 1, return the last value written to DTRTX.
- If TXfull is set to 0, return an UNKNOWN value.

After the read, TXfull is cleared to 0.

Writes to this register:

- If TXfull is set to 1, set DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTX_EL0

If [EDSCR](#).ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONstrained UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRTX_EL0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|--------------|
| Debug | 0x08C | DBGDTRTX_EL0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Purpose

Configuration

Attributes

Field descriptions

Page 3987

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

| WT | Meaning |
|-----|------------------------------|
| 0b0 | Unlinked data address match. |
| 0b1 | Linked data address match. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>_EL1](#) is being watched.

| BAS | Description |
|----------|---|
| xxxxxx1 | Match byte at DBGWVR<n>_EL1 |
| xxxxxx1x | Match byte at DBGWVR<n>_EL1 + 1 |
| xxxxx1xx | Match byte at DBGWVR<n>_EL1 + 2 |
| xxxx1xxx | Match byte at DBGWVR<n>_EL1 + 3 |

In cases where [DBGWVR<n>_EL1](#) addresses a double-word:

| BAS | Description, if DBGWVR<n>_EL1[2] == 0 |
|----------|---|
| xxx1xxxx | Match byte at DBGWVR<n>_EL1 + 4 |
| xx1xxxxx | Match byte at DBGWVR<n>_EL1 + 5 |
| x1xxxxxx | Match byte at DBGWVR<n>_EL1 + 6 |
| 1xxxxxxx | Match byte at DBGWVR<n>_EL1 + 7 |

If [DBGWVR<n>_EL1\[2\]](#) == 1, only BAS[3:0] is used. Arm deprecates setting [DBGWVR<n>_EL1\[2\]](#) == 1.

The valid values for BAS are non-zero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

| LSC | Meaning |
|------|---|
| 0b01 | Match instructions that load from a watchpointed address. |
| 0b10 | Match instructions that store to a watchpointed address. |
| 0b11 | Match instructions that load from or store to a watchpointed address. |

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n. Possible values are:

| E | Meaning |
|-----|----------------------|
| 0b0 | Watchpoint disabled. |
| 0b1 | Watchpoint enabled. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGWCR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWCR<n>_EL1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|------------------|---------------|
| Debug | 0x808 + (16 * n) | DBGWCR<n>_EL1 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>_EL1](#).

Configuration

External register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register [DBGWVR<n>_EL1\[63:0\]](#).

External register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWVR<n>\[31:0\]](#).

DBGWVR<n>_EL1 is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|-------------|----|----|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RESS[14:4] | | | | | | | | | | | Bits[52:49] | | | VA[48:2] | | | | | | | | | | | | | | | | | | |
| VA[48:2] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | RES0 | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

RESS[14:4], bits [63:53]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. For more information, see RESS[14:4].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

Arm deprecates setting [DBGWVR<n>_EL1\[2\] == 1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGWVR<n>_EL1**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWVR<n>_EL1 can be accessed through the external debug interface:

| Component | Offset | Instance | Range |
|-----------|------------------|---------------|-------|
| Debug | 0x800 + (16 * n) | DBGWVR<n>_EL1 | 63:0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDAA32PFR, External Debug Auxiliary Processor Feature Register

The EDAA32PFR characteristics are:

Purpose

Provides information about implemented PE features.

Note

The register mnemonic, EDAA32PFR, is derived from previous definitions of this register that defined this register only when AArch64 was not supported.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

It is IMPLEMENTATION DEFINED whether EDAA32PFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDAA32PFR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|-----|----|----|----|-----|----|----|----|------|----|----|----|------|--|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | MSA_frac | | | | EL3 | | | | EL2 | | | | PMSA | | | | VMSA | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | |

Bits [63:20]

Reserved, RES0.

MSA_frac, bits [19:16]

When EDAA32PFR.PMSA == 0b0000 and EDAA32PFR.VMSA == 0b1111:

Memory System Architecture fractional field. This holds the information on additional Memory System Architectures supported. Defined values are:

| MSA_frac | Meaning |
|----------|---|
| 0b0001 | PMSAv8-64 supported in all translation regimes. VMSAv8-64 not supported. |
| 0b0010 | PMSAv8-64 supported in all translation regimes. In addition to PMSAv8-64, stage 1 EL1&0 translation regime also supports VMSAv8-64. |

All other values are reserved.

Otherwise:

Reserved, RES0.

EL3, bits [15:12]**When EDPFR.EL3 == 0b0000:**

AArch32 EL3 Exception level handling. Defined values are:

| EL3 | Meaning |
|--------|---|
| 0b0000 | EL3 is not implemented or can be executed in AArch64 state. |
| 0b0001 | EL3 can be executed in AArch32 state only. |

All other values are reserved.

Note

[EDPFR](#).{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Otherwise:

Reserved, RAZ.

EL2, bits [11:8]**When EDPFR.EL2 == 0b0000:**

AArch32 EL2 Exception level handling. Defined values are:

| EL2 | Meaning |
|--------|---|
| 0b0000 | EL2 is not implemented or can be executed in AArch64 state. |
| 0b0001 | EL2 can be executed in AArch32 state only. |

All other values are reserved.

Note

[EDPFR](#).{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Otherwise:

Reserved, RAZ.

PMSA, bits [7:4]

Indicates support for a 32-bit PMSA. Defined values are:

| PMSA | Meaning |
|--------|------------------------|
| 0b0000 | PMSA-32 not supported. |
| 0b0100 | PMSAv8-32 supported. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

VMSA, bits [3:0]**When EDAA32PFR.PMSA != 0b0000:**

Indicates support for a VMSA in addition to a 32-bit PMSA. Defined values are:

| VMSA | Meaning |
|--------|---------------------|
| 0b0000 | VMSA not supported. |

All other values are reserved.

When EDAA32PFR.PMSA == 0b0000:

Defined values are:

| VMSA | Meaning |
|--------|---|
| 0b0000 | VMSAv8-64 supported. |
| 0b1111 | Memory system architecture described by EDAA32PFR.MSA_frac. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Otherwise:

Reserved, RAZ.

Accessing EDAA32PFR

EDAA32PFR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| Debug | 0xD60 | EDAA32PFR |

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

Purpose

Allows implementations to support IMPLEMENTATION DEFINED controls.

Configuration

It is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain.

If FEAT_DoPD is implemented, this register is implemented in the Core power domain.

If FEAT_DoPD is not implemented, the power domain that this register is implemented in is IMPLEMENTATION DEFINED.

Changing this register from its reset value causes IMPLEMENTATION DEFINED behavior, including possible deviation from the architecturally-defined behavior.

If the EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when the OS Lock is locked, [OSLSR_EL1](#).OSLK == 1, and when the Core is powered off.

Attributes

EDACR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
 - On a Cold reset, this field resets to an architecturally UNKNOWN value.
 - On an External debug reset, the value of this field is unchanged.
 - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
 - On a Cold reset, the value of this field is unchanged.
 - On an External debug reset, this field resets to an architecturally UNKNOWN value.
 - On a Warm reset, the value of this field is unchanged.

Accessing EDACR

EDACR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
|-----------|--------|----------|

| | | |
|-------|-------|-------|
| Debug | 0x094 | EDACR |
|-------|-------|-------|

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL_0 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is **RO**.

Accessing EDCIDR0

EDCIDR0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xFF0 | EDCIDR0 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | CLASS | | | PRMBL_1 | | | | |

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

| CLASS | Meaning |
|--------|----------------------|
| 0b1001 | CoreSight component. |

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000.

Access to this field is **RO**.

Accessing EDCIDR1

EDCIDR1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xFF4 | EDCIDR1 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL_2 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is **RO**.

Accessing EDCIDR2

EDCIDR2 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xFF8 | EDCIDR2 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL_3 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is **RO**.

Accessing EDCIDR3

EDCIDR3 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xFFC | EDCIDR3 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDCIDSR, External Debug Context ID Sample Register

The EDCIDSR characteristics are:

Purpose

Contains the sampled value of the Context ID, captured on reading [EDPCSR](#)[31:0].

Configuration

EDCIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDCIDSR are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDCIDSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CONTEXTIDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

CONTEXTIDR, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent [EDPCSR](#) sample. When the most recent [EDPCSR](#) sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from [CONTEXTIDR_EL1](#).
- If EL1 is using AArch32, then the Context ID is sampled from [CONTEXTIDR](#).
- If EL3 is implemented and is using AArch32, then [CONTEXTIDR](#) is a banked register, and EDCIDSR samples the current banked copy of [CONTEXTIDR](#) for the Security state that is associated with the most recent [EDPCSR](#) sample.

Because the value written to EDCIDSR is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether EDCIDSR is set to the original or new value if [EDPCSR](#) samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDCIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

EDCIDSR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0x0A4 | EDCIDSR |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVAFF0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MPIDR_EL1lo | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

MPIDR_EL1lo, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing EDDEVAFF0

EDDEVAFF0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| Debug | 0xFA8 | EDDEVAFF0 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVAFF1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | MPIDR_EL1hi | | | | | | | | | | | | | | | |

MPIDR_EL1hi, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing EDDEVAFF1

EDDEVAFF1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| Debug | 0xFAC | EDDEVAFF1 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the external debug component.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|---------|----------|----|----|----|---------|----|----|----|----|----------|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ARCHITECT | | | | | | | | | | | PRESENT | REVISION | | | | ARCHVER | | | | | ARCHPART | | | | | | | | | | |

ARCHITECT, bits [31:21]

Defines the architecture of the component. For debug, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is **RO**.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For debug, the revision defined by Armv8 is 0x0.

All other values are reserved.

Reads as 0b0000.

Access to this field is **RO**.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component. Defined values are:

| ARCHVER | Meaning |
|----------------|---|
| 0b0110 | Armv8 debug architecture. |
| 0b0111 | Armv8 debug architecture with Virtualization Host Extensions. |
| 0b1000 | Armv8.2 debug architecture, FEAT_Debugv8p2. |
| 0b1001 | Armv8.4 debug architecture, FEAT_Debugv8p4. |
| 0b1010 | Armv8.8 debug architecture, FEAT_Debugv8p8. |

EDDEVARCH.ARCHVER and EDDEVARCH.ARCHPART are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHVER is EDDEVARCH.ARCHID[15:12].

FEAT_VHE adds the functionality identified by the value 0b0111.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

FEAT_Debugv8p8 adds the functionality identified by the value 0b1010.

From Armv8.1, when FEAT_VHE is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

EDDEVARCH.ARCHVER and EDDEVARCH.ARCHPART are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHPART is EDDEVARCH.ARCHID[11:0].

Armv8-A debug architecture.

Reads as 0xA15.

Access to this field is **RO**.

Accessing EDDEVARCH

EDDEVARCH can be accessed through the external debug interface:

| Component | Offset | Instance |
|------------------|---------------|-----------------|
| Debug | 0xFBC | EDDEVARCH |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|---------|----|----|----|------|----|----|----|----|----|----|----|------------|----|----|----|----------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | AuxRegs | | | | RES0 | | | | | | | | DebugPower | | | | PCSample | | | | | | | | | | | |

Bits [31:28]

Reserved, RES0.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Defined values are:

| AuxRegs | Meaning |
|---------|--|
| 0b0000 | None supported. |
| 0b0001 | Support for External Debug Auxiliary Control Register, EDACR . |

All other values are reserved.

Bits [23:8]

Reserved, RES0.

DebugPower, bits [7:4]

Indicates support for the FEAT_DoPD feature. Defined values are:

| DebugPower | Meaning |
|------------|---|
| 0b0000 | FEAT_DoPD not implemented. Registers in the external debug interface register map are implemented in a mix of the Debug and Core power domains. |
| 0b0001 | FEAT_DoPD implemented. All registers in the external debug interface register map are implemented in the Core power domain. |

FEAT_DoPD implements the functionality added by the value 0b0001.

All other values are reserved.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:

| PCSample | Meaning |
|----------|---|
| 0b0000 | PC Sample-based Profiling Extension is not implemented in the external debug registers space. |
| 0b0010 | Only EDPCSR and EDCIDS are implemented. This option is only permitted if EL3 and EL2 are not implemented. |
| 0b0011 | EDPCSR , EDCIDS , and EDVIDSR are implemented. |

All other values are reserved.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID.PCSample](#).

Accessing EDDEVID

EDDEVID can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xFC8 | EDDEVID |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDDEVID1, External Debug Device ID register 1

The EDDEVID1 characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | PCSROffset | | | |

Bits [31:4]

Reserved, RES0.

PCSROffset, bits [3:0]

This field indicates the offset applied to PC samples returned by reads of [EDPCSR](#). Permitted values of this field in Armv8 are:

| PCSROffset | Meaning |
|------------|--|
| 0b0000 | EDPCSR not implemented. |
| 0b0010 | EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state. |

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID](#).PCSample.

Accessing EDDEVID1

EDDEVID1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xFC4 | EDDEVID1 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

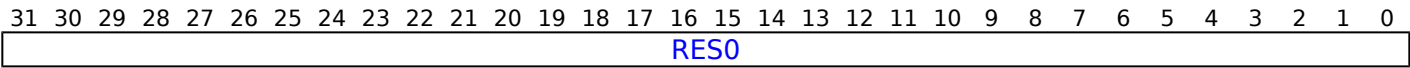

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing EDDEVID2

EDDEVID2 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xFC0 | EDDEVID2 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDDEVTTYPE, External Debug Device Type register

The EDDEVTTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PEs debug logic.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVTTYPE is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-----|---|---|---|-------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | SUB | | | | MAJOR | | | |

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as 0b0001.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type. Indicates this is a debug logic component.

Reads as 0b0101.

Access to this field is **RO**.

Accessing EDDEVTTYPE

EDDEVTTYPE can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|------------|
| Debug | 0xFCC | EDDEVTTYPE |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDDFR, External Debug Feature Register

The EDDFR characteristics are:

Purpose

Provides top level information about the debug system.

Note

Debuggers must use [EDDEVARCH](#) to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

It is IMPLEMENTATION DEFINED whether EDDFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDDFR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|------|----|----|----|------|----|----|----|-----------|----|----|----|------|----|----|----|---------|----|----|----|----------|----|----|----|---------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | TraceFilt | | | | | | | | UNKNOWN | | | | | | | | | | | |
| CTX_CMPs | | | | RES0 | | | | WRPs | | | | RES0 | | | | BRPs | | | | PMUVer | | | | TraceVer | | | | UNKNOWN | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:44]

Reserved, RES0.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

| TraceFilt | Meaning |
|-----------|---|
| 0b0000 | Armv8.4 Self-hosted Trace Extension is not implemented. |
| 0b0001 | Armv8.4 Self-hosted Trace Extension is implemented. |

All other values are reserved.

FEAT_TRF implements the functionality added by 0b0001.

From Armv8.4, the permitted values are 0b0000 and 0b0001.

Bits [39:32]

Reserved, UNKNOWN.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64DFR0_EL1](#).CTX_CMPs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64DFR0_EL1](#).WRPs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64DFR0_EL1](#).BRPs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

| PMUVer | Meaning |
|--------|--|
| 0b0000 | Performance Monitors Extension not implemented. |
| 0b0001 | Performance Monitors Extension, PMUv3 implemented. |
| 0b0100 | PMUv3 for Armv8.1. As 0b0001, and adds support for: <ul style="list-style-type: none"> Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. If EL2 is implemented, the MDCR_EL2.HPMD control. |
| 0b0101 | PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR_EL1 register. |
| 0b0110 | PMUv3 for Armv8.5. As 0b0101, and adds support for: <ul style="list-style-type: none"> 64-bit event counters. If EL2 is implemented, the MDCR_EL2.HCCD control. If EL3 is implemented, the MDCR_EL3.SCCD control. |
| 0b0111 | PMUv3 for Armv8.7. As 0b0110, and adds support for: <ul style="list-style-type: none"> The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO controls. If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls. |
| 0b1000 | PMUv3 for Armv8.8. As 0b0111, and: <ul style="list-style-type: none"> Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected. |
| 0b1111 | IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations. |

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

| TraceVer | Meaning |
|----------|---|
| 0b0000 | PE trace unit System registers not implemented. |
| 0b0001 | PE trace unit System registers implemented. |

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64DFR0_EL1](#).TraceVer.

Bits [3:0]

Reserved, UNKNOWN.

Accessing EDDFR**EDDFR can be accessed through the external debug interface:**

| Component | Offset | Instance | Range |
|-----------|--------|----------|-------|
| Debug | 0xD28 | EDDFR | 31:0 |

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

| Component | Offset | Instance | Range |
|-----------|--------|----------|-------|
| Debug | 0xD2C | EDDFR | 63:32 |

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

Purpose

Controls Exception Catch debug events. For more information, see 'Summary of Exception Catch debug event control'.

Configuration

External register EDECCR bits [31:0] are architecturally mapped to AArch64 System register [OSECCR_EL1\[31:0\]](#).

External register EDECCR bits [31:0] are architecturally mapped to AArch32 System register [DBGOSECCR\[31:0\]](#).

EDECCR is in the Core power domain.

Attributes

EDECCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:23]

Reserved, RES0.

RLR2, bit [22]

When FEAT_RME is implemented:

Controls exception catch on exception return to Realm EL2 in conjunction with EDECCR.RLE2.

| RLR2 | Meaning |
|------|---|
| 0b0 | If EDECCR.RLE2 is 0, then Exception Catch debug events are disabled for Realm EL2. If EDECCR.RLE2 is 1, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL2. |
| 0b1 | If EDECCR.RLE2 is 0, then Exception Catch debug events are enabled for exception returns to Realm EL2. If EDECCR.RLE2 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL2. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RLR1, bit [21]**When FEAT_RME is implemented:**

Controls exception catch on exception return to Realm EL1 in conjunction with EDECCR.RLE1.

| RLR1 | Meaning |
|-------------|---|
| 0b0 | If EDECCR.RLE1 is 0, then Exception Catch debug events are disabled for Realm EL1. If EDECCR.RLE1 is 1, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL1. |
| 0b1 | If EDECCR.RLE1 is 0, then Exception Catch debug events are enabled for exception returns to Realm EL1. If EDECCR.RLE1 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL1. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RLR0, bit [20]**When FEAT_RME is implemented:**

Controls exception catch on exception return to Realm EL0.

| RLR0 | Meaning |
|-------------|--|
| 0b0 | Exception Catch debug events are disabled for Realm EL0. |
| 0b1 | Exception Catch debug events are enabled for exception returns to Realm EL0. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [19]

Reserved, RES0.

RLE2, bit [18]**When FEAT_RME is implemented:**

Controls exception catch on exception entry to Realm EL2. Also controls exception catch on exception return to Realm EL2 in conjunction with EDECCR.RLR2.

| RLE2 | Meaning |
|-------------|---|
| 0b0 | If EDECCR.RLR2 is 0, then Exception Catch debug events are disabled for Realm EL2. If EDECCR.RLR2 is 1, then Exception Catch debug events are enabled for exception returns to Realm EL2. |
| 0b1 | If EDECCR.RLR2 is 0, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL2. If EDECCR.RLR2 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL2. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RLE1, bit [17]

When FEAT_RME is implemented:

Controls exception catch on exception entry to Realm EL1. Also controls exception catch on exception return to Realm EL1 in conjunction with EDECCR.RLR1.

| RLE1 | Meaning |
|-------------|---|
| 0b0 | If EDECCR.RLR1 is 0, then Exception Catch debug events are disabled for Realm EL1. If EDECCR.RLR1 is 1, then Exception Catch debug events are enabled for exception returns to Realm EL1. |
| 0b1 | If EDECCR.RLR1 is 0, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL1. If EDECCR.RLR1 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL1. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RLE0, bit [16]

Access to this field is **RES0**.

NSR3, bit [15]

Access to this field is **RES0**.

NSR2, bit [14]

When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:

Controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSE2.

| NSR2 | Meaning |
|-------------|--|
| 0b0 | If EDECCR.NSE2 is 0, then Exception Catch debug events are disabled for Non-secure EL2. If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2. |
| 0b1 | If EDECCR.NSE2 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL2. If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSR1, bit [13]

When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

Controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSE1.

| NSR1 | Meaning |
|------|--|
| 0b0 | If EDECCR.NSE1 is 0, then Exception Catch debug events are disabled for Non-secure EL1. If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1. |
| 0b1 | If EDECCR.NSE1 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL1. If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSR0, bit [12]

When FEAT_Debugv8p2 is implemented and Non-secure EL0 is implemented:

Controls exception catch on exception return to Non-secure EL0.

| NSR0 | Meaning |
|------|---|
| 0b0 | Exception Catch debug events are disabled for Non-secure EL0. |
| 0b1 | Exception Catch debug events are enabled for exception returns to Non-secure EL0. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR3, bit [11]

When FEAT_Debugv8p2 is implemented and EL3 is implemented:

Controls exception catch on exception return to EL3 in conjunction with EDECCR.SE3.

| SR3 | Meaning |
|------------|--|
| 0b0 | If EDECCR.SE3 is 0, then Exception Catch debug events are disabled for EL3. If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3. |
| 0b1 | If EDECCR.SE3 is 0, then Exception Catch debug events are enabled for exception returns to EL3. If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR2, bit [10]

When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

Controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SE2.

| SR2 | Meaning |
|------------|--|
| 0b0 | If EDECCR.SE2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2. |
| 0b1 | If EDECCR.SE2 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL2. If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR1, bit [9]

When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

Controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SE1.

| SR1 | Meaning |
|------------|--|
| 0b0 | If EDECCR.SE1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1. |
| 0b1 | If EDECCR.SE1 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL1. If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR0, bit [8]

When FEAT_Debugv8p2 is implemented and Secure EL0 is implemented:

Controls exception catch on exception return to Secure EL0.

| SR0 | Meaning |
|-----|---|
| 0b0 | Exception Catch debug events are disabled for Secure EL0. |
| 0b1 | Exception Catch debug events are enabled for exception returns to Secure EL0. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSE3, bit [7]

Access to this field is **RES0**.

NSE2, bit [6]

When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:

Controls exception catch on exception entry to Non-secure EL2. Also controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSR2.

| NSE2 | Meaning |
|------|---|
| 0b0 | If EDECCR.NSR2 is 0, then Exception Catch debug events are disabled for Non-secure EL2. If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL2. |
| 0b1 | If EDECCR.NSR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2. If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2. |

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

When Non-secure EL2 is implemented:

Coarse-grained exception catch for Non-secure EL2. Controls Exception Catch debug events for Non-secure EL2.

| NSE2 | Meaning |
|-------------|---|
| 0b0 | Exception Catch debug events are disabled for Non-secure EL2. |
| 0b1 | Exception Catch debug events are enabled for Non-secure EL2. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSE1, bit [5]

When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

Controls exception catch on exception entry to Non-secure EL1. Also controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSR1.

| NSE1 | Meaning |
|-------------|---|
| 0b0 | If EDECCR.NSR1 is 0, then Exception Catch debug events are disabled for Non-secure EL1. If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL1. |
| 0b1 | If EDECCR.NSR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1. If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1. |

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

When Non-secure EL1 is implemented:

Coarse-grained exception catch for Non-secure EL1. Controls Exception Catch debug events for Non-secure EL1.

| NSE1 | Meaning |
|-------------|---|
| 0b0 | Exception Catch debug events are disabled for Non-secure EL1. |
| 0b1 | Exception Catch debug events are enabled for Non-secure EL1. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSE0, bit [4]

Access to this field is **RES0**.

SE3, bit [3]

When FEAT_Debugv8p2 is implemented and EL3 is implemented:

Controls exception catch on exception entry to EL3. Also controls exception catch on exception return to EL3 in conjunction with EDECCR.SR3.

| SE3 | Meaning |
|-----|---|
| 0b0 | If EDECCR.SR3 is 0, then Exception Catch debug events are disabled for EL3. If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception returns to EL3. |
| 0b1 | If EDECCR.SR3 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3. If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3. |

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

When FEAT_Debugv8p2 is not implemented and EL3 is implemented:

Coarse-grained exception catch for EL3. Controls Exception Catch debug events for EL3.

| SE3 | Meaning |
|-----|--|
| 0b0 | Exception Catch debug events are disabled for EL3. |
| 0b1 | Exception Catch debug events are enabled for EL3. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE2, bit [2]

When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

Controls exception catch on exception entry to Secure EL2. Also controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SR2.

| SE2 | Meaning |
|-----|---|
| 0b0 | If EDECCR.SR2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL2. |
| 0b1 | If EDECCR.SR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2. |

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE1, bit [1]

When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

Controls exception catch on exception entry to Secure EL1. Also controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SR1.

| SE1 | Meaning |
|-----|---|
| 0b0 | If EDECCR.SR1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL1. |
| 0b1 | If EDECCR.SR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1. |

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

When Secure EL1 is implemented:

Coarse-grained exception catch for Secure EL1. Controls Exception Catch debug events for Secure EL1.

| SE1 | Meaning |
|-----|---|
| 0b0 | Exception Catch debug events are disabled for Secure EL1. |
| 0b1 | Exception Catch debug events are enabled for Secure EL1. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE0, bit [0]

Access to this field is **RES0**.

Accessing EDECCR

EDECCR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0x098 | EDECCR |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDECR, External Debug Execution Control Register

The EDECR characteristics are:

Purpose

Controls Halting debug events.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDECR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|----|-----|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | SS | RCE | OSUCE |

Bits [31:3]

Reserved, RES0.

SS, bit [2]

Halting step enable. Possible values of this field are:

| SS | Meaning |
|-----|------------------------------------|
| 0b0 | Halting step debug event disabled. |
| 0b1 | Halting step debug event enabled. |

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is CONSTRAINED UNPREDICTABLE as described in 'Changing the value of EDECR.SS when not in Debug state'.

The reset behavior of this field is:

- On a Cold reset, when FEAT_DoPD is implemented, this field resets to 0.
- On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 0.

RCE, bit [1]

When FEAT_DoPD is not implemented:

Reset Catch Enable.

| RCE | Meaning |
|-----|-----------------------------------|
| 0b0 | Reset Catch debug event disabled. |
| 0b1 | Reset Catch debug event enabled. |

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Otherwise:

Reserved, RES0.

OSUCE, bit [0]**When FEAT_DoPD is not implemented:**

OS Unlock Catch Enable.

| OSUCE | Meaning |
|-------|---------------------------------------|
| 0b0 | OS Unlock Catch debug event disabled. |
| 0b1 | OS Unlock Catch debug event enabled. |

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Accessing EDECR

EDECR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0x024 | EDECR |

This interface is accessible as follows:

- When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are **RO**.
- When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDES, External Debug Event Status Register

The EDES characteristics are:

Purpose

Indicates the status of internally pending Halting debug events.

Configuration

EDES is in the Core power domain.

Attributes

EDES is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|----|----|----|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | EC | SS | RC | OSUC |

Bits [31:4]

Reserved, RES0.

EC, bit [3]

When FEAT_Debugv8p8 is implemented:

Exception Catch debug event pending.

| EC | Meaning |
|-----|---|
| 0b0 | Exception Catch debug event is not pending. |
| 0b1 | Exception Catch debug event is pending. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

SS, bit [2]

When FEAT_DoPD is implemented:

Halting step debug event pending. Possible values of this field are:

| SS | Meaning |
|-----|--|
| 0b0 | Reading this means that a Halting step debug event is not pending. Writing this means no action. |
| 0b1 | Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Halting step debug event pending. Possible values of this field are:

| SS | Meaning |
|-----|--|
| 0b0 | Reading this means that a Halting step debug event is not pending. Writing this means no action. |
| 0b1 | Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event. |

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [EDEC.R](#).SS.

RC, bit [1]

Reset Catch debug event pending. Possible values of this field are:

| RC | Meaning |
|-----|--|
| 0b0 | Reading this means that a Reset Catch debug event is not pending. Writing this means no action. |
| 0b1 | Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event. |

The reset behavior of this field is:

- On a Warm reset:
 - When FEAT_DoPD is implemented, this field resets to the value in [CTIDEVCTL](#).RCE.
 - When FEAT_DoPD is not implemented, this field resets to the value in [EDEC.R](#).RCE.

OSUC, bit [0]

OS Unlock Catch debug event pending. Possible values of this field are:

| OSUC | Meaning |
|------|---|
| 0b0 | Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action. |
| 0b1 | Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing EDES

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is **CONSTRAINED UNPREDICTABLE** whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

EDES can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0x020 | EDES |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.

- When IsCorePowered(), !DoubleLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

Purpose

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

It is IMPLEMENTATION DEFINED whether EDITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

EDITCTRL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | IME | | | | | | | | | | | | | | | |

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

| IME | Meaning |
|-----|---------------------------|
| 0b0 | Normal operation. |
| 0b1 | Integration mode enabled. |

The following resets apply:

- Whichever power domain the register is implemented in, this field resets to 0.
- Otherwise, the value of this field is unchanged.

Accessing EDITCTRL

EDITCTRL can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xF00 | EDITCTRL |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

Purpose

Used in Debug state for passing instructions to the PE for execution.

Configuration

EDITR is in the Core power domain.

Attributes

EDITR is a 32-bit register.

Field descriptions

When AArch32 is supported and in AArch32 state:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| hw2 | | | | | | | | | | | | | | | | hw1 | | | | | | | | | | | | | | | |

hw2, bits [31:16]

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information, see 'Behavior in Debug state'.

Note

The hw2 field is displayed on the left. This is not the usual convention for display of T32 instruction halfwords.

hw1, bits [15:0]

First halfword of the T32 instruction to be executed on the PE.

Note

The hw1 field is displayed on the right. This is not the usual convention for display of T32 instruction halfwords.

When AArch64 is supported and in AArch64 state:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| A64 instruction to be executed on the PE | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

A64 instruction to be executed on the PE.

Accessing EDITR

If `EDSCR.ITE == 0` when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is **CONSTRAINED UNPREDICTABLE**, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

EDITR ignores writes if the PE is in Non-debug state.

EDITR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0x084 | EDITR |

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `SoftwareLockStatus()` accesses to this register are **WI**.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `!SoftwareLockStatus()` accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

Purpose

Allows or disallows access to the external debug registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and [EDLSR](#) to check the current status of the lock.

Attributes

EDLAR is a 32-bit register.

Field descriptions

When Software Lock is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | KEY | | | | | | | | | | | | | | | |

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing EDLAR

EDLAR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xFB0 | EDLAR |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

Purpose

Indicates the current status of the software lock for external debug registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses [EDLAR](#) to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|-----|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | nTT | SLK | SLI |

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

| SLK | Meaning |
|-----|---|
| 0b0 | Lock clear. Writes are permitted to this component's registers. |
| 0b1 | Lock set. Writes to this component's registers are ignored, and reads have no side effects. |

The reset behavior of this field is:

- On a Cold reset, when FEAT_DoPD is implemented, this field resets to 1.
- On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

| SLI | Meaning |
|-----|--|
| 0b0 | Software Lock not implemented or not memory-mapped access. |
| 0b1 | Software Lock implemented and memory-mapped access. |

Accessing EDLSR**EDLSR can be accessed through the memory-mapped interfaces:**

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xFB4 | EDLSR |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

EDPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDPCSR are RES0.

EDPCSR[63:32] and EDPCSR[31:0] are accessed at 32-bit memory mapped addresses that are not contiguous.

If FEAT_VHE is implemented, the format of this register differs depending on the value of [EDSCR.SC2](#).

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDPCSR is a 64-bit register.

Field descriptions

When FEAT_VHE is not implemented or EDSCR.SC2 == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| PC Sample high word, EDPCSRhi | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| PC Sample low word | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

PC Sample high word, EDPCSRhi. If [EDVIDSR.HV](#) == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from [EDVIDSR.{NS,E2,E3}](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#) to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#). The translation regime that EDPCSR samples can be determined from [EDVIDSR](#).{NS,E2,E3}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#) are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_VHE is implemented and EDSCR.SC2 == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------|----|------|----|----|----|----|----|-------------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| NS | EL | RES0 | | | | | | PC Sample high word, EDPCSRhi | | | | | | | | | | | | | | | | | | | | | | | | |
| PC Sample low word | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

| NS | Meaning |
|-----|----------------------------------|
| 0b0 | Sample is from Secure state. |
| 0b1 | Sample is from Non-secure state. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

| EL | Meaning |
|------|---------------------|
| 0b00 | Sample is from EL0. |
| 0b01 | Sample is from EL1. |
| 0b10 | Sample is from EL2. |
| 0b11 | Sample is from EL3. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [60:56]

Reserved, RES0.

Bits [55:32]

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#) to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#). The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#) are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'

EDPCSR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance | Range |
|-----------|--------|----------|-------|
| Debug | 0x0A0 | EDPCSR | 31:0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

| Component | Offset | Instance | Range |
|-----------|--------|----------|-------|
| Debug | 0x0AC | EDPCSR | 63:32 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

It is IMPLEMENTATION DEFINED whether EDPFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDPFR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|

Bits [63:60]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

Bits [59:56]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

Bits [55:52]

Reserved, RES0.

Bits [51:48]

From Armv8.4:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

| AMU | Meaning |
|--------|--|
| 0b0000 | Activity Monitors Extension is not implemented. |
| 0b0001 | FEAT_AMUv1 is implemented. |
| 0b0010 | FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters. |

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

Bits [43:40]**From Armv8.2:**

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

SEL2, bits [39:36]

Secure EL2. Defined values are:

| SEL2 | Meaning |
|--------|--------------------------------|
| 0b0000 | Secure EL2 is not implemented. |
| 0b0001 | Secure EL2 is implemented. |

All other values are reserved.

SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

| SVE | Meaning |
|--------|-------------------------|
| 0b0000 | SVE is not implemented. |
| 0b0001 | SVE is implemented. |

All other values are reserved.

Bits [31:28]**From Armv8.2:**

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

GIC, bits [27:24]

System register GIC interface support. Defined values are:

| GIC | Meaning |
|------------|--|
| 0b0000 | GIC CPU interface system registers not implemented. |
| 0b0001 | System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported. |
| 0b0011 | System register interface to version 4.1 of the GIC CPU interface is supported. |

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).GIC.

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

| AdvSIMD | Meaning |
|----------------|--|
| 0b0000 | Advanced SIMD is implemented, including support for the following Sisd and SIMD operations: <ul style="list-style-type: none"> Integer byte, halfword, word and doubleword element operations. Single-precision and double-precision floating-point arithmetic. Conversions between single-precision and half-precision data types, and double-precision and half-precision data types. |
| 0b0001 | As for 0b0000, and also includes support for half-precision floating-point arithmetic. |
| 0b1111 | Advanced SIMD is not implemented. |

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support, that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support, that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).AdvSIMD.

FP, bits [19:16]

Floating-point. Defined values are:

| FP | Meaning |
|-----------|---|
| 0b0000 | Floating-point is implemented, and includes support for: <ul style="list-style-type: none"> Single-precision and double-precision floating-point types. Conversions between single-precision and half-precision data types, and double-precision and half-precision data types. |
| 0b0001 | As for 0b0000, and also includes support for half-precision floating-point arithmetic. |
| 0b1111 | Floating-point is not implemented. |

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support, that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with floating-point support, that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without floating-point support.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).FP.

EL3, bits [15:12]

AArch64 EL3 Exception level handling. Defined values are:

| EL3 | Meaning |
|--------|--|
| 0b0000 | EL3 is not implemented or cannot be executed in AArch64 state. |
| 0b0001 | EL3 can be executed in AArch64 state only. |
| 0b0010 | EL3 can be executed in both Execution states. |

When the value of [EDAA32PFR](#).EL3 is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).EL3.

EL2, bits [11:8]

AArch64 EL2 Exception level handling. Defined values are:

| EL2 | Meaning |
|--------|--|
| 0b0000 | EL2 is not implemented or cannot be executed in AArch64 state. |
| 0b0001 | EL2 can be executed in AArch64 state only. |
| 0b0010 | EL2 can be executed in both Execution states. |

When the value of [EDAA32PFR](#).EL2 is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).EL2.

EL1, bits [7:4]

AArch64 EL1 Exception level handling. Defined values are:

| EL1 | Meaning |
|--------|---|
| 0b0000 | EL1 cannot be executed in AArch64 state. |
| | EL1 can be executed in AArch32 state only. |
| 0b0001 | EL1 can be executed in AArch64 state only. |
| 0b0010 | EL1 can be executed in both Execution states. |

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).EL1.

EL0, bits [3:0]

AArch64 EL0 Exception level handling. Defined values are:

| EL0 | Meaning |
|--------|---|
| 0b0000 | EL0 cannot be executed in AArch64 state. |
| | EL0 can be executed in AArch32 state only. |
| 0b0001 | EL0 can be executed in AArch64 state only. |
| 0b0010 | EL0 can be executed in both Execution states. |

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).EL0.

Accessing EDPFR

EDPFR can be accessed through the external debug interface:

| Component | Offset | Instance | Range |
|-----------|--------|----------|-------|
| Debug | 0xD20 | EDPFR | 31:0 |

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

| Component | Offset | Instance | Range |
|-----------|--------|----------|-------|
| Debug | 0xD24 | EDPFR | 63:32 |

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

EDPIDR0, External Debug Peripheral Identification Register 0

The EDPIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|--------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PART_0 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR0

EDPIDR0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xFE0 | EDPIDR0 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---|--------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | DES_0 | | | | PART_1 | | | |

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR1

EDPIDR1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xFE4 | EDPIDR1 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|-------|----|-------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | REVISION | | | | JEDEC | | DES_1 | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR2

EDPIDR2 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xFE8 | EDPIDR2 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|--------|---|---|---|------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | REVAND | | | | CMOD | | | |

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using [EDPIDR2](#).REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR3

EDPIDR3 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
|-----------|--------|----------|

| | | |
|-------|-------|---------|
| Debug | 0xFEC | EDPIDR3 |
|-------|-------|---------|

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR4 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|------|---|---|-------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | SIZE | | | DES_2 | | | | |

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR4

EDPIDR4 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
|-----------|--------|----------|

| | | |
|-------|-------|---------|
| Debug | 0xFD0 | EDPIDR4 |
|-------|-------|---------|

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

Purpose

Controls the PE functionality related to powerup, reset, and powerdown.

Configuration

EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.

CORENPDRQ is the only field that is mapped between the EDPRCR and DBGPRCR and DBGPRCR_EL1.

Attributes

EDPRCR is a 32-bit register.

Field descriptions

When FEAT_DoPD is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|------|-----------|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | CWRR | CORENPDRQ | | |

Bits [31:2]

Reserved, RES0.

CWRR, bit [1]

When FEAT_RME is implemented:

The PE ignores all writes to this bit.

Otherwise:

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

| CWRR | Meaning |
|------|---------------------|
| 0b0 | No action. |
| 0b1 | Request Warm reset. |

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- **RAZ/WI** if any of the following are true:
 - OSLockStatus()
 - SoftwareLockStatus()
- Otherwise, access to this field is **WO/RAZ**.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

| CORENPDRQ | Meaning |
|-----------|--|
| 0b0 | If the system responds to a powerdown request, it powers down Core power domain. |
| 0b1 | If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain. |

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the [DBGPRCR.CORENPDRQ](#) and [DBGPRCR_EL1.CORENPDRQ](#) fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Accessing this field has the following behavior:

- When OSLockStatus(), access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|------|----|------|----|-----------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | COREPURQ | | RES0 | | CWRR | | CORENPDRQ | | | | | | | | | |

Bits [31:4]

Reserved, RES0.

COREPURQ, bit [3]

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

| COREPURQ | Meaning |
|----------|--|
| 0b0 | Do not request power up of the Core power domain. |
| 0b1 | Request power up of the Core power domain, and emulation of powerdown. |

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRUPREQ signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Bit [2]

Reserved, RES0.

CWRR, bit [1]

When FEAT_RME is implemented:

The PE ignores all writes to this bit.

Otherwise:

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

| CWRR | Meaning |
|------|---------------------|
| 0b0 | No action. |
| 0b1 | Request Warm reset. |

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- **RAZ/WI** if any of the following are true:
 - !IsCorePowered()
 - DoubleLockStatus()
 - OSLockStatus()
 - SoftwareLockStatus()
- Otherwise, access to this field is **WO/RAZ**.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

| CORENPDRQ | Meaning |
|-----------|--|
| 0b0 | If the system responds to a powerdown request, it powers down Core power domain. |
| 0b1 | If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain. |

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the [DBGPRCR](#).CORENPDRQ and [DBGPRCR_EL1](#).CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR](#).COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in [EDPRCR](#).COREPURQ.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - !IsCorePowered()
 - DoubleLockStatus()
 - OSLockStatus()
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Accessing EDPRCR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

EDPRCR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0x310 | EDPRCR |

This interface is accessible as follows:

- When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are **RO**.
- When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

Purpose

Holds information about the reset and powerdown state of the PE.

Configuration

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.

Attributes

EDPRSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|-------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-----|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-----|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|----|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | EPMAD | | | | | | | | | | | | | | | | ETADE | | | | | | | | | | | | | | | | EDADE | | | | | | | | | | | | | | | | STAD | | | | | | | | | | | | | | | | ETAD | | | | | | | | | | | | | | | | SDR | | | | | | | | | | | | | | | | SPMAD | | | | | | | | | | | | | | | | EPMAD | | | | | | | | | | | | | | | | SDAD | | | | | | | | | | | | | | | | EDAD | | | | | | | | | | | | | | | | DLK | | | | | | | | | | | | | | | | OSLK | | | | | | | | | | | | | | | | HALTED | | | | | | | | | | | | | | | | SP | | | | | | | | | | | | | | | |

Bits [31:17]

Reserved, RES0.

EPMAD, bit [16]

When FEAT_RME is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Access Disable Extended Status. Together with EDPRSR.EPMAD, reports whether access to Performance Monitor registers by an external debugger is permitted.

For a description of the values derived by evaluating EPMAD and EPMAD together, see EDPRSR.EPMAD.

Otherwise:

Reserved, RES0.

ETADE, bit [15]

When FEAT_RME is implemented, external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable Extended Status. Together with EDPRSR.ETAD, reports whether access to PE Trace Unit registers by an external debugger is permitted.

For a description of the values derived by evaluating ETAD and ETAD together, see EDPRSR.ETAD.

Otherwise:

Reserved, RES0.

EDADE, bit [14]**When FEAT_RME is implemented:**

External Debug Access Disable Extended Status. Together with EDPRSR.EDAD, reports whether access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) by an external debugger is permitted.

For a description of the values derived by evaluating EDAD and EDADE together, see EDPRSR.EDAD.

Otherwise:

Reserved, RES0.

STAD, bit [13]**When external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:**

Sticky ETAD error. Set to 1 when a Non-secure external debug interface access to an external trace register returns an error because AllowExternalTraceAccess() == FALSE for the access.

| STAD | Meaning |
|------|---|
| 0b0 | Since EDPRSR was last read, no external accesses to the PE Trace Unit registers have failed because AllowExternalTraceAccess() was FALSE for the access. |
| 0b1 | Since EDPRSR was last read, at least one external access to the PE Trace Unit registers has failed because AllowExternalTraceAccess() was FALSE for the access. |

If IsCorePowered() == TRUE, the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE then this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE then it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This bit is in the Core power domain.

Note

If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - DoubleLockStatus()
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - EDPRSR.R == 1
- Otherwise, access to this field is **RC/WI**.

Otherwise:

Reserved, RES0.

ETAD, bit [12]**When FEAT_RME is implemented, external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:**

External Trace Access Disable Status. Together with EDPRSR.ETADE, reports whether access to PE Trace Unit registers by an external debugger is permitted.

| ETADE | ETAD | Meaning |
|-------|------|--|
| 0b0 | 0b0 | Access to PE Trace Unit registers by an external debugger is permitted. |
| 0b0 | 0b1 | Root and Secure access to PE Trace Unit registers by an external debugger is permitted. Realm and Non-secure access to PE Trace Unit registers by an external debugger is not permitted. |
| 0b1 | 0b0 | Root and Realm access to PE Trace Unit registers by an external debugger is permitted. Secure and Non-secure access to PE Trace Unit registers by an external debugger is not permitted. |
| 0b1 | 0b1 | Root access to PE Trace Unit registers by an external debugger is permitted. Secure, Non-secure, and Realm access to PE Trace Unit registers by an external debugger is not permitted. |

When external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable status.

| ETAD | Meaning |
|------|--|
| 0b0 | External Non-secure PE Trace Unit accesses enabled. AllowExternalTraceAccess() == TRUE for a Non-secure access. |
| 0b1 | External Non-secure PE Trace Unit accesses disabled. AllowExternalTraceAccess() == FALSE for a Non-secure access. |

This bit is in the Core power domain.

Note

If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - DoubleLockStatus()
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

SDR, bit [11]

Sticky Debug Restart. Set to 1 when the PE exits Debug state.

Permitted values are:

| SDR | Meaning |
|-----|--|
| 0b0 | The PE has not restarted since EDPRSR was last read. |
| 0b1 | The PE has restarted since EDPRSR was last read. |

Note

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If The Core power domain is powered up, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

SPMAD, bit [10]

When FEAT_Debugv8p4 is implemented:

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because AllowExternalPMUAccess() == FALSE.

Permitted values are:

| SPMAD | Meaning |
|-------|---|
| 0b0 | No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read. |
| 0b1 | At least one Non-secure external debug interface access to the external Performance Monitors register has failed and returned an error because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read. |

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

Otherwise:

Sticky EPMAD error.

| SPMAD | Meaning |
|-------|---|
| 0b0 | No external debug interface accesses to the Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE since EDPRSR was last read. |
| 0b1 | At least one external debug interface access to the Performance Monitors registers has failed and returned an error because AllowExternalPMUAccess() == FALSE since EDPRSR was last read. |

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - OSLockStatus()
 - DoubleLockStatus()
 - EDPRSR.R == 1
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

EPMAD, bit [9]

When FEAT_RME is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Access Disable Status. Together with EDPRSR.EPMADE, reports whether access to Performance Monitor registers by an external debugger is permitted.

| EPMADE | EPMAD | Meaning |
|--------|-------|--|
| 0b0 | 0b0 | Access to Performance Monitor registers by an external debugger is permitted. |
| 0b0 | 0b1 | Root and Secure access to Performance Monitor registers by an external debugger is permitted. Realm and Non-secure access to Performance Monitor registers by an external debugger is not permitted. |
| 0b1 | 0b0 | Root and Realm access to Performance Monitor registers by an external debugger is permitted. Secure and Non-secure access to Performance Monitor registers by an external debugger is not permitted. |
| 0b1 | 0b1 | Root access to Performance Monitor registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Performance Monitor registers by an external debugger is not permitted. |

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Non-secure Access Disable status.

| EPMAD | Meaning |
|--------------|--|
| 0b0 | External Non-secure Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE for a Non-secure access. |
| 0b1 | External Non-secure Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE for a Non-secure access. |

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

When FEAT_PMUv3 is implemented:

External Performance Monitors access disable status.

| EPMAD | Meaning |
|--------------|---|
| 0b0 | External Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE. |
| 0b1 | External Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE. |

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - OSLockStatus()
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

SDAD, bit [8]

When FEAT_Debugv8p4 is implemented:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

| SDAD | Meaning |
|-------------|--|
| 0b0 | No Non-secure external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read. |
| 0b1 | At least one Non-secure external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read. |

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

Otherwise:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

| SDAD | Meaning |
|------|--|
| 0b0 | No external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE since EDPRSR was last read. |
| 0b1 | At least one external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE since EDPRSR was last read. |

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This bit is UNKNOWN on reads if OSLockStatus() == TRUE and external debug writes to [OSLAR_EL1](#) do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

EDAD, bit [7]

When FEAT_RME is implemented:

External Debug Access Disable Status. Together with EDPRSR.EDADE, reports whether access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) by an external debugger is permitted.

| EDADE | EDAD | Meaning |
|-------|------|--|
| 0b0 | 0b0 | Access to Debug registers by an external debugger is permitted. |
| 0b0 | 0b1 | Root and Secure access to Debug registers by an external debugger is permitted. Realm and Non-secure access to Debug registers by an external debugger is not permitted. |
| 0b1 | 0b0 | Root and Realm access to Debug registers by an external debugger is permitted. Secure and Non-secure access to Debug registers by an external debugger is not permitted. |
| 0b1 | 0b1 | Root access to Debug registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Debug registers by an external debugger is not permitted. |

When FEAT_Debugv8p4 is implemented:

External Debug Access Disable status.

| EDAD | Meaning |
|------|--|
| 0b0 | External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE for a Non-secure access. |
| 0b1 | External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE for a Non-secure access. |

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable status.

| EDAD | Meaning |
|------|---|
| 0b0 | External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE. |
| 0b1 | External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE. |

This bit is not valid and reads UNKNOWN if OSLockStatus() == TRUE and external debug writes to [OSLAR_EL1](#) do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

Otherwise:

External Debug Access Disable status.

| EDAD | Meaning |
|------|--|
| 0b0 | External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. <code>AllowExternalDebugAccess() == TRUE</code> . |
| 0b1 | External access to breakpoint registers, watchpoint registers disabled. It is IMPLEMENTATION DEFINED whether accesses to OSLAR_EL1 are enabled or disabled. <code>AllowExternalDebugAccess() == FALSE</code> . |

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - `(FEAT_DoPD is not implemented and !IsCorePowered())`
 - `DoubleLockStatus()`
 - `EDPRSR.R == 1`
- Otherwise, access to this field is **RO**.

DLK, bit [6]

When FEAT_Debugv8p4 is implemented:

This field is RES0.

When FEAT_Debugv8p2 is implemented and FEAT_DoubleLock is implemented:

Double Lock.

From Armv8.2, this field is deprecated.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **RAZ/WI** if all of the following are true:
 - `IsCorePowered()`
 - `!DoubleLockStatus()`
- Otherwise, access to this field is **UNKNOWN/WI**.

When FEAT_DoubleLock is implemented:

Double Lock.

This field returns the result of the pseudocode function `DoubleLockStatus()`.

If the Core power domain is powered up and `DoubleLockStatus() == TRUE`, it is IMPLEMENTATION DEFINED whether:

- `EDPRSR.PU` reads as 1, `EDPRSR.DLK` reads as 1, and `EDPRSR.SPD` is UNKNOWN.
- `EDPRSR.PU` reads as 0, `EDPRSR.DLK` is UNKNOWN, and `EDPRSR.SPD` reads as 0.

This field is in the Core power domain.

| DLK | Meaning |
|-----|---|
| 0b0 | <code>DoubleLockStatus()</code> returns FALSE. |
| 0b1 | <code>DoubleLockStatus()</code> returns TRUE and the Core power domain is powered up. |

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - FEAT_DoPD is not implemented
 - !IsCorePowered()
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

OSLK, bit [5]

OS Lock status bit.

A read of this bit returns the value of [OSLSR_EL1.OSLK](#).

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

HALTED, bit [4]

Halted status bit.

| HALTED | Meaning |
|--------|---------------------------|
| 0b0 | PE is in Non-debug state. |
| 0b1 | PE is in Debug state. |

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - FEAT_DoPD is not implemented
 - !IsCorePowered()
- Otherwise, access to this field is **RO**.

SR, bit [3]

Sticky core Reset status bit.

Permitted values are:

| SR | Meaning |
|-----|---|
| 0b0 | The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read. |
| 0b1 | The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read. |

If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

R, bit [2]

PE Reset status bit.

Permitted values are:

| R | Meaning |
|-----|--|
| 0b0 | The non-debug logic of the PE is not in reset state. |
| 0b1 | The non-debug logic of the PE is in reset state. |

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
- Otherwise, access to this field is **RO**.

SPD, bit [1]

Sticky core Powerdown status bit.

If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, then:

- If FEAT_Debugv8p2 is implemented, this bit reads as 0.
- If FEAT_Debugv8p2 is not implemented, this bit might read as 0 or 1.

For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

| SPD | Meaning |
|-----|--|
| 0b0 | If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core power domain is lost. If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not been lost. |
| 0b1 | The state of the debug registers in the Core power domain has been lost. |

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

When FEAT_DoPD is not implemented and the Core power domain is in either retention or powerdown state, the value of EDPRSR.SPD is IMPLEMENTATION DEFINED. For more information, see 'EDPRSR.SPD when the Core domain is in either retention or powerdown state'.

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Accessing this field has the following behavior:

- **RAZ/WI** if all of the following are true:
 - FEAT_DoPD is not implemented
 - !IsCorePowered()
- **UNKNOWN/WI** if all of the following are true:
 - IsCorePowered()
 - DoubleLockStatus()
- Otherwise, access to this field is **RO**.

PU, bit [0]

When FEAT_DoPD is implemented:

Core powerup status bit.

Access to this field is **RAO/WI**.

When FEAT_Debugv8p2 is implemented:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

| PU | Meaning |
|-----|---|
| 0b0 | Either the Core power domain is in a low-power or powerdown state, or FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, meaning the debug registers in the Core power domain cannot be accessed. |
| 0b1 | The Core power domain is in a powerup state, and either FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, meaning the debug registers in the Core power domain can be accessed. |

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'

Access to this field is **RO**.

Otherwise:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

When the Core power domain is powered-up and DoubleLockStatus() == TRUE, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

Otherwise, permitted values are:

| PU | Meaning |
|-----|---|
| 0b0 | Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed. |
| 0b1 | Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed. |

If FEAT_DoubleLock is implemented, the Core power domain is powered up, and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

Access to this field is **RO**.

Accessing EDPRSR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, then:
 - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
 - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If FEAT_DoPD is not implemented and the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

EDPRSR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0x314 | EDPRSR |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

EDRCR, External Debug Reserve Control Register

The EDRCR characteristics are:

Purpose

This register is used to allow imprecise entry to Debug state and clear sticky bits in [EDSCR](#).

Configuration

EDRCR is in the Core power domain.

Attributes

EDRCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|------|---|-----|---|------|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | CBRR0 | | CSPA | | CSE | | RES0 | | | | | | |

Bits [31:5]

Reserved, RES0.

CBRRQ, bit [4]

Allow imprecise entry to Debug state. The actions on writing to this bit are:

| CBRRQ | Meaning |
|-------|--|
| 0b0 | No action. |
| 0b1 | Allow imprecise entry to Debug state, for example by canceling pending bus accesses. |

Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.

This feature is optional. If this feature is not implemented, writes to this bit are ignored.

CSPA, bit [3]

Clear Sticky Pipeline Advance. This bit is used to clear the [EDSCR](#).PipeAdv bit to 0. The actions on writing to this bit are:

| CSPA | Meaning |
|------|--|
| 0b0 | No action. |
| 0b1 | Clear the EDSCR .PipeAdv bit to 0. |

CSE, bit [2]

Clear Sticky Error. Used to clear the [EDSCR](#) cumulative error bits to 0. The actions on writing to this bit are:

| CSE | Meaning |
|-----|--|
| 0b0 | No action. |
| 0b1 | Clear the EDSCR .{TXU, RXO, ERR} bits, and, if the PE is in Debug state, the EDSCR .ITO bit, to 0. |

Bits [1:0]

Reserved, RES0.

Accessing EDRCR

EDRCR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0x090 | EDRCR |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

External register EDSCR bits [30:29] are architecturally mapped to AArch64 System register [MDCCSR_EL0\[30:29\]](#).

EDSCR is in the Core power domain.

Attributes

EDSCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|----|--------|----|--------|----|-------|----|-----|----|---------|----|-----|----|--------|----|-----|----|-------|----|--------|----|-----|---|-----|---|-----|---|----|---|----|---|------|--|--------|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | |
| TFO | | RXfull | | TXfull | | TORXO | | TXU | | PipeAdv | | ITE | | INTdis | | TDA | | MASC2 | | NSRES0 | | SDD | | NSE | | HDE | | RW | | EL | | AERR | | STATUS | |

TFO, bit [31]

When FEAT_TRF is implemented:

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

| TFO | Meaning |
|-----|--|
| 0b0 | Trace Filter controls are not affected. |
| 0b1 | Trace Filter controls in TRFCR_EL1 and TRFCR_EL2 are ignored. Trace Filter controls TRFCR and HTRFCR are ignored. |

When [OSLSR_EL1](#).OSLK is 1, this bit can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

This bit is ignored by the PE when any of the following is true:

- ExternalSecureNoninvasiveDebugEnabled() is FALSE and the Effective value of [MDCR_EL3](#).STE is 1.
- FEAT_RME is implemented, ExternalRealmNoninvasiveDebugEnabled() is FALSE, and the Effective value of [MDCR_EL3](#).RLTE is 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

TXfull, bit [29]

DTRTX full.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

ITO, bit [28]

ITR overrun. Set to 0 on entry to Debug state.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

RXO, bit [27]

DTRRX overrun.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

TXU, bit [26]

DTRTX underrun.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

PipeAdv, bit [25]

Pipeline Advance. Indicates that software execution is progressing.

| PipeAdv | Meaning |
|---------|---|
| 0b0 | No progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA . |
| 0b1 | Progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA . |

The architecture does not define precisely when this field is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing. For example, a PE might set this field to 1 each time the PE retires one or more instructions, or at periodic intervals during the progression of an instruction.

When FEAT_MOPS is implemented, CPY, CPYF, SET, and SETG Memory Set and Copy instructions are examples of instructions that periodically make forward progress.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

ITE, bit [24]

ITR empty.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

INTdis, bits [23:22]

When FEAT_RME is implemented:

Interrupt disable. Disables taking interrupts in Non-debug state.

| INTdis | Meaning |
|--------|--|
| 0b00 | This bit has no effect on the masking of interrupts. |
| 0b01 | If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked. If ExternalRootInvasiveDebugEnabled() is TRUE, then all interrupts taken to Root state are masked. If ExternalRealmInvasiveDebugEnabled() is TRUE, then all interrupts taken to Realm state are masked. |

Note

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1](#).OSLK is 1, this field can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_RME is implemented, bit[23] of this register is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

When FEAT_Debugv8p4 is implemented:

Interrupt disable. Disables taking interrupts in Non-debug state.

| INTdis | Meaning |
|--------|--|
| 0b00 | Masking of interrupts is controlled by PSTATE and interrupt routing controls. |
| 0b01 | If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked. |

Note

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1](#).OSLK is 1, this field can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_Debugv8p4 is implemented, bit[23] of this register is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Interrupt disable. Disables taking interrupts in Non-debug state.

| INTdis | Meaning |
|--------|--|
| 0b00 | Masking of interrupts is controlled by PSTATE and interrupt routing controls. |
| 0b01 | If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure EL1 are masked. |
| 0b10 | If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure EL1 are masked. |
| 0b11 | If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked. |

Note

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1](#).OSLK is 1, this field can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRExt](#) System registers.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

Support for the values 0b01 and 0b10 is IMPLEMENTATION DEFINED. If these values are not supported, they are reserved. If programmed with a reserved value, the PE behaves as if INTdis has been programmed with a defined value, other than for a direct read of EDSCR, and the value returned by a read of EDSCR.INTdis is UNKNOWN.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

TDA, bit [21]

Traps accesses to the following debug System registers:

- AArch64: [DBGBCR<n>_EL1](#), [DBGBVR<n>_EL1](#), [DBGWCR<n>_EL1](#), [DBGWVR<n>_EL1](#).
- AArch32: [DBGBCR<n>](#), [DBGBVR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).

| TDA | Meaning |
|-----|---|
| 0b0 | Accesses to debug System registers do not generate a Software Access Debug event. |
| 0b1 | Accesses to debug System registers generate a Software Access Debug event, if OSLSR_EL1 .OSLK is 0 and if halting is allowed. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

MA, bit [20]

Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

| MA | Meaning |
|-----|---------------------|
| 0b0 | Normal access mode. |
| 0b1 | Memory access mode. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and FEAT_PCSRv8p2 is not implemented:

Sample [CONTEXTIDR_EL2](#). Controls whether the PC Sample-based Profiling Extension samples [CONTEXTIDR_EL2](#) or [VTTBR_EL2](#).VMID.

| SC2 | Meaning |
|-----|---|
| 0b0 | Sample VTTBR_EL2 .VMID. |
| 0b1 | Sample CONTEXTIDR_EL2 . |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NS, bit [18]

When FEAT_RME is implemented:

Non-secure status. Together with the NSE field, gives the current Security state:

| NSE | NS | Meaning |
|-----|-----|-------------|
| 0b0 | 0b0 | Secure. |
| 0b0 | 0b1 | Non-secure. |
| 0b1 | 0b0 | Root. |
| 0b1 | 0b1 | Realm. |

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

Otherwise:

Non-secure status. In Debug state, gives the current Security state:

| NS | Meaning |
|-----|-------------------|
| 0b0 | Secure state. |
| 0b1 | Non-secure state. |

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

Bit [17]

Reserved, RES0.

SDD, bit [16]

When FEAT_RME is implemented:

Secure debug disabled.

Reports the inverse of ExternalRootInvasiveDebugEnabled().

Access to this field is **RO**.

Otherwise:

Secure debug disabled.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled().

In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

In Non-debug state:

- SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

Access to this field is **RO**.

NSE, bit [15]

When FEAT_RME is implemented:

Together with the NS field, this field gives the current Security state.

For a description of the values derived by evaluating NS and NSE together, see EDSCR.NS.

In Non-debug state, this bit is UNKNOWN.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

HDE, bit [14]

Halting debug enable.

| HDE | Meaning |
|------------|--|
| 0b0 | Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events. |
| 0b1 | Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

RW, bits [13:10]

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.

| RW | Meaning | Applies when |
|--------|--|--|
| 0b1111 | Any of the following: <ul style="list-style-type: none"> The PE is in Non-debug state. The PE is at EL0 using AArch64. The PE is not at EL0, and EL1, EL2, and EL3 are using AArch64. | |
| 0b1110 | The PE is in Debug state at EL0. EL0 is using AArch32. EL1, EL2, and EL3 are using AArch64. | When AArch32 is supported |
| 0b110x | The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is enabled in the current Security state and is using AArch64. If implemented, EL3 is using AArch64. | When AArch32 is supported and EL2 is implemented |
| 0b10xx | The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is not implemented, disabled in the current Security state, or using AArch32. EL3 is using AArch64. | When AArch32 is supported and EL3 is implemented |
| 0b0xxx | The PE is in Debug state. All Exception levels are using AArch32. | When AArch32 is supported |

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **RAO/WI**.
- Otherwise, access to this field is **RO**.

EL, bits [9:8]

Exception level. In Debug state, gives the current Exception level of the PE.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

A, bit [7]

SError interrupt pending. In Debug state, indicates whether an SError interrupt is pending:

- If [HCR_EL2](#).{AMO, TGE} = {1, 0}, EL2 is enabled in the current Security state, and the PE is executing at EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

| A | Meaning |
|-----|------------------------------|
| 0b0 | No SError interrupt pending. |
| 0b1 | SErrror interrupt pending. |

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

STATUS, bits [5:0]

Debug status flags.

| STATUS | Meaning |
|---------------|--|
| 0b000001 | PE is restarting, exiting Debug state. |
| 0b000010 | PE is in Non-debug state. |
| 0b000111 | Breakpoint. |
| 0b010011 | External debug request. |
| 0b011011 | Halting step, normal. |
| 0b011111 | Halting step, exclusive. |
| 0b100011 | OS Unlock Catch. |
| 0b100111 | Reset Catch. |
| 0b101011 | Watchpoint. |
| 0b101111 | HLT instruction. |
| 0b110011 | Software access to debug register. |
| 0b110111 | Exception Catch. |
| 0b111011 | Halting step, no syndrome. |

All other values of STATUS are reserved.

Access to this field is **RO**.

Accessing EDSCR

EDSCR can be accessed through the external debug interface:

| Component | Offset | Instance |
|------------------|---------------|-----------------|
| Debug | 0x088 | EDSCR |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

Purpose

Contains sampled values captured on reading [EDPCSR](#)[31:0].

Configuration

EDVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDVIDSR are RES0.

If FEAT_VHE is implemented, the format of this register differs depending on the value of [EDSCR](#).SC2.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

When the PC Sample-based Profiling Extension is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDVIDSR is a 32-bit register.

Field descriptions

When FEAT_VHE is not implemented or EDSCR.SC2 == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|---|---|------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NS | E2 | E3 | HV | RES0 | | | | | | | | | | | | VMID[15:8] | | | | | | | | VMID | | | | | | | |

This format applies in all Armv8.0 implementations.

NS, bit [31]

Non-secure state sample. Indicates the Security state associated with the most recent [EDPCSR](#) sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

| NS | Meaning |
|-----|----------------------------------|
| 0b0 | Sample is from Secure state. |
| 0b1 | Sample is from Non-secure state. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E2, bit [30]**When EL2 is implemented:**

Exception level 2 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL2.

| E2 | Meaning |
|-----------|-------------------------|
| 0b0 | Sample is not from EL2. |
| 0b1 | Sample is from EL2. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [29]**When EL3 is implemented and AArch64 is supported:**

Exception level 3 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL3 using AArch64.

| E3 | Meaning |
|-----------|---------------------------------------|
| 0b0 | Sample is not from EL3 using AArch64. |
| 0b1 | Sample is from EL3 using AArch64. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HV, bit [28]

EDPCSRhi ([EDPCSR](#)[63:32]) valid. Indicates whether bits [63:32] of the most recent [EDPCSR](#) sample might be nonzero:

| HV | Meaning |
|-----------|--|
| 0b0 | Bits[63:32] of the most recent EDPCSR sample are zero. |
| 0b1 | Bits[63:32] of the most recent EDPCSR sample might be nonzero. |

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi ([EDPCSR](#)[63:32]) does not need to be read.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [27:16]

Reserved, RES0.

VMID[15:8], bits [15:8]**When FEAT_VMID16 is implemented and EL2 is implemented:**

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]**When EL2 is implemented:**

VMID sample. The VMID associated with the most recent EDPCSRlo ([EDPCSR](#)[31:0]) sample. When the most recent [EDPCSR](#) sample was generated:

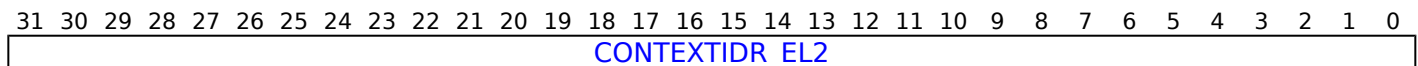

- This field is RES0 if any of the following apply:
 - The PE is executing in Secure state.
 - The PE is executing at EL2.
- Otherwise:
 - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or [VTCR_EL2](#).VS is 1, this field is set to [VTTBR_EL2](#).VMID.
 - If EL2 is using AArch64, FEAT_VMID16 is implemented, and [VTCR_EL2](#).VS is 0, PMVIDSR.VMID[7:0] is set to [VTTBR_EL2](#).VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
 - If EL2 is using AArch32, this field is set to [VTTBR](#).VMID.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and EDSCR.SC2 == 1:**CONTEXTIDR_EL2, bits [31:0]**

Context ID. The value of [CONTEXTIDR_EL2](#) that is associated with the most recent [EDPCSR](#) sample. When the most recent [EDPCSR](#) sample is generated:

- If the PE is not executing at EL3, EL2 is using AArch64, and EL2 is enabled in the current Security state, then this field is set to the Context ID sampled from [CONTEXTIDR_EL2](#).
- Otherwise, this field is set to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

EDVIDSR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0x0A8 | EDVIDSR |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Configuration

EDWAR is in the Core power domain.

Attributes

EDWAR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| Watchpoint address | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Watchpoint address | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the [DC ZVA](#) block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of EDWAR[63:32] is UNKNOWN if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See 'Determining the memory location that caused a Watchpoint exception'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDWAR

EDWAR can be accessed through the external debug interface:

| Component | Offset | Instance | Range |
|-----------|--------|----------|-------|
| Debug | 0x030 | EDWAR | 31:0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

| Component | Offset | Instance | Range |
|-----------|--------|----------|-------|
| Debug | 0x034 | EDWAR | 63:32 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

ERRCIDR0, Component Identification Register 0

The ERRCIDR0 characteristics are:

Purpose

Provides discovery information about the component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.
ERRCIDR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | PRMBL_0 | | | | | | | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Component identification preamble, segment 0.
Reads as 0x0D.
Access to this field is **RO**.

Accessing ERRCIDR0

ERRCIDR0 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| RAS | 0xFF0 | ERRCIDR0 |

Accesses on this interface are **RO**.

ERRCIDR1, Component Identification Register 1

The ERRCIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRCIDR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---|---------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | CLASS | | | | PRMBL_1 | | | |

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

| CLASS | Meaning |
|--------|---|
| 0b1111 | Generic peripheral with IMPLEMENTATION DEFINED register layout. |

Other values are defined by the CoreSight Architecture.

This field reads as 0xF.

PRMBL_1, bits [3:0]

Component identification preamble, segment 1.

Reads as 0b0000.

Access to this field is **RO**.

Accessing ERRCIDR1

ERRCIDR1 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| RAS | 0xFF4 | ERRCIDR1 |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

ERRCIDR2, Component Identification Register 2

The ERRCIDR2 characteristics are:

Purpose

Provides discovery information about the component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.
ERRCIDR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | PRMBL_2 | | | | | | | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Component identification preamble, segment 2.
Reads as 0x05.
Access to this field is **RO**.

Accessing ERRCIDR2

ERRCIDR2 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| RAS | 0xFF8 | ERRCIDR2 |

Accesses on this interface are **RO**.

ERRCIDR3, Component Identification Register 3

The ERRCIDR3 characteristics are:

Purpose

Provides discovery information about the component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.
ERRCIDR3 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | PRMBL_3 | | | | | | | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Component identification preamble, segment 3.
Reads as 0xB1.
Access to this field is **RO**.

Accessing ERRCIDR3

ERRCIDR3 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| RAS | 0xFFC | ERRCIDR3 |

Accesses on this interface are **RO**.

ERRCRICR0, Critical Error Interrupt Configuration Register 0

The ERRCRICR0 characteristics are:

Purpose

Critical Error Interrupt configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR0 are RES0.

ERRCRICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR0 is a 64-bit register.

Field descriptions

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | ADDR | | | | | | | | | | | | | | | | | | | | | | | | |
| ADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRCRICR0.ADDR << 2) is the address that the component writes to when signaling the Critical Error Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR0

ERRCRICR0 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-----------|
| RAS | 0xEA0 | ERRCRICR0 |

Accesses on this interface are **RW**.

ERRCRICR1, Critical Error Interrupt Configuration Register 1

The ERRCRICR1 characteristics are:

Purpose

Critical Error Interrupt configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR1 are RES0.

ERRCRICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR1 is a 32-bit register.

Field descriptions

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DATA | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR1

ERRCRICR1 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-----------|
| RAS | 0xEA8 | ERRCRICR1 |

Accesses on this interface are **RW**.

ERRCRICR2, Critical Error Interrupt Configuration Register 2

The ERRCRICR2 characteristics are:

Purpose

Critical Error Interrupt control and configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR2 are RES0.

ERRCRICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR2 is a 32-bit register.

Field descriptions

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|-------|---|----|---|---------|---|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | IRQEN | | NSMSI | | SH | | MemAttr | | |

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

| IRQEN | Meaning |
|-------|-----------|
| 0b0 | Disabled. |
| 0b1 | Enabled. |

The reset behavior of this field is:

- On an Error recovery reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRCRICR2:

Security attribute. Defines the physical address space for message signaled interrupts.

| NSMSI | Meaning |
|-------|-------------|
| 0b0 | Secure. |
| 0b1 | Non-secure. |

The reset behavior of this field is:

- On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRCRICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

| SH | Meaning |
|------|------------------|
| 0b00 | Not shared. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

All other values are reserved.

This field is ignored when ERRCRICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

| MemAttr | Meaning |
|---------|--|
| 0b0000 | Device-nGnRnE memory. |
| 0b0001 | Device-nGnRE memory. |
| 0b0010 | Device-nGRE memory. |
| 0b0011 | Device-GRE memory. |
| 0b0101 | Normal memory, Inner Non-cacheable, Outer Non-cacheable. |
| 0b0110 | Normal memory, Inner Write-Through, Outer Non-cacheable. |
| 0b0111 | Normal memory, Inner Write-Back, Outer Non-cacheable. |
| 0b1001 | Normal memory, Inner Non-cacheable, Outer Write-Through. |
| 0b1010 | Normal memory, Inner Write-Through, Outer Write-Through. |
| 0b1011 | Normal memory, Inner Write-Back, Outer Write-Through. |
| 0b1101 | Normal memory, Inner Non-cacheable, Outer Write-Back. |
| 0b1110 | Normal memory, Inner Write-Through, Outer Write-Back. |
| 0b1111 | Normal memory, Inner Write-Back, Outer Write-Back. |

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR2

ERRCRICR2 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-----------|
| RAS | 0xEAC | ERRCRICR2 |

Accesses on this interface are **RW**.

ERRDEVAFF, Device Affinity Register

The ERRDEVAFF characteristics are:

Purpose

For a group of error records that has affinity with a single PE or a group of PEs, ERRDEVAFF is a copy of [MPIDR_EL1](#) or part of [MPIDR_EL1](#):

- If the group of error records has affinity with a single PE, the affinity level is 0, ERRDEVAFF reads the same value as [MPIDR_EL1](#), and ERRDEVAFF.F0V reads-as-one to indicate affinity level 0.
- If the group of error records has affinity with a group of PEs, the affinity level is 1, 2, or 3, parts of ERRDEVAFF reads the same value as parts of [MPIDR_EL1](#), and the rest of ERRDEVAFF indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1 then all of the following are true:

- All the PEs in the group have the same values in [MPIDR_EL1](#).{Aff3,Aff2}, and these values are equal to ERRDEVAFF.{Aff3,Aff2}.
- ERRDEVAFF.Aff1 is nonzero and not 0x80, and ERRDEVAFF.{Aff0,F0V} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the group of error records has affinity with is indicated by the least-significant set bit in ERRDEVAFF.Aff1. In this example, if ERRDEVAFF.Aff1[2:0] is 0b100, then the group of error records has affinity with the up-to 8 PEs that have [MPIDR_EL1](#).Aff1[7:3] == ERRDEVAFF.Aff1[7:3].

If RAS System Architecture v1.1 is not implemented, ERRDEVAFF can only describe a group of error records that is affine with a single PE or all the PEs at an affinity level.

Configuration

This register is present only when the group of error records has affinity with a PE or cluster of PEs. Otherwise, direct accesses to ERRDEVAFF are RES0.

ERRDEVAFF is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVAFF is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| RES0 | | | | | | | | | | | | | | | | | | | | | | | | Aff3 | | | | | | | | |
| FOV | U | RES0 | | | | | | MT | Aff2 | | | | | | | | Aff1 | | | | | | | | Aff0 | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

PE affinity level 3. The [MPIDR_EL1](#).Aff3 field, viewed from the highest Exception level of the associated PE or PEs.

F0V, bit [31]

Indicates that the ERRDEVAFF.Aff0 field is valid.

| F0V | Meaning |
|------------|---|
| 0b0 | ERRDEVAFF.Aff0 is not valid, and the PE affinity is above level 0 or a subset of level 0. |
| 0b1 | ERRDEVAFF.Aff0 is valid, and the PE affinity is at level 0. |

U, bit [30]

When **ERRDEVAFF.F0V == 1**:

Uniprocessor. The [MPIDR_EL1](#).U field, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

When **ERRDEVAFF.F0V == 1**:

Multithreaded. The [MPIDR_EL1](#).MT field, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Aff2, bits [23:16]

When affine with a PE or PEs at affinity level 2 or below:

PE affinity level 2. The [MPIDR_EL1](#).Aff2 field, viewed from the highest Exception level of the associated PE or PEs.

When affine with a sub-set of PEs at affinity level 2:

PE affinity level 2. Defines part of the [MPIDR_EL1](#).Aff2 field, viewed from the highest Exception level of the associated PEs.

| Aff2 | Meaning |
|-------------|--|
| 0bxxxxxxx1 | ERRDEVAFF.Aff2[7:1] is the value of MPIDR_EL1 .Aff2[7:1], viewed from the highest Exception level of the associated PEs. |
| 0bxxxxxx10 | ERRDEVAFF.Aff2[7:2] is the value of MPIDR_EL1 .Aff2[7:2], viewed from the highest Exception level of the associated PEs. |
| 0bxxxxx100 | ERRDEVAFF.Aff2[7:3] is the value of MPIDR_EL1 .Aff2[7:3], viewed from the highest Exception level of the associated PEs. |
| 0bxxxx1000 | ERRDEVAFF.Aff2[7:4] is the value of MPIDR_EL1 .Aff2[7:4], viewed from the highest Exception level of the associated PEs. |
| 0bxxx10000 | ERRDEVAFF.Aff2[7:5] is the value of MPIDR_EL1 .Aff2[7:5], viewed from the highest Exception level of the associated PEs. |
| 0bxx100000 | ERRDEVAFF.Aff2[7:6] is the value of MPIDR_EL1 .Aff2[7:6], viewed from the highest Exception level of the associated PEs. |
| 0bx1000000 | ERRDEVAFF.Aff2[7] is the value of MPIDR_EL1 .Aff2[7], viewed from the highest Exception level of the associated PEs. |

Otherwise:

PE affinity level 2. Indicates whether the PE affinity is at level 3.

| Aff2 | Meaning |
|------|----------------------------|
| 0x80 | PE affinity is at level 3. |

All other values are reserved.

Aff1, bits [15:8]**When affine with a PE or PEs at affinity level 1 or below:**

PE affinity level 1. The [MPIDR_EL1](#).Aff1 field, viewed from the highest Exception level of the associated PE or PEs.

When affine with a sub-set of PEs at affinity level 1:

PE affinity level 1. Defines part of the [MPIDR_EL1](#).Aff1 field, viewed from the highest Exception level of the associated PEs.

| Aff1 | Meaning |
|------------|--|
| 0bxxxxxxx1 | ERRDEVAFF.Aff1[7:1] is the value of MPIDR_EL1 .Aff1[7:1], viewed from the highest Exception level of the associated PEs. |
| 0bxxxxxx10 | ERRDEVAFF.Aff1[7:2] is the value of MPIDR_EL1 .Aff1[7:2], viewed from the highest Exception level of the associated PEs. |
| 0bxxxxx100 | ERRDEVAFF.Aff1[7:3] is the value of MPIDR_EL1 .Aff1[7:3], viewed from the highest Exception level of the associated PEs. |
| 0bxxxx1000 | ERRDEVAFF.Aff1[7:4] is the value of MPIDR_EL1 .Aff1[7:4], viewed from the highest Exception level of the associated PEs. |
| 0bxxx10000 | ERRDEVAFF.Aff1[7:5] is the value of MPIDR_EL1 .Aff1[7:5], viewed from the highest Exception level of the associated PEs. |
| 0bxx100000 | ERRDEVAFF.Aff1[7:6] is the value of MPIDR_EL1 .Aff1[7:6], viewed from the highest Exception level of the associated PEs. |
| 0bx1000000 | ERRDEVAFF.Aff1[7] is the value of MPIDR_EL1 .Aff1[7], viewed from the highest Exception level of the associated PEs. |

Otherwise:

PE affinity level 1. Indicates whether the PE affinity is at level 2.

| Aff1 | Meaning |
|------|--|
| 0x00 | PE affinity is above level 2 or a subset of level 2. |
| 0x80 | PE affinity is at level 2. |

Aff0, bits [7:0]**When affine with a PE at affinity level 0:**

PE affinity level 0. The [MPIDR_EL1](#).Aff0 field, viewed from the highest Exception level of the associated PE.

When affine with a sub-set of PEs at affinity level 0:

PE affinity level 0. Defines part of the [MPIDR_EL1](#).Aff0 field, viewed from the highest Exception level of the associated PEs.

| Aff0 | Meaning |
|------------|--|
| 0bxxxxxxx1 | ERRDEVAFF.Aff0[7:1] is the value of MPIDR_EL1 .Aff0[7:1], viewed from the highest Exception level of the associated PEs. |
| 0bxxxxxx10 | ERRDEVAFF.Aff0[7:2] is the value of MPIDR_EL1 .Aff0[7:2], viewed from the highest Exception level of the associated PEs. |
| 0bxxxxx100 | ERRDEVAFF.Aff0[7:3] is the value of MPIDR_EL1 .Aff0[7:3], viewed from the highest Exception level of the associated PEs. |
| 0bxxxx1000 | ERRDEVAFF.Aff0[7:4] is the value of MPIDR_EL1 .Aff0[7:4], viewed from the highest Exception level of the associated PEs. |
| 0bxxx10000 | ERRDEVAFF.Aff0[7:5] is the value of MPIDR_EL1 .Aff0[7:5], viewed from the highest Exception level of the associated PEs. |
| 0bxx100000 | ERRDEVAFF.Aff0[7:6] is the value of MPIDR_EL1 .Aff0[7:6], viewed from the highest Exception level of the associated PEs. |
| 0bx1000000 | ERRDEVAFF.Aff0[7] is the value of MPIDR_EL1 .Aff0[7], viewed from the highest Exception level of the associated PEs. |

Otherwise:

PE affinity level 0. Indicates whether the PE affinity is at level 1.

| Aff0 | Meaning |
|------|--|
| 0x00 | PE affinity is above level 1 or a subset of level 1. |
| 0x80 | PE affinity is at level 1. |

Accessing ERRDEVAFF

ERRDEVAFF can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-----------|
| RAS | 0xFA8 | ERRDEVAFF |

Accesses on this interface are **RO**.

ERRDEVARCH, Device Architecture Register

The ERRDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

Configuration

ERRDEVARCH is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVARCH is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|---------|----------|----|----|----|---------|----|----|----|----------|----|---|---|---|---|---|---|---|---|---|---|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| ARCHITECT | | | | | | | | | | | PRESENT | REVISION | | | | ARCHVER | | | | ARCHPART | | | | | | | | | | | | |

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

| ARCHITECT | Meaning |
|---------------|--|
| 0b01000111011 | JEP106 continuation code 0x4, ID code 0x3B. Arm Limited. |

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

PRESENT, bit [20]

DEVARCH Present. Defines that the DEVARCH register is present.

| PRESENT | Meaning |
|---------|--|
| 0b0 | Device Architecture information not present. |
| 0b1 | Device Architecture information present. |

This field reads as 1.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

| REVISION | Meaning |
|----------|---|
| 0b0000 | RAS System Architecture v1.0. |
| 0b0001 | RAS System Architecture v1.1. As 0b0000 and also: <ul style="list-style-type: none"> Simplifies ERR<n>STATUS. Adds support for additional ERR<n>MISC<m> registers. Adds support for the optional RAS Timestamp Extension. Adds support for the optional Common Fault Injection Model Extension. |

All other values are reserved.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

| ARCHVER | Meaning |
|---------|-----------------------------|
| 0b0000 | RAS System Architecture v1. |

All other values are reserved.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0b0000.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

| ARCHPART | Meaning |
|----------|--------------------------|
| 0xA00 | RAS System Architecture. |

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA00.

Accessing ERRDEVARCH

ERRDEVARCH can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|------------|
| RAS | 0xFBC | ERRDEVARCH |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

ERRDEVID, Device Configuration Register

The ERRDEVID characteristics are:

Purpose

Provides discovery information for the component.

Configuration

ERRDEVID is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVID is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | NUM | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the error records in this group, plus one. Each implemented record is owned by a node. A node might own multiple records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRDEVID

ERRDEVID can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| RAS | 0xFC8 | ERRDEVID |

Accesses on this interface are **RO**.

ERRERICR0, Error Recovery Interrupt Configuration Register 0

The ERRERICR0 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR0 are RES0.

ERRERICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR0 is a 64-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | ADDR | | | | | | | | | | | | | | | | | | | | | | | | |
| ADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | RES0 | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRERICR0.ADDR << 2) is the address that the component writes to when signaling the Error Recovery Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR0

ERRERICR0 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-----------|
| RAS | 0xE90 | ERRERICR0 |

Accesses on this interface are **RW**.

ERRERICR1, Error Recovery Interrupt Configuration Register 1

The ERRERICR1 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR1 are RES0.

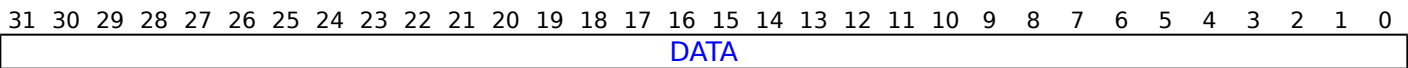

ERRERICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR1 is a 32-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

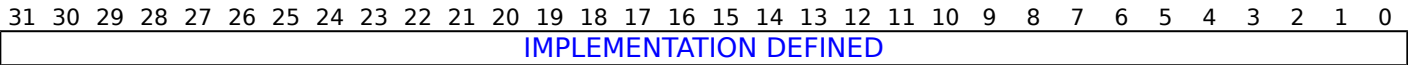

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR1

ERRERICR1 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-----------|
| RAS | 0xE98 | ERRERICR1 |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRERICR2, Error Recovery Interrupt Configuration Register 2

The ERRERICR2 characteristics are:

Purpose

Error Recovery Interrupt control and configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR2 are RES0.

ERRERICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR2 is a 32-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|---|-------|---|-------|---|----|---------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | RES0 | | | | | | | | | | | | IRQEN | | NSMSI | | SH | MemAttr | | | |

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

| IRQEN | Meaning |
|-------|-----------|
| 0b0 | Disabled. |
| 0b1 | Enabled. |

The reset behavior of this field is:

- On an Error recovery reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRERICR2:

Security attribute. Defines the physical address space for message signaled interrupts.

| NSMSI | Meaning |
|-------|-------------|
| 0b0 | Secure. |
| 0b1 | Non-secure. |

The reset behavior of this field is:

- On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRERICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

| SH | Meaning |
|------|------------------|
| 0b00 | Not shared. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

All other values are reserved.

This field is ignored when ERRERICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

| MemAttr | Meaning |
|---------|--|
| 0b0000 | Device-nGnRnE memory. |
| 0b0001 | Device-nGnRE memory. |
| 0b0010 | Device-nGRE memory. |
| 0b0011 | Device-GRE memory. |
| 0b0101 | Normal memory, Inner Non-cacheable, Outer Non-cacheable. |
| 0b0110 | Normal memory, Inner Write-Through, Outer Non-cacheable. |
| 0b0111 | Normal memory, Inner Write-Back, Outer Non-cacheable. |
| 0b1001 | Normal memory, Inner Non-cacheable, Outer Write-Through. |
| 0b1010 | Normal memory, Inner Write-Through, Outer Write-Through. |
| 0b1011 | Normal memory, Inner Write-Back, Outer Write-Through. |
| 0b1101 | Normal memory, Inner Non-cacheable, Outer Write-Back. |
| 0b1110 | Normal memory, Inner Write-Through, Outer Write-Back. |
| 0b1111 | Normal memory, Inner Write-Back, Outer Write-Back. |

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

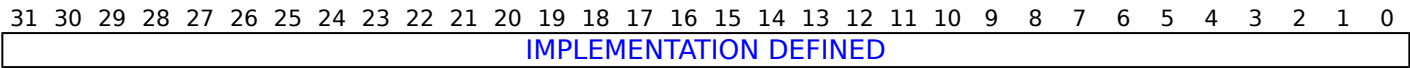

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR2

ERRERICR2 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-----------|
| RAS | 0xE9C | ERRERICR2 |

Accesses on this interface are **RW**.

ERRFHICR0, Fault Handling Interrupt Configuration Register 0

The ERRFHICR0 characteristics are:

Purpose

Fault Handling Interrupt configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR0 are RES0.

ERRFHICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR0 is a 64-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | ADDR | | | | | | | | | | | | | | | | | | | | | | | | |
| ADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | RES0 | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRFHICR0.ADDR << 2) is the address that the component writes to when signaling the Fault Handling Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR0

ERRFHICR0 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-----------|
| RAS | 0xE80 | ERRFHICR0 |

Accesses on this interface are **RW**.

ERRFHICR1, Fault Handling Interrupt Configuration Register 1

The ERRFHICR1 characteristics are:

Purpose

Fault Handling Interrupt configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR1 are RES0.

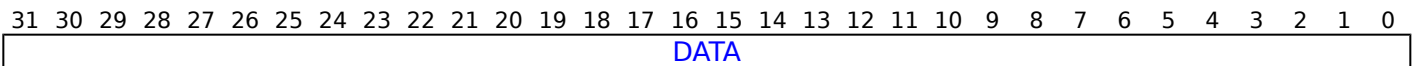

ERRFHICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR1 is a 32-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

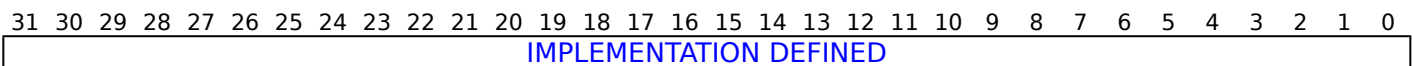

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR1

ERRFHICR1 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-----------|
| RAS | 0xE88 | ERRFHICR1 |

Accesses on this interface are **RW**.

ERRFHICR2, Fault Handling Interrupt Configuration Register 2

The ERRFHICR2 characteristics are:

Purpose

Fault Handling Interrupt control and configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR2 are RES0.

ERRFHICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR2 is a 32-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|-------|----|-------|----|----|----|---------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | IRQEN | | NSMSI | | SH | | MemAttr | | | | | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

| IRQEN | Meaning |
|-------|-----------|
| 0b0 | Disabled. |
| 0b1 | Enabled. |

The reset behavior of this field is:

- On an Error recovery reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRFHICR2:

Security attribute. Defines the physical address space for message signaled interrupts.

| NSMSI | Meaning |
|-------|-------------|
| 0b0 | Secure. |
| 0b1 | Non-secure. |

The reset behavior of this field is:

- On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRFHICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

| SH | Meaning |
|------|------------------|
| 0b00 | Not shared. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

All other values are reserved.

This field is ignored when ERRFHICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

| MemAttr | Meaning |
|---------|--|
| 0b0000 | Device-nGnRnE memory. |
| 0b0001 | Device-nGnRE memory. |
| 0b0010 | Device-nGRE memory. |
| 0b0011 | Device-GRE memory. |
| 0b0101 | Normal memory, Inner Non-cacheable, Outer Non-cacheable. |
| 0b0110 | Normal memory, Inner Write-Through, Outer Non-cacheable. |
| 0b0111 | Normal memory, Inner Write-Back, Outer Non-cacheable. |
| 0b1001 | Normal memory, Inner Non-cacheable, Outer Write-Through. |
| 0b1010 | Normal memory, Inner Write-Through, Outer Write-Through. |
| 0b1011 | Normal memory, Inner Write-Back, Outer Write-Through. |
| 0b1101 | Normal memory, Inner Non-cacheable, Outer Write-Back. |
| 0b1110 | Normal memory, Inner Write-Through, Outer Write-Back. |
| 0b1111 | Normal memory, Inner Write-Back, Outer Write-Back. |

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR2

ERRFHICR2 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|-----------|
| RAS | 0xE8C | ERRFHICR2 |

Accesses on this interface are **RW**.

ERRGSR, Error Group Status Register

The ERRGSR characteristics are:

Purpose

Shows the status for the records in the group.

Configuration

ERRGSR is implemented only as part of a memory-mapped group of error records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

Attributes

ERRGSR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 |
| RES0 | | | | | | | | S55 | S54 | S53 | S52 | S51 | S50 | S49 | S48 | S47 | S46 | S45 | S44 | S43 | S42 | S41 | S40 | S39 | S38 | S37 | S36 | S35 |
| S31 | S30 | S29 | S28 | S27 | S26 | S25 | S24 | S23 | S22 | S21 | S20 | S19 | S18 | S17 | S16 | S15 | S14 | S13 | S12 | S11 | S10 | S9 | S8 | S7 | S6 | S5 | S4 | S3 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 |

Bits [63:56]

Reserved, RES0.

S<m>, bit [m], for m = 55 to 0

When error record <m> is implemented and error record <m> supports this type of reporting:

The status for error record <m>. A read-only copy of [ERR<m>STATUS.V](#).

| S<m> | Meaning |
|------|---------------------|
| 0b0 | No error. |
| 0b1 | One or more errors. |

If the Common Fault Injection Model is implemented, up-to 24 records can be implemented meaning bits [55:24] are RES0.

Otherwise:

Reserved, RES0.

Accessing ERRGSR

ERRGSR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| RAS | 0xE00 | ERRGSR |

Accesses on this interface are **RO**.

ERRIIDR, Implementation Identification Register

The ERRIIDR characteristics are:

Purpose

Defines the implementer of the component.

Configuration

Implementation of this register is OPTIONAL.

This register is present only when RAS System Architecture v1.1 is implemented.

Attributes

ERRIIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|----------|----|----|----|-------------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ProductID | | | | | | | | | | | | Variant | | | | Revision | | | | Implementer | | | | | | | | | | | |

ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

If [ERRPIDR0](#) and [ERRPIDR1](#) are implemented, [ERRPIDR0](#).PART_0 matches bits [7:0] of ERRIIDR.ProductID and [ERRPIDR1](#).PART_1 matches bits [11:8] of ERRIIDR.ProductID.

Variant, bits [19:16]

Component major revision.

This field distinguishes product variants or major revisions of the product.

If [ERRPIDR2](#) is implemented, [ERRPIDR2](#).REVISION matches ERRIIDR.Variant.

Revision, bits [15:12]

Component minor revision.

This field distinguishes minor revisions of the product.

If [ERRPIDR3](#) is implemented, [ERRPIDR3](#).REVAND matches ERRIIDR.Revision.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the RAS component. For an Arm implementation, this field has the value 0x43B.

Bits [11:8] contain the JEP106 continuation code of the implementer, and bits [6:0] contain the JEP106 identity code of the implementer. Bit 7 is RES0.

If [ERRPIDR4](#) is implemented, [ERRPIDR2](#) is implemented, and [ERRPIDR1](#) is implemented, [ERRPIDR4](#).DES_2 matches bits [11:8] of ERRIIDR.Implementer, [ERRPIDR2](#).DES_1 matches bits [6:4] of ERRIIDR.Implementer, and [ERRPIDR1](#).DES_0 matches bits [3:0] of ERRIIDR.Implementer.

Accessing ERRIIDR

ERRIIDR can be accessed through the memory-mapped interfaces:

| Component | Offset |
|-----------|--------|
| RAS | 0xE10 |

Accesses on this interface are **RO**.

ERRIMPDEF<n>, IMPLEMENTATION DEFINED Register <n>, n = 0 - 191

The ERRIMPDEF<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED RAS extensions.

Configuration

This register is present only when the Common Fault Injection Model Extension is not implemented, ERRDEVID.NUM <= 32 and an implementation implements ERRIMPDEF<n>. Otherwise, direct accesses to ERRIMPDEF<n> are RES0.

Attributes

ERRIMPDEF<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRIMPDEF<n>

ERRIMPDEF<n> can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|-----------------|--------------|
| RAS | 0x800 + (8 * n) | ERRIMPDEF<n> |

Accesses on this interface are **RW**.

ERRIRQCR<n>, Generic Error Interrupt Configuration Register, n = 0 - 15

The ERRIRQCR<n> characteristics are:

Purpose

The ERRIRQCR<n> registers are reserved for IMPLEMENTATION DEFINED interrupt configuration registers.

The architecture provides a recommended layout for the ERRIRQCR<n> registers. These registers are named:

- [ERRFHICR0](#), [ERRFHICR1](#), and [ERRFHICR2](#) for the fault handling interrupt controls.
- [ERRERICR0](#), [ERRERICR1](#), and [ERRERICR2](#) for the error recovery interrupt controls.
- [ERRCRICR0](#), [ERRCRICR1](#), and [ERRCRICR2](#) for the critical error interrupt controls.
- [ERRIRQSR](#) for the status register.

This section describes the generic, IMPLEMENTATION DEFINED, format.

Configuration

This register is present only when the interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQCR<n> are RES0.

ERRIRQCR<n> is implemented only as part of a memory-mapped group of error records.

Attributes

ERRIRQCR<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED controls. The content of these registers is IMPLEMENTATION DEFINED.

Accessing ERRIRQCR<n>

ERRIRQCR<n> can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|-----------------|-------------|
| RAS | 0xE80 + (8 * n) | ERRIRQCR<n> |

Accesses on this interface are **RW**.

ERRIRQSR, Error Interrupt Status Register

The ERRIRQSR characteristics are:

Purpose

Interrupt status register.

Configuration

This register is present only when interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQSR are RES0.

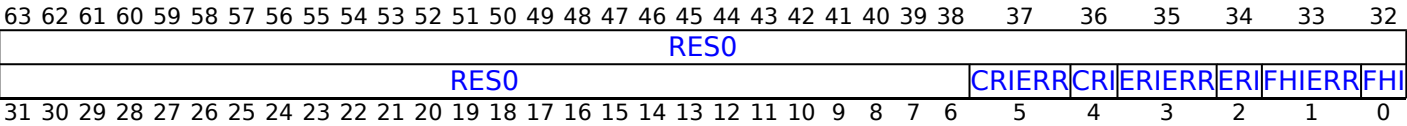

ERRIRQSR is implemented only as part of a memory-mapped group of error records.

Attributes

ERRIRQSR is a 64-bit register.

Field descriptions

When the implementation uses the recommended layout for the ERRIRQCR<n> registers:

Bits [63:6]

Reserved, RES0.

CRIERR, bit [5]

When the Critical Error Interrupt is implemented:

Critical Error Interrupt Error.

| CRIERR | Meaning |
|--------|---|
| 0b0 | Critical Error Interrupt write has not returned an error since this field was last cleared to zero. |
| 0b1 | Critical Error Interrupt write has returned an error since this field was last cleared to zero. |

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CRI, bit [4]**When the Critical Error Interrupt is implemented:**

Critical Error Interrupt write in progress.

| CRI | Meaning |
|------------|---|
| 0b0 | Critical Error Interrupt write not in progress. |
| 0b1 | Critical Error Interrupt write in progress. |

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual [ERR<n>STATUS](#) registers.

Access to this field is **RO**.**Otherwise:**

Reserved, RES0.

ERIERR, bit [3]**When the Error Recovery Interrupt is implemented:**

Error Recovery Interrupt Error.

| ERIERR | Meaning |
|---------------|---|
| 0b0 | Error Recovery Interrupt write has not returned an error since this field was last cleared to zero. |
| 0b1 | Error Recovery Interrupt write has returned an error since this field was last cleared to zero. |

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.**Otherwise:**

Reserved, RES0.

ERI, bit [2]**When the Error Recovery Interrupt is implemented:**

Error Recovery Interrupt write in progress.

| ERI | Meaning |
|------------|---|
| 0b0 | Error Recovery Interrupt write not in progress. |
| 0b1 | Error Recovery Interrupt write in progress. |

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual [ERR<n>STATUS](#) registers.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

FHIERR, bit [1]

When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt Error.

| FHIERR | Meaning |
|---------------|---|
| 0b0 | Fault Handling Interrupt write has not returned an error since this field was last cleared to zero. |
| 0b1 | Fault Handling Interrupt write has returned an error since this field was last cleared to zero. |

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

FHI, bit [0]

When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt write in progress.

| FHI | Meaning |
|------------|---|
| 0b0 | Fault Handling Interrupt write not in progress. |
| 0b1 | Fault Handling Interrupt write in progress. |

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

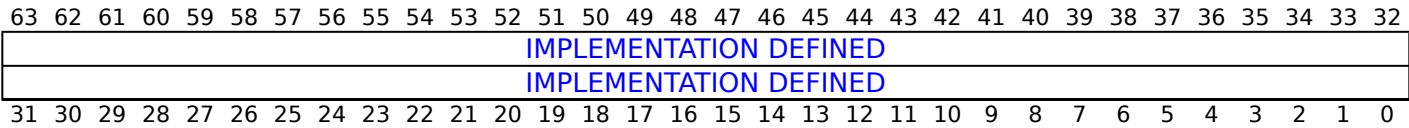

To determine whether an interrupt is active, software must examine the individual [ERR<n>STATUS](#) registers.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRIRQSR

ERRIRQSR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| RAS | 0xEF8 | ERRIRQSR |

Accesses on this interface are **RW**.

ERR<n>ADDR, Error Record Address Register, n = 0 - 65534

The ERR<n>ADDR characteristics are:

Purpose

If an address is associated with a detected error, then it is written to ERR<n>ADDR when the error is recorded. It is IMPLEMENTATION DEFINED how the recorded address maps to the software-visible physical address. Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

Configuration

This register is present only when error record <n> is implemented and error record <n> includes an address associated with an error. Otherwise, direct accesses to ERR<n>ADDR are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

Attributes

ERR<n>ADDR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|-----|------|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| NS | SI | AI | VA | NSE | RES0 | | PADDR | | | | | | | | | | | | | | | | | | | | | | | | |
| PADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

NS, bit [63]

When FEAT_RME is implemented:

Non-secure attribute. With ERR<n>ADDR.NSE, indicates the physical address space of the recorded location.

| NS | Meaning |
|-----|---|
| 0b0 | When ERR<n>ADDR.NSE == 0: ERR<n>ADDR.PADDR is a Secure address. When ERR<n>ADDR.NSE == 1: ERR<n>ADDR.PADDR is a Root address. |
| 0b1 | When ERR<n>ADDR.NSE == 0: ERR<n>ADDR.PADDR is a Non-secure address. When ERR<n>ADDR.NSE == 1: ERR<n>ADDR.PADDR is a Realm address. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RME is not implemented:

Non-secure attribute.

| NS | Meaning |
|-----|---|
| 0b0 | ERR<n>ADDR.PADDR is a Secure address. |
| 0b1 | ERR<n>ADDR.PADDR is a Non-secure address. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SI, bit [62]

When FEAT_RME is implemented:

Secure Incorrect. Indicates whether ERR<n>ADDR.{NS, NSE} are valid.

| SI | Meaning |
|-----|---|
| 0b0 | ERR<n>ADDR.{NS, NSE} are correct. That is, they match the programmers' view of the physical address space for the recorded location. |
| 0b1 | ERR<n>ADDR.{NS, NSE} might not be correct, and might not match the programmers' view of the physical address space for the recorded location. |

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RME is not implemented:

Secure Incorrect. Indicates whether ERR<n>ADDR.NS is valid.

| SI | Meaning |
|-----|--|
| 0b0 | ERR<n>ADDR.NS is correct. That is, it matches the programmers' view of the Non-secure attribute for the recorded location. |
| 0b1 | ERR<n>ADDR.NS might not be correct, and might not match the programmers' view of the Non-secure attribute for the recorded location. |

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AI, bit [61]

Address Incorrect. Indicates whether ERR<n>ADDR.PADDR is a valid physical address that is known to match the programmers' view of the physical address for the recorded location.

| AI | Meaning |
|-----|--|
| 0b0 | ERR<n>ADDR.PADDR is a valid physical address. That is, it matches the programmers' view of the physical address for the recorded location. |
| 0b1 | ERR<n>ADDR.PADDR might not be a valid physical address, and might not match the programmers' view of the physical address for the recorded location. |

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

VA, bit [60]

Virtual Address. Indicates whether ERR<n>ADDR.PADDR field is a virtual address.

| VA | Meaning |
|-----|--|
| 0b0 | ERR<n>ADDR.PADDR is not a virtual address. |
| 0b1 | ERR<n>ADDR.PADDR is a virtual address. |

No context information is provided for the virtual address. When ERR<n>ADDR.VA is 1, ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1}.

Support for this field is optional. If this field is not implemented and ERR<n>ADDR.PADDR field is a virtual address, then ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1}.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [59]

When FEAT_RME is implemented:

Physical Address Space. Together with ERR<n>ADDR.NS, indicates the address space for ERR<n>ADDR.PADDR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [58:56]

Reserved, RES0.

PADDR, bits [55:0]

Physical Address. Address of the recorded location. If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value. Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing ERR<n>ADDR

ERR<n>ADDR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|------------------|------------|
| RAS | 0x018 + (64 * n) | ERR<n>ADDR |

This interface is accessible as follows:

- When the Common Fault Injection Model Extension is implemented by the node that owns this error record, ERR<q>PFGF.AV == 0 and ERR<n>STATUS.AV == 1 accesses to this register are **RO**.
- When the Common Fault Injection Model Extension is not implemented by the node that owns this error record and ERR<n>STATUS.AV == 1 accesses to this register are **RO**.
- Otherwise accesses to this register are **RW**.

ERR<n>CTLR, Error Record Control Register, n = 0 - 65534

The ERR<n>CTLR characteristics are:

Purpose

The error control register contains enable bits for the node that writes to this record:

- Enabling error detection and correction.
- Enabling the critical error, error recovery, and fault handling interrupts.
- Enabling in-band error response for uncorrected errors.

For each bit, if the node does not support the feature, then the bit is RES0. The definition of each record is IMPLEMENTATION DEFINED.

Configuration

This register is present only when error record <n> is implemented and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>CTLR are RES0.

[ERR<n>FR](#) describes the features implemented by the node.

Attributes

ERR<n>CTLR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [63:32]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

Bits [31:14]

Reserved, RES0.

CI, bit [13]

When ERR<n>FR.CI == 0b10:

Critical error interrupt enable. When enabled, the critical error interrupt is generated for a critical error condition.

| CI | Meaning |
|-----|--|
| 0b0 | Critical error interrupt not generated for critical errors. Critical errors are treated as Uncontained errors. |
| 0b1 | Critical error interrupt generated for critical errors. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [12]

Reserved, RES0.

WDUI, bit [11]

When **ERR<n>FR.DUI == 0b11:**

Error recovery interrupt for Deferred errors on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on writes.

| WDUI | Meaning |
|------|---|
| 0b0 | Error recovery interrupt not generated for Deferred errors on writes. |
| 0b1 | Error recovery interrupt generated for Deferred errors on writes. |

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DUI, bit [10]

When **ERR<n>FR.DUI == 0b10:**

Error recovery interrupt for Deferred errors enable.

When [ERR<n>FR.DUI == 0b10](#), this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Deferred error.

| DUI | Meaning |
|-----|---|
| 0b0 | Error recovery interrupt not generated for Deferred errors. |
| 0b1 | Error recovery interrupt generated for Deferred errors. |

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When **ERR<n>FR.DUI == 0b11:**

Error recovery interrupt for Deferred errors on reads enable.

When [ERR<n>FR.DUI == 0b11](#), this field is named RDUI.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on reads.

| RDUI | Meaning |
|-------------|--|
| 0b0 | Error recovery interrupt not generated for Deferred errors on reads. |
| 0b1 | Error recovery interrupt generated for Deferred errors on reads. |

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WCFI, bit [9]

When ERR<n>FR.CFI == 0b11:

Fault handling interrupt for Corrected errors on writes enable.

When enabled:

- If the node implements Corrected error counters for writes, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see [ERR<n>MISC0](#).
- Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on writes.

| WCFI | Meaning |
|-------------|--|
| 0b0 | Fault handling interrupt not generated for Corrected errors on writes. |
| 0b1 | Fault handling interrupt generated for Corrected errors on writes. |

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CFI, bit [8]

When ERR<n>FR.CFI == 0b10:

Fault handling interrupt for Corrected errors enable.

When [ERR<n>FR.CFI](#) == 0b10, this control applies to errors arising from both reads and writes.

When enabled:

- If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see [ERR<n>MISC0](#).
- Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error.

| CFI | Meaning |
|------------|--|
| 0b0 | Fault handling interrupt not generated for Corrected errors. |
| 0b1 | Fault handling interrupt generated for Corrected errors. |

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.CFI == 0b11:

Fault handling interrupt for Corrected errors on reads enable.

When [ERR<n>FR.CFI](#) == 0b11, this field is named RCFI.

When enabled:

- If the node implements Corrected error counters for reads, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see [ERR<n>MISC0](#).
- Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on reads.

| RCFI | Meaning |
|------|---|
| 0b0 | Fault handling interrupt not generated for Corrected errors on reads. |
| 0b1 | Fault handling interrupt generated for Corrected errors on reads. |

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUE, bit [7]

When ERR<n>FR.UE == 0b11:

In-band error response on writes enable.

When enabled, responses to writes that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

| WUE | Meaning |
|-----|---|
| 0b0 | In-band error response for uncorrected errors on writes disabled. |
| 0b1 | In-band error response for uncorrected errors on writes enabled. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WFI, bit [6]

When ERR<n>FR.FI == 0b11:

Fault handling interrupt on writes enable.

When enabled:

- The fault handling interrupt is generated for errors recorded as either Deferred error or Uncorrected error on writes.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
 - If the node implements Corrected error counters for writes, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
 - Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on writes.

| WFI | Meaning |
|-----|--|
| 0b0 | Fault handling interrupt on writes disabled. |
| 0b1 | Fault handling interrupt on writes enabled. |

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUI, bit [5]

When **ERR<n>FR.UI == 0b11**:

Uncorrected error recovery interrupt on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on writes.

| WUI | Meaning |
|-----|--|
| 0b0 | Error recovery interrupt on writes disabled. |
| 0b1 | Error recovery interrupt on writes enabled. |

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UE, bit [4]

When **ERR<n>FR.UE == 0b10**:

In-band error response enable.

When [ERR<n>FR.UE == 0b10](#), this control applies to errors arising from both reads and writes.

When enabled, responses to transactions that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

| UE | Meaning |
|-----|---|
| 0b0 | In-band error response for uncorrected errors disabled. |
| 0b1 | In-band error response for uncorrected errors enabled. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.UE == 0b11:

In-band error response on reads enable.

When [ERR<n>FR.UE](#) == 0b11, this field is named RUE.

When enabled, responses to reads that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

| RUE | Meaning |
|-----|--|
| 0b0 | In-band error response for uncorrected errors on reads disabled. |
| 0b1 | In-band error response for uncorrected errors on reads enabled. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FI, bit [3]**When ERR<n>FR.FI == 0b10:**

Fault handling interrupt enable.

When [ERR<n>FR.FI](#) == 0b10, this control applies to errors arising from both reads and writes.

When enabled:

- The fault handling interrupt is generated for all errors recorded as either Deferred error or Uncorrected error.
- If the fault handling interrupt for Corrected errors control is not implemented:
 - If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
 - Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error.

| FI | Meaning |
|-----|------------------------------------|
| 0b0 | Fault handling interrupt disabled. |
| 0b1 | Fault handling interrupt enabled. |

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.FI == 0b11:

Fault handling interrupt on reads enable.

When [ERR<n>FR.FI](#) == 0b11, this field is named RFI.

When enabled:

- The fault handling interrupt is generated for errors recorded as either Deferred error or Uncorrected error on reads.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
 - If the node implements Corrected error counters for reads, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
 - Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on reads.

| RFI | Meaning |
|-----|---|
| 0b0 | Fault handling interrupt on reads disabled. |
| 0b1 | Fault handling interrupt on reads enabled. |

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UI, bit [2]

When **ERR<n>FR.UI == 0b10:**

Uncorrected error recovery interrupt enable.

When [ERR<n>FR.UI == 0b10](#), this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Uncorrected error.

| UI | Meaning |
|-----|------------------------------------|
| 0b0 | Error recovery interrupt disabled. |
| 0b1 | Error recovery interrupt enabled. |

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When **ERR<n>FR.UI == 0b11:**

Uncorrected error recovery interrupt on reads enable.

When [ERR<n>FR.UI == 0b11](#), this field is named RUI.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on reads.

| RUI | Meaning |
|-----|---|
| 0b0 | Error recovery interrupt on reads disabled. |
| 0b1 | Error recovery interrupt on reads enabled. |

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMPLEMENTATION DEFINED, bit [1]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

ED, bit [0]

When ERR<n>FR.ED == 0b10:

Error reporting and logging enable. When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an IMPLEMENTATION DEFINED control for error injection.

| ED | Meaning |
|-----|---------------------------|
| 0b0 | Error reporting disabled. |
| 0b1 | Error reporting enabled. |

It is IMPLEMENTATION DEFINED whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrected errors might result in corrupt data being silently propagated by the node.

Note

If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this field is set to 0 on Cold reset, meaning errors are not reported from Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. Otherwise, the Cold reset value is IMPLEMENTATION DEFINED. If the Cold reset value is 1, the reset values of other controls in this register are also IMPLEMENTATION DEFINED and should not be UNKNOWN.

The reset behavior of this field is:

- On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

Accessing ERR<n>CTLR

ERR<n>CTLR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|------------------|------------|
| RAS | 0x008 + (64 * n) | ERR<n>CTLR |

Accesses on this interface are RW.

ERR<n>FR, Error Record Feature Register, n = 0 - 65534

The ERR<n>FR characteristics are:

Purpose

Defines whether <n> is the first record owned by a node:

- If <n> is the first error record owned by a node, then ERR<n>FR.ED is not 0b00.
- If <n> is not the first error record owned by a node, then ERR<n>FR.ED is 0b00.

If <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

Attributes

ERR<n>FR is a 64-bit register.

Field descriptions

When error record <n> is not the first error record owned by the node:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | ED |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:2]

Reserved, RES0.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is not the first error record owned the node.

| ED | Meaning |
|------|---|
| 0b00 | Error record <n> is not the first error record owned by the node. |

This field reads as 0b00.

When error record <n> is the first error record owned by the node:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------------|------|----|----|----|----|----|----|-----|-----|----|----|----|-----|----|-----|---------------------------|----|----|----|---------------------------|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| IMPLEMENTATION DEFINED | | | | | | | | | CE | DE | UE | OU | ER | UE | UC | IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | |
| FRX | RES0 | | | | | TS | CI | INJ | CEO | | | | DUI | RP | CEC | CFI | UE | FI | UI | IMPLEMENTATION DEFINED | | | | | ED | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IMPLEMENTATION DEFINED, bits [63:55]**When ERR<n>FR.FRX != 1:**

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

CE, bits [54:53]**When ERR<n>FR.FRX == 1:**

Corrected Error recording. Describes the types of Corrected errors the node can record, if any.

| CE | Meaning |
|------|--|
| 0b00 | Does not record Corrected errors. |
| 0b01 | Records only transient or persistent Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to either 0b01 or 0b11. |
| 0b10 | Records only non-specific Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to 0b10. |
| 0b11 | Records all types of Corrected error. |

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

DE, bit [52]**When ERR<n>FR.FRX == 1:**

Deferred Error recording. Describes whether the node supports recording Deferred errors.

| DE | Meaning |
|-----|----------------------------------|
| 0b0 | Does not record Deferred errors. |
| 0b1 | Records Deferred errors. |

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEO, bit [51]**When ERR<n>FR.FRX == 1:**

Latent or Restartable Error recording. Describes whether the node supports recording Latent or Restartable errors.

| UEO | Meaning |
|-----|---|
| 0b0 | Does not record Latent or Restartable errors. |
| 0b1 | Records Latent or Restartable errors. |

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UER, bit [50]**When ERR<n>FR.FRX == 1:**

Signaled or Recoverable Error recording. Describes whether the node supports recording Signaled or Recoverable errors.

| UER | Meaning |
|-----|---|
| 0b0 | Does not record Signaled or Recoverable errors. |
| 0b1 | Records Signaled or Recoverable errors. |

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEU, bit [49]**When ERR<n>FR.FRX == 1:**

Unrecoverable Error recording. Describes whether the node supports recording Unrecoverable errors.

| UEU | Meaning |
|-----|---------------------------------------|
| 0b0 | Does not record Unrecoverable errors. |
| 0b1 | Records Unrecoverable errors. |

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UC, bit [48]**When ERR<n>FR.FRX == 1:**

Uncontainable Error recording. Describes whether the node supports recording Uncontainable errors.

| UC | Meaning |
|-----|---------------------------------------|
| 0b0 | Does not record Uncontainable errors. |
| 0b1 | Records Uncontainable errors. |

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

IMPLEMENTATION DEFINED, bits [47:32]

Reserved for identifying IMPLEMENTATION DEFINED controls.

FRX, bit [31]**When RAS System Architecture v1.1 is implemented:**

Feature Register extension. Defines whether ERR<n>FR[63:48] are architecturally defined.

| FRX | Meaning |
|-----|--|
| 0b0 | ERR<n>FR[63:48] are IMPLEMENTATION DEFINED. |
| 0b1 | ERR<n>FR[63:48] are defined by the architecture. |

Otherwise:

Reserved, RES0.

Bits [30:26]

Reserved, RES0.

TS, bits [25:24]

Timestamp Extension. Indicates whether, for each error record <m> owned by this node, [ERR<m>MISC3](#) is used as the timestamp register, and, if it is, the timebase used by the timestamp.

| TS | Meaning |
|---|---|
| 0b00 | Does not support a timestamp register. |
| 0b01 | Implements a timestamp register in ERR<n>MISC3 for each error record <m> owned by the node. The timestamp uses the same timebase as the system Generic Timer. |
| Note For an error record that has an affinity to a PE, this is the same timer that is visible through CNTPCT_ELO at the highest Exception level on that PE. | |
| 0b10 | Implements a timestamp register in ERR<m>MISC3 for each error record <m> owned by the node. The timestamp uses an IMPLEMENTATION DEFINED timebase. |

All other values are reserved.

CI, bits [23:22]

Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented by the node.

| CI | Meaning |
|------|--|
| 0b00 | Does not support the critical error interrupt. ERR<n>CTLR.CI is RES0. |
| 0b01 | Critical error interrupt is supported and always enabled. ERR<n>CTLR.CI is RES0. |
| 0b10 | Critical error interrupt is supported and controllable using ERR<n>CTLR.CI . |

All other values are reserved.

INJ, bits [21:20]

Fault Injection Extension. Indicates whether the Common Fault Injection Model Extension is implemented by the node.

| INJ | Meaning |
|------|---|
| 0b00 | Does not support the Common Fault Injection Model Extension. |
| 0b01 | Supports the Common Fault Injection Model Extension. See ERR<n>PFGF for more information. |

All other values are reserved.

CEO, bits [19:18]**When ERR<n>FR.CEC != 0b000:**

Corrected Error overwrite. Indicates the behavior of the node when a second or subsequent Corrected error is recorded and a first Corrected error has previously been recorded by an error record <m> owned by the node.

| CEO | Meaning |
|------|---|
| 0b00 | Keeps the previous error syndrome. |
| 0b01 | If ERR<m>STATUS.OF is 1 before the Corrected error is counted, then the error record keeps the previous syndrome. Otherwise the previous syndrome is overwritten. |

All other values are reserved.

The second or subsequent Corrected error is counted by the Corrected error counter, regardless of the value of this field. If counting the error causes unsigned overflow of the counter, then [ERR<m>STATUS.OF](#) is set to 1.

This means that, if no other error is subsequently recorded that overwrites the syndrome:

- If ERR<n>FR.CEO is 0b00, the error record holds the syndrome for the first recorded Corrected error.
- If ERR<n>FR.CEO is 0b01, the error record holds the syndrome for the most recently recorded Corrected error before the counter overflows.

Otherwise:

Reserved, RES0.

DUI, bits [17:16]

When ERR<n>FR.UI != 0b00:

Error recovery interrupt for deferred errors control. Indicates whether the enabling and disabling of error recovery interrupts on deferred errors is supported by the node.

| DUI | Meaning |
|------|---|
| 0b00 | Does not support the enabling and disabling of error recovery interrupts on deferred errors. ERR<n>CTLR.DUI is RES0. |
| 0b10 | Enabling and disabling of error recovery interrupts on deferred errors is supported and controllable using ERR<n>CTLR.DUI . |
| 0b11 | Enabling and disabling of error recovery interrupts on deferred errors is supported, and controllable using ERR<n>CTLR.WDUI for writes and ERR<n>CTLR.RDUI for reads. |

All other values are reserved.

Otherwise:

Reserved, RES0.

RP, bit [15]

When ERR<n>FR.CEC != 0b000:

Repeat counter. Indicates whether the node implements a second Corrected error counter in [ERR<m>MISC0](#) for each error record <m> owned by the node that can record countable errors.

| RP | Meaning |
|-----|---|
| 0b0 | Implements a single Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. |
| 0b1 | Implements a first (repeat) counter and a second (other) counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. The repeat counter is the same size as the primary error counter. |

Otherwise:

Reserved, RES0.

CEC, bits [14:12]

Corrected Error Counter. Indicates whether the node implements the standard Corrected error counter mechanisms in [ERR<m>MISC0](#) for each error record <m> owned by the node that can record countable errors.

| CEC | Meaning |
|-------|--|
| 0b000 | Does not implement the standard Corrected error counter model. |
| 0b010 | Implements an 8-bit Corrected error counter in ERR<m>MISC0 [39:32] for each error record <m> owned by the node that can record countable errors. |
| 0b100 | Implements a 16-bit Corrected error counter in ERR<m>MISC0 [47:32] for each error record <m> owned by the node that can record countable errors. |

All other values are reserved.

Note

Implementations might include other error counter models, or might include the standard model and not indicate this in ERR<n>FR.

CFI, bits [11:10]

When ERR<n>FR.FI != 0b00:

Fault handling interrupt for corrected errors control. Indicates whether the enabling and disabling of fault handling interrupts on corrected errors is supported by the node.

| CFI | Meaning |
|------|--|
| 0b00 | Does not support the enabling and disabling of fault handling interrupts on corrected errors. ERR<n>CTLR .CFI is RES0. |
| 0b10 | Enabling and disabling of fault handling interrupts on corrected errors is supported and controllable using ERR<n>CTLR .CFI. |
| 0b11 | Enabling and disabling of fault handling interrupts on corrected errors is supported, and controllable using ERR<n>CTLR .WCFI for writes and ERR<n>CTLR .RCFI for reads. |

All other values are reserved.

Otherwise:

Reserved, RES0.

UE, bits [9:8]

In-band error response (External Abort). Indicates whether the in-band error response and associated controls are implemented by the node.

| UE | Meaning |
|------|---|
| 0b00 | Does not support the in-band error response. ERR<n>CTLR .UE is RES0. |
| 0b01 | In-band error response is supported and always enabled. ERR<n>CTLR .UE is RES0. |
| 0b10 | In-band error response is supported and controllable using ERR<n>CTLR .UE. |
| 0b11 | In-band error response is supported, and controllable using ERR<n>CTLR .WUE for writes and ERR<n>CTLR .RUE for reads. |

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

FI, bits [7:6]

Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are implemented by the node.

| FI | Meaning |
|------|--|
| 0b00 | Does not support the fault handling interrupt. ERR<n>CTLR .FI is RES0. |
| 0b01 | Fault handling interrupt is supported and always enabled. ERR<n>CTLR .FI is RES0. |
| 0b10 | Fault handling interrupt is supported and controllable using ERR<n>CTLR .FI. |
| 0b11 | Fault handling interrupt is supported, and controllable using ERR<n>CTLR .WFI for writes and ERR<n>CTLR .RFI for reads. |

UI, bits [5:4]

Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are implemented by the node.

| UI | Meaning |
|------|--|
| 0b00 | Does not support the error handling interrupt. ERR<n>CTLR .UI is RES0. |
| 0b01 | Error handling interrupt is supported and always enabled. ERR<n>CTLR .UI is RES0. |
| 0b10 | Error handling interrupt is supported and controllable using ERR<n>CTLR .UI. |
| 0b11 | Error handling interrupt is supported, and controllable using ERR<n>CTLR .WUI for writes and ERR<n>CTLR .RUI for reads. |

IMPLEMENTATION DEFINED, bits [3:2]

IMPLEMENTATION DEFINED.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is the first record owned the node, and whether the node implements the controls for enabling and disabling error reporting and logging.

| ED | Meaning |
|------|--|
| 0b01 | Error reporting and logging always enabled. ERR<n>CTLR .ED is RES0. |
| 0b10 | Error reporting and logging is controllable using ERR<n>CTLR .ED. |

All other values are reserved.

Accessing ERR<n>FR

ERR<n>FR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|------------------|----------|
| RAS | 0x000 + (64 * n) | ERR<n>FR |

Accesses on this interface are **RO**.

ERR<n>MISC0, Error Record Miscellaneous Register 0, n = 0 - 65534

The ERR<n>MISC0 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record <n> implements architecturally-defined Corrected error counters ([ERR<q>FR.CEC](#) != 0b000), and error record <n> can record countable errors, then ERR<n>MISC0 implements the architecturally-defined Corrected error counter or counters.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC0 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC0, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>MISC0 is a 64-bit register.

Field descriptions

When ERR<q>FR.CEC == 0b000:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b100 and ERR<q>FR.RP == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | OF | CEC | | | | | | | | | | | | | | | |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OF, bit [47]

Sticky overflow bit. Set to 1 when ERR<n>MISC0.CEC is incremented and wraps through zero.

| OF | Meaning |
|-----|-----------------------------|
| 0b0 | Counter has not overflowed. |
| 0b1 | Counter has overflowed. |

A direct write that modifies this field might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [46:32]

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b010 and ERR<q>FR.RP == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [63:40]

IMPLEMENTATION DEFINED syndrome.

OF, bit [39]

Sticky overflow bit. Set to 1 when ERR<n>MISC0.CEC is incremented and wraps through zero.

| OF | Meaning |
|-----|-----------------------------|
| 0b0 | Counter has not overflowed. |
| 0b1 | Counter has overflowed. |

A direct write that modifies this field might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [38:32]

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b100 and ERR<q>FR.RP == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| OFO | CECO | | | | | | | | | | | | | | | OFR | CECR | | | | | | | | | | | | | | |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

OFO, bit [63]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

| OFO | Meaning |
|-----|-----------------------------------|
| 0b0 | Other counter has not overflowed. |
| 0b1 | Other counter has overflowed. |

A direct write that modifies this field might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [62:48]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [47]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

| OFR | Meaning |
|-----|------------------------------------|
| 0b0 | Repeat counter has not overflowed. |
| 0b1 | Repeat counter has overflowed. |

A direct write that modifies this field might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [46:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b010 and ERR<q>FR.RP == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|------|----|----|----|----|----|----|----|-----|------|----|----|----|----|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | OFO | CECO | | | | | | | | OFR | CECR | | | | | | | |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OFO, bit [47]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

| OFO | Meaning |
|-----|-----------------------------------|
| 0b0 | Other counter has not overflowed. |
| 0b1 | Other counter has overflowed. |

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [46:40]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [39]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

| OFR | Meaning |
|-----|------------------------------------|
| 0b0 | Repeat counter has not overflowed. |
| 0b1 | Repeat counter has overflowed. |

A direct write that modifies this field might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [38:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC0

Reads from ERR<n>MISC0 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and [ERR<q>PFGF.MV](#) is 1, then some parts of this register are read/write when [ERR<n>STATUS.MV](#) is 1. See [ERR<n>PFGF.MV](#) for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When [ERR<n>STATUS.MV](#) is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC0 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|------------------|-------------|
| RAS | 0x020 + (64 * n) | ERR<n>MISC0 |

Accesses on this interface are **RW**.

ERR<n>MISC1, Error Record Miscellaneous Register 1, n = 0 - 65534

The ERR<n>MISC1 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC1 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC1, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>MISC1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC1

Reads from ERR<n>MISC1 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and [ERR<q>PFGF](#).MV is 1, then some parts of this register are read/write when [ERR<n>STATUS](#).MV is 1. See [ERR<n>PFGF](#).MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When [ERR<n>STATUS](#).MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC1 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|------------------|-------------|
| RAS | 0x028 + (64 * n) | ERR<n>MISC1 |

Accesses on this interface are **RW**.

ERR<n>MISC2, Error Record Miscellaneous Register 2, n = 0 - 65534

The ERR<n>MISC2 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when (an implementation implements ERR<n>MISC2 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC2 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC2, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC2 does not require zeroing to return the record to a quiescent state.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>MISC2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC2

Reads from ERR<n>MISC2 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and [ERR<q>PFGF](#).MV is 1, then some parts of this register are read/write when [ERR<n>STATUS](#).MV is 1. See [ERR<n>PFGF](#).MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When [ERR<n>STATUS](#).MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC2 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|---------------------------|-------------|
| RAS | $0 \times 030 + (64 * n)$ | ERR<n>MISC2 |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>MISC3, Error Record Miscellaneous Register 3, n = 0 - 65534

The ERR<n>MISC3 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record n supports the RAS Timestamp Extension ([ERR<q>FR.TS](#) != 0b00), then ERR<n>MISC3 contains the timestamp value for error record n when the error was detected. Otherwise the contents of ERR<n>MISC3 are IMPLEMENTATION DEFINED.

Configuration

This register is present only when (an implementation implements ERR<n>MISC3 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC3 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC3, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC3 does not require zeroing to return the record to a quiescent state.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>MISC3 is a 64-bit register.

Field descriptions

When ERR<q>FR.TS != 0b00:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | TS | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | TS | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

TS, bits [63:0]

Timestamp. Timestamp value recorded when the error was detected. Valid only if [ERR<n>STATUS.V](#) == 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO** or **RW**.

When ERR<q>FR.TS == 0b00:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC3

Reads from ERR<n>MISC3 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and [ERR<q>PFGF.MV](#) is 1, then some parts of this register are read/write when [ERR<n>STATUS.MV](#) is 1. See [ERR<n>PFGF.MV](#) for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When [ERR<n>STATUS.MV](#) is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC3 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|------------------|-------------|
| RAS | 0x038 + (64 * n) | ERR<n>MISC3 |

Accesses on this interface are **RW**.

ERR<n>PFGCDN, Pseudo-fault Generation Countdown Register, n = 0 - 65534

The ERR<n>PFGCDN characteristics are:

Purpose

Generates one of the errors enabled in the corresponding [ERR<n>PFGCTL](#) register.

Configuration

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCDN are RES0.

[ERR<n>FR](#) describes the features implemented by the node.

Attributes

ERR<n>PFGCDN is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | CDN | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

CDN, bits [31:0]

Countdown value.

This field is copied to Error Generation Counter when either:

- Software writes [ERR<n>PFGCTL](#).CDNEN with 1.
- The Error Generation Counter decrements to zero and [ERR<n>PFGCTL](#).R == 1.

While [ERR<n>PFGCTL](#).CDNEN == 1 and the Error Generation Counter is nonzero, the counter decrements by 1 for each cycle at an IMPLEMENTATION DEFINED clock rate. When the counter reaches 0, one of the errors enabled in the [ERR<n>PFGCTL](#) register is generated.

Note

The current Error Generation Counter value is not visible to software.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing ERR<n>PFGCDN

ERR<n>PFGCDN can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------------------|--------------|
| RAS | $0x810 + (64 * n)$ | ERR<n>PFGCDN |

Accesses on this interface are **RW**.

ERR<n>PFGCTL, Pseudo-fault Generation Control Register, n = 0 - 65534

The ERR<n>PFGCTL characteristics are:

Purpose

Enables controlled fault generation.

Configuration

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCTL are RES0.

[ERR<n>FR](#) describes the features implemented by the node.

Attributes

ERR<n>PFGCTL is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|------|----|----|----|----|----|----|----|----|----|----|--------|--------|------|----|----|------|------|-----|------|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

CDNEN, bit [31]

Countdown Enable. Controls transfers of the value held in [ERR<n>PFGCDN](#) to the Error Generation Counter and enables this counter.

| CDNEN | Meaning |
|-------|---|
| 0b0 | The Error Generation Counter is disabled. |
| 0b1 | The Error Generation Counter is enabled. On a write of 1 to this field, the Error Generation Counter is set to ERR<n>PFGCDN.CDN . |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

R, bit [30]

When the node supports this control:

Restart. Controls whether the Error Generation Counter restarts or stops counting on reaching zero.

| R | Meaning |
|----------|---|
| 0b0 | On reaching zero, the Error Generation Counter will stop counting. |
| 0b1 | On reaching zero, the Error Generation Counter is set to ERR<n>PFGCDN.CDN . |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:13]

Reserved, RES0.

Bit [12]

When the node always sets [ERR<n>STATUS.MV](#) to 0b1 when an injected error is recorded:

Reserved, RAO/WI.

When the node supports this control:

Miscellaneous syndrome. The value written to [ERR<n>STATUS.MV](#) when an injected error is recorded.

| MV | Meaning |
|-----------|---|
| 0b0 | ERR<n>STATUS.MV is set to 0 when an injected error is recorded. |
| 0b1 | ERR<n>STATUS.MV is set to 1 when an injected error is recorded. |

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

When the node always sets [ERR<n>STATUS.AV](#) to 0b1 when an injected error is recorded:

Reserved, RAO/WI.

When the node supports this control:

Address syndrome. The value written to [ERR<n>STATUS.AV](#) when an injected error is recorded.

| AV | Meaning |
|-----------|---|
| 0b0 | ERR<n>STATUS.AV is set to 0 when an injected error is recorded. |
| 0b1 | ERR<n>STATUS.AV is set to 1 when an injected error is recorded. |

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PN, bit [10]**When the node supports this control:**

Poison flag. The value written to [ERR<n>STATUS.PN](#) when an injected error is recorded.

| PN | Meaning |
|-----|---|
| 0b0 | ERR<n>STATUS.PN is set to 0 when an injected error is recorded. |
| 0b1 | ERR<n>STATUS.PN is set to 1 when an injected error is recorded. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ER, bit [9]**When the node supports this control:**

Error Reported flag. The value written to [ERR<n>STATUS.ER](#) when an injected error is recorded.

| ER | Meaning |
|-----|---|
| 0b0 | ERR<n>STATUS.ER is set to 0 when an injected error is recorded. |
| 0b1 | ERR<n>STATUS.ER is set to 1 when an injected error is recorded. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CI, bit [8]**When the node supports this control:**

Critical Error flag. The value written to [ERR<n>STATUS.CI](#) when an injected error is recorded.

| CI | Meaning |
|-----|---|
| 0b0 | ERR<n>STATUS.CI is set to 0 when an injected error is recorded. |
| 0b1 | ERR<n>STATUS.CI is set to 1 when an injected error is recorded. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CE, bits [7:6]**When the node supports this control:**

Corrected Error generation enable. Controls the type of injected Corrected error generated by the fault injection feature of the node.

| CE | Meaning |
|------|--|
| 0b00 | An injected Corrected error will not be generated by the fault injection feature of the node. |
| 0b01 | An injected non-specific Corrected error is generated in the fault injection state. ERR<n>STATUS .CE is set to 0b10 when the injected error is recorded. |
| 0b10 | An injected transient Corrected error is generated in the fault injection state. ERR<n>STATUS .CE is set to 0b01 when the injected error is recorded. |
| 0b11 | An injected persistent Corrected error is generated in the fault injection state. ERR<n>STATUS .CE is set to 0b11 when the injected error is recorded. |

The set of permitted values for this field is defined by [ERR<n>PFGF](#).CE.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DE, bit [5]**When the node supports this control:**

Deferred Error generation enable. Controls whether an injected Deferred error is generated by the fault injection feature of the node.

| DE | Meaning |
|-----|---|
| 0b0 | An injected Deferred error will not be generated by the fault generation feature of the node. |
| 0b1 | An injected Deferred error is generated in the fault injection state. |

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEO, bit [4]**When the node supports this control:**

Latent or Restartable Error generation enable. Controls whether an injected Latent or Restartable error is generated by the fault injection feature of the node.

| UEO | Meaning |
|-----|--|
| 0b0 | An injected Latent or Restartable error will not be generated by the fault generation feature of the node. |
| 0b1 | An injected Latent or Restartable error is generated in the fault injection state. |

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UER, bit [3]

When the node supports this control:

Signaled or Recoverable Error generation enable. Controls whether an injected Signaled or Recoverable error is generated by the fault injection feature of the node.

| UER | Meaning |
|-----|--|
| 0b0 | An injected Signaled or Recoverable error will not be generated by the fault generation feature of the node. |
| 0b1 | An injected Signaled or Recoverable error is generated in the fault injection state. |

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEU, bit [2]

When the node supports this control:

Unrecoverable Error generation enable. Controls whether an injected Unrecoverable error is generated by the fault injection feature of the node.

| UEU | Meaning |
|-----|--|
| 0b0 | An injected Unrecoverable error will not be generated by the fault generation feature of the node. |
| 0b1 | An injected Unrecoverable error is generated in the fault injection state. |

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UC, bit [1]**When the node supports this control:**

Uncontainable Error generation enable. Controls whether an injected Uncontainable error is generated by the fault injection feature of the node.

| UC | Meaning |
|-----|--|
| 0b0 | An injected Uncontainable error will not be generated by the fault generation feature of the node. |
| 0b1 | An injected Uncontainable error is generated in the fault injection state. |

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OF, bit [0]**When the node supports this control:**

Overflow flag. The value written to [ERR<n>STATUS](#).OF when an injected error is recorded.

| OF | Meaning |
|-----|--|
| 0b0 | ERR<n>STATUS .OF is set to 0 when an injected error is recorded. |
| 0b1 | ERR<n>STATUS .OF is set to 1 when an injected error is recorded. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing ERR<n>PFGCTL

ERR<n>PFGCTL can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|------------------|--------------|
| RAS | 0x808 + (64 * n) | ERR<n>PFGCTL |

Accesses on this interface are **RW**.

ERR<n>PFGF, Pseudo-fault Generation Feature Register, n = 0 - 65534

The ERR<n>PFGF characteristics are:

Purpose

Defines which common architecturally-defined fault generation features are implemented.

Configuration

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGF are RES0.

[ERR<n>FR](#) describes the features implemented by the node.

Attributes

ERR<n>PFGF is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|-----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | R | SYN | NA | RES0 | | | | | | | | | | | | | | MV | AV | PN | ER | CI | CE | DE | UE | O | UE | R | UE | U | C | O | F |

Bits [63:31]

Reserved, RES0.

R, bit [30]

Restartable. Support for Error Generation Counter restart mode.

| R | Meaning |
|-----|--|
| 0b0 | The node does not support this feature. ERR<n>PFGCTL.R is RES0. |
| 0b1 | Error Generation Counter restart mode is implemented and is controlled by ERR<n>PFGCTL.R . ERR<n>PFGCTL.R is a read/write field. |

SYN, bit [29]

Syndrome. Fault syndrome injection.

| SYN | Meaning |
|-----|---|
| 0b0 | When an injected error is recorded, the node sets ERR<n>STATUS .{IERR, SERR} to IMPLEMENTATION DEFINED values. ERR<n>STATUS .{IERR, SERR} are UNKNOWN when ERR<n>STATUS.V is 0. |
| 0b1 | When an injected error is recorded, the node does not update the ERR<n>STATUS .{IERR, SERR} fields. ERR<n>STATUS .{IERR, SERR} are writable when ERR<n>STATUS.V is 0. |

Note

If ERR<n>PFGF.SYN is 1, software can write specific values into the [ERR<n>STATUS](#).{IERR, SERR} fields when setting up a fault injection event. The sets of values that can be written to these fields is IMPLEMENTATION DEFINED.

NA, bit [28]

No access required. Defines whether this component fakes detection of the error on an access to the component or spontaneously in the fault injection state.

| NA | Meaning |
|-----|--|
| 0b0 | The component fakes detection of the error on an access to the component. |
| 0b1 | The component fakes detection of the error spontaneously in the fault injection state. |

Bits [27:13]

Reserved, RES0.

MV, bit [12]

Miscellaneous syndrome.

Additional syndrome injection. Defines whether software can control all or part of the syndrome recorded in the ERR<n>MISC<m> registers when an injected error is recorded.

| MV | Meaning |
|-----|--|
| 0b0 | When an injected error is recorded, the node might update ERR<n>MISC<m>. If any syndrome is recorded by the node in ERR<n>MISC<m>, then ERR<n>STATUS .MV is set to 1. ERR<n>PFGCTL .MV is RES0. |
| 0b1 | When an injected error is recorded, the node might update some, but not all ERR<n>MISC<m> syndrome fields, and updates ERR<n>STATUS .MV as follows: <ul style="list-style-type: none"> If any syndrome is recorded by the node in ERR<n>MISC<m>, then ERR<n>STATUS.MV is set to 1. Otherwise, ERR<n>STATUS.MV is set to ERR<n>PFGCTL.MV. <p>It is IMPLEMENTATION DEFINED which ERR<n>MISC<m> syndrome fields, if any, are updated. Some syndrome fields might always be updated by the node when an error is recorded. For example, a corrected error counter might always be updated when any countable error, including a countable injected error, is recorded. Other ERR<n>MISC<m> syndrome fields are not updated by the node and are writable when ERR<n>STATUS.MV is 0.</p> <p>If the node always sets ERR<n>STATUS.MV to 1 when recording an injected error then ERR<n>PFGCTL.MV is RAO/WI, otherwise ERR<n>PFGCTL.MV is a read/write field.</p> |

Note

If ERR<n>PFGF.MV is 1, software can write specific additional syndrome values into the ERR<n>MISC<m> registers when setting up a fault injection event. The values that can be written to these registers are IMPLEMENTATION DEFINED.

AV, bit [11]

Address syndrome. Address syndrome injection.

| AV | Meaning |
|-----|--|
| 0b0 | When an injected error is recorded, the node either sets ERR<n>ADDR and ERR<n>STATUS .AV for the access, or leaves these unchanged. ERR<n>PFGCTL .AV is RES0. |
| 0b1 | When an injected error is recorded, the node does not update ERR<n>ADDR and does one of: <ul style="list-style-type: none"> Sets ERR<n>STATUS.AV to ERR<n>PFGCTL.AV. ERR<n>PFGCTL.AV is a read/write field. Sets ERR<n>STATUS.AV to 1. ERR<n>PFGCTL.AV is RAO/WI. ERR<n>ADDR is writable when ERR<n>STATUS .AV is 0. |

Note

If ERR<n>PFGF.AV is 1, software can write a specific address value into [ERR<n>ADDR](#) when setting up a fault injection event.

PN, bit [10]

When the node supports this flag:

Poison flag. Describes how the fault generation feature of the node sets the [ERR<n>STATUS](#).PN status flag.

| PN | Meaning |
|-----|--|
| 0b0 | When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS .PN to 1. ERR<n>PFGCTL .PN is RES0. |
| 0b1 | When an injected error is recorded, ERR<n>STATUS .PN is set to ERR<n>PFGCTL .PN. ERR<n>PFGCTL .PN is a read/write field. |

This behavior replaces the architecture-defined rules for setting the [ERR<n>STATUS](#).PN bit.

Otherwise:

Reserved, RAZ.

ER, bit [9]

When the node supports this flag:

Error Reported flag. Describes how the fault generation feature of the node sets the [ERR<n>STATUS](#).ER status flag.

| ER | Meaning |
|-----|--|
| 0b0 | When an injected error is recorded, the node sets ERR<n>STATUS .ER according to the architecture-defined rules for setting the ER field. ERR<n>PFGCTL .ER is RES0. |
| 0b1 | When an injected error is recorded, ERR<n>STATUS .ER is set to ERR<n>PFGCTL .ER. This behavior replaces the architecture-defined rules for setting the ER bit. ERR<n>PFGCTL .ER is a read/write field. |

Otherwise:

Reserved, RAZ.

CI, bit [8]

When the node supports this flag:

Critical Error flag. Describes how the fault generation feature of the node sets the [ERR<n>STATUS](#).CI status flag.

| CI | Meaning |
|-----|--|
| 0b0 | When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.CI to 1. ERR<n>PFGCTL.CI is RES0. |
| 0b1 | When an injected error is recorded, ERR<n>STATUS.CI is set to ERR<n>PFGCTL.CI . ERR<n>PFGCTL.CI is a read/write field. |

This behavior replaces the architecture-defined rules for setting the [ERR<n>STATUS.CI](#) bit.

Otherwise:

Reserved, RAZ.

CE, bits [7:6]

When the node supports this type of error:

Corrected Error generation. Describes the types of Corrected error that the fault generation feature of the node can generate.

| CE | Meaning |
|------|--|
| 0b00 | The fault generation feature of the node does not generate Corrected errors. ERR<n>PFGCTL.CE is RES0. |
| 0b01 | The fault generation feature of the node allows generation of a non-specific Corrected error, that is, a Corrected error that is recorded by setting ERR<n>STATUS.CE to 0b10. ERR<n>PFGCTL.CE is a read/write field. The values 0b10 and 0b11 in ERR<n>PFGCTL.CE are reserved. |
| 0b11 | The fault generation feature of the node allows generation of transient or persistent Corrected errors, that is, Corrected errors that are recorded by setting ERR<n>STATUS.CE to 0b01 or 0b11 respectively. ERR<n>PFGCTL.CE is a read/write field. The value 0b01 in ERR<n>PFGCTL.CE is reserved. |

All other values are reserved.

If [ERR<n>FR.FRX](#) is 1, then [ERR<n>FR.CE](#) indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

DE, bit [5]

When the node supports this type of error:

Deferred Error generation. Describes whether the fault generation feature of the node can generate Deferred errors.

| DE | Meaning |
|-----|---|
| 0b0 | The fault generation feature of the node does not generate Deferred errors. ERR<n>PFGCTL.DE is RES0. |
| 0b1 | The fault generation feature of the node allows generation of Deferred errors. ERR<n>PFGCTL.DE is a read/write field. |

If [ERR<n>FR.FRX](#) is 1, then [ERR<n>FR.DE](#) indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UEO, bit [4]**When the node supports this type of error:**

Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate Latent or Restartable errors.

| UEO | Meaning |
|-----|--|
| 0b0 | The fault generation feature of the node does not generate Latent or Restartable errors. ERR<n>PFGCTL .UEO is RES0. |
| 0b1 | The fault generation feature of the node allows generation of Latent or Restartable errors. ERR<n>PFGCTL .UEO is a read/write field. |

If [ERR<n>FR](#).FRX is 1, then [ERR<n>FR](#).UEO indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UER, bit [3]**When the node supports this type of error:**

Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate Signaled or Recoverable errors.

| UER | Meaning |
|-----|--|
| 0b0 | The fault generation feature of the node does not generate Signaled or Recoverable errors. ERR<n>PFGCTL .UER is RES0. |
| 0b1 | The fault generation feature of the node allows generation of Signaled or Recoverable errors. ERR<n>PFGCTL .UER is a read/write field. |

If [ERR<n>FR](#).FRX is 1, then [ERR<n>FR](#).UER indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UEU, bit [2]**When the node supports this type of error:**

Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate Unrecoverable errors.

| UEU | Meaning |
|-----|--|
| 0b0 | The fault generation feature of the node does not generate Unrecoverable errors. ERR<n>PFGCTL .UEU is RES0. |
| 0b1 | The fault generation feature of the node allows generation of Unrecoverable errors. ERR<n>PFGCTL .UEU is a read/write field. |

If [ERR<n>FR](#).FRX is 1, then [ERR<n>FR](#).UEU indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UC, bit [1]**When the node supports this type of error:**

Uncontainable Error generation. Describes whether the fault generation feature of the node can generate Uncontainable errors.

| UC | Meaning |
|-----|---|
| 0b0 | The fault generation feature of the node does not generate Uncontainable errors. ERR<n>PFGCTL .UC is RES0. |
| 0b1 | The fault generation feature of the node allows generation of Uncontainable errors. ERR<n>PFGCTL .UC is a read/write field. |

If [ERR<n>FR](#).FRX is 1, then [ERR<n>FR](#).UC indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

OF, bit [0]**When the node supports this flag:**

Overflow flag. Describes how the fault generation feature of the node sets the [ERR<n>STATUS](#).OF status flag.

| OF | Meaning |
|-----|--|
| 0b0 | When an injected error is recorded, the node sets ERR<n>STATUS .OF according to the architecture-defined rules for setting the OF field. ERR<n>PFGCTL .OF is RES0. |
| 0b1 | When an injected error is recorded, ERR<n>STATUS .OF is set to ERR<n>PFGCTL .OF. This behavior replaces the architecture-defined rules for setting the OF bit. ERR<n>PFGCTL .OF is a read/write field. |

Otherwise:

Reserved, RAZ.

Accessing ERR<n>PFGF**ERR<n>PFGF can be accessed through the memory-mapped interfaces:**

| Component | Offset | Instance |
|-----------|------------------|------------|
| RAS | 0x800 + (64 * n) | ERR<n>PFGF |

Accesses on this interface are **RO**.

ERR<n>STATUS, Error Record Primary Status Register, n = 0 - 65534

The ERR<n>STATUS characteristics are:

Purpose

Contains status information for error record <n>, including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An IMPLEMENTATION DEFINED extended error code.

Within this register:

- ERR<n>STATUS.{AV, V, MV} are valid bits that define whether error record <n> registers are valid.
- ERR<n>STATUS.{UE, OF, CE, DE, UET} encode the types of error or errors recorded.
- ERR<n>STATUS.{CI, ER, PN, IERR, SERR} are syndrome fields.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>STATUS are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>STATUS, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>STATUS is a 64-bit register.

Field descriptions

When RAS System Architecture v1.1 is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|-----|----|------|----|----|----|----|------|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| AV | V | UE | ER | OF | MV | CE | DE | PN | UET | CI | RES0 | | | | | IERR | | | | | | | SERR | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

| AV | Meaning |
|-----|--|
| 0b0 | ERR<n>ADDR not valid. |
| 0b1 | ERR<n>ADDR contains an address associated with the highest priority error recorded by this record. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

| V | Meaning |
|-----|---|
| 0b0 | ERR<n>STATUS not valid. |
| 0b1 | ERR<n>STATUS valid. At least one error has been recorded. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

UE, bit [29]

Uncorrected Error.

| UE | Meaning |
|-----|--|
| 0b0 | No errors have been detected, or all detected errors have been either corrected or deferred. |
| 0b1 | At least one detected error was not corrected and not deferred. |

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

ER, bit [28]

Error Reported.

| ER | Meaning |
|-----|---|
| 0b0 | No in-band error response (External Abort) signaled to the Requester making the access or other transaction. |
| 0b1 | An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: <ul style="list-style-type: none"> • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected. • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is not implemented and the component always reports errors. |

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

Note

An in-band error response signaled by the component might be masked and not generate any exception.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE == 0
 - this field can be set to 0b1 by a Deferred error
- **UNKNOWN/WI** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - this field is never set to 0b1 by a Deferred error
- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.
- ERR<n>STATUS.V was previously 1, a Corrected error counter is not implemented, and a Corrected error is recorded.
- ERR<n>STATUS.V was previously 1, and a type of error other than a Corrected error is recorded.

Otherwise, this field is unchanged when an error is recorded.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.

- A direct write to this field that clears this field to zero might indirectly set the counter overflow flag to an UNKNOWN value.

| OF | Meaning |
|-----|--|
| 0b0 | Since this field was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed. |
| 0b1 | Since this field was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed. |

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

MV, bit [26]

When error record <n> includes an additional information for an error:

Miscellaneous Registers Valid.

| MV | Meaning |
|-----|--|
| 0b0 | ERR<n>MISC<m> not valid. |
| 0b1 | The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record. |

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

| CE | Meaning |
|------|--|
| 0b00 | No errors were corrected. |
| 0b01 | At least one transient error was corrected. |
| 0b10 | At least one error was corrected. |
| 0b11 | At least one persistent error was corrected. |

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

DE, bit [23]

Deferred Error.

| DE | Meaning |
|-----|--|
| 0b0 | No errors were deferred. |
| 0b1 | At least one error was not corrected and deferred. |

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

PN, bit [22]

Poison.

| PN | Meaning |
|-----|--|
| 0b0 | Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded. |
| 0b1 | Uncorrected error or Deferred error recorded because a poison value was detected. |

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI** if any of the following are true:
 - ERR<n>STATUS.V == 0
 - (ERR<n>STATUS.DE == 0 and ERR<n>STATUS.UE == 0)
- Otherwise, access to this field is **W1C**.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

| UET | Meaning |
|------|---|
| 0b00 | Uncorrected error, Uncontainable error (UC). |
| 0b01 | Uncorrected error, Unrecoverable error (UEU). |
| 0b10 | Uncorrected error, Latent or Restartable error (UEO). |
| 0b11 | Uncorrected error, Signaled or Recoverable error (UER). |

Note

Software might use the information in the error record registers to determine what recovery is necessary.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - ERR<n>STATUS.V == 0
 - ERR<n>STATUS.UE == 0
- Otherwise, access to this field is **W1C**.

CI, bit [19]

Critical Error. Indicates whether a critical error condition has been recorded.

| CI | Meaning |
|-----|------------------------------|
| 0b0 | No critical error condition. |
| 0b1 | Critical error condition. |

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

Bits [18:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - the Common Fault Injection Model Extension is not implemented by the node that owns this error record

- ERR<n>STATUS.V == 0
- **UNKNOWN/WI** if all of the following are true:
 - ERR<q>PFGF.SYN == 0
 - ERR<n>STATUS.V == 0
- Otherwise, access to this field is **RW**.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

| SERR | Meaning |
|-------------|--|
| 0x00 | No error. |
| 0x01 | IMPLEMENTATION DEFINED error. |
| 0x02 | Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer. |
| 0x03 | IMPLEMENTATION DEFINED pin. For example, nSEI pin. |
| 0x04 | Assertion failure. For example, consistency failure. |
| 0x05 | Error detected on internal data path. For example, parity on ALU result. |
| 0x06 | Data value from associative memory. For example, ECC error on cache data. |
| 0x07 | Address/control value from associative memory. For example, ECC error on cache tag. |
| 0x08 | Data value from a TLB. For example, ECC error on TLB data. |
| 0x09 | Address/control value from a TLB. For example, ECC error on TLB tag. |
| 0x0A | Data value from producer. For example, parity error on write data bus. |
| 0x0B | Address/control value from producer. For example, parity error on address bus. |
| 0x0C | Data value from (non-associative) external memory. For example, ECC error in SDRAM. |
| 0x0D | Illegal address (software fault). For example, access to unpopulated memory. |
| 0x0E | Illegal access (software fault). For example, byte write to word register. |
| 0x0F | Illegal state (software fault). For example, device not ready. |
| 0x10 | Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers. |
| 0x11 | Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers. |
| 0x12 | Error response from Completer of access. For example, error response from cache write-back. |
| 0x13 | External timeout. For example, timeout on interaction with another component. |
| 0x14 | Internal timeout. For example, timeout on interface within the component. |
| 0x15 | Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further. |
| 0x16 | Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further. |
| 0x17 | Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester. |
| 0x18 | Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer. |
| 0x19 | Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe. |
| 0x1A | Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code. |

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI** if all of the following are true:
 - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
 - ERR<n>STATUS.V == 0
- UNKNOWN/WI** if all of the following are true:
 - ERR<q>PFGF.SYN == 0
 - ERR<n>STATUS.V == 0
- Otherwise, access to this field is **RW**.

When RAS System Architecture v1.0 is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|-----|------|----|----|----|----|----|------|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| AV | V | UE | ER | OF | MV | CE | DE | PN | UET | RES0 | | | | | | IERR | | | | | | SERR | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

| AV | Meaning |
|-----|--|
| 0b0 | ERR<n>ADDR not valid. |
| 0b1 | ERR<n>ADDR contains an address associated with the highest priority error recorded by this record. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

| V | Meaning |
|-----|---|
| 0b0 | ERR<n>STATUS not valid. |
| 0b1 | ERR<n>STATUS valid. At least one error has been recorded. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **RO** if all of the following are true:
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

UE, bit [29]

Uncorrected Error.

| UE | Meaning |
|-----|--|
| 0b0 | No errors have been detected, or all detected errors have been either corrected or deferred. |
| 0b1 | At least one detected error was not corrected and not deferred. |

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
 - ERR<n>STATUS.OF == 1
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

ER, bit [28]

Error Reported.

| ER | Meaning |
|-----|---|
| 0b0 | No in-band error response (External Abort) signaled to the Requester making the access or other transaction. |
| 0b1 | An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: <ul style="list-style-type: none"> • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected. • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is not implemented and the component always reports errors. |

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

Note

An in-band error response signaled by the component might be masked and not generate any exception.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0, if this field is never set to 1 by a Deferred error.
- Clearing ERR<n>STATUS.{UE,DE} to {0,0}, if this field can be set to 1 by a Deferred error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE == 0
 - this field can be set to 0b1 by a Deferred error
- **UNKNOWN/WI** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - this field is never set to 0b1 by a Deferred error
- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 1.
- A Deferred error is detected, ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE != 0b00. ERR<n>STATUS.CE might be updated for the new Corrected error.
- A Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is set to 1 when one of the following occurs:

- A Deferred error is detected and ERR<n>STATUS.UE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, and ERR<n>STATUS.{UE, DE} != {0, 0}.
- A Corrected error counter is implemented, ERR<n>STATUS.{UE, DE} != {0, 0}, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is cleared to 0 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0.
- A Deferred error is detected, ERR<n>STATUS.UE == 0, and ERR<n>STATUS.DE == 0.
- A Corrected error is detected, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE == 0b00.

The IMPLEMENTATION DEFINED clearing of this field might also depend on the value of the other error status fields.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.
- A direct write to this field that clears this field to 0 might indirectly set the counter overflow flag to an UNKNOWN value.

| OF | Meaning |
|---|--|
| 0b0 | <p>If ERR<n>STATUS.UE == 1, then no error syndrome for an Uncorrected error has been discarded.</p> <p>If ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1, then no error syndrome for a Deferred error has been discarded.</p> <p>If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and a Corrected error counter is implemented, then the counter has not overflowed.</p> <p>If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, ERR<n>STATUS.CE != 0b00, and no Corrected error counter is implemented, then no error syndrome for a Corrected error has been discarded.</p> |
| <p>Note</p> <p>This field might have been set to 1 when an error syndrome was discarded and later cleared to 0 when a higher priority syndrome was recorded.</p> | |
| 0b1 | At least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed. |

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

MV, bit [26]

When error record <n> includes an additional information for an error:

Miscellaneous Registers Valid.

| MV | Meaning |
|-----|--|
| 0b0 | ERR<n>MISC<m> not valid. |
| 0b1 | The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record. |

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0

- ERR<n>STATUS.CE != 0b00
- ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

| CE | Meaning |
|------|--|
| 0b00 | No errors were corrected. |
| 0b01 | At least one transient error was corrected. |
| 0b10 | At least one error was corrected. |
| 0b11 | At least one persistent error was corrected. |

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
 - ERR<n>STATUS.OF == 1
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

DE, bit [23]

Deferred Error.

| DE | Meaning |
|-----|--|
| 0b0 | No errors were deferred. |
| 0b1 | At least one error was not corrected and deferred. |

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
 - ERR<n>STATUS.OF == 1
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write

- Otherwise, access to this field is **W1C**.

PN, bit [22]

Poison.

| PN | Meaning |
|-----|--|
| 0b0 | Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded. |
| 0b1 | Uncorrected error or Deferred error recorded because a poison value was detected. |

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing both ERR<n>STATUS.{DE, UE} to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI** if any of the following are true:
 - ERR<n>STATUS.V == 0
 - (ERR<n>STATUS.DE == 0 and ERR<n>STATUS.UE == 0)
- RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

| UET | Meaning |
|------|---|
| 0b00 | Uncorrected error, Uncontainable error (UC). |
| 0b01 | Uncorrected error, Unrecoverable error (UEU). |
| 0b10 | Uncorrected error, Latent or Restartable error (UEO). |
| 0b11 | Uncorrected error, Signaled or Recoverable error (UER). |

Note

Software might use the information in the error record registers to determine what recovery is necessary.

If this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - ERR<n>STATUS.V == 0
 - ERR<n>STATUS.UE == 0
- **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Bits [19:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
 - ERR<n>STATUS.V == 0
- **UNKNOWN/WI** if all of the following are true:
 - ERR<q>PFGF.SYN == 0
 - ERR<n>STATUS.V == 0
- **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **RW**.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

| SERR | Meaning |
|-------------|--|
| 0x00 | No error. |
| 0x01 | IMPLEMENTATION DEFINED error. |
| 0x02 | Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer. |
| 0x03 | IMPLEMENTATION DEFINED pin. For example, nSEI pin. |
| 0x04 | Assertion failure. For example, consistency failure. |
| 0x05 | Error detected on internal data path. For example, parity on ALU result. |
| 0x06 | Data value from associative memory. For example, ECC error on cache data. |
| 0x07 | Address/control value from associative memory. For example, ECC error on cache tag. |
| 0x08 | Data value from a TLB. For example, ECC error on TLB data. |
| 0x09 | Address/control value from a TLB. For example, ECC error on TLB tag. |
| 0x0A | Data value from producer. For example, parity error on write data bus. |
| 0x0B | Address/control value from producer. For example, parity error on address bus. |
| 0x0C | Data value from (non-associative) external memory. For example, ECC error in SDRAM. |
| 0x0D | Illegal address (software fault). For example, access to unpopulated memory. |
| 0x0E | Illegal access (software fault). For example, byte write to word register. |
| 0x0F | Illegal state (software fault). For example, device not ready. |
| 0x10 | Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers. |
| 0x11 | Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers. |
| 0x12 | Error response from Completer of access. For example, error response from cache write-back. |
| 0x13 | External timeout. For example, timeout on interaction with another component. |
| 0x14 | Internal timeout. For example, timeout on interface within the component. |
| 0x15 | Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further. |
| 0x16 | Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further. |
| 0x17 | Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester. |
| 0x18 | Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer. |
| 0x19 | Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe. |
| 0x1A | Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code. |

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
 - ERR<n>STATUS.V == 0
- **UNKNOWN/WI** if all of the following are true:
 - ERR<q>PFGF.SYN == 0
 - ERR<n>STATUS.V == 0
- **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **RW**.

Accessing ERR<n>STATUS

ERR<n>STATUS.{AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI} are write-one-to-clear (W1C) fields, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero. ERR<n>STATUS.{IERR, SERR} are read/write (RW) fields, although the set of implemented valid values is IMPLEMENTATION DEFINED. See also [ERR<n>PFGF.SYN](#).

After reading ERR<n>STATUS, software must clear the valid fields in the register to allow new errors to be recorded. However, between reading the register and clearing the valid fields, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to ERR<n>STATUS.{UE, DE, CE} are ignored if ERR<n>STATUS.OF is 1 and is not being cleared to 0.
- Writes to ERR<n>STATUS.V are ignored if any of ERR<n>STATUS.{UE, DE, CE} are nonzero and are not being cleared to zero.
- Writes to ERR<n>STATUS.{AV, MV} and the ERR<n>STATUS.{ER, PN, UET, IERR, SERR} syndrome fields are ignored if the highest priority nonzero error status field is not being cleared to zero. The error status fields in priority order from highest to lowest, are ERR<n>STATUS.UE, ERR<n>STATUS.DE, and ERR<n>STATUS.CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

- Any of ERR<n>STATUS.{V, UE, OF, CE, DE} are nonzero before the write.
- The write does not clear the nonzero ERR<n>STATUS.{V, UE, OF, CE, DE} fields to zero by writing ones to the applicable field or fields.

Some of the fields in ERR<n>STATUS are also defined as UNKNOWN where certain combinations of ERR<n>STATUS.{V, DE, UE} are zero. The rules for writes to ERR<n>STATUS allow a node to implement such a field as a fixed read-only value.

For example, when RAS System Architecture v1.1 is implemented, a write to ERR<n>STATUS when ERR<n>STATUS.V is 1 results in either ERR<n>STATUS.V field being cleared to zero, or ERR<n>STATUS.V not changing. Since all fields in ERR<n>STATUS, other than ERR<n>STATUS.{AV, V, MV}, usually read as UNKNOWN values when ERR<n>STATUS.V is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid fields in the register to allow new errors to be recorded, Arm recommends that software:

- Read ERR<n>STATUS and determine which fields need to be cleared to zero.
- Write ones to all the W1C fields that are nonzero in the read value.

- Write zero to all the W1C fields that are zero in the read value.
- Write zero to all the RW fields.

Otherwise, these fields might not have the correct value when a new fault is recorded.

An exception is when the node supports writing to these fields as part of fault injection. See also [ERR<n>PFGF.SYN](#).

ERR<n>STATUS can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|---------------------------|--------------|
| RAS | $0 \times 010 + (64 * n)$ | ERR<n>STATUS |

This interface is accessible as follows:

- When ERR<n>STATUS.V != 0, ERR<n>STATUS.V is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When ERR<n>STATUS.UE != 0, ERR<n>STATUS.UE is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When ERR<n>STATUS.OF != 0, ERR<n>STATUS.OF is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When ERR<n>STATUS.CE != 0b00, ERR<n>STATUS.CE is not being cleared to 0b00 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When ERR<n>STATUS.DE != 0, ERR<n>STATUS.DE is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- Otherwise accesses to this register are **RW**.

ERRPIDR0, Peripheral Identification Register 0

The ERRPIDR0 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | PART_0 | | | | | | | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, bits [7:0].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in [ERRPIDR1](#).PART_1 and ERRPIDR0.PART_0. There are 8 bits, [ERRPIDR2](#).REVISION and [ERRPIDR3](#).REVAND, available to define the revision of the component.
- If a 16-bit part number is used, it is stored in [ERRPIDR2](#).PART_2, [ERRPIDR1](#).PART_1 and ERRPIDR0.PART_0. There are 4 bits, [ERRPIDR3](#).REVISION, available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR0

ERRPIDR0 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| RAS | 0xFE0 | ERRPIDR0 |

Accesses on this interface are **RO**.

ERRPIDR1, Peripheral Identification Register 1

The ERRPIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---|--------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | DES_0 | | | | PART_1 | | | |

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0]. ERRPIDR1.DES_0 and [ERRPIDR2.DES_1](#) together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be not the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, bits [11:8].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and [ERRPIDR0.PART_0](#). There are 8 bits, [ERRPIDR2.REVISION](#) and [ERRPIDR3.REVAND](#), available to define the revision of the component.

- If a 16-bit part number is used, it is stored in [ERRPIDR2](#).PART_2, ERRPIDR1.PART_1 and [ERRPIDR0](#).PART_0. There are 4 bits, [ERRPIDR3](#).REVISION, available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR1

ERRPIDR1 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| RAS | 0xFE4 | ERRPIDR1 |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRPIDR2, Peripheral Identification Register 2

The ERRPIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR2 is a 32-bit register.

Field descriptions

When the component uses a 12-bit part number:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|-------|----|-------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | REVISION | | | | JEDEC | | DES 1 | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component major revision. ERRPIDR2.REVISION and [ERRPIDR3.REVAND](#) together form the revision number of the component, with ERRPIDR2.REVISION being the most significant part and [ERRPIDR3.REVAND](#) the least significant part. When a component is changed, ERRPIDR2.REVISION or [ERRPIDR3.REVAND](#) are increased to ensure that software can differentiate the different revisions of the component. [ERRPIDR3.REVAND](#) should be set to 0b0000 when ERRPIDR2.REVISION is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. [ERRPIDR1.DES_0](#) and ERRPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the

implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

When the component uses a 16-bit part number:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|-------|----|-------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | PART_2 | | | | JEDEC | | DES_1 | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

PART_2, bits [7:4]

Part number, bits [15:12].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in [ERRPIDR1.PART_1](#) and [ERRPIDR0.PART_0](#). There are 8 bits, [ERRPIDR2.REVISION](#) and [ERRPIDR3.REVAND](#), available to define the revision of the component.
- If a 16-bit part number is used, it is stored in [ERRPIDR2.PART_2](#), [ERRPIDR1.PART_1](#) and [ERRPIDR0.PART_0](#). There are 4 bits, [ERRPIDR3.REVISION](#), available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. [ERRPIDR1.DES_0](#) and [ERRPIDR2.DES_1](#) together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR2

ERRPIDR2 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| RAS | 0xFE8 | ERRPIDR2 |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRPIDR3, Peripheral Identification Register 3

The ERRPIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR3 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR3 is a 32-bit register.

Field descriptions

When the component uses a 12-bit part number:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | REVAND | | | | CMOD | | | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Component minor revision. [ERRPIDR2.REVISION](#) and ERRPIDR3.REVAND together form the revision number of the component, with [ERRPIDR2.REVISION](#) being the most significant part and ERRPIDR3.REVAND the least significant part. When a component is changed, [ERRPIDR2.REVISION](#) or ERRPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. ERRPIDR3.REVAND should be set to 0b0000 when [ERRPIDR2.REVISION](#) is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.

- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

When the component uses a 16-bit part number:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | REVISION | | | | CMOD | | | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component revision. When a component is changed, ERRPIDR3.REVISION is increased to ensure that software can differentiate the different revisions of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR3

ERRPIDR3 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| RAS | 0xFEC | ERRPIDR3 |

Accesses on this interface are **RO**.

ERRPIDR4, Peripheral Identification Register 4

The ERRPIDR4 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR4 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR4 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|------|---|---|---|-------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | SIZE | | | | DES_2 | | | |

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component.

The distance from the start of the address space used by this component to the end of the component identification registers.

A value of 0b0000 means one of the following is true:

- The component uses a single 4KB block.
- The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.

Any other value means the component occupies $2^{\text{ERRPIDR4.SIZE}}$ 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value 0x4.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR4

ERRPIDR4 can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| RAS | 0xFD0 | ERRPIDR4 |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_ABPR, CPU Interface Aliased Binary Point Register

The GICC_ABPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_ABPR are RES0.

In systems that support two Security states:

- This register is an alias of the Non-secure copy of [GICC_BPR](#).
- Non-secure accesses to this register return a shifted value of the binary point.
- If [ICC_CTLR_EL3](#).CBPR_EL1NS == 1, Secure accesses to this register access [ICC_BPR0_EL1](#).

Attributes

GICC_ABPR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|--------------|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | Binary_Point | |

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- 'Secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when [GICC_CTLR](#).CBPR == 0.
- 'Non-secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for all other cases.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICC_ABPR

This register is used only when System register access is not enabled. When System register access is enabled, the System registers [ICC_BPR0_EL1](#) and [ICC_BPR1_EL1](#) provide equivalent functionality.

GICC_ABPR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|--------|-----------|
| GIC CPU interface | 0x001C | GICC_ABPR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_AEOIR, CPU Interface Aliased End Of Interrupt Register

The GICC_AEOIR characteristics are:

Purpose

A write to this register performs priority drop for the specified Group 1 interrupt and, if the appropriate [GICC_CTLR.EOImodeS](#) or [GICC_CTLR.EOImodeNS](#) field == 0, also deactivates the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_AEOIR are RES0.

When [GICD_CTLR.DS](#)==0, this register is an alias of the Non-secure view of [GICC_EOIR](#). A Secure access to this register is identical to a Non-secure access to [GICC_EOIR](#).

Attributes

GICC_AEOIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_AEOIR

A write to this register must correspond to the most recently acknowledged Group 1 interrupt. If a value other than the last value read from [GICC_AIAR](#) is written to this register, the effect is UNPREDICTABLE.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_EOIR1](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_EOIR1_EL1](#) provides equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_AEOIR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|--------|------------|
| GIC CPU interface | 0x0024 | GICC_AEOIR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_AHPPIR, CPU Interface Aliased Highest Priority Pending Interrupt Register

The GICC_AHPPIR characteristics are:

Purpose

If the highest priority pending interrupt is in Group 1, this register provides the INTID of the highest priority pending interrupt on the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_AHPPIR are RES0.

If [GICD_CTLR.DS](#)=0, this register is an alias of the Non-secure view of [GICC_HPPIR](#). A Secure access to this register is identical to a Non-secure access to [GICC_HPPIR](#).

Attributes

GICC_AHPPIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_AHPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_HPPIR1](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_HPPIR1_EL1](#) provides equivalent functionality.

If the highest priority pending interrupt is in Group 0, a read of this register returns the special INTID 1023.

Interrupt identifiers corresponding to an interrupt group that is not enabled are ignored.

If the highest priority pending interrupt is a direct interrupt that is both individually enabled in the Distributor and part of an interrupt group that is enabled in the Distributor, and the interrupt group is disabled in the CPU interface for this PE, this register returns the special INTID 1023.

For more information about pending interrupts that are not considered when determining the highest priority pending interrupt, see 'Preemption' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_AHPPIR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|--------|-------------|
| GIC CPU interface | 0x0028 | GICC_AHPPIR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICC_AIAR, CPU Interface Aliased Interrupt Acknowledge Register

The GICC_AIAR characteristics are:

Purpose

Provides the INTID of the signaled Group 1 interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_AIAR are RES0.

When [GICD_CTLR.DS](#)==0, this register is an alias of the Non-secure view of [GICC_IAR](#). A Secure access to this register is identical to a Non-secure access to [GICC_IAR](#).

Attributes

GICC_AIAR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_AIAR

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_AIAR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
|-----------|--------|----------|

| | | |
|----------------------|--------|-----------|
| GIC CPU interface | 0x0020 | GICC_AIAR |
|----------------------|--------|-----------|

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICC_APR<n>, CPU Interface Active Priorities Registers, n = 0 - 3

The GICC_APR<n> characteristics are:

Purpose

Provides information about interrupt active priorities.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_APR<n> are RES0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

When [GICD_CTLR.DS](#) == 0, these registers are Banked, and Non-secure accesses do not affect Secure operation. The Secure copies of these registers hold active priorities for Group 0 interrupts, and the Non-secure copies provide a Non-secure view of the active priorities for Group 1 interrupts.

GICC_APR1 is only implemented in implementations that support 6 or more bits of priority. GICC_APR2 and GICC_APR3 are only implemented in implementations that support 7 bits of priority.

When [GICD_CTLR.DS](#) == 1, these registers hold the active priorities for Group 0 interrupts, and the active priorities for Group 1 interrupts are held by the [GICC_NSAPR<n>](#) registers.

Attributes

GICC_APR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing GICC_APR<n>

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- In AArch64:
 - For Group 0, [ICC_AP0R<n>_EL1](#).
 - For Group 1, [ICC_AP1R<n>_EL1](#).
- In AArch32:
 - For Group 0, [ICC_AP0R<n>](#).
 - For Group 1, [ICC_AP1R<n>](#).

GICC_APR<n> can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|---------------------------|-------------|
| GIC CPU interface | $0 \times 00D0 + (4 * n)$ | GICC_APR<n> |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICC_BPR, CPU Interface Binary Point Register

The GICC_BPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_BPR are RES0.

In systems that support two Security states:

- This register is Banked.
- The Secure instance of this register determines Group 0 interrupt preemption.
- The Non-secure instance of this register determines Group 1 interrupt preemption.

In systems that support only one Security state, when [GICC_CTLR](#).CBPR == 0, this register determines only Group 0 interrupt preemption.

When [GICC_CTLR](#).CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

Attributes

GICC_BPR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | Binary Point | | | | | | | | | | | | | |

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- 'Secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when [GICC_CTLR](#).CBPR == 0.
- 'Non-secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for all other cases.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Note

Aliasing the Non-secure GICC_BPR as [GICC_ABPR](#) in a multiprocessor system permits a PE that can make only Secure accesses to configure the preemption setting for Group 1 interrupts by accessing [GICC_ABPR](#).

Accessing GICC_BPR

This register is used only when System register access is not enabled. When System register access is enabled this register is RAZ/WI, and the System registers [ICC_BPR0_EL1](#) and [ICC_BPR1_EL1](#) provide equivalent functionality.

GICC_BPR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|--------|----------|
| GIC CPU interface | 0x0008 | GICC_BPR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICC_CTLR, CPU Interface Control Register

The GICC_CTLR characteristics are:

Purpose

Controls the CPU interface, including enabling of interrupt groups, interrupt signal bypass, binary point registers used, and separation of priority drop and interrupt deactivation.

Note

If the GIC implementation supports two Security states, independent EOI controls are provided for accesses from each Security state. Secure accesses handle both Group 0 and Group 1 interrupts, and Non-secure accesses handle Group 1 interrupts only.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_CTLR are RES0.

In a GIC implementation that supports two Security states:

- This register is Banked.
- The register bit assignments are different in the Secure and Non-secure copies.

Attributes

GICC_CTLR is a 32-bit register.

Field descriptions

When GICD_CTLR.DS==0, Non-secure access:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|-----------|----|------|----|---------------|----|---------------|----|------|----|------------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | EOImodeNS | | RES0 | | IRQBypDisGrp1 | | FIQBypDisGrp1 | | RES0 | | EnableGrp1 | | | | | | | | | | | |

Bits [31:10]

Reserved, RES0.

EOImodeNS, bit [9]

Controls the behavior of Non-secure accesses to [GICC_EOIR](#), [GICC_AEOIR](#), and [GICC_DIR](#).

| EOImodeNS | Meaning |
|-----------|---|
| 0b0 | GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE. |
| 0b1 | GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality. |

Note

An implementation is permitted to make this bit RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [8:7]

Reserved, RES0.

IRQBypDisGrp1, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

| IRQBypDisGrp1 | Meaning |
|---------------|--|
| 0b0 | The bypass IRQ signal is signaled to the PE. |
| 0b1 | The bypass IRQ signal is not signaled to the PE. |

If System register access is enabled for EL3 and [ICC_SRE_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

FIQBypDisGrp1, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

| FIQBypDisGrp1 | Meaning |
|---------------|--|
| 0b0 | The bypass FIQ signal is signaled to the PE. |
| 0b1 | The bypass FIQ signal is not signaled to the PE. |

If System register access is enabled for EL3 and [ICC_SRE_EL3.DFB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [4:1]

Reserved, RES0.

EnableGrp1, bit [0]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

| EnableGrp1 | Meaning |
|------------|--|
| 0b0 | Group 1 interrupt signaling is disabled. |
| 0b1 | Group 1 interrupt signaling is enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When GICD_CTLR.DS==0, Secure access:

| | | | | | |
|--|-----------|----------|---------------|---------------|---------------|
| 313029282726252423222120191817161514131211 | 10 | 9 | 8 | 7 | 6 |
| RES0 | EOImodeNS | EOImodeS | IRQBypDisGrp1 | FIQBypDisGrp1 | IRQBypDisGrp0 |

Bits [31:11]

Reserved, RES0.

EOImodeNS, bit [10]

Controls the behavior of Non-secure accesses to [GICC_EOIR](#), [GICC_AEOIR](#), and [GICC_DIR](#).

| EOImodeNS | Meaning |
|-----------|---|
| 0b0 | GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE. |
| 0b1 | GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality. |

Note

An implementation is permitted to make this bit RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EOImodeS, bit [9]

Controls the behavior of Secure accesses to [GICC_EOIR](#), [GICC_AEOIR](#), and [GICC_DIR](#).

| EOImodeS | Meaning |
|----------|---|
| 0b0 | GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE. |
| 0b1 | GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality. |

Note

An implementation is permitted to make this bit RAO/WI.

This field shares state with [GICC_CTLR](#).EOImode.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

IRQBypDisGrp1, bit [8]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

| IRQBypDisGrp1 | Meaning |
|---------------|--|
| 0b0 | The bypass IRQ signal is signaled to the PE. |
| 0b1 | The bypass IRQ signal is not signaled to the PE. |

If System register access is enabled for EL3 and [ICC_SRE_EL3](#).DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

FIQByDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

| FIQByDisGrp1 | Meaning |
|--------------|--|
| 0b0 | The bypass FIQ signal is signaled to the PE. |
| 0b1 | The bypass FIQ signal is not signaled to the PE. |

If System register access is enabled for EL3 and [ICC_SRE_EL3.DFB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

IRQByDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

| IRQByDisGrp0 | Meaning |
|--------------|--|
| 0b0 | The bypass IRQ signal is signaled to the PE. |
| 0b1 | The bypass IRQ signal is not signaled to the PE. |

If System register access is enabled for EL3 and [ICC_SRE_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

FIQByDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

| FIQByDisGrp0 | Meaning |
|--------------|--|
| 0b0 | The bypass FIQ signal is signaled to the PE. |
| 0b1 | The bypass FIQ signal is not signaled to the PE. |

If System register access is enabled for EL3 and [ICC_SRE_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

CBPR, bit [4]

Controls whether [GICC_BPR](#) provides common control of preemption to Group 0 and Group 1 interrupts:

| CBPR | Meaning |
|------|--|
| 0b0 | GICC_BPR determines preemption for Group 0 interrupts only. |
| 0b1 | GICC_ABPR determines preemption for Group 1 interrupts. GICC_BPR determines preemption for both Group 0 and Group 1 interrupts. |

This field is an alias of [ICC_CTLR_EL3.CBPR_EL1NS](#).

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of [GICC_BPR](#) returns the value of Secure [GICC_BPR](#).Binary_Point, incremented by 1, and saturated to 0b111.
- Non-secure writes of [GICC_BPR](#) are ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

FIQEn, bit [3]

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

| FIQEn | Meaning |
|-------|---|
| 0b0 | Group 0 interrupts are signaled using the IRQ signal. |
| 0b1 | Group 0 interrupts are signaled using the FIQ signal. |

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bit [2]

Reserved, RES0.

EnableGrp1, bit [1]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

| EnableGrp1 | Meaning |
|------------|--|
| 0b0 | Group 1 interrupt signaling is disabled. |
| 0b1 | Group 1 interrupt signaling is enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

| EnableGrp0 | Meaning |
|------------|--|
| 0b0 | Group 0 interrupt signaling is disabled. |
| 0b1 | Group 0 interrupt signaling is enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When GICD_CTLR.DS == 1:

| | | | | | |
|--|---------|---------------|---------------|---------------|---------------|
| 31302928272625242322212019181716151413121110 | 9 | 8 | 7 | 6 | 5 |
| RES0 | EOImode | IRQBypDisGrp1 | FIQBypDisGrp1 | IRQBypDisGrp0 | FIQBypDisGrp0 |

Bits [31:10]

Reserved, RES0.

EOImode, bit [9]

Controls the behavior of accesses to [GICC_EOIR](#), [GICC_AEOIR](#), and [GICC_DIR](#).

| EOImode | Meaning |
|---------|---|
| 0b0 | GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE. |
| 0b1 | GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality. |

Note

An implementation is permitted to make this bit RAO/WI.

This field shares state with [GICC_CTLR.EOImodeS](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

IRQBypDisGrp1, bit [8]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

| IRQBypDisGrp1 | Meaning |
|---------------|--|
| 0b0 | The bypass IRQ signal is signaled to the PE. |
| 0b1 | The bypass IRQ signal is not signaled to the PE. |

If System register access is enabled for EL3 and [ICC_SRE_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

FIQBypDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

| FIQBypDisGrp1 | Meaning |
|----------------------|--|
| 0b0 | The bypass FIQ signal is signaled to the PE. |
| 0b1 | The bypass FIQ signal is not signaled to the PE. |

If System register access is enabled for EL3 and [ICC_SRE_EL3.DFB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

IRQBypDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

| IRQBypDisGrp0 | Meaning |
|----------------------|--|
| 0b0 | The bypass IRQ signal is signaled to the PE. |
| 0b1 | The bypass IRQ signal is not signaled to the PE. |

If System register access is enabled for EL3 and [ICC_SRE_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

FIQBypDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

| FIQBypDisGrp0 | Meaning |
|----------------------|--|
| 0b0 | The bypass FIQ signal is signaled to the PE. |
| 0b1 | The bypass FIQ signal is not signaled to the PE. |

If System register access is enabled for EL3 and [ICC_SRE_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

CBPR, bit [4]

Controls whether [GICC_BPR](#) provides common control of preemption to Group 0 and Group 1 interrupts:

| CBPR | Meaning |
|------|--|
| 0b0 | GICC_BPR determines preemption for Group 0 interrupts only. |
| 0b1 | GICC_ABPR determines preemption for Group 1 interrupts. GICC_BPR determines preemption for both Group 0 and Group 1 interrupts. |

This field is an alias of [ICC_CTLR_EL3.CBPR_EL1NS](#).

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of [GICC_BPR](#) returns the value of Secure [GICC_BPR](#).Binary_Point, incremented by 1, and saturated to 0b111.
- Non-secure writes of [GICC_BPR](#) are ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

FIQEn, bit [3]

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

| FIQEn | Meaning |
|-------|---|
| 0b0 | Group 0 interrupts are signaled using the IRQ signal. |
| 0b1 | Group 0 interrupts are signaled using the FIQ signal. |

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bit [2]

Reserved, RES0.

EnableGrp1, bit [1]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

| EnableGrp1 | Meaning |
|------------|--|
| 0b0 | Group 1 interrupt signaling is disabled. |
| 0b1 | Group 1 interrupt signaling is enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

| EnableGrp0 | Meaning |
|------------|--|
| 0b0 | Group 0 interrupt signaling is disabled. |
| 0b1 | Group 0 interrupt signaling is enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing GICC_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_CTLR](#) and [ICC_MCTLR](#) provide equivalent functionality.
- For AArch64 implementations, [ICC_CTLR_EL1](#) and [ICC_CTLR_EL3](#) provide equivalent functionality.

GICC_CTLR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|--------|-----------|
| GIC CPU interface | 0x0000 | GICC_CTLR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_DIR, CPU Interface Deactivate Interrupt Register

The GICC_DIR characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_DIR are RES0.

Attributes

GICC_DIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_DIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_DIR](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_DIR_EL1](#) provides equivalent functionality.

Writes to this register have an effect only in the following cases:

- When [GICD_CTLR](#).DS == 1, if [GICC_CTLR](#).EOImode == 1.
- In GIC implementations that support two Security states:
 - If the access is Secure and [GICC_CTLR](#).EOImodeS == 1.
 - If the access is Non-secure and [GICC_CTLR](#).EOImodeNS == 1.

The following writes must be ignored:

- Writes to this register when the corresponding EOImode field in [GICC_CTLR](#) == 0. In systems that support system error generation, an implementation might generate a system error.
- Writes to this register when the corresponding EOImode field in [GICC_CTLR](#) == 0 and the corresponding interrupt is not active. In systems that support system error generation, an implementation might generate a system error. In implementations using the GIC Stream Protocol Interface, these writes correspond to a Deactivate packet for an interrupt that is not active. For more information, see 'Deactivate (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If the corresponding EOImode field in [GICC_CTLR](#) is 1 and this register is written to without a corresponding write to [GICC_EOIR](#) or [GICC_AEOIR](#), the interrupt is deactivated but the bit corresponding to it in the active priorities registers remains set.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_DIR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|--------|----------|
| GIC CPU interface | 0x1000 | GICC_DIR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICC_EOIR, CPU Interface End Of Interrupt Register

The GICC_EOIR characteristics are:

Purpose

A write to this register performs priority drop for the specified interrupt and, if the appropriate [GICC_CTLR](#).EOImodeS or [GICC_CTLR](#).EOImodeNS field == 0, also deactivates the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_EOIR are RES0.

If [GICD_CTLR](#).DS==0:

- This register is Common.
- [GICC_AEOIR](#) is an alias of the Non-secure view of this register.

For Secure writes when [GICD_CTLR](#).DS==0, or for Secure and Non-secure writes when [GICD_CTLR](#).DS==1, the register provides functionality for Group 0 interrupts.

For Non-secure writes when [GICD_CTLR](#).DS==1, the register provides functionality for Group 1 interrupts.

Attributes

GICC_EOIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

For every read of a valid INTID from [GICC_IAR](#), the connected PE must perform a matching write to GICC_EOIR. The value written to GICC_EOIR must be the INTID from [GICC_IAR](#). Reads of INTIDs 1020-1023 do not require matching writes.

Note

Arm recommends that software preserves the entire register value read from [GICC_IAR](#), and writes that value back to GICC_EOIR on completion of interrupt processing.

For nested interrupts, the order of writes to this register must be the reverse of the order of interrupt acknowledgement. Behavior is UNPREDICTABLE if:

- This ordering constraint is not maintained.
- The value written to this register does not match an active interrupt, or the ID of a spurious interrupt.
- The value written to this register does not match the last valid interrupt value read from [GICC_IAR](#).

For general information about the effect of writes to end of interrupt registers, and about the possible separation of the priority drop and interrupt deactivate operations, see 'Interrupt lifecycle' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If [GICD_CTLR.DS](#)==0:

- [GICC_CTLR.EOImodeS](#) controls the behavior of Secure accesses to GICC_EOIR and [GICC_AEOIR](#).
- [GICC_CTLR.EOImodeNS](#) controls the behavior of Non-secure accesses to GICC_EOIR and [GICC_AEOIR](#).

Accessing GICC_EOIR

The following writes must be ignored:

- Writes of INTIDs 1020-1023.
- Secure writes corresponding to Group 1 interrupts. In systems that support system error generation, an implementation might generate a system error. In this case, GIC behavior is predictable, and the highest Secure active priority (in the Secure copy of [GICC_APR<n>](#)) will be reset if the highest active priority is Secure. System behavior is UNPREDICTABLE.
- Non-secure writes corresponding to Group 0 interrupts when [GICC_CTLR.EOImodeS](#) == 1. In systems that support system error generation, an implementation might generate a system error. In this case, GIC behavior is predictable, and the highest Non-secure active priority (in the Non-secure copy of [GICC_APR<n>](#)) will be reset if the highest active priority is Non-secure. System behavior is UNPREDICTABLE.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_EOIR0](#) and [ICC_EOIR1](#) provide equivalent functionality.
- For AArch64 implementations, [ICC_EOIR0_EL1](#) and [ICC_EOIR1_EL1](#) provide equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_EOIR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|--------|-----------|
| GIC CPU interface | 0x0010 | GICC_EOIR |

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

GICC_HPPIR, CPU Interface Highest Priority Pending Interrupt Register

The GICC_HPPIR characteristics are:

Purpose

Provides the INTID of the highest priority pending interrupt on the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_HPPIR are RES0.

If [GICD_CTLR.DS](#)==0:

- This register is Common.
- [GICC_AHPPIR](#) is an alias of the Non-secure view of this register.

Attributes

GICC_HPPIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_HPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_HPPIR0](#) and [ICC_HPPIR1](#) provide equivalent functionality.
- For AArch64 implementations, [ICC_HPPIR0_EL1](#) and [ICC_HPPIR1_EL1](#) provide equivalent functionality.

If the highest priority pending interrupt is in Group 0, a Non-secure read of this register returns the special INTID 1023.

For Secure reads when [GICD_CTLR.DS](#)==0, or for Secure and Non-secure reads when [GICD_CTLR.DS](#)==1, returns the special INTID 1022 if the highest priority pending interrupt is in Group 1.

If no interrupts are in the pending state, a read of this register returns the special INTID 1023.

Interrupt identifiers corresponding to an interrupt group that is not enabled are ignored.

If the highest priority pending interrupt is a direct interrupt that is both individually enabled in the Distributor and part of an interrupt group that is enabled in the Distributor, and the interrupt group is disabled in the CPU interface for this PE, this register returns the special INTID 1023.

For more information about pending interrupts that are not considered when determining the highest priority pending interrupt, see 'Preemption' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_HPPIR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|--------|------------|
| GIC CPU interface | 0x0018 | GICC_HPPIR |

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_IAR, CPU Interface Interrupt Acknowledge Register

The GICC_IAR characteristics are:

Purpose

Provides the INTID of the signaled interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_IAR are RES0.

This register is available in all configurations of the GIC. If [GICD_CTLR.DS](#)=0:

- This register is Common.
- [GICC_AIAR](#) is an alias of the Non-secure view of this register.

The format of the INTID is governed by whether affinity routing is enabled for a Security state.

Attributes

GICC_IAR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A read of this register returns the INTID of the highest priority pending interrupt for the CPU interface. The read returns a spurious INTID of 1023 if any of the following apply:

- Forwarding of interrupts by the Distributor to the CPU interface is disabled.
- Signaling of interrupts by the CPU interface to the connected PE is disabled.
- There are no pending interrupts on the CPU interface with sufficient priority for the interface to signal it to the PE.

When the GIC returns a valid INTID to a read of this register it treats the read as an acknowledge of that interrupt. In addition, it changes the interrupt status from pending to active, or to active and pending if the pending state of the interrupt persists. Normally, the pending state of an interrupt persists only if the interrupt is level-sensitive and remains asserted.

For every read of a valid INTID from GICC_IAR, the connected PE must perform a matching write to [GICC_EOIR](#).

Note

- Arm recommends that software preserves the entire register value read from this register, and writes that value back to [GICC_EOIR](#) on completion of interrupt processing.
 - For SPIs, although multiple target PEs might attempt to read this register at any time, only one PE can obtain a valid INTID. For more information, see 'Activation' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).
-

Accessing GICC_IAR

When [GICD_CTLR.DS](#)==1, if the highest priority pending interrupt is in Group 1, the special INTID 1022 is returned.

In GIC implementations that support two Security states, if the highest priority pending interrupt is in Group 0, Non-secure reads return the special INTID 1023.

In GIC implementations that support two Security states, if the highest priority pending interrupt is in Group 1, Secure reads return the special INTID 1022.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_IAR0](#) and [ICC_IAR1](#) provide equivalent functionality.
- For AArch64 implementations, [ICC_IAR0_EL1](#) and [ICC_IAR1_EL1](#) provide equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_IAR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|--------|----------|
| GIC CPU interface | 0x000C | GICC_IAR |

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GICC_IIDR, CPU Interface Identification Register

The GICC_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_IIDR are RES0.

Attributes

GICC_IIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----------------------|----|----|----|----------|----|----|----|-------------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ProductID | | | | | | | | | | | | Architecture_version | | | | Revision | | | | Implementer | | | | | | | | | | | |

ProductID, bits [31:20]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture_version, bits [19:16]

The version of the GIC architecture that is implemented.

| Architecture_version | Meaning |
|----------------------|--|
| 0b0001 | GICv1. |
| 0b0010 | GICv2. |
| 0b0011 | FEAT_GICv3 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1. |
| 0b0100 | FEAT_GICv4 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1. |

Other values are reserved.

Revision, bits [15:12]

Revision number for the CPU interface.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the CPU interface.

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

Accessing GICC_IIDR

GICC_IIDR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|--------|-----------|
| GIC CPU interface | 0x00FC | GICC_IIDR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_NSAPR<n>, CPU Interface Non-secure Active Priorities Registers, n = 0 - 3

The GICC_NSAPR<n> characteristics are:

Purpose

Provides information about Group 1 interrupt active priorities.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_NSAPR<n> are RES0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

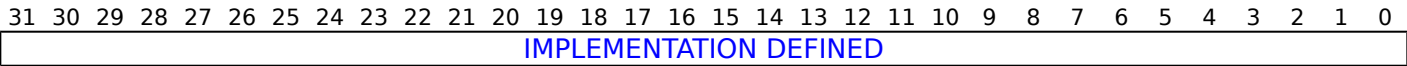

When [GICD_CTLR.DS](#)==0, these registers are RAZ/WI to Non-secure accesses.

GICC_NSAPR1 is only implemented in implementations that support 6 or more bits of priority. GICC_NSAPR2 and GICC_NSAPR3 are only implemented in implementations that support 7 bits of priority.

Attributes

GICC_NSAPR<n> is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing GICC_NSAPR<n>

GICC_NSAPR<n> can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|------------------|---------------|
| GIC CPU interface | 0x00E0 + (4 * n) | GICC_NSAPR<n> |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICC_PMR, CPU Interface Priority Mask Register

The GICC_PMR characteristics are:

Purpose

This register provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Note

Higher interrupt priority corresponds to a lower value of the Priority field.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_PMR are RES0.

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICC_PMR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|----------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | Priority | | | | | | | |

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = 0b0.
- For 64 supported levels, bits [1:0] = 0b00.
- For 32 supported levels, bits [2:0] = 0b000.
- For 16 supported levels, bits [3:0] = 0b0000.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICC_PMR

If the GIC implementation supports two Security states:

- Non-secure accesses to this register can only read or write values corresponding to the lower half of the priority range.
- If a Secure write has programmed the register with a value that corresponds to a value in the upper half of the priority range then:
 - Any Non-secure read of the register returns 0x00, regardless of the value held in the register.
 - Non-secure writes are ignored.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

GICC_PMR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|--------|----------|
| GIC CPU interface | 0x0004 | GICC_PMR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICC_RPR, CPU Interface Running Priority Register

The GICC_RPR characteristics are:

Purpose

This register indicates the running priority of the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_RPR are RES0.

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICC_RPR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|----------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | Priority | | | | | | | |

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR was set to the minimum value.

Accessing GICC_RPR

If there is no active interrupt on the CPU interface, the idle priority value is returned.

If the GIC implementation supports two Security states, a Non-secure read of the Priority field returns:

- 0x00 if the field value is less than 0x80.
- The Non-secure view of the Priority value if the field value is 0x80 or more.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Software cannot determine the number of implemented priority bits from this register.

GICC_RPR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|--------|----------|
| GIC CPU interface | 0x0014 | GICC_RPR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICC_STATUSR, CPU Interface Status Register

The GICC_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_STATUSR are RES0.

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

This register is used only when System register access is not enabled. If System register access is enabled, this register is not updated. Equivalent functionality might be provided by appropriate traps and exceptions.

Attributes

GICC_STATUSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|---|---|---|-----|---|------|---|------|---|-----|--|-----|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | |
| | | | | | | | | | | | | | RES0 | | | | | | | | | | | | ASV | | WROD | | RWOD | | WRD | | RRD | |

Bits [31:5]

Reserved, RES0.

ASV, bit [4]

Attempted security violation.

| ASV | Meaning |
|-----|---|
| 0b0 | Normal operation. |
| 0b1 | A Non-secure access to a Secure register has been detected. |

Note

This bit is not set to 1 for registers where any of the fields are Non-secure.

WROD, bit [3]

Write to an RO location.

| WROD | Meaning |
|------|--|
| 0b0 | Normal operation. |
| 0b1 | A write to an RO location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

| RWOD | Meaning |
|-------------|--|
| 0b0 | Normal operation. |
| 0b1 | A read of a WO location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

| WRD | Meaning |
|------------|---|
| 0b0 | Normal operation. |
| 0b1 | A write to a reserved location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

| RRD | Meaning |
|------------|--|
| 0b0 | Normal operation. |
| 0b1 | A read of a reserved location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICC_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

If this register is implemented, [GICV_STATUSR](#) must also be implemented.

GICC_STATUSR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------|---------------|------------------|
| GIC CPU interface | 0x002C | GICC_STATUSR (S) |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.

| Component | Offset | Instance |
|-------------------|---------------|-------------------|
| GIC CPU interface | 0x002C | GICC_STATUSR (NS) |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_CLRSPI_NSR, Clear Non-secure SPI Pending Register

The GICD_CLRSPI_NSR characteristics are:

Purpose

Removes the pending state from a valid SPI if permitted by the Security state of the access and the [GICD_NSACR<n>](#) value for that SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

If [GICD_TYPER](#).MBIS == 0, this register is reserved.

When [GICD_CTLR](#).DS == 1, this register provides functionality for all SPIs.

Attributes

GICD_CLRSPI_NSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | INTID | | | | | | | | | | | |

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to [GICD_SETSPI_NSR](#) or [GICD_SETSPI_SR](#) adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to [GICD_CLRSPI_NSR](#), [GICD_CLRSPI_SR](#), or [GICD_ICPENDR<n>](#).
- For a level-sensitive interrupt, a write to [GICD_SETSPI_NSR](#) or [GICD_SETSPI_SR](#) adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to [GICD_CLRSPI_NSR](#) or [GICD_CLRSPI_SR](#). If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_CLRSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding [GICD_NSACR<n>](#) register is less than 0b10.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can clear the pending state of any valid SPI.

GICD_CLRSPI_NSR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|--------|-----------------|
| GIC Distributor | Dist_base | 0x0048 | GICD_CLRSPI_NSR |

Accesses on this interface are **WO**.

GICD_CLRSPI_SR, Clear Secure SPI Pending Register

The GICD_CLRSPI_SR characteristics are:

Purpose

Removes the pending state from a valid SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

If [GICD_TYPER](#).MBIS == 0, this register is reserved.

When [GICD_CTLR](#).DS == 1, this register is WI.

Attributes

GICD_CLRSPI_SR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | INTID | | | | | | | | | | | | |

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to [GICD_SETSPI_NSR](#) or [GICD_SETSPI_SR](#) adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to [GICD_CLRSPI_NSR](#), [GICD_CLRSPI_SR](#), or [GICD_ICPENDR<n>](#).
- For a level-sensitive interrupt, a write to [GICD_SETSPI_NSR](#) or [GICD_SETSPI_SR](#) adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to [GICD_CLRSPI_NSR](#) or [GICD_CLRSPI_SR](#). If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_CLRSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICD_CLRSPI_SR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|--------|----------------|
| GIC Distributor | Dist_base | 0x0058 | GICD_CLRSPI_SR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **WO**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **WI**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRoot() accesses to this register are **WO**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRealm() accesses to this register are **WI**.

GICD_CPENDSGIR<n>, SGI Clear-Pending Registers, n = 0 - 3

The GICD_CPENDSGIR<n> characteristics are:

Purpose

Removes the pending state from an SGI.

A write to this register changes the state of a pending SGI to inactive, and the state of an active and pending SGI to active.

Configuration

Four SGI clear-pending registers are implemented. Each register contains eight clear-pending bits for each of four SGIs, for a total of 16 possible SGIs.

In multiprocessor implementations, each PE has a copy of these registers.

Attributes

GICD_CPENDSGIR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---|----|----|----|----|----|----|----|---|----|----|----|----|----|----|----|---|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SGI_clear_pending_bits3 | | | | | | | | SGI_clear_pending_bits2 | | | | | | | | SGI_clear_pending_bits1 | | | | | | | | SGI_clear_pending_bits0 | | | | | | | |

SGI_clear_pending_bits<x>, bits [8x+7:8x], for x = 3 to 0

Removes the pending state from SGI number $4n + x$ for the PE corresponding to the bit number written to.

Reads and writes have the following behavior:

| SGI_clear_pending_bits<x> | Meaning |
|---------------------------|--|
| 0x00 | If read, indicates that the SGI from the corresponding PE is not pending and is not active and pending. If written, has no effect. |
| 0x01 | If read, indicates that the SGI from the corresponding PE is pending or is active and pending. If written, removes the pending state from the SGI for the corresponding PE. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For SGI ID m , generated by processing element C writing to the corresponding [GICD_SGIR](#) field, where DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_CPENDSGIR<n> number is given by $n = m \text{ DIV } 4$.
- The offset of the required register is $(0xF10 + (4n))$.
- The offset of the required field within the register GICD_CPENDSGIR<n> is given by $m \text{ MOD } 4$.
- The required bit in the 8-bit SGI clear-pending field m is bit C .

Accessing GICD_CPENDSGIR<n>

These registers are used only when affinity routing is not enabled. When affinity routing is enabled, this register is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

GICD_CPENDSGIR<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|-------------------|
| GIC Distributor | Dist_base | 0x0F10 + (4 * n) | GICD_CPENDSGIR<n> |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICD_CTLR, Distributor Control Register

The GICD_CTLR characteristics are:

Purpose

Enables interrupts and affinity routing.

Configuration

The format of this register depends on the Security state of the access and the number of Security states supported, which is specified by GICD_CTLR.DS.

Attributes

GICD_CTLR is a 32-bit register.

Field descriptions

When access is Secure, in a system that supports two Security states:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|----|--------|-------|------|-------------|--------------|--------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RWP | | | | | | | | | | | | | | | | | | | | | | | | E1NWF | DS | ARE_NS | ARE_S | RES0 | EnableGrp1S | EnableGrp1NS | EnableGrp1NS |

RWP, bit [31]

Register Write Pending. Read only. Indicates whether a register write is in progress or not:

| RWP | Meaning |
|------------|---|
| 0b0 | No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces. |
| 0b1 | Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated. |

This field tracks writes to:

- GICD_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.
- GICD_ICENABLER<n>.

Updates to other register fields are not tracked by this field.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:8]

Reserved, RES0.

E1NWF, bit [7]

Enable 1 of N Wakeup Functionality.

It is IMPLEMENTATION DEFINED whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

| E1NWF | Meaning |
|--------------|---|
| 0b0 | A PE that is asleep cannot be picked for 1 of N interrupts. |
| 0b1 | A PE that is asleep can be picked for 1 of N interrupts as determined by IMPLEMENTATION DEFINED controls. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

DS, bit [6]

Disable Security.

| DS | Meaning |
|-----------|---|
| 0b0 | Non-secure accesses are not permitted to access and modify registers that control Group 0 interrupts. |
| 0b1 | Non-secure accesses are permitted to access and modify registers that control Group 0 interrupts. |

If DS is written from 0 to 1 when GICD_CTLR.ARE_S == 1, then GICD_CTLR.ARE for the single Security state is RAO/WI.

If the Distributor only supports a single Security state, this bit is RAO/WI.

If the Distributor supports two Security states, it IMPLEMENTATION DEFINED whether this bit is programmable or implemented as RAZ/WI.

When this field is set to 1, all accesses to GICD_CTLR access the single Security state view, and all bits are accessible.

When set to 1, this field can only be cleared by a hardware reset.

Writing this bit from 0 to 1 is UNPREDICTABLE if any of the following is true:

- [GICD_CTLR.EnableGrp0](#)==1.
- [GICD_CTLR.EnableGrp1S](#)==1.
- [GICD_CTLR.EnableGrp1NS](#)==1.
- One or more INTID is in the Active or Active and Pending state.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

ARE_NS, bit [5]

Affinity Routing Enable, Non-secure state.

| ARE_NS | Meaning |
|---------------|---|
| 0b0 | Affinity routing disabled for Non-secure state. |
| 0b1 | Affinity routing enabled for Non-secure state. |

When affinity routing is enabled for the Secure state, this field is RAO/WI.

Changing the ARE_NS settings from 0 to 1 is UNPREDICTABLE except when GICD_CTLR.EnableGrp1 Non-secure == 0.

Changing the ARE_NS settings from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility for Non-secure state is not implemented, this field is RAO/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

ARE_S, bit [4]

Affinity Routing Enable, Secure state.

| ARE_S | Meaning |
|--------------|---|
| 0b0 | Affinity routing disabled for Secure state. |
| 0b1 | Affinity routing enabled for Secure state. |

Changing the ARE_S setting from 0 to 1 is UNPREDICTABLE except when all of the following apply:

- GICD_CTLR.EnableGrp0==0.
- GICD_CTLR.EnableGrp1S==0.
- GICD_CTLR.EnableGrp1NS==0.

Changing the ARE_S settings from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility for Secure state is not implemented, this field is RAO/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Bit [3]

Reserved, RES0.

EnableGrp1S, bit [2]

Enable Secure Group 1 interrupts.

| EnableGrp1S | Meaning |
|--------------------|---|
| 0b0 | Secure Group 1 interrupts are disabled. |
| 0b1 | Secure Group 1 interrupts are enabled. |

If GICD_CTLR.ARE_S == 0, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

EnableGrp1NS, bit [1]

Enable Non-secure Group 1 interrupts.

| EnableGrp1NS | Meaning |
|---------------------|---|
| 0b0 | Non-secure Group 1 interrupts are disabled. |
| 0b1 | Non-secure Group 1 interrupts are enabled. |

Note

This field also controls whether LPIs are forwarded to the PE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enable Group 0 interrupts.

| EnableGrp0 | Meaning |
|-------------------|----------------------------------|
| 0b0 | Group 0 interrupts are disabled. |
| 0b1 | Group 0 interrupts are enabled. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

When access is Non-secure, in a system that supports two Security states:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|------|-------------|----|------------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RWP | RES0 | | | | | | | | | | | | | | | | ARE_NS | | RES0 | EnableGrp1A | | EnableGrp1 | | | | | | | | | |

RWP, bit [31]

This bit is a read-only alias of the Secure GICD_CTLR.RWP bit.

Bits [30:5]

Reserved, RES0.

ARE_NS, bit [4]

This bit is a read-write alias of the Secure GICD_CTLR.ARE_NS bit.

If GICv2 backwards compatibility for Non-secure state is not implemented, this field is RAO/WI.

Bits [3:2]

Reserved, RES0.

EnableGrp1A, bit [1]

If ARE_NS == 1, then this bit is a read-write alias of the Secure GICD_CTLR.EnableGrp1NS bit.

If ARE_NS == 0, then this bit is RES0.

EnableGrp1, bit [0]

If ARE_NS == 0, then this bit is a read-write alias of the Secure GICD_CTLR.EnableGrp1NS bit.

If ARE_NS == 1, then this bit is RES0.

When in a system that supports only a single Security state:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|-------|----|------|-----|------|------------|---|------------|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RWP | RES0 | | | | | | | | | | | | | | | | nASSGReq | | E1NWF | DS | RES0 | ARE | RES0 | EnableGrp1 | | EnableGrp0 | | | | | |

RWP, bit [31]

Register Write Pending. Read only. Indicates whether a register write is in progress or not:

| RWP | Meaning |
|-----|---|
| 0b0 | No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces. |
| 0b1 | Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated. |

This field tracks updates to:

- GICD_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.

- GICD_ICENABLER<n>, the bits that allow disabling of SPIs.

Updates to other register fields are not tracked by this field.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:9]

Reserved, RES0.

nASSGImeq, bit [8]

When FEAT_GICv4p1 is implemented:

Controls whether SGIs have an active state.

This bit is RES0 if [GICD_TYPER2](#).GICD_TYPER2.nASSGImeq is 0.

This bit is WI when any of GICD_CTLR.{EnableGrp0,EnableGrp1} is 1.

| nASSGImeq | Meaning |
|-----------|---|
| 0b0 | SGIs have an active state and must be deactivated. |
| 0b1 | SGIs do not have an active state and do not require deactivation. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Otherwise:

Reserved, RES0.

E1NWF, bit [7]

Enable 1 of N Wakeup Functionality.

It is IMPLEMENTATION DEFINED whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

| E1NWF | Meaning |
|-------|---|
| 0b0 | A PE that is asleep cannot be picked for 1 of N interrupts. |
| 0b1 | A PE that is asleep can be picked for 1 of N interrupts as determined by IMPLEMENTATION DEFINED controls. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

DS, bit [6]

Disable Security. This field is RAO/WI.

Bit [5]

Reserved, RES0.

ARE, bit [4]

Affinity Routing Enable.

| ARE | Meaning |
|-----|----------------------------|
| 0b0 | Affinity routing disabled. |
| 0b1 | Affinity routing enabled. |

Changing the ARE settings from 0 to 1 is UNPREDICTABLE except when all of the following apply:

- GICD_CTLR.EnableGrp1==0.
- GICD_CTLR.EnableGrp0==0.

Changing ARE from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility is not implemented, this field is RAO/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Bits [3:2]

Reserved, RES0.

EnableGrp1, bit [1]

Enable Group 1 interrupts.

| EnableGrp1 | Meaning |
|------------|------------------------------|
| 0b0 | Group 1 interrupts disabled. |
| 0b1 | Group 1 interrupts enabled. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enable Group 0 interrupts.

| EnableGrp0 | Meaning |
|------------|----------------------------------|
| 0b0 | Group 0 interrupts are disabled. |
| 0b1 | Group 0 interrupts are enabled. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_CTLR

If an interrupt is pending within a CPU interface when the corresponding GICD_CTLR.EnableGrpX bit is written from 1 to 0 the interrupt must be retrieved from the CPU interface.

Note

This might have no effect on the forwarded interrupt if it has already been activated. When a write changes the value of ARE for a Security state or the value of the DS bit, the format used for interpreting the remaining bits provided in the write data is the format that applied before the write takes effect.

GICD_CTLR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|--------|-----------|
| GIC Distributor | Dist_base | 0x0000 | GICD_CTLR |

Accesses on this interface are **RW**.

GICD_ICACTIVER<n>, Interrupt Clear-Active Registers, n = 0 - 31

The GICD_ICACTIVER<n> characteristics are:

Purpose

Deactivates the corresponding interrupt. These registers are used when saving and restoring GIC state.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)==0, these registers are Common.

The number of implemented GICD_ICACTIVER<n> registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ICACTIVER0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ICACTIVER0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICACTIVER<n> is a 32-bit register.

Field descriptions

| | | | | | | |
|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | |
| Clear_active_bit31 | Clear_active_bit30 | Clear_active_bit29 | Clear_active_bit28 | Clear_active_bit27 | Clear_active_bit26 | Clear_active_bit25 |

Clear_active_bit<x>, bit [x], for x = 31 to 0

Removes the active state from interrupt number 32n + x. Reads and writes have the following behavior:

| Clear_active_bit<x> | Meaning |
|---------------------|--|
| 0b0 | If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICACTIVER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ICACTIVER is (0x380 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Accessing GICD_ICACTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, the bits corresponding to SGIs and PPIs in that Security state are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by [GICR_ICACTIVER0](#).

Bits corresponding to unimplemented interrupts are RAZ/WI.

If [GICD_CTLR.DS](#)==0, unless the [GICD_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

GICD_ICACTIVER<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------------|-------------------|
| GIC Distributor | Dist_base | 0x0380 + (4 * n) | GICD_ICACTIVER<n> |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICD_ICACTIVER<n>E, Interrupt Clear-Active Registers (extended SPI range), n = 0 - 31

The GICD_ICACTIVER<n>E characteristics are:

Purpose

Removes the active state from the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICACTIVER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICACTIVER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ICACTIVER<n>E is a 32-bit register.

Field descriptions

| | | | | | | |
|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | Cle |
| Clear_active_bit31 | Clear_active_bit30 | Clear_active_bit29 | Clear_active_bit28 | Clear_active_bit27 | Clear_active_bit26 | Cle |

Clear_active_bit<x>, bit [x], for x = 31 to 0

For the extended SPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

| Clear_active_bit<x> | Meaning |
|---------------------|--|
| 0b0 | If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICACTIVER<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_ICACTIVER<n>E is $(0 \times 1C00 + (4 \times n))$.
- The bit number of the required group modifier bit in this register is $(m-4096) \text{ MOD } 32$.

Accessing GICD_ICACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICACTIVER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICACTIVER<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|--------------------|
| GIC Distributor | Dist_base | 0x1C00 + (4 * n) | GICD_ICACTIVER<n>E |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ICENABLER<n>, Interrupt Clear-Enable Registers, n = 0 - 31

The GICD_ICENABLER<n> characteristics are:

Purpose

Disables forwarding of the corresponding interrupt to the CPU interfaces.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)=0, these registers are Common.

The number of implemented [GICD_ICENABLER<n>](#) registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ICENABLER0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ICENABLER0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICENABLER<n> is a 32-bit register.

Field descriptions

| | | | | | |
|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 |
| Clear_enable_bit31 | Clear_enable_bit30 | Clear_enable_bit29 | Clear_enable_bit28 | Clear_enable_bit27 | Clear_enable_bit26 |

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, controls the forwarding of interrupt number $32n + x$ to the CPU interfaces. Reads and writes have the following behavior:

| Clear_enable_bit<x> | Meaning |
|---------------------|--|
| 0b0 | If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect. |
| 0b1 | If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0. |

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICENABLER<n> number, n, is given by $n = m \text{ DIV } 32$.
- The offset of the required GICD_ICENABLER is $(0 \times 180 + (4 * n))$.
- The bit number of the required group modifier bit in this register is $m \text{ MOD } 32$.

Note

Writing a 1 to a GICD_ICENABLER<n> bit only disables the forwarding of the corresponding interrupt from the Distributor to any CPU interface. It does not prevent the interrupt from changing state, for example becoming pending or active and pending if it is already active.

Accessing GICD_ICENABLER<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICENABLER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When [GICD_CTLR.DS](#)=0, bits corresponding to Group 0 and Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to [GICD_ISENABLER<n>](#) and [GICD_ICENABLER<n>](#) where n=0.

Completion of a write to this register does not guarantee that the effects of the write are visible throughout the affinity hierarchy. To ensure an enable has been cleared, software must write to the register with bits set to 1 to clear the required enables. Software must then poll [GICD_CTLR.RWP](#) until it has the value zero.

GICD_ICENABLER<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------------|-------------------|
| GIC Distributor | Dist_base | 0x0180 + (4 * n) | GICD_ICENABLER<n> |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ICENABLER<n>E, Interrupt Clear-Enable Registers, n = 0 - 31

The GICD_ICENABLER<n>E characteristics are:

Purpose

Disables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICENABLER<n>E are RES0.

When [GICD_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD_TYPER.ESPI](#)==1, the number of implemented [GICD_ICENABLER<n>E](#) registers is ([GICD_TYPER.ESPI_range](#)+1). Registers are numbered from 0.

Attributes

GICD_ICENABLER<n>E is a 32-bit register.

Field descriptions

| | | | | | |
|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 |
| Clear_enable_bit31 | Clear_enable_bit30 | Clear_enable_bit29 | Clear_enable_bit28 | Clear_enable_bit27 | Clear_enable_bit26 |

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

| Clear_enable_bit<x> | Meaning |
|---------------------|---|
| 0b0 | If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect. |
| 0b1 | If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICENABLER<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_ICENABLER<n>E is $(0x1400 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-4096) \text{ MOD } 32$.

Accessing GICD_ICENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICENABLER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICENABLER<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------------|--------------------|
| GIC Distributor | Dist_base | 0x1400 + (4 * n) | GICD_ICENABLER<n>E |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ICFGR<n>, Interrupt Configuration Registers, n = 0 - 63

The GICD_ICFGR<n> characteristics are:

Purpose

Determines whether the corresponding interrupt is edge-triggered or level-sensitive.

Configuration

These registers are available in all GIC configurations. If the GIC implementation supports two Security states, these registers are Common.

GICD_ICFGR1 is Banked for each connected PE with [GICR_TYPER](#).Processor_Number < 8.

Accessing GICD_ICFGR1 from a PE with [GICR_TYPER](#).Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICFGR<n>

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

For SGIs, Int_config fields are RO, meaning that GICD_ICFGR0 is RO.

Changing Int_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

Fields corresponding to unimplemented interrupts are RAZ/WI.

Attributes

GICD_ICFGR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | |
|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 |
| Int_config15 | Int_config14 | Int_config13 | Int_config12 | Int_config11 | Int_config10 | Int_config9 | Int_config8 | Int_config7 | Int_config6 | Int_config5 | Int_config4 | Int_config3 | Int_config2 | Int_config1 | Int_config0 | | | |

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

| Int_config<x> | Meaning |
|---------------|---|
| 0b00 | Corresponding interrupt is level-sensitive. |
| 0b10 | Corresponding interrupt is edge-triggered. |

Int_config[0] (bit [2x]) is RES0.

For SGIs, this field always indicates edge-triggered.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_ICFGR<n>

For SPIs and PPIs, when [GICD_CTLR.DS](#)==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICD_ICFGR<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|---------------|
| GIC Distributor | Dist_base | 0x0C00 + (4 * n) | GICD_ICFGR<n> |

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ICFGR<n>E, Interrupt Configuration Registers (Extended SPI Range), n = 0 - 63

The GICD_ICFGR<n>E characteristics are:

Purpose

Determines whether the corresponding SPI in the extended SPI range is edge-triggered or level-sensitive.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICFGR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICFGR<n>E registers is ((GICD_TYPER.ESPI_range+1)*2). Registers are numbered from 0.

Attributes

GICD_ICFGR<n>E is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | |
|--------------|--------------|--------------|--------------|--------------|--------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 |
| Int_config15 | Int_config14 | Int_config13 | Int_config12 | Int_config11 | Int_config10 | Int_config9 | Int_config8 | Int_config7 | Int_config6 | Int_config5 | Int_config4 | Int_config3 | Int_config2 | Int_config1 | Int_config0 | Int_config0 | Int_config0 | Int_config0 |

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config[0] (bit[2x]) is RES0.

| Int_config<x> | Meaning |
|---------------|---|
| 0b00 | Corresponding interrupt is level-sensitive. |
| 0b10 | Corresponding interrupt is edge-triggered. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_ICFGR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICFGR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICFGR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|-------|--------|----------|
|-----------|-------|--------|----------|

| | | | |
|--------------------|-----------|---------------------|----------------|
| GIC Distributor | Dist_base | 0x3000 + (4 * n) | GICD_ICFGR<n>E |
|--------------------|-----------|---------------------|----------------|

Accesses on this interface are **RW**.

GICD_ICPENDR<n>, Interrupt Clear-Pending Registers, n = 0 - 31

The GICD_ICPENDR<n> characteristics are:

Purpose

Removes the pending state from the corresponding interrupt.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)==0, these registers are Common.

The number of implemented [GICD_ICPENDR<n>](#) registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ICPENDR0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ICPENDR0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICPENDR<n> is a 32-bit register.

Field descriptions

| 31 | 30 | 29 | 28 | 27 | 26 |
|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|
| Clear_pending_bit31 | Clear_pending_bit30 | Clear_pending_bit29 | Clear_pending_bit28 | Clear_pending_bit27 | Clear_pending_bit26 |

Clear_pending_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, removes the pending state from interrupt number 32n + x. Reads and writes have the following behavior:

| Clear_pending_bit<x> | Meaning |
|----------------------|---|
| 0b0 | If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: <ul style="list-style-type: none"> If the interrupt is an SGI. In this case, the write is ignored. The pending state of an SGI can be cleared using GICD_CPENDSGIR<n>. If the interrupt is not pending and is not active and pending. If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICPENDR<n> number, n, is given by $n = m \text{ DIV } 32$.
- The offset of the required GICD_ICPENDR is $(0x200 + (4*n))$.
- The bit number of the required group modifier bit in this register is $m \text{ MOD } 32$.

Accessing GICD_ICPENDR<n>

Clear-pending bits for SGIs are RO/WI.

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by [GICR_ICPENDR0](#).
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be cleared by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If [GICD_CTLR.DS](#)=0, unless the [GICD_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

GICD_ICPENDR<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|-----------------|
| GIC Distributor | Dist_base | 0x0280 + (4 * n) | GICD_ICPENDR<n> |

Accesses on this interface are **RW**.

GICD_ICPENDR<n>E, Interrupt Clear-Pending Registers (extended SPI range), n = 0 - 31

The GICD_ICPENDR<n>E characteristics are:

Purpose

Removes the pending state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICPENDR<n>E are RES0.

When [GICD_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD_TYPER.ESPI](#)==1, the number of implemented GICD_ICPENDR<n>E registers is ([GICD_TYPER.ESPI_range](#)+1). Registers are numbered from 0.

Attributes

GICD_ICPENDR<n>E is a 32-bit register.

Field descriptions

| | | | | | |
|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 |
| Clear_pending_bit31 | Clear_pending_bit30 | Clear_pending_bit29 | Clear_pending_bit28 | Clear_pending_bit27 | Clear_pending_bit26 |

Clear_pending_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the pending state to interrupt number x. Reads and writes have the following behavior:

| Clear_pending_bit<x> | Meaning |
|----------------------|---|
| 0b0 | If read, indicates that the corresponding interrupt is not pending. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: <ul style="list-style-type: none">If the interrupt is not pending and is not active and pending.If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ICPENDR<n>E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICPENDR<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_ICPENDR<n>E is $(0x1800 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-4096) \text{ MOD } 32$.

Accessing GICD_ICPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICPENDR<n>E, the corresponding bit is RES0.

When [GICD_CTLR](#).DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICPENDR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|------------------|
| GIC Distributor | Dist_base | 0x1800 + (4 * n) | GICD_ICPENDR<n>E |

Accesses on this interface are **RW**.

GICD_IGROUPR<n>, Interrupt Group Registers, n = 0 - 31

The GICD_IGROUPR<n> characteristics are:

Purpose

Controls whether the corresponding interrupt is in Group 0 or Group 1.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)==0, these registers are Secure.

The number of implemented GICD_IGROUPR<n> registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_IGROUPR0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_IGROUPR0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_IGROUPR<n> is a 32-bit register.

Field descriptions

| | | | | | |
|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 |
| Group_status_bit31 | Group_status_bit30 | Group_status_bit29 | Group_status_bit28 | Group_status_bit27 | Group_status_bit26 |

Group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit.

| Group_status_bit<x> | Meaning |
|---------------------|---|
| 0b0 | When GICD_CTLR.DS ==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS ==0, the corresponding interrupt is Secure. |
| 0b1 | When GICD_CTLR.DS ==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS ==0, the corresponding interrupt is Non-secure Group 1. |

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICD_IGRPMODR<n>](#) to form a 2-bit field that defines an interrupt group. The encoding of this field is described in [GICD_IGRPMODR<n>](#).

If affinity routing is disabled for the Security state of an interrupt, then:

- The corresponding [GICD_IGRPMODR<n>](#) bit is RES0.
- For Secure interrupts, the interrupt is Secure Group 0.
- For Non-secure interrupts, the interrupt is Non-secure Group 1.

The reset behavior of this field is:

- On a GIC reset:

- When n == 0, this field resets to an UNKNOWN value.
- When n > 0, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGROUPR<n> number, n, is given by $n = m \text{ DIV } 32$.
- The offset of the required GICD_IGROUP is $(0x080 + (4*n))$.
- The bit number of the required group modifier bit in this register is $m \text{ MOD } 32$.

Accessing GICD_IGROUPR<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_IGROUPR0.

When [GICD_CTLR.DS](#)==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Accesses to GICD_IGROUPR0 when affinity routing is not enabled for a Security state access the same state as [GICR_IGROUPR0](#), and must update Redistributor state associated with the PE performing the accesses. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IGROUPR<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|-----------------|
| GIC Distributor | Dist_base | 0x0080 + (4 * n) | GICD_IGROUPR<n> |

Accesses on this interface are **RW**.

GICD_IGROUPR<n>E, Interrupt Group Registers (extended SPI range), n = 0 - 31

The GICD_IGROUPR<n>E characteristics are:

Purpose

Controls whether the corresponding SPI in the extended SPI range is in Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IGROUPR<n>E are RES0.

When [GICD_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD_TYPER.ESPI](#)==1:

- The number of implemented GICD_IGROUPR<n>E registers is ([GICD_TYPER.ESPI_range](#)+1). Registers are numbered from 0.
- When [GICD_CTLR.DS](#)==0, this register is Secure.

Attributes

GICD_IGROUPR<n>E is a 32-bit register.

Field descriptions

| | | | | | |
|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 |
| Group_status_bit31 | Group_status_bit30 | Group_status_bit29 | Group_status_bit28 | Group_status_bit27 | Group_status_bit26 |

Group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit.

| Group_status_bit<x> | Meaning |
|---------------------|---|
| 0b0 | When GICD_CTLR.DS ==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS ==0, the corresponding interrupt is Secure. |
| 0b1 | When GICD_CTLR.DS ==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS ==0, the corresponding interrupt is Non-secure Group 1. |

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICD_IGRPMODR<n>E](#) to form a 2-bit field that defines an interrupt group. The encoding of this field is described in [GICD_IGRPMODR<n>E](#).

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0:

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGROUPR<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_IGROUPR<n>E is $(0 \times 1000 + (4 \times n))$.

- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGROUPR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IGROUPR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|------------------|
| GIC Distributor | Dist_base | 0x1000 + (4 * n) | GICD_IGROUPR<n>E |

Accesses on this interface are **RW**.

GICD_IGRPMODR<n>, Interrupt Group Modifier Registers, n = 0 - 31

The GICD_IGRPMODR<n> characteristics are:

Purpose

When [GICD_CTLR.DS](#)==0, this register together with the [GICD_IGROUPR<n>](#) registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- Secure Group 1.

Configuration

When [GICD_CTLR.DS](#)==0, these registers are Secure.

The number of implemented [GICD_IGROUPR<n>](#) registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

When [GICD_CTLR.ARE_S](#)==0 or [GICD_CTLR.DS](#)==1, the GICD_IGRPMODR<n> registers are RES0. An implementation can make these registers RAZ/WI in this case.

Attributes

GICD_IGRPMODR<n> is a 32-bit register.

Field descriptions

| | | | | | |
|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------|
| 31 | 30 | 29 | 28 | 27 | |
| Group_modifier_bit31 | Group_modifier_bit30 | Group_modifier_bit29 | Group_modifier_bit28 | Group_modifier_bit27 | Group... |

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. When affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICD_IGROUPR<n>](#) to form a 2-bit field that defines an interrupt group:

| Group modifier bit | Group status bit | Definition | Short name |
|--------------------|------------------|---|------------|
| 0b0 | 0b0 | Secure Group 0 | G0S |
| 0b0 | 0b1 | Non-secure Group 1 | G1NS |
| 0b1 | 0b0 | Secure Group 1 | G1S |
| 0b1 | 0b1 | Reserved, treated as Non-secure Group 1 | - |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n> number, n, is given by $n = m \text{ DIV } 32$.
- The offset of the required GICD_IGRPMODR is $(0 \times 080 + (4 * n))$.
- The bit number of the required group modifier bit in this register is $m \text{ MOD } 32$.

See [GICD_IGROUPR<n>](#) for information about the GICD_IGRPMODR0 reset value.

Accessing GICD_IGRPMODR<n>

When affinity routing is enabled for Secure state, GICD_IGRPMODR0 is RES0 and equivalent functionality is proved by [GICR_IGRPMODR0](#).

When [GICD_CTLR](#).DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IGRPMODR<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|-------------------|------------------|
| GIC Distributor | Dist_base | 0x0D000 + (4 * n) | GICD_IGRPMODR<n> |

Accesses on this interface are **RW**.

GICD_IGRPMODR<n>E, Interrupt Group Modifier Registers (extended SPI range), n = 0 - 31

The GICD_IGRPMODR<n>E characteristics are:

Purpose

When [GICD_CTLR.DS](#)==0, this register together with the [GICD_IGROUPR<n>E](#) registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IGRPMODR<n>E are RES0.

GICD_IGRPMODR<n>E resets to 0x00000000.

When [GICD_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD_TYPER.ESPI](#)==1:

- The number of implemented GICD_IGRPMODR<n>E registers is ([GICD_TYPER.ESPI_range](#)+1). Registers are numbered from 0.
- When [GICD_CTLR.DS](#)==0, this register is Secure.

Attributes

GICD_IGRPMODR<n>E is a 32-bit register.

Field descriptions

| 31 | 30 | 29 | 28 | 27 | |
|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|
| Group_modifier_bit31 | Group_modifier_bit30 | Group_modifier_bit29 | Group_modifier_bit28 | Group_modifier_bit27 | Group_modifier_bit26 |

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICD_IGROUPR<n>E](#) to form a 2-bit field that defines an interrupt group:

| Group modifier bit | Group status bit | Definition | Short name |
|--------------------|------------------|---|------------|
| 0b0 | 0b0 | Secure Group 0 | G0S |
| 0b0 | 0b1 | Non-secure Group 1 | G1NS |
| 0b1 | 0b0 | Secure Group 1 | G1S |
| 0b1 | 0b1 | Reserved, treated as Non-secure Group 1 | - |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_IGRPMODR<n>E is $(0x3400 + (4*n))$.

- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_IGRPMODR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGRPMODR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IGRPMODR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------------|-------------------|
| GIC Distributor | Dist_base | 0x3400 + (4 * n) | GICD_IGRPMODR<n>E |

Accesses on this interface are **RW**.

GICD_IIDR, Distributor Implementer Identification Register

The GICD_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the Distributor.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GICD_IIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|------|----|----|----|---------|----|----|----|----------|----|----|----|-------------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ProductID | | | | | | | | RES0 | | | | Variant | | | | Revision | | | | Implementer | | | | | | | | | | | |

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the Distributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

Accessing GICD_IIDR

GICD_IIDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|--------------------|-----------|--------|-----------|
| GIC Distributor | Dist_base | 0x0008 | GICD_IIDR |

Accesses on this interface are **RO**.

GICD_INMIR<n>, Non-maskable Interrupt Registers, x = 0 to 31, n = 0 - 31

The GICD_INMIR<n> characteristics are:

Purpose

Holds whether the corresponding SPI has the non-maskable property.

Configuration

This register is present only when FEAT_GICv3_NMI is implemented. Otherwise, direct accesses to GICD_INMIR<n> are RES0.

When [GICR_TYPER](#).NMI is 0, this register is RES0.

The number of implemented GICD_INMIR<n> registers is ([GICD_TYPER](#).ITLinesNumber+1). Registers are numbered from 0.

Attributes

GICD_INMIR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | |
|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 |
| NMI31 | NMI30 | NMI29 | NMI28 | NMI27 | NMI26 | NMI25 | NMI24 | NMI23 | NMI22 | NMI21 | NMI20 | NMI19 | NMI18 | NMI17 | NMI16 | NMI15 | NMI14 |

NMI<x>, bit [x], for x = 31 to 0

Non-maskable property.

| NMI<x> | Meaning |
|--------|--|
| 0b0 | Interrupt does not have the non-maskable property. |
| 0b1 | Interrupt has the the non-maskable property. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_INMI<n> number, n, is given by $n = (m \text{ DIV } 32)$.
- The offset of the required GICD_INMI is $(0xF80 + (4*n))$.
- The bit number of the required in this register is $(m \text{ MOD } 32)$.

Accessing GICD_INMIR<n>

For SGIs and PPIs:

- The field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_INMIR0.

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGROUPR<n>E, the corresponding bit is RES0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_INMIR<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|---------------|
| GIC Distributor | Dist_base | 0x0F80 + (4 * n) | GICD_INMIR<n> |

Accesses on this interface are **RW**.

GICD_INMIR<n>E, Non-maskable Interrupt Registers for Extended SPIs, x = 0 to 31, n = 0 - 31

The GICD_INMIR<n>E characteristics are:

Purpose

Holds whether the corresponding SPI in the extended SPI range has the non-maskable property.

Configuration

This register is present only when FEAT_GICv3p1 is implemented and FEAT_GICv3_NMI is implemented. Otherwise, direct accesses to GICD_INMIR<n>E are RES0.

When [GICD_TYPER](#).ESPI is 0 or [GICD_TYPER](#).NMI is 0, these registers are RES0.

When [GICD_TYPER](#).ESPI is 1: the number of implemented GICD_INMIR<n>E registers is ([GICD_TYPER](#).ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_INMIR<n>E is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | |
|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 |
| NMI31 | NMI30 | NMI29 | NMI28 | NMI27 | NMI26 | NMI25 | NMI24 | NMI23 | NMI22 | NMI21 | NMI20 | NMI19 | NMI18 | NMI17 | NMI16 | NMI15 | NMI14 |

NMI<x>, bit [x], for x = 31 to 0

Non-maskable property.

| NMI<x> | Meaning |
|--------|--|
| 0b0 | Interrupt does not have the non-maskable property. |
| 0b1 | Interrupt has the the non-maskable property. |

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_INMIR<n>E number, n, is given by $n = ((m-4096) \text{ DIV } 32)$.
- The offset of the required GICD_INMIR<n>E is $(0x3B00 + (4*n))$.
- The bit number in this register is $((m-4096) \text{ MOD } 32)$.

Accessing GICD_INMIR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGROUPR<n>E, the corresponding bit is RES0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_INMIR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|----------------|
| GIC Distributor | Dist_base | 0x3B00 + (4 * n) | GICD_INMIR<n>E |

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_IPRIORITYR<n>, Interrupt Priority Registers, n = 0 - 254

The GICD_IPRIORITYR<n> characteristics are:

Purpose

Holds the priority of the corresponding interrupt.

Configuration

These registers are available in all configurations of the GIC. When [GICD_CTLR.DS](#)==0, these registers are Common.

The number of implemented GICD_IPRIORITYR<n> registers is 8*([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_IPRIORITYR0 to GICD_IPRIORITYR7 are Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_IPRIORITYR0 to GICD_IPRIORITYR7 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_IPRIORITYR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|--------------------|----|----|----|----|----|----|----|--------------------|----|----|----|----|----|---|---|--------------------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Priority_offset_3B | | | | | | | | Priority_offset_2B | | | | | | | | Priority_offset_1B | | | | | | | | Priority_offset_0B | | | | | | | |

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IPRIORITYR<n> number, n, is given by $n = m \text{ DIV } 4$.
- The offset of the required GICD_IPRIORITYR<n> register is $(0x400 + (4*n))$.
- The byte offset of the required Priority field in this register is $m \text{ MOD } 4$, where:
 - Byte offset 0 refers to register bits [7:0].
 - Byte offset 1 refers to register bits [15:8].
 - Byte offset 2 refers to register bits [23:16].
 - Byte offset 3 refers to register bits [31:24].

Accessing GICD_IPRIORITYR<n>

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt:

- [GICR_IPRIORITYR<n>](#) is used instead of GICD_IPRIORITYR<n> where n = 0 to 7 (that is, for SGIs and PPIs).
- GICD_IPRIORITYR<n> is RAZ/WI where n = 0 to 7.

These registers are byte-accessible.

A register field corresponding to an unimplemented interrupt is RAZ/WI.

A GIC might implement fewer than eight priority bits, but must implement at least bits [7:4] of each field. In each field, unimplemented bits are RAZ/WI, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When [GICD_CTLR.DS](#)==0:

- A register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in 'Software accesses of interrupt priority' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

It is IMPLEMENTATION DEFINED whether changing the value of a priority field changes the priority of an active interrupt.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IPRIORITYR<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|--------------------|
| GIC Distributor | Dist_base | 0x0400 + (4 * n) | GICD_IPRIORITYR<n> |

Accesses on this interface are **RW**.

GICD_IPRIORITYR<n>E, Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.,
n = 0 - 255

GICD_IPRIORITYR<n>E, Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC., n = 0 - 255

The GICD_IPRIORITYR<n>E characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IPRIORITYR<n>E are RES0.

When [GICD_TYPER](#).ESPI==0, these registers are RES0.

When [GICD_TYPER](#).ESPI==1, the number of implemented GICD_IPRIORITYR<n>E registers is (([GICD_TYPER](#).ESPI_range+1)*8). Registers are numbered from 0.

Attributes

GICD_IPRIORITYR<n>E is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------------------|----|----|----|----|----|----|----|------------------------------------|----|----|----|----|----|----|----|------------------------------------|----|----|----|----|----|---|---|------------------------------------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Priority_offset_3B | | | | | | | | Priority_offset_2B | | | | | | | | Priority_offset_1B | | | | | | | | Priority_offset_0B | | | | | | | |

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

GICD_IPRIORITYR<n>E, Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.,
n = 0 - 255

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IPRIORITYR<n> number, n, is given by $n = (m-4096) \text{ DIV } 4$.
- The offset of the required GICD_IPRIORITYR<n>E register is $(0x2000 + (4*n))$.
- The byte offset of the required Priority field in this register is $m \text{ MOD } 4$, where:
 - Byte offset 0 refers to register bits [7:0].
 - Byte offset 1 refers to register bits [15:8].
 - Byte offset 2 refers to register bits [23:16].
 - Byte offset 3 refers to register bits [31:24].

Accessing GICD_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISACTIVER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

GICD_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|---------------------|
| GIC Distributor | Dist_base | 0x2000 + (4 * n) | GICD_IPRIORITYR<n>E |

Accesses on this interface are **RW**.

GICD_IROUTER<n>, Interrupt Routing Registers, n = 32 - 1019

The GICD_IROUTER<n> characteristics are:

Purpose

When affinity routing is enabled, provides routing information for the SPI with INTID n.

Configuration

These registers are available in all configurations of the GIC. If the GIC implementation supports two Security states, these registers are Common.

The maximum value of n is given by (32*(GICD_TYPER.ITLinesNumber+1) - 1). [GICD_IROUTER<n>](#) registers where n=0 to 31 are reserved.

Attributes

GICD_IROUTER<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Aff3 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Aff0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Aff1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Aff2 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Interrupt_Routing_Mode | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Interrupt_Routing_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

| Interrupt_Routing_Mode | Meaning |
|------------------------|---|
| 0b0 | Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively. |
| 0b1 | Interrupts routed to any PE defined as a participating node. |

If GICD_IROUTER<n>.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending behavior is CONSTRAINED UNPREDICTABLE:

- The interrupt is not forwarded to any PE, direct reads return the written value

- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the UNKNOWN implemented PE
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the written value

In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD_IROUTER<n>.{Aff3, Aff2, Aff1, Aff0} are UNKNOWN.

Note

An implementation might choose to make the Aff<n> fields RO when this field is 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:24]

Reserved, RES0.

Aff2, bits [23:16]

Affinity level 2.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For an SPI with INTID m:

- The corresponding GICD_IROUTER<n> register number, n, is given by $n = m$.
- The offset of the GICD_IROUTER<n> register is $0x6000 + 8n$.

Accessing GICD_IROUTER<n>

These registers are used only when affinity routing is enabled. When affinity routing is not enabled:

- These registers are RES0. An implementation is permitted to make the register RAZ/WI in this case.
- The [GICD_ITARGETSR<n>](#) registers provide interrupt routing information.

Note

When affinity routing becomes enabled for a Security state (for example, following a reset or following a write to [GICD_CTLR](#)) the value of all writeable fields in this register is UNKNOWN for that Security state. When the group of an

interrupt changes so the ARE setting for the interrupt changes to 1, the value of this register is UNKNOWN for that interrupt.

If [GICD_CTLR.DS](#)==0, unless the [GICD_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any GICD_IROUTER<n> registers that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

Note

For each interrupt, a GIC implementation might support fewer than 256 values for an affinity level. In this case, some bits of the corresponding affinity level field might be RO. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IROUTER<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|-----------------|
| GIC Distributor | Dist_base | 0x6000 + (8 * n) | GICD_IROUTER<n> |

Accesses on this interface are **RW**.

GICD_IROUTER<n>E, Interrupt Routing Registers (Extended SPI Range), n = 0 - 1023

The GICD_IROUTER<n>E characteristics are:

Purpose

When affinity routing is enabled, provides routing information for the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IROUTER<n>E are RES0.

When [GICD_TYPER](#).ESPI==0, these registers are RES0.

When [GICD_TYPER](#).ESPI==1, the number of implemented GICD_IROUTER<n>E registers is ((([GICD_TYPER](#).ESPI_range+1)*32)-1). Registers are numbered from 0.

Attributes

GICD_IROUTER<n>E is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|------|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|------|----|----|----|------|----|----|----|------|----|----|----|--|--|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | Aff3 | | | | | | | | | | | |
| Interrupt_Routing_Mode | | | | RES0 | | | | | | | | Aff2 | | | | | | | | Aff1 | | | | | | | | Aff0 | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | |

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Interrupt_Routing_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

| Interrupt_Routing_Mode | Meaning |
|------------------------|---|
| 0b0 | Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively. |
| 0b1 | Interrupts routed to any PE defined as a participating node. |

If GICD_IROUTER<n>E.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending behavior is CONSTRAINED UNPREDICTABLE:

GICD_IROUTER<n>E, Interrupt Routing Registers (Extended SPI Range), n = 0 - 1023

- The interrupt is not forwarded to any PE, direct reads return the written value
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the UNKNOWN implemented PE
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the written value

In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD_IROUTER<n>E.{Aff3, Aff2, Aff1, Aff0} are UNKNOWN.

Note

An implementation might choose to make the Aff<n> fields RO when this field is 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:24]

Reserved, RES0.

Aff2, bits [23:16]

Affinity level 2.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For an SPI with INTID m:

- The corresponding GICD_IROUTER<n>E register number, n, is given by $n = m$.
- The offset of the GICD_IROUTER<n>E register is $0x6000 + 8n$.

Accessing GICD_IROUTER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IROUTER<n>E, the register is RES0.

When [GICD_CTLR.DS=0](#), a register that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IROUTER<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|------------------|
| GIC Distributor | Dist_base | 0x8000 + (8 * n) | GICD_IROUTER<n>E |

Accesses on this interface are **RW**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ISACTIVER<n>, Interrupt Set-Active Registers, n = 0 - 31

The GICD_ISACTIVER<n> characteristics are:

Purpose

Activates the corresponding interrupt. These registers are used when saving and restoring GIC state.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)==0, these registers are Common.

The number of implemented [GICD_ISACTIVER<n>](#) registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ISACTIVER0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ISACTIVER0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ISACTIVER<n> is a 32-bit register.

Field descriptions

| | | | | | | |
|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 |
| Set_active_bit31 | Set_active_bit30 | Set_active_bit29 | Set_active_bit28 | Set_active_bit27 | Set_active_bit26 | Set_active_bit25 |

Set_active_bit<x>, bit [x], for x = 31 to 0

Adds the active state to interrupt number 32n + x. Reads and writes have the following behavior:

| Set_active_bit<x> | Meaning |
|-------------------|---|
| 0b0 | If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISACTIVER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ISACTIVER is (0x300 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Accessing GICD_ISACTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by [GICR_ISACTIVER0](#).

Bits corresponding to unimplemented interrupts are RAZ/WI.

If [GICD_CTLR.DS](#) == 0, unless the [GICD_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

The bit reads as one if the status of the interrupt is active or active and pending. [GICD_ISPENDR<n>](#) and [GICD_ICPENDR<n>](#) provide the pending status of the interrupt.

GICD_ISACTIVER<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|-------------------|
| GIC Distributor | Dist_base | 0x0300 + (4 * n) | GICD_ISACTIVER<n> |

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ISACTIVER<n>E, Interrupt Set-Active Registers (extended SPI range), n = 0 - 31

The GICD_ISACTIVER<n>E characteristics are:

Purpose

Adds the active state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ISACTIVER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISACTIVER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ISACTIVER<n>E is a 32-bit register.

Field descriptions

| | | | | | | |
|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 |
| Set_active_bit31 | Set_active_bit30 | Set_active_bit29 | Set_active_bit28 | Set_active_bit27 | Set_active_bit26 | Set_active_bit25 |

Set_active_bit<x>, bit [x], for x = 31 to 0

For the extended SPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

| Set_active_bit<x> | Meaning |
|-------------------|---|
| 0b0 | If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISACTIVER<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_ISACTIVER<n>E is $(0x1A00 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-4096) \text{ MOD } 32$.

Accessing GICD_ISACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISACTIVER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISACTIVER<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|--------------------|
| GIC Distributor | Dist_base | 0x1A00 + (4 * n) | GICD_ISACTIVER<n>E |

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ISENABLER<n>, Interrupt Set-Enable Registers, n = 0 - 31

The GICD_ISENABLER<n> characteristics are:

Purpose

Enables forwarding of the corresponding interrupt to the CPU interfaces.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)==0, these registers are Common.

The number of implemented GICD_ISENABLER<n> registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ISENABLER0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ISENABLER0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ISENABLER<n> is a 32-bit register.

Field descriptions

| | | | | | | |
|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 |
| Set_enable_bit31 | Set_enable_bit30 | Set_enable_bit29 | Set_enable_bit28 | Set_enable_bit27 | Set_enable_bit26 | Set_enable_bit25 |

Set_enable_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, controls the forwarding of interrupt number 32n + x to the CPU interfaces. Reads and writes have the following behavior:

| Set_enable_bit<x> | Meaning |
|-------------------|---|
| 0b0 | If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect. |
| 0b1 | If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1. |

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ISENABLER is (0x100 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

At start-up, and after a reset, a PE can use this register to discover which peripheral INTIDs the GIC supports. If [GICD_CTLR.DS](#)=0 in a system that supports EL3, the PE must do this for the Secure view of the available interrupts, and Non-secure software running on the PE must do this discovery after the Secure software has configured interrupts as Group 0/Secure Group 1 and Non-secure Group 1.

Accessing GICD_ISENABLER<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ISENABLER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When [GICD_CTLR.DS](#)=0, bits corresponding to Group 0 or Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to [GICD_ISENABLER<n>](#) and [GICD_ICENABLER<n>](#) where n=0.

For SPIs and PPIs, each bit controls the forwarding of the corresponding interrupt from the Distributor to the CPU interfaces.

GICD_ISENABLER<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|-------------------|
| GIC Distributor | Dist_base | 0x0100 + (4 * n) | GICD_ISENABLER<n> |

Accesses on this interface are **RW**.

GICD_ISENABLER<n>E, Interrupt Set-Enable Registers, n = 0 - 31

The GICD_ISENABLER<n>E characteristics are:

Purpose

Enables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ISENABLER<n>E are RES0.

When [GICD_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD_TYPER.ESPI](#)==1, the number of implemented [GICD_ISENABLER<n>E](#) registers is ([GICD_TYPER.ESPI_range](#)+1). Registers are numbered from 0.

Attributes

GICD_ISENABLER<n>E is a 32-bit register.

Field descriptions

| | | | | | | |
|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 |
| Set_enable_bit31 | Set_enable_bit30 | Set_enable_bit29 | Set_enable_bit28 | Set_enable_bit27 | Set_enable_bit26 | Set_enable_bit25 |

Set_enable_bit<x>, bit [x], for x = 31 to 0

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

| Set_enable_bit<x> | Meaning |
|-------------------|---|
| 0b0 | If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect. |
| 0b1 | If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_ISENABLER<n>E is $(0x1200 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-4096) \text{ MOD } 32$.

Accessing GICD_ISENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISENABLER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISENABLER<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|--------------------|
| GIC Distributor | Dist_base | 0x1200 + (4 * n) | GICD_ISENABLER<n>E |

Accesses on this interface are **RW**.

GICD_ISPENDR<n>, Interrupt Set-Pending Registers, n = 0 - 31

The GICD_ISPENDR<n> characteristics are:

Purpose

Adds the pending state to the corresponding interrupt.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)=0, these registers are Common.

The number of implemented [GICD_ISPENDR<n>](#) registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ISPENDR0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ISPENDR0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ISPENDR<n> is a 32-bit register.

Field descriptions

| | | | | | | |
|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | |
| Set_pending_bit31 | Set_pending_bit30 | Set_pending_bit29 | Set_pending_bit28 | Set_pending_bit27 | Set_pending_bit26 | Set_pending_bit25 |

Set_pending_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, adds the pending state to interrupt number 32n + x. Reads and writes have the following behavior:

| Set pending bit<x> | Meaning |
|--------------------|---|
| 0b0 | If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: <ul style="list-style-type: none"> • If the interrupt is an SGI. The pending state of an SGI can be set using GICD_SPENDSGIR<n>. • If the interrupt is not inactive and is not active. • If the interrupt is already pending because of a write to GICD_ISPENDR<n>. • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Accessing GICD_ISPENDR<n>

Set-pending bits for SGIs are read-only and ignore writes. The Set-pending bits for SGIs are provided as [GICD_SPENDSGIR<n>](#).

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ISPENDR0.
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be set by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If [GICD_CTLR.DS](#)=0, unless the [GICD_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

GICD_ISPENDR<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|-----------------|
| GIC Distributor | Dist_base | 0x0200 + (4 * n) | GICD_ISPENDR<n> |

Accesses on this interface are **RW**.

GICD_ISPENDR<n>E, Interrupt Set-Pending Registers (extended SPI range), n = 0 - 31

The GICD_ISPENDR<n>E characteristics are:

Purpose

Adds the pending state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ISPENDR<n>E are RES0.

When [GICD_TYPER](#).ESPI==0, these registers are RES0.

When [GICD_TYPER](#).ESPI==1, the number of implemented GICD_ISPENDR<n>E registers is ([GICD_TYPER](#).ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ISPENDR<n>E is a 32-bit register.

Field descriptions

| | | | | | | |
|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|--------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | Se |
| Set_pending_bit31 | Set_pending_bit30 | Set_pending_bit29 | Set_pending_bit28 | Set_pending_bit27 | Set_pending_bit26 | Se |

Set_pending_bit<x>, bit [x], for x = 31 to 0

For the extended SPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

| Set_pending_bit<x> | Meaning |
|--------------------|---|
| 0b0 | If read, indicates that the corresponding interrupt is not pending. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: <ul style="list-style-type: none">If the interrupt is already pending because of a write to GICD_ISPENDR<n>E.If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISPENDR<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.

- The offset of the required GICD_ISPENDR<n>E is $(0 \times 1600 + (4 * n))$.
- The bit number of the required group modifier bit in this register is $(m - 4096) \text{ MOD } 32$.

Accessing GICD_ISPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISPENDR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISPENDR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|---------------------------|------------------|
| GIC Distributor | Dist_base | $0 \times 1600 + (4 * n)$ | GICD_ISPENDR<n>E |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICD_ITARGETSR<n>, Interrupt Processor Targets Registers, n = 0 - 254

The GICD_ITARGETSR<n> characteristics are:

Purpose

When affinity routing is not enabled, holds the list of target PEs for the interrupt. That is, it holds the list of CPU interfaces to which the Distributor forwards the interrupt if it is asserted and has sufficient priority.

Configuration

These registers are available in all configurations of the GIC. When [GICD_CTLR.DS](#)==0, these registers are Common.

The number of implemented GICD_ITARGETSR<n> registers is 8*([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ITARGETSR0 to GICD_ITARGETSR7 are Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ITARGETSR0 to GICD_ITARGETSR7 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ITARGETSR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------------------------|----|----|----|----|----|----|----|---------------------------------------|----|----|----|----|----|----|----|---------------------------------------|----|----|----|----|----|---|---|---------------------------------------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CPU_targets_offset_3B | | | | | | | | CPU_targets_offset_2B | | | | | | | | CPU_targets_offset_1B | | | | | | | | CPU_targets_offset_0B | | | | | | | |

PEs in the system number from 0, and each bit in a PE targets field refers to the corresponding PE. For example, a value of 0x3 means that the Pending interrupt is sent to PEs 0 and 1. For GICD_ITARGETSR0-GICD_ITARGETSR7, a read of any targets field returns the number of the PE performing the read.

CPU_targets_offset_3B, bits [31:24]

PE targets for an interrupt, at byte offset 3.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

CPU_targets_offset_2B, bits [23:16]

PE targets for an interrupt, at byte offset 2.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

CPU_targets_offset_1B, bits [15:8]

PE targets for an interrupt, at byte offset 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

CPU_targets_offset_0B, bits [7:0]

PE targets for an interrupt, at byte offset 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

The bits that are set to 1 in the PE targets field determine which PEs are targeted:

| Value of PE targets field | Interrupt targets |
|---------------------------|-------------------|
| 0bxxxxxx1 | CPU interface 0 |
| 0bxxxxxx1x | CPU interface 1 |
| 0bxxxxxx1xx | CPU interface 2 |
| 0bxxxx1xxx | CPU interface 3 |
| 0bxxx1xxxx | CPU interface 4 |
| 0bxx1xxxxx | CPU interface 5 |
| 0bx1xxxxxx | CPU interface 6 |
| 0b1xxxxxxx | CPU interface 7 |

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ITARGETSR<n> number, n, is given by $n = m \text{ DIV } 4$.
- The offset of the required GICD_ITARGETSR<n> register is $(0x800 + (4*n))$.
- The byte offset of the required Priority field in this register is $m \text{ MOD } 4$, where:
 - Byte offset 0 refers to register bits [7:0].
 - Byte offset 1 refers to register bits [15:8].
 - Byte offset 2 refers to register bits [23:16].
 - Byte offset 3 refers to register bits [31:24].

Software can write to these registers at any time. Any change to a targets field value:

- Has no effect on any active interrupt. This means that removing a CPU interface from a targets list does not cancel an active state for interrupts on that CPU interface. There is no effect on interrupts that are active and pending until the active status is cleared, at which time it is treated as a pending interrupt.
- Has an effect on any pending interrupts. This means:
 - Enables the CPU interface to be chosen as a target for the pending interrupt using an IMPLEMENTATION DEFINED mechanism.
 - Removing a CPU interface from the target list of a pending interrupt removes the pending state of the interrupt on that CPU interface.

Accessing GICD_ITARGETSR<n>

These registers are used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt, the target PEs for an interrupt are defined by [GICD_IROUTER<n>](#) and the associated byte in GICD_ITARGETSR<n> is RES0. An implementation is permitted to make the byte RAZ/WI in this case.

- These registers are byte-accessible.
- A register field corresponding to an unimplemented interrupt is RAZ/WI.
- A field bit corresponding to an unimplemented CPU interface is RAZ/WI.
- GICD_ITARGETSR0-GICD_ITARGETSR7 are read-only. Each field returns a value that corresponds only to the PE reading the register.
- It is IMPLEMENTATION DEFINED which, if any, SPIs are statically configured in hardware. The field for such an SPI is read-only, and returns a value that indicates the PE targets for the interrupt.
- If [GICD_CTLR.DS](#)==0, unless the [GICD_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

In a single connected PE implementation, all interrupts target one PE, and these registers are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_ITARGETSR<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|-------------------|
| GIC Distributor | Dist_base | 0x0800 + (4 * n) | GICD_ITARGETSR<n> |

Accesses on this interface are **RW**.

GICD_NSACR<n>, Non-secure Access Control Registers, n = 0 - 63

The GICD_NSACR<n> characteristics are:

Purpose

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

Configuration

The concept of selective enabling of Non-secure access to Group 0 and Secure Group 1 interrupts applies to SGIs and SPIs.

GICD_NSACR0 is a Banked register used for SGIs. A copy is provided for every PE that has a CPU interface and that supports this feature.

Attributes

GICD_NSACR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | |
|-------------|-------------|-------------|-------------|-------------|-------------|------------|------------|------------|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 |
| NS_access15 | NS_access14 | NS_access13 | NS_access12 | NS_access11 | NS_access10 | NS_access9 | NS_access8 | NS_access7 | | | | | | | | | |

NS_access<x>, bits [2x+1:2x], for x = 15 to 0

Controls Non-secure access of the interrupt with ID $16n + x$.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:

| NS_access<x> | Meaning |
|--------------|--|
| 0b00 | No Non-secure access is permitted to fields associated with the corresponding interrupt. |
| 0b01 | Non-secure read and write access is permitted to set-pending bits in GICD_ISPENDR<n> associated with the corresponding interrupt. A Non-secure write access to GICD_SETSPI_NSR is permitted to set the pending state of the corresponding interrupt. A Non-secure write access to GICD_SGIR is permitted to generate a Secure SGI for the corresponding interrupt. An implementation might also provide read access to clear-pending bits in GICD_ICPENDR<n> associated with the corresponding interrupt. |
| 0b10 | As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the GICD_ICPENDR<n> registers. A Non-secure write access to GICD_CLRSPI_NSR is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the GICD_ISACTIVER<n> and GICD_ICACTIVER<n> registers. |
| 0b11 | For GICD_NSACR0 this encoding is reserved and treated as 10. For all other GICD_NSACR<n> registers this encoding is treated as 0b10, but adds Non-secure read and write access permission to GICD_ITARGETSR<n> and GICD_IROUTER<n> fields associated with the corresponding interrupt. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_NSACR<n> number, n, is given by $n = m \text{ DIV } 16$.
- The offset of the required GICD_NSACR<n> register is $(0xE00 + (4*n))$.

Note

Because each field in this register comprises two bits, GICD_NSACR0 controls access rights to SGI registers, GICD_NSACR1 controls access to PPI registers (and is always RAZ/WI), and all other GICD_NSACR<n> registers control access to SPI registers.

For compatibility with GICv2, writes to GICD_NSACR0 for a particular PE must be coordinated within the Distributor and must update [GICR_NSACR](#) for the Redistributor associated with that PE.

Accessing GICD_NSACR<n>

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Secure state, GICD_NSACR0 is RES0 and [GICR_NSACR](#) provides equivalent functionality for SGIs.

These registers do not support PPIs, therefore GICD_NSACR1 is RAZ/WI.

GICD_NSACR<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|-------------------|---------------|
| GIC Distributor | Dist_base | $0xE00 + (4 * n)$ | GICD_NSACR<n> |

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **RAZ/WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **RW**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **RAZ/WI**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRoot() accesses to this register are **RW**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRealm() accesses to this register are **RAZ/WI**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_NSACR<n>E, Non-secure Access Control Registers, n = 0 - 63

The GICD_NSACR<n>E characteristics are:

Purpose

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_NSACR<n>E are RES0.

When [GICD_TYPER](#).ESPI==0, these registers are RES0.

When [GICD_TYPER](#).ESPI==1, the number of implemented GICD_ICFGR<n>E registers is (([GICD_TYPER](#).ESPI_range+1)*2). Registers are numbered from 0.

Attributes

GICD_NSACR<n>E is a 32-bit register.

Field descriptions

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 |
|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|----------------------------|----------------------------|----------------------------|----|----|----|----|----|----|----|----|----|
| NS_access15 | NS_access14 | NS_access13 | NS_access12 | NS_access11 | NS_access10 | NS_access9 | NS_access8 | NS_access7 | | | | | | | | | |

NS_access<x>, bits [2x+1:2x], for x = 15 to 0

Controls Non-secure access of the interrupt with ID 16n + x.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:

| NS_access<x> | Meaning |
|--------------|---|
| 0b00 | No Non-secure access is permitted to fields associated with the corresponding interrupt. |
| 0b01 | Non-secure read and write access is permitted to set-pending bits in GICD_ISPENDR<n>E associated with the corresponding interrupt. A Non-secure write access to GICD_SETSPI_NSR is permitted to set the pending state of the corresponding interrupt. |
| 0b10 | As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the GICD_ICPENDR<n>E registers. A Non-secure write access to GICD_CLRSPI_NSR is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the GICD_ISACTIVER<n>E and GICD_ICACTIVER<n>E registers. |
| 0b11 | This encoding is treated as 0b10, but adds Non-secure read and write access permission to GICD_IROUTER<n>E fields associated with the corresponding interrupt. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_NSACR<n>E number, n, is given by $n = (m - 4096) \text{ DIV } 16$.
- The offset of the required GICD_NSACR<n>E register is $(0 \times 3600 + (4 * n))$.

Accessing GICD_NSACR<n>E

GICD_NSACR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|---------------------------|----------------|
| GIC Distributor | Dist_base | $0 \times 3600 + (4 * n)$ | GICD_NSACR<n>E |

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **RAZ/WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **RW**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **RAZ/WI**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRoot() accesses to this register are **RW**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRealm() accesses to this register are **RAZ/WI**.

GICD_SETSPI_NSR, Set Non-secure SPI Pending Register

The GICD_SETSPI_NSR characteristics are:

Purpose

Adds the pending state to a valid SPI if permitted by the Security state of the access and the [GICD_NSACR<n>](#) value for that SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

If [GICD_TYPER](#).MBIS == 0, this register is reserved.

When [GICD_CTLR](#).DS == 1, this register provides functionality for all SPIs.

Attributes

GICD_SETSPI_NSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | INTID | | | | | | | | | | | |

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or [GICD_SETSPI_SR](#) adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to [GICD_CLRSPI_NSR](#), [GICD_CLRSPI_SR](#), or [GICD_ICPENDR<n>](#).
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or [GICD_SETSPI_SR](#) adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to [GICD_CLRSPI_NSR](#) or [GICD_CLRSPI_SR](#). If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_SETSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding [GICD_NSACR<n>](#) register is 0.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can set the pending state of any valid SPI.

GICD_SETSPI_NSR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|--------|-----------------|
| GIC Distributor | Dist_base | 0x0040 | GICD_SETSPI_NSR |

Accesses on this interface are **WO**.

GICD_SETSPI_SR, Set Secure SPI Pending Register

The GICD_SETSPI_SR characteristics are:

Purpose

Adds the pending state to a valid SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

If [GICD_TYPER](#).MBIS == 0, this register is reserved.

When [GICD_CTLR](#).DS == 1, this register is WI.

Attributes

GICD_SETSPI_SR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | INTID | | | | | | | | | | | | |

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to [GICD_SETSPI_NSR](#) or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to [GICD_CLRSPI_NSR](#), [GICD_CLRSPI_SR](#), or [GICD_ICPENDR<n>](#).
- For a level-sensitive interrupt, a write to [GICD_SETSPI_NSR](#) or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to [GICD_CLRSPI_NSR](#) or [GICD_CLRSPI_SR](#). If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_SETSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICD_SETSPI_SR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|--------|----------------|
| GIC Distributor | Dist_base | 0x0050 | GICD_SETSPI_SR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **WO**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **WI**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRoot() accesses to this register are **WO**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRealm() accesses to this register are **WI**.

GICD_SGIR, Software Generated Interrupt Register

The GICD_SGIR characteristics are:

Purpose

Controls the generation of SGIs.

Configuration

This register is available in all configurations of the GIC. If the GIC supports two Security states this register is Common.

Attributes

GICD_SGIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|------------------|----|----|----|---------------|----|----|----|----|----|-------|----|------|----|----|----|---|---|-------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | TargetListFilter | | | | CPUTargetList | | | | | | NSATT | | RES0 | | | | | | INTID | | | | | | | |

Bits [31:26]

Reserved, RES0.

TargetListFilter, bits [25:24]

Determines how the Distributor processes the requested SGI.

| TargetListFilter | Meaning |
|------------------|---|
| 0b00 | Forward the interrupt to the CPU interfaces specified by GICD_SGIR.CPUTargetList. |
| 0b01 | Forward the interrupt to all CPU interfaces except that of the PE that requested the interrupt. |
| 0b10 | Forward the interrupt only to the CPU interface of the PE that requested the interrupt. |
| 0b11 | Reserved. |

CPUTargetList, bits [23:16]

When GICD_SGIR.TargetListFilter is 0b00, this field defines the CPU interfaces to which the Distributor must forward the interrupt.

Each bit of the field refers to the corresponding CPU interface. For example, CPUTargetList[0] corresponds to interface 0. Setting a bit to 1 indicates that the interrupt must be forwarded to the corresponding interface.

If this field is 0b00000000 when GICD_SGIR.TargetListFilter is 0b00, the Distributor does not forward the interrupt to any CPU interface.

NSATT, bit [15]

Specifies the required group of the SGI.

| NSATT | Meaning |
|-------|---|
| 0b0 | Forward the SGI specified in the INTID field to a specified CPU interface only if the SGI is configured as Group 0 on that interface. |
| 0b1 | Forward the SGI specified in the INTID field to a specified CPU interface only if the SGI is configured as Group 1 on that interface. |

This field is writable only by a Secure access. Non-secure accesses can also generate Group 0 interrupts, if allowed to do so by GICD_NSACR0. Otherwise, Non-secure writes to GICD_SGIR generate an SGI only if the specified SGI is programmed as Group 1, regardless of the value of bit [15] of the write.

Bits [14:4]

Reserved, RES0.

INTID, bits [3:0]

The INTID of the SGI to forward to the specified CPU interfaces.

Accessing GICD_SGIR

This register is used only when affinity routing is not enabled. When affinity routing is enabled, this register is RES0.

It is IMPLEMENTATION DEFINED whether this register has any effect when the forwarding of interrupts by the Distributor is disabled by [GICD_CTLR](#).

GICD_SGIR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|--------|-----------|
| GIC Distributor | Dist_base | 0x0F00 | GICD_SGIR |

Accesses on this interface are **WO**.

GICD_SPENDSGIR<n>, SGI Set-Pending Registers, n = 0 - 3

The GICD_SPENDSGIR<n> characteristics are:

Purpose

Adds the pending state to an SGI.

A write to this register changes the state of an inactive SGI to pending, and the state of an active SGI to active and pending.

Configuration

Four SGI set-pending registers are implemented. Each register contains eight set-pending bits for each of four SGIs, for a total of 16 possible SGIs.

In multiprocessor implementations, each PE has a copy of these registers.

Attributes

GICD_SPENDSGIR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------|----|----|----|----|----|----|----|-----------------------|----|----|----|----|----|----|----|-----------------------|----|----|----|----|----|---|---|-----------------------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SGI_set_pending_bits3 | | | | | | | | SGI_set_pending_bits2 | | | | | | | | SGI_set_pending_bits1 | | | | | | | | SGI_set_pending_bits0 | | | | | | | |

SGI_set_pending_bits<x>, bits [8x+7:8x], for x = 3 to 0

Adds the pending state to SGI number 4n + x for the PE corresponding to the bit number written to.

Reads and writes have the following behavior:

| SGI_set_pending_bits<x> | Meaning |
|-------------------------|---|
| 0x00 | If read, indicates that the SGI from the corresponding PE is not pending and is not active and pending. If written, has no effect. |
| 0x01 | If read, indicates that the SGI from the corresponding PE is pending or is active and pending. If written, adds the pending state to the SGI for the corresponding PE. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For SGI ID m, generated by processing element C writing to the corresponding [GICD_SGIR](#) field, where DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_SPENDSGIR<n> number is given by n = m DIV 4.
- The offset of the required register is (0xF20 + (4n)).
- The offset of the required field within the register GICD_SPENDSGIR<n> is given by m MOD 4.
- The required bit in the 8-bit SGI set-pending field m is bit C.

Accessing GICD_SPENDSGIR<n>

These registers are used only when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt then the bit associated with SGI in that Security state is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

GICD_SPENDSGIR<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|------------------|-------------------|
| GIC Distributor | Dist_base | 0x0F20 + (4 * n) | GICD_SPENDSGIR<n> |

Accesses on this interface are **RW**.

GICD_STATUSR, Error Reporting Status Register

The GICD_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

Attributes

GICD_STATUSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|------|----|-----|----|-----|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | WROD | | RWOD | | WRD | | RRD | | | | | | | | | |

Bits [31:4]

Reserved, RES0.

WROD, bit [3]

Write to an RO location.

| WROD | Meaning |
|------|--|
| 0b0 | Normal operation. |
| 0b1 | A write to an RO location has been detected. |
