AFSR0_EL1, Auxiliary Fault Status Register 0 (EL1)

The AFSR0_EL1 characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL1.

Configuration

AArch64 System register AFSR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ADESR\[31:0\]](#).

Attributes

AFSR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AFSR0_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic AFSR0_EL1 or AFSR0_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, AFSR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0001	0b000

AFSR1_EL2, Auxiliary Fault Status Register 1 (EL2)

The AFSR1_EL2 characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL2.

Configuration

AArch64 System register AFSR1_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HIAFSR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

AFSR1_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for [AMEVCNTR0<n>_EL0](#).

Note

[AMCGCR_EL0](#).CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR0<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR0<n>_EL0 is enabled. When written, disables AMEVCNTR0<n>_EL0 .

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENCLR0_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, AMCNTENCLR0_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b100

AMCNTENCLR1_EL0, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1_EL0 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>_EL0](#).

Configuration

AArch64 System register AMCNTENCLR1_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENCLR1\[31:0\]](#).

AArch64 System register AMCNTENCLR1_EL0 bits [31:0] are architecturally mapped to External register [AMCNTENCLR1\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1_EL0 are UNDEFINED.

Attributes

AMCNTENCLR1_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 3.

If FEAT_AMUv1p1 is implemented, [HCR_EL2](#).AMVOFFEN is 1, [SCR_EL3](#).AMVOFFEN is 1, [HCR_EL2](#).{E2H, TGE} is not {1,1}, and EL2 is implemented in the current Security state, access to these registers at EL0 or EL1 return (PCount<63:0> - [AMEVCNTVOFF0<n>_EL2](#)<63:0>).

PCount is the physical count returned when AMEVCNTR0<n>_EL0 is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMEVCNTR0<n>_EL0

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n>_EL0 are UNDEFINED.

Note

[AMCGCR_EL0](#).CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, AMEVCNTR0<m>_EL0 ; Where m = 0-3

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b010:m[3]	m[2:0]

AMEVCNTR1<n>_EL0, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n>_EL0 characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configuration

AArch64 System register AMEVCNTR1<n>_EL0 bits [63:0] are architecturally mapped to AArch32 System register [AMEVCNTR1<n>\[63:0\]](#).

AArch64 System register AMEVCNTR1<n>_EL0 bits [63:0] are architecturally mapped to External register [AMEVCNTR1<n>\[63:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n>_EL0 are UNDEFINED.

Attributes

AMEVCNTR1<n>_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

AMEVTYPER1<n>_EL0, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n>_EL0 characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter [AMEVCNTR1<n>_EL0](#) counts.

Configuration

AArch64 System register AMEVTYPER1<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMEVTYPER1<n>\[31:0\]](#).

AArch64 System register AMEVTYPER1<n>_EL0 bits [31:0] are architecturally mapped to External register [AMEVTYPER1<n>\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n>_EL0 are UNDEFINED.

Attributes

AMEVTYPER1<n>_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter [AMEVCNTR1<n>_EL0](#).

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter [AMEVCNTR1<n>_EL0](#), then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by [AMEVCNTR1<n>_EL0](#) might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter [AMEVCNTR1<n>_EL0](#) is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVTYPER1<n>_EL0

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n>_EL0 are UNDEFINED.

Note

[AMCGCR_EL0](#).CG1NC identifies the number of auxiliary activity monitor event counters.

APDAKeyHi_EL1, Pointer Authentication Key A for Data (bits[127:64])

The APDAKeyHi_EL1 characteristics are:

Purpose

Holds bits[127:64] of key A used for authentication of data pointer values.

Note

The term APDAKey_EL1 is used to describe the concatenation of [APDAKeyHi_EL1](#): [APDAKeyLo_EL1](#).

Configuration

This register is present only when FEAT_PAuth is implemented. Otherwise, direct accesses to APDAKeyHi_EL1 are UNDEFINED.

Attributes

APDAKeyHi_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

APDBKeyHi_EL1, Pointer Authentication Key B for Data (bits[127:64])

The APDBKeyHi_EL1 characteristics are:

Purpose

Holds bits[127:64] of key B used for authentication of data pointer values.

Note

The term APDBKey_EL1 is used to describe the concatenation of [APDBKeyHi_EL1](#): [APDBKeyLo_EL1](#).

Configuration

This register is present only when FEAT_PAuth is implemented. Otherwise, direct accesses to APDBKeyHi_EL1 are UNDEFINED.

Attributes

APDBKeyHi_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
64 bit value, bits[127:64] of the 128 bit pointer authentication key value																															
64 bit value, bits[127:64] of the 128 bit pointer authentication key value																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

64 bit value, bits[127:64] of the 128 bit pointer authentication key value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing APDBKeyHi_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, APDBKeyHi_EL1

op0	op1	CRn	CRm	op2

APGAKeyHi_EL1, Pointer Authentication Key A for Code (bits[127:64])

The APGAKeyHi_EL1 characteristics are:

Purpose

Holds bits[127:64] of key used for generic pointer authentication code.

Note

The term APGAKey_EL1 is used to describe the concatenation of [APGAKeyHi_EL1](#): [APGAKeyLo_EL1](#).

Configuration

This register is present only when FEAT_PAuth is implemented. Otherwise, direct accesses to APGAKeyHi_EL1 are UNDEFINED.

Attributes

APGAKeyHi_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

APGAKeyLo_EL1, Pointer Authentication Key A for Code (bits[63:0])

The APGAKeyLo_EL1 characteristics are:

Purpose

Holds bits[63:0] of key used for generic pointer authentication code.

Note

The term APGAKey_EL1 is used to describe the concatenation of [APGAKeyHi_EL1](#): [APGAKeyLo_EL1](#).

Configuration

This register is present only when FEAT_PAuth is implemented. Otherwise, direct accesses to APGAKeyLo_EL1 are UNDEFINED.

Attributes

APGAKeyLo_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing APGAKeyLo_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, APGAKeyLo_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0011	0b000

APIBKeyLo_EL1, Pointer Authentication Key B for Instruction (bits[63:0])

The APIBKeyLo_EL1 characteristics are:

Purpose

Holds bits[63:0] of key B used for authentication of instruction pointer values.

Note

The term APIBKey_EL1 is used to describe the concatenation of [APIBKeyHi_EL1](#): [APIBKeyLo_EL1](#).

Configuration

This register is present only when FEAT_PAuth is implemented. Otherwise, direct accesses to APIBKeyLo_EL1 are UNDEFINED.

Attributes

APIBKeyLo_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

- 64 bit value, bits[63:0] of the 128 bit pointer authentication key value.
- The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing APIBKeyLo_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, APIBKeyLo_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0001	0b010

```

AT S1E0R, Address Translate Stage 1 EL0 Read

The AT S1E0R characteristics are:

Purpose

Performs stage 1 address translation from EL0, with permissions as if reading from the given virtual address from EL0, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of [SCR_EL3.NS](#):
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the EL1&0 translation regime.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the EL2&0 translation regime.
- Otherwise, the EL1&0 translation regime.

Configuration

There are no configuration notes.

Attributes

AT S1E0R is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

BRB IALL, Invalidate the Branch Record Buffer

The BRB IALL characteristics are:

Purpose

Invalidates all Branch records in the Branch Record Buffer.

Configuration

This instruction is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRB IALL are UNDEFINED.

Attributes

BRB IALL is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the BRB IALL instruction

Rt should be encoded as 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

BRB IALL

op0	op1	CRn	CRm	op2
0b01	0b001	0b0111	0b0010	0b100

```

BRB INJ, Branch Record Injection into the Branch Record Buffer

The BRB INJ characteristics are:

Purpose

Injects the Branch Record held in [BRBINFINJ_EL1](#), [BRBSRCINJ_EL1](#), and [BRBTGTINJ_EL1](#) into the Branch Record Buffer.

Configuration

This instruction is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRB INJ are UNDEFINED.

Attributes

BRB INJ is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the BRB INJ instruction

Rt should be encoded as 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

BRB INJ

op0	op1	CRn	CRm	op2
0b01	0b001	0b0111	0b0010	0b101

(new)

ERTN	Meaning
0b0	Disable the recording Branch records for exception return instructions from EL1.
0b1	Enable the recording Branch records for exception return instructions from EL1.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Bits [21:109]

Reserved, RES0.

FZPSS, bit [9]

When FEAT_PMUv3_SS is implemented:

Freeze BRBE on PMU Snapshot.

FZPSS	Meaning
0b0	Branch recording is not affected by this control.
0b1	If either EL2 is not implemented or BRBCR_EL2.FZPSS is 1, then a BRBE freeze event occurs when a PMU snapshot occurs.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FZP, bit [8]

When FEAT_PMUv3 is implemented:

Freeze BRBE on PMU overflow.

FZP	Meaning
0b0	Branch recording is not affected by this control.
0b1	A BRBE freeze event occurs when a PMU overflow occurs.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control.

TS	Meaning	Applies when
0b01	Virtual timestamp. The BRBE recorded timestamp is the physical counter value, minus the value of CNTVOFF_EL2 .	When FEAT_ECV is implemented
0b10	Guest physical timestamp. The BRBE recorded timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2 : <ul style="list-style-type: none"> EL3 is implemented and SCR_EL3.ECVEn == 0. EL2 is implemented and CNTHCTL_EL2.ECV == 0. 	
0b11	Physical timestamp. The BRBE recorded timestamp is the physical counter value.	

All other values are reserved.

This field is ignored by the PE when EL2 is implemented and [BRBCR_EL2.TS](#) != 0b00.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

MPRED, bit [4]

Mask the recording of mispredicts.

MPRED	Meaning
0b0	Disable the recording of mispredict information.
0b1	Allow the recording of mispredict information.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

CC, bit [3]

Enable the recording of cycle count information.

CC	Meaning
0b0	Disable the recording of cycle count information.
0b1	Allow the recording of cycle count information.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E1BRE, bit [1]

EL1 Branch recording enable.

E1BRE	Meaning
0b0	Branch recording prohibited at EL1.
0b1	Branch recording enabled at EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

E0BRE, bit [0]

EL0 Branch recording enable.

E0BRE	Meaning
0b0	Branch recording prohibited at EL0.
0b1	Branch recording enabled at EL0.

This field is ignored by the PE when EL2 is implemented and enabled in the current Security state and [HCR_EL2.TGE](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing BRBCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBCR_EL1

op0	op1	CRn	CRm	op2
0b10	0b001	0b1001	0b0000	0b000

ERTN	Meaning
0b0	Disable the recording Branch records for exception return instructions from EL2.
0b1	Enable the recording Branch records for exception return instructions from EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Bits [21:109]

Reserved, RES0.

FZPSS, bit [9]

When FEAT_PMUv3_SS is implemented:

Freeze BRBE on PMU Snapshot.

FZPSS	Meaning
0b0	Branch recording is not affected by this control.
0b1	If BRBCR_EL1.FZPSS is 1, then a BRBE freeze event occurs when a PMU snapshot occurs.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FZP, bit [8]

When FEAT_PMUv3 is implemented:

Freeze BRBE on PMU overflow.

FZP	Meaning
0b0	Branch recording is not affected by this control.
0b1	A BRBE freeze event occurs when a PMU overflow occurs.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control.

TS	Meaning	Applies when
0b00	Timestamp controlled by BRBCR_EL1.TS .	
0b01	Virtual timestamp. The BRBE recorded timestamp is the physical counter value, minus the value of CNTVOFF_EL2 .	
0b10	Guest physical timestamp. The BRBE recorded timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2 : <ul style="list-style-type: none"> EL3 is implemented and SCR_EL3.ECVEn == 0. EL2 is implemented and CNTHCTL_EL2.ECV == 0. 	When FEAT_ECV is implemented
0b11	Physical timestamp. The BRBE recorded timestamp is the physical counter value.	

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

MPRED, bit [4]

Mask the recording of mispredicts.

MPRED	Meaning
0b0	Disable the recording of mispredict information.
0b1	Allow the recording of mispredict information.

If EL2 is not implemented, then the Effective value of this field is 1, other than for a direct read of the register.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

CC, bit [3]

Enable the recording of cycle count information.

CC	Meaning
0b0	Disable the recording of cycle count information.
0b1	Allow the recording of cycle count information.

If EL2 is not implemented, then the Effective value of this field is 1, other than for a direct read of the register.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E2BRE, bit [1]

EL2 Branch recording enable.

E2BRE	Meaning
0b0	Branch recording prohibited at EL2.
0b1	Branch recording enabled at EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

E0HBRE, bit [0]

EL0 Branch recording enable.

E0HBRE	Meaning
0b0	Branch recording prohibited at EL0 when HCR_EL2.TGE == 1.
0b1	Branch recording enabled at EL0 when HCR_EL2.TGE == 1.

This field is ignored by the PE when any of the following are true:

- [HCR_EL2.TGE](#) == 0.
- EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing BRBCR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, accesses from EL2 using the register name BRBCR_EL2 or BRBCR_EL1 are not guaranteed to be ordered with respect to accesses using the other register name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBCR_EL1

op0	op1	CRn	CRm	op2
0b10	0b001	0b1001	0b0000	0b000

BRBFCCR_EL1, Branch Record Buffer Function Control Register

The BRBFCCR_EL1 characteristics are:

Purpose

Functional controls for the Branch Record Buffer.

Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBFCCR_EL1 are UNDEFINED.

Attributes

BRBFCCR_EL1 is a 64-bit register.

Field descriptions

Bits [63:30]

Reserved, RES0.

BANK, bits [29:28]

Branch record buffer bank access control.

BANK	Meaning
0b00	Select branch records 0 to 31.
0b01	Select branch records 32 to 63.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:23]

Reserved, RES0.

CONDDIR, bit [22]

Match on conditional direct branch instructions.

CONDDIR	Meaning
0b0	Do not match on conditional direct branch instructions.
0b1	Match on conditional direct branch instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

DIRCALL, bit [21]

Match on direct branch with link instructions.

DIRCALL	Meaning
0b0	Do not match on direct branch with link instructions.
0b1	Match on direct branch with link instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

INDCALL, bit [20]

Match on indirect branch with link instructions.

INDCALL	Meaning
0b0	Do not match on indirect branch with link instructions.
0b1	Match on indirect branch with link instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

RTN, bit [19]

Match on function return instructions.

RTN	Meaning
0b0	Do not match on function return instructions.
0b1	Match on function return instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

INDIRECT, bit [18]

Match on indirect branch instructions.

INDIRECT	Meaning
0b0	Do not match on indirect branch instructions.
0b1	Match on indirect branch instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

DIRECT, bit [17]

Match on unconditional direct branch instructions.

DIRECT	Meaning
0b0	Do not match on unconditional direct branch instructions.
0b1	Match on unconditional direct branch instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

EnI, bit [16]

Include or exclude matches.

EnI	Meaning
0b0	Include records for matches, and exclude records for non-matches.
0b1	Exclude records for matches, and include records for non-matches.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Bits [15:8]

Reserved, RES0.

PAUSED, bit [7]

Branch recording Paused status.

PAUSED	Meaning
0b0	Branch recording is not Paused.
0b1	Branch recording is Paused.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

LASTFAILED, bit [6]**When FEAT_TME is implemented:**

Indicates transaction failure or cancellation.

LASTFAILED	Meaning
0b0	Indicates that no transactions in a non-prohibited region have failed or been canceled since the last Branch record was generated.
0b1	Indicates that at least one transaction in a non-prohibited region has failed or been canceled since the last Branch record was generated.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:0]

Reserved, RES0.

Accessing BRBFCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBFCR_EL1

op0	op1	CRn	CRm	op2
0b10	0b001	0b1001	0b0000	0b001

BRBIDR0_EL1, Branch Record Buffer ID0 Register

The BRBIDR0_EL1 characteristics are:

Purpose

Indicates the features of the branch buffer unit.

Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBIDR0_EL1 are UNDEFINED.

Attributes

BRBIDR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0															
RES0																CC				FORMAT				NUMREC							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:16]

Reserved, RES0.

CC, bits [15:12]

Cycle counter support. Defined values are:

CC	Meaning
0b0101	20-bit cycle counter implemented.

All other values are reserved.

FORMAT, bits [11:8]

Data format of records of the Branch record buffer. Defined values are:

FORMAT	Meaning
0b0000	Format 0.

All other values are reserved.

NUMREC, bits [7:0]

Number of records supported. Defined values are:

NUMREC	Meaning
0x08	8 branch records implemented.
0x10	16 branch records implemented.
0x20	32 branch records implemented.
0x40	64 branch records implemented.

All other values are reserved.

Accessing BRBIDR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBIDR0_EL1

op0	op1	CRn	CRm	op2
0b10	0b001	0b1001	0b0010	0b000

BRBINFINJ_EL1, Branch Record Buffer Information Injection Register

The BRBINFINJ_EL1 characteristics are:

Purpose

The information of a Branch record for injection.

Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBINFINJ_EL1 are UNDEFINED.

Attributes

BRBINFINJ_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																	CCU		CC												
RES0														LASTFAILED		T	RES0		TYPE						EL	MPRED	RES0		VALID		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:47]

Reserved, RES0.

CCU, bit [46]

The number of PE clock cycles since the last Branch record entry is UNKNOWN.

CCU	Meaning
0b0	Indicates that the number of PE clock cycles since the last Branch record is indicated by BRBINFINJ_EL1.CC.
0b1	Indicates that the number of PE clock cycles since the last Branch record is UNKNOWN.

The value in this field is only valid when BRBINFINJ_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINFINJ_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

CC, bits [45:32]

The number of PE clock cycles since the last Branch record entry.

The format of this field uses a mantissa and exponent to express the cycle count value, as follows:

- CC bits[7:0] indicate the mantissa M.
- CC bits[13:8] indicate the exponent E.

The cycle count is expressed using the following function:

if IsZero(E) then UInt(M) else UInt('1':M:Zeros(UInt(E)-1))

If required, the cycle count is rounded to a multiple of $2^{(E-1)}$ towards zero before being encoded.

A value of all ones in both the mantissa and exponent indicates the cycle count value exceeded the size of the cycle counter.

The value in this field is only valid when BRBINFINJ_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **RES0** if any of the following are true:
 - BRBINFINJ_EL1.CCU == 1
 - BRBINFINJ_EL1.VALID == 0b00
- Otherwise, access to this field is **RW**.

Bits [31:18]

Reserved, RES0.

LASTFAILED, bit [17]

When FEAT_TME is implemented:

Indicates transaction failure or cancellation.

LASTFAILED	Meaning
0b0	Indicates that no transactions in a non-prohibited region have failed or been canceled between the previous Branch record and this Branch record.
0b1	Indicates that at least one transaction in a non-prohibited region has failed or been canceled between the previous Branch record and this Branch record.

The value in this field is only valid when BRBINFINJ_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINFINJ_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

T, bit [16]

When FEAT_TME is implemented:

Transactional state.

T	Meaning
0b0	The branch or exception was not executed in Transactional state.
0b1	The branch or exception was executed in Transactional state.

The value in this field is only valid when BRBINFINJ_EL1.VALID == 0b10 or BRBINFINJ_EL1.VALID == 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **RES0** if any of the following are true:
 - BRBINFINJ_EL1.VALID == 0b00
 - BRBINFINJ_EL1.VALID == 0b01
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

Bits [15:14]

Reserved, RES0.

TYPE, bits [13:8]

Branch type.

TYPE	Meaning
0b000000	Unconditional direct branch, excluding Branch with link.
0b000001	Indirect branch, excluding Branch with link, Return from subroutine, and Exception return.
0b000010	Direct Branch with link.
0b000011	Indirect Branch with link.
0b000101	Return from subroutine.
0b000111	Exception return.
0b001000	Conditional direct branch.
0b100001	Debug halt.
0b100010	Call.
0b100011	Trap.
0b100100	SError.
0b100110	Instruction debug.
0b100111	Data debug.
0b101010	Alignment.
0b101011	Inst Fault.
0b101100	Data Fault.
0b101110	IRQ.
0b101111	FIQ.
0b111001	Debug State Exit.

All other values are reserved.

The value in this field is only valid when BRBINFINJ_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINFINJ_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

EL, bits [7:6]

The Exception Level at the target address.

EL	Meaning	Applies when
0b00	EL0.	When FEAT_BRBEv1p1 is implemented
0b01	EL1.	
0b10	EL2.	
0b11	EL3.	

The value in this field is only valid when BRBINFINJ_EL1.VALID == 0b11 or BRBINFINJ_EL1.VALID == 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **RES0** if any of the following are true:
 - BRBINFINJ_EL1.VALID == 0b00
 - BRBINFINJ_EL1.VALID == 0b10
- Otherwise, access to this field is **RW**.

MPRED, bit [5]

Branch mispredict.

MPRED	Meaning
0b0	Branch was correctly predicted or the result of the prediction was not captured.
0b1	Branch was incorrectly predicted.

The value in this field is only valid when BRBINFINJ_EL1.VALID == 0b11 or BRBINFINJ_EL1.VALID == 0b10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **RES0** if any of the following are true:
 - BRBINFINJ_EL1.VALID == 0b00
 - BRBINFINJ_EL1.VALID == 0b01
 - BRBINFINJ_EL1.TYPE[5] == 1
- Otherwise, access to this field is **RW**.

Bits [4:2]

Reserved, RES0.

VALID, bits [1:0]

The Branch record is valid.

VALID	Meaning
0b00	This Branch record is not valid. The values of following fields are not valid: <ul style="list-style-type: none"> • BRBTGTINJ_EL1.ADDRESS. • BRBSRCINJ_EL1.ADDRESS. • BRBINFINJ_EL1.MPRED. • BRBINFINJ_EL1.LASTFAILED. • BRBINFINJ_EL1.T. • BRBINFINJ_EL1.EL. • BRBINFINJ_EL1.TYPE. • BRBINFINJ_EL1.CC. • BRBINFINJ_EL1.CCU.
0b01	This Branch record is valid. The values of following fields are not valid: <ul style="list-style-type: none"> • BRBSRCINJ_EL1.ADDRESS. • BRBINFINJ_EL1.T. • BRBINFINJ_EL1.MPRED.
0b10	This Branch record is valid. The values of following fields are not valid: <ul style="list-style-type: none"> • BRBTGTINJ_EL1.ADDRESS. • BRBINFINJ_EL1.EL.
0b11	This Branch record is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing BRBINFINJ_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBINFINJ_EL1

op0	op1	CRn	CRm	op2
0b10	0b001	0b1001	0b0001	0b000

BRBINF<n>_EL1, Branch Record Buffer Information Register <n>, n = 0 - 31

The BRBINF<n>_EL1 characteristics are:

Purpose

The information for Branch record n + ([BRBFCCR_EL1](#).BANK × 32).

Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBINF<n>_EL1 are UNDEFINED.

Attributes

BRBINF<n>_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																	CCU		CC												
RES0														LASTFAILED		T	RES0		TYPE						EL	MPRED	RES0		VALID		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:47]

Reserved, RES0.

CCU, bit [46]

The number of PE clock cycles since the last Branch record entry is UNKNOWN.

CCU	Meaning
0b0	Indicates that the number of PE clock cycles since the last Branch record is indicated by BRBINF<n>_EL1.CC.
0b1	Indicates that the number of PE clock cycles since the last Branch record is UNKNOWN.

The value in this field is only valid when BRBINF<n>_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINF<n>_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RO**.

CC, bits [45:32]

The number of PE clock cycles since the last Branch record entry.

The format of this field uses a mantissa and exponent to express the cycle count value, as follows:

- CC bits[7:0] indicate the mantissa M.
- CC bits[13:8] indicate the exponent E.

The cycle count is expressed using the following function:

if IsZero(E) then UInt(M) else UInt('1':M:Zeros(UInt(E)-1))

If required, the cycle count is rounded to a multiple of $2^{(E-1)}$ towards zero before being encoded.

A value of all ones in both the mantissa and exponent indicates the cycle count value exceeded the size of the cycle counter.

The value in this field is only valid when BRBINF<n>_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **RES0** if any of the following are true:
 - BRBINF<n>_EL1.CCU == 1
 - BRBINF<n>_EL1.VALID == 0b00
- Otherwise, access to this field is **RO**.

Bits [31:18]

Reserved, RES0.

LASTFAILED, bit [17]

When FEAT_TME is implemented:

Indicates transaction failure or cancellation.

LASTFAILED	Meaning
0b0	Indicates that no transactions in a non-prohibited region have failed or been canceled between the previous Branch record and this Branch record.
0b1	Indicates that at least one transaction in a non-prohibited region has failed or been canceled between the previous Branch record and this Branch record.

The value in this field is only valid when BRBINF<n>_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINF<n>_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

T, bit [16]

When FEAT_TME is implemented:

Transactional state.

T	Meaning
0b0	The branch or exception was not executed in Transactional state.
0b1	The branch or exception was executed in Transactional state.

The value in this field is only valid when BRBINF<n>_EL1.VALID == 0b10 or BRBINF<n>_EL1.VALID == 0b11.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **RES0** if any of the following are true:
 - BRBINF<n>_EL1.VALID == 0b00
 - BRBINF<n>_EL1.VALID == 0b01
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [15:14]

Reserved, RES0.

TYPE, bits [13:8]

Branch type.

TYPE	Meaning
0b000000	Unconditional direct branch, excluding Branch with link.
0b000001	Indirect branch, excluding Branch with link, Return from subroutine, and Exception return.
0b000010	Direct Branch with link.
0b000011	Indirect Branch with link.
0b000101	Return from subroutine.
0b000111	Exception return.
0b001000	Conditional direct branch.
0b100001	Debug halt.
0b100010	Call.
0b100011	Trap.
0b100100	SError.
0b100110	Instruction debug.
0b100111	Data debug.
0b101010	Alignment.
0b101011	Inst Fault.
0b101100	Data Fault.
0b101110	IRQ.
0b101111	FIQ.
0b111001	Debug State Exit.

All other values are reserved.

The value in this field is only valid when BRBINF<n>_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINF<n>_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RO**.

EL, bits [7:6]

The Exception Level at the target address.

EL	Meaning	Applies when
0b00	EL0.	
0b01	EL1.	
0b10	EL2.	
0b11	EL3.	When FEAT_BRBEv1p1 is implemented

The value in this field is only valid when BRBINF<n>_EL1.VALID == 0b11 or BRBINF<n>_EL1.VALID == 0b01.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **RES0** if any of the following are true:
 - BRBINF<n>_EL1.VALID == 0b00
 - BRBINF<n>_EL1.VALID == 0b10
- Otherwise, access to this field is **RO**.

MPRED, bit [5]

Branch mispredict.

MPRED	Meaning
0b0	Branch was correctly predicted or the result of the prediction was not captured.
0b1	Branch was incorrectly predicted.

The value in this field is only valid when BRBINF<n>_EL1.VALID == 0b11 or BRBINF<n>_EL1.VALID == 0b10.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **RES0** if any of the following are true:
 - BRBINF<n>_EL1.VALID == 0b00
 - BRBINF<n>_EL1.VALID == 0b01
 - BRBINF<n>_EL1.TYPE[5] == 1
- Otherwise, access to this field is **RO**.

Bits [4:2]

Reserved, RES0.

VALID, bits [1:0]

The Branch record is valid.

VALID	Meaning
0b00	This Branch record is not valid. The values of following fields are not valid: <ul style="list-style-type: none"> • BRBTGT<n>_EL1.ADDRESS. • BRBSRC<n>_EL1.ADDRESS. • BRBINF<n>_EL1.MPRED. • BRBINF<n>_EL1.LASTFAILED. • BRBINF<n>_EL1.T. • BRBINF<n>_EL1.EL. • BRBINF<n>_EL1.TYPE. • BRBINF<n>_EL1.CC. • BRBINF<n>_EL1.CCU.
0b01	This Branch record is valid. The values of following fields are not valid: <ul style="list-style-type: none"> • BRBSRC<n>_EL1.ADDRESS. • BRBINF<n>_EL1.T. • BRBINF<n>_EL1.MPRED.
0b10	This Branch record is valid. The values of following fields are not valid: <ul style="list-style-type: none"> • BRBTGT<n>_EL1.ADDRESS. • BRBINF<n>_EL1.EL.
0b11	This Branch record is valid.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing BRBINF<n>_EL1

BRBINF<n>_EL1 reads-as-zero if $n + (\text{BRBFCR_EL1.BANK} \times 32) \geq \text{BRBIDR0_EL1.NUMREC}$.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBINF<m>_EL1 ; Where m = 0-31

op0	op1	CRn	CRm	op2
0b10	0b001	0b1000	m[3:0]	m[4]:0b00

```

integer m = UInt(op2<2>:CRm<3:0>);

BRBSRCINJ_EL1, Branch Record Buffer Source Address Injection Register

The BRBSRCINJ_EL1 characteristics are:

Purpose

The source address of a Branch record for injection.

Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBSRCINJ_EL1 are UNDEFINED.

Attributes

BRBSRCINJ_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ADDRESS																															
ADDRESS																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ADDRESS, bits [63:0]

Source virtual address of the Branch record.

When a direct write occurs with a value with ADDRESS bits [63:P] being other than all zeroes or all ones, an UNKNOWN value which is not all zeroes or all ones is written to bits [63:P]. P is defined as the virtual address size supported by the PE, as returned by VAMax(). The value in bits [P-1:0] are the value written.

When a direct write occurs with a value with ADDRESS bits [63:P] being all zeroes or all ones, the written value is written to bits [63:0], and a read of the register returns the written value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **RES0** if any of the following are true:
 - BRBINFINJ_EL1.VALID == 0b00
 - BRBINFINJ_EL1.VALID == 0b01
- Otherwise, access to this field is **RW**.

Accessing BRBSRCINJ_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBSRCINJ_EL1

BRBSRC<n>_EL1, Branch Record Buffer Source Address Register <n>, n = 0 - 31

The BRBSRC<n>_EL1 characteristics are:

Purpose

The source address of Branch record n + ([BRBFCCR_EL1](#).BANK × 32).

Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBSRC<n>_EL1 are UNDEFINED.

Attributes

BRBSRC<n>_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ADDRESS																															
ADDRESS																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ADDRESS, bits [63:0]

Source virtual address of the Branch record.

When an indirect write occurs with a value with ADDRESS bits [63:P] being other than all zeroes or all ones, an UNKNOWN value which is not all zeroes or all ones is written to bits [63:P]. P is defined as the virtual address size supported by the PE, as returned by VAMax(). The value in bits [P-1:0] are the value written.

When an indirect write occurs with a value with ADDRESS bits [63:P] being all zeroes or all ones, the written value is written to bits [63:0], and a read of the register returns the written value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **RES0** if any of the following are true:
 - BRBINF<n>_EL1.VALID == 0b00
 - BRBINF<n>_EL1.VALID == 0b01
- Otherwise, access to this field is **RO**.

Accessing BRBSRC<n>_EL1

BRBSRC<n>_EL1 is RES0 if n + ([BRBFCCR_EL1](#).BANK × 32) >= [BRBIDR0_EL1](#).NUMREC.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBSRC<m>_EL1 ; Where m = 0-31

BRBTGTINJ_EL1, Branch Record Buffer Target Address Injection Register

The BRBTGTINJ_EL1 characteristics are:

Purpose

The target address of a Branch record for injection.

Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBTGTINJ_EL1 are UNDEFINED.

Attributes

BRBTGTINJ_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ADDRESS																															
ADDRESS																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ADDRESS, bits [63:0]

Target virtual address of the Branch record.

When a direct write occurs with a value with ADDRESS bits [63:P] being other than all zeroes or all ones, an UNKNOWN value which is not all zeroes or all ones is written to bits [63:P]. P is defined as the virtual address size supported by the PE, as returned by VAMax(). The value in bits [P-1:0] are the value written.

When a direct write occurs with a value with ADDRESS bits [63:P] being all zeroes or all ones, the written value is written to bits [63:0], and a read of the register returns the written value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **RES0** if any of the following are true:
 - BRBINFINJ_EL1.VALID == 0b00
 - BRBINFINJ_EL1.VALID == 0b10
- Otherwise, access to this field is **RW**.

Accessing BRBTGTINJ_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBTGTINJ_EL1

op0	op1	CRn	CRm	op2
-----	-----	-----	-----	-----

0b10	0b001	0b1001	0b0001	0b010

CCSIDR_EL1, Current Cache Size ID Register

The CCSIDR_EL1 characteristics are:

Purpose

Provides information about the architecture of the currently selected cache.

Configuration

AArch64 System register CCSIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CCSIDR\[31:0\]](#).

AArch64 System register CCSIDR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [CCSIDR2\[31:0\]](#).

The implementation includes one CCSIDR_EL1 for each cache that it can access. [CSSELR_EL1](#) selects which Cache Size ID Register is accessible.

Attributes

CCSIDR_EL1 is a 64-bit register.

Field descriptions

When FEAT_CCIDX is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
RES0								NumSets																										
RES0								Associativity																									LineSize	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [63:56]

Reserved, RES0.

NumSets, bits [55:32]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Bits [31:24]

Reserved, RES0.

Associativity, bits [23:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

($\log_2(\text{Number of bytes in cache line})$) - 4. For example:

- For a line length of 16 bytes: $\log_2(16) = 4$, LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes: $\log_2(32) = 5$, LineSize entry = 1.

Note

The C++ 17 specification has two defined parameters relating to the granularity of memory that does not interfere. For generic software and tools, Arm will set the hardware_destructive_interference_size parameter to 256 bytes and the hardware_constructive_interference_size parameter to 64 bytes.

When FEAT_MTE2 is implemented **and enabled**, where a cache only holds Allocation tags, this field is RES0.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
UNKNOWN				NumSets																Associativity								LineSize			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [63:32]

Reserved, RES0.

Bits [31:28]

Reserved, UNKNOWN.

NumSets, bits [27:13]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Associativity, bits [12:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

($\log_2(\text{Number of bytes in cache line})$) - 4. For example:

- For a line length of 16 bytes: $\log_2(16) = 4$, LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes: $\log_2(32) = 5$, LineSize entry = 1.

When FEAT_MTE2 is implemented, where a cache only holds Allocation tags, this field is RES0.

Note

The C++ 17 specification has two defined parameters relating to the granularity of memory that does not interfere. For generic software and tools, Arm will set the hardware_destructive_interference_size parameter to 256 bytes and the hardware_constructive_interference_size parameter to 64 bytes.

Accessing CCSIDR_EL1

If [CSELR_EL1](#).{TnD, Level, InD} is programmed to a cache level that is not implemented, then on a read of the CCSIDR_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR_EL1 read is treated as NOP.
- The CCSIDR_EL1 read is UNDEFINED.
- The CCSIDR_EL1 read returns an UNKNOWN value.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CCSIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID2 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && HCR_EL2.TID4 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1')
    && HFGTR_EL2.CCSIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = CCSIDR_EL1;
elseif PSTATE.EL == EL2 then
    X[t, 64] = CCSIDR_EL1;
elseif PSTATE.EL == EL3 then
    X[t, 64] = CCSIDR_EL1;

```

CFP RCTX, Control Flow Prediction Restriction by Context

The CFP RCTX characteristics are:

Purpose

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Control flow predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when FEAT_SPECRES is implemented. Otherwise, direct accesses to CFP RCTX are UNDEFINED.

Attributes

CFP RCTX is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0															GVMID	VMID															
RES0				NSE	NS	EL		RES0								GASID	ASID														
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:28]

Reserved, RES0.

NSE, bit [27]

When FEAT_RME is implemented:

Together with the NS field, selects the Security state.

For a description of the values derived by evaluating NS and NSE together, see CFP_RCTX.NS.

Otherwise:

Reserved, RES0.

NS, bit [26]

When FEAT_RME is implemented:

Together with the NSE field, selects the Security state. Defined values are:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Some Effective values are determined by the current Security state:

- When executed in Secure state, the Effective value of NSE is 0.
- When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.

- When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

This instruction is treated as a NOP when executed at EL3 and either:

An instruction with an EL field that has a value other than 0b11 (EL3) is treated as a NOP when executed at EL3 with CFP_RCTX.{NSE, NS} == {1, 0}.

- CFP_RCTX.{NSE, NS} selects a reserved value.
- CFP_RCTX.{NSE, NS} == {1, 0} and CFP_RCTX.EL has a value other than 0b11.

Otherwise:

Security State. Defined values are:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing the CFP RCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

CFP RCTX, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b100

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLR_EL1.EnRCTX == '0' then

CLIDR_EL1, Cache Level ID Register

The CLIDR_EL1 characteristics are:

Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

Configuration

AArch64 System register CLIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CLIDR\[31:0\]](#).

Attributes

CLIDR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																Ttype7	Ttype6	Ttype5	Ttype4	Ttype3	Ttype2	Ttype1	ICB								
ICB		LoUU		LoC		LoUIS		Ctype7		Ctype6		Ctype5		Ctype4		Ctype3		Ctype2		Ctype1											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:47]

Reserved, RES0.

Ttype<n>, bits [2(n-1)+34:2(n-1)+33], for n = 7 to 1 When FEAT_MTE2 is implemented:

Tag cache type. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy.

Ttype<n>	Meaning
0b00	No Tag Cache.
0b01	Separate Allocation Tag Cache.
0b10	Unified Allocation Tag and Data cache, Allocation Tags and Data in unified lines.
0b11	Unified Allocation Tag and Data cache, Allocation Tags and Data in separate lines.

Otherwise:

Reserved, RES0.

ICB, bits [32:30]

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

ICB	Meaning
0b000	Not disclosed by this mechanism.
0b001	L1 cache is the highest Inner Cacheable level.
0b010	L2 cache is the highest Inner Cacheable level.
0b011	L3 cache is the highest Inner Cacheable level.
0b100	L4 cache is the highest Inner Cacheable level.
0b101	L5 cache is the highest Inner Cacheable level.
0b110	L6 cache is the highest Inner Cacheable level.
0b111	L7 cache is the highest Inner Cacheable level.

LoUU, bits [29:27]

Level of Unification Uniprocessor for the cache hierarchy.

For a description of the values of this field, see Terminology for Clean, Invalidate, and Clean and Invalidate instructions.

Note

This field does not describe the requirements for instruction cache invalidation. See [CTR_EL0.DIC](#).

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

LoC, bits [26:24]

Level of Coherence for the cache hierarchy.

For a description of the values of this field, see Terminology for Clean, Invalidate, and Clean and Invalidate instructions.

LoUIS, bits [23:21]

Level of Unification Inner Shareable for the cache hierarchy.

For a description of the values of this field, see Terminology for Clean, Invalidate, and Clean and Invalidate instructions.

Note

This field does not describe the requirements for instruction cache invalidation. See [CTR_EL0.DIC](#).

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 7 to 1

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

Ctype<n>	Meaning
0b000	No cache.
0b001	Instruction cache only.
0b010	Data cache only.
0b011	Separate instruction and data caches.
0b100	Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

Accessing CLIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CLIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b001

```

CNTHCTL_EL2, Counter-timer Hypervisor Control register

The CNTHCTL_EL2 characteristics are:

Purpose

Controls the generation of an event stream from the physical counter, and access from EL1 to the physical counter and the EL1 physical timer.

Configuration

AArch64 System register CNTHCTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHCTL\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

CNTHCTL_EL2 is a 64-bit register.

Field descriptions

When FEAT_VHE is implemented and HCR_EL2.E2H == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	
																		RES0				
RES0												CNTPMASK	CNTVMASK	EVNTIS	EL1NVVCT	EL1NVPCT	EL1TVCT	EL1TVT	ECV	EL1PTEN	EL1PCTE	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	

Bits [63:20]

Reserved, RES0.

CNTPMASK, bit [19]

When FEAT_RME is implemented:

CNTPMASK	Meaning
0b0	This control has no affect on CNTP_CTL_EL0.IMASK .
0b1	CNTP_CTL_EL0.IMASK behaves as if set to 1 for all purposes other than a direct read of the field.

This bit is RES0 in Non-secure and Secure state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CNTVMASK, bit [18]**When FEAT_RME is implemented:**

CNTVMASK	Meaning
0b0	This control has no affect on CNTV_CTL_EL0 .IMASK.
0b1	CNTV_CTL_EL0 .IMASK behaves as if set to 1 for all purposes other than a direct read of the field.

This bit is RES0 in Non-secure and Secure state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENTIS, bit [17]**When FEAT_ECV is implemented:**

Controls the scale of the generation of the event stream.

EVENTIS	Meaning
0b0	The CNTHCTL_EL2.EVENTI field applies to CNTPCT_EL0 [15:0].
0b1	The CNTHCTL_EL2.EVENTI field applies to CNTPCT_EL0 [23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVVCT, bit [16]**When FEAT_ECV is implemented:**

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H==1 && HCR_EL2.TGE==1) HCR_EL2.NV2==0 HCR_EL2.NV1==1 HCR_EL2.NV==0), this control does not cause any instructions to be trapped. If ((HCR_EL2.E2H==0 HCR_EL2.TGE==0) && HCR_EL2.NV2==1 && HCR_EL2.NV1==0 && HCR_EL2.NV==1), then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVPCT, bit [15]

When FEAT_ECV is implemented:

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVPCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H==1 && HCR_EL2.TGE==1) HCR_EL2.NV2==0 HCR_EL2.NV1==1 HCR_EL2.NV==0), this control does not cause any instructions to be trapped. If (HCR_EL2.E2H==0 HCR_EL2.TGE==0) && HCR_EL2.NV2==1 && HCR_EL2.NV1==0 && HCR_EL2.NV==1 , then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVCT, bit [14]

When FEAT_ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

EL1TVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	<p>If HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.</p> <p>If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then:</p> <ul style="list-style-type: none"> In AArch64 state, traps EL0 and EL1 accesses to CNTVCT_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN. In AArch32 state, traps EL0 and EL1 accesses to CNTVCT to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN or CNTKCTL.PL0VCTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]

When FEAT_ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

EL1TVT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	<p>If HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.</p> <p>If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then:</p> <ul style="list-style-type: none"> In AArch64 state, traps EL0 and EL1 accesses to CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN. In AArch32 state, traps EL0 and EL1 accesses to CNTV_CTL, CNTV_CVAL, and CNTV_TVAL to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN or CNTKCTL.PL0VTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECV, bit [12]

When FEAT_ECV is implemented:

Enables the Enhanced Counter Virtualization functionality registers.

ECV	Meaning
0b0	Enhanced Counter Virtualization functionality is disabled.
0b1	When HCR_EL2 .{E2H, TGE} == {1, 1} or SCR_EL3 .{NS, EEL2} == {0, 0}, then Enhanced Counter Virtualization functionality is disabled. When SCR_EL3 .NS or SCR_EL3 .EEL2 are 1, and HCR_EL2 .E2H or HCR_EL2 .TGE are 0, then Enhanced Counter Virtualization functionality is enabled when EL2 is enabled for the current Security state. This means that: <ul style="list-style-type: none"> An MRS to CNTPCT_EL0 from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - CNTPOFF_EL2<63:0>). The EL1 physical timer interrupt is triggered when ((PCount<63:0> - CNTPOFF_EL2<63:0>) - PCVal<63:0>) is greater than or equal to 0. PCount<63:0> is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3. PCVal<63:0> is the EL1 physical timer compare value for this timer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1PTEN, bit [11]

When [HCR_EL2](#).TGE is 0, traps EL0 and EL1 accesses to the E1 physical timer registers to EL2 when EL2 is enabled in the current Security state.

EL1PTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTP_CTL_EL0 , CNTP_CVAL_EL0 , and CNTP_TVAL_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1 .ELOPTEN. From AArch32 state: EL0 and EL1 accesses to the CNTP_CTL , CNTP_CVAL , and CNTP_TVAL are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1 .ELOPTEN or CNTKCTL .PLOPTEN.
0b1	This control does not cause any instructions to be trapped.

When [HCR_EL2](#).TGE is 1, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCTEN, bit [10]

When [HCR_EL2](#).TGE is 0, traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [CNTPCT_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to [CNTPCT](#) are trapped to EL2, reported using EC syndrome value 0x04.

EL1PCTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTPCT_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN . From AArch32 state: EL0 and EL1 accesses to the CNTPCT are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN .
0b1	This control does not cause any instructions to be trapped.

When [HCR_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ELOPTEN, bit [9]

When [HCR_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR_EL2.TGE](#) is 1, traps EL0 accesses to the physical timer registers to EL2.

ELOPTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTP_CTL_EL0 , CNTP_CVAL_EL0 , and CNTP_TVAL_EL0 registers are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTP_CTL , CNTP_CVAL and CNTP_TVAL registers are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ELOVTEN, bit [8]

When [HCR_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR_EL2.TGE](#) is 1, traps EL0 accesses to the virtual timer registers to EL2.

ELOVTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTV_CTL_EL0 , CNTV_CVAL_EL0 , and CNTV_TVAL_EL0 registers are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTV_CTL , CNTV_CVAL , and CNTV_TVAL registers are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of [CNTPCT_EL0](#), as seen from EL2, is the trigger for the event stream generated from that counter when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of [CNTPCT_EL0](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of [CNTPCT_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the [CNTPCT_EL0](#) trigger bit, as seen from EL2 and defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from [CNTPCT_EL0](#) as seen from EL2.

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ELOVCTEN, bit [1]

When [HCR_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR_EL2.TGE](#) is 1, traps EL0 accesses to the frequency register and virtual counter register to EL2.

ELOVCTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTVCT_EL0 are trapped to EL2. EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL2, if CNTHCTL_EL2.EL0PCTEN is also 0. EL0 using AArch32: EL0 accesses to the CNTVCT are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTFRQ register are trapped to EL2, if CNTHCTL.EL0PCTEN is also 0.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

When [HCR_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR_EL2.TGE](#) is 1, traps EL0 accesses to the frequency register and physical counter register to EL2.

EL0PCTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTPCT_EL0 are trapped to EL2. EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL2, if CNTHCTL_EL2.EL0VCTEN is also 0. EL0 using AArch32: EL0 accesses to the CNTPCT are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTFRQ and register are trapped to EL2, if CNTHCTL_EL2.EL0VCTEN is also 0.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

636261605958575655545352	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20

The following format field descriptions apply in all Armv8.0 implementations.

It also explains the behavior when EL3 is implemented and EL2 is not implemented.

Bits [63:20]

Reserved, RES0.

CNTPMASK, bit [19]

When FEAT_RME is implemented:

CNTPMASK	Meaning
0b0	This control has no affect on CNTP_CTL_EL0.IMASK .
0b1	CNTP_CTL_EL0.IMASK behaves as if set to 1 for all purposes other than a direct read of the field.

This bit is RES0 in Non-secure and Secure state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CNTVMASK, bit [18]

When FEAT_RME is implemented:

CNTVMASK	Meaning
0b0	This control has no affect on CNTV_CTL_EL0.IMASK .
0b1	CNTV_CTL_EL0.IMASK behaves as if set to 1 for all purposes other than a direct read of the field.

This bit is RES0 in Non-secure and Secure state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_ELO [15:0].
0b1	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_ELO [23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVVCT, bit [16]

When FEAT_ECV is implemented:

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H ==1 && HCR_EL2.TGE ==1) HCR_EL2.NV2 ==0 HCR_EL2.NV1 ==1 HCR_EL2.NV ==0), this control does not cause any instructions to be trapped. If ((HCR_EL2.E2H ==0 HCR_EL2.TGE ==0) && HCR_EL2.NV2 ==1 && HCR_EL2.NV1 ==0 && HCR_EL2.NV ==1), then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVPCT, bit [15]**When FEAT_ECV is implemented:**

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVPCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H ==1 && HCR_EL2.TGE ==1) HCR_EL2.NV2 ==0 HCR_EL2.NV1 ==1 HCR_EL2.NV ==0), this control does not cause any instructions to be trapped. If (HCR_EL2.E2H ==0 HCR_EL2.TGE ==0) && HCR_EL2.NV2 ==1 && HCR_EL2.NV1 ==0 && HCR_EL2.NV ==1, then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVCT, bit [14]**When FEAT_ECV is implemented:**

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

EL1TVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If HCR_EL2 .{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then: In AArch64 state, traps EL0 and EL1 accesses to CNTVCT_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN . In AArch32 state, traps EL0 and EL1 accesses to CNTVCT to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN or CNTKCTL.PL0VCTEN .

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]**When FEAT_ECV is implemented:**

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

EL1TVT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	<p>If HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.</p> <p>If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then:</p> <ul style="list-style-type: none"> In AArch64 state, traps EL0 and EL1 accesses to CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN. In AArch32 state, traps EL0 and EL1 accesses to CNTV_CTL, CNTV_CVAL, and CNTV_TVAL to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN or CNTKCTL.PL0VTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECV, bit [12]**When FEAT_ECV is implemented:**

Enables the Enhanced Counter Virtualization functionality registers.

ECV	Meaning
0b0	Enhanced Counter Virtualization functionality is disabled.
0b1	<p>When HCR_EL2.{E2H, TGE} == {1, 1} or SCR_EL3.{NS, EEL2} == {0, 0}, then Enhanced Counter Virtualization functionality is disabled.</p> <p>When SCR_EL3.NS or SCR_EL3.EEL2 are 1, and HCR_EL2.E2H or HCR_EL2.TGE are 0, then Enhanced Counter Virtualization functionality is enabled when EL2 is enabled for the current Security state. This means that:</p> <ul style="list-style-type: none"> An MRS to CNTPCT_EL0 from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - CNTPOFF_EL2<63:0>). The EL1 physical timer interrupt is triggered when ((PCount<63:0> - CNTPOFF_EL2<63:0>) - PCVal<63:0>) is greater than or equal to 0. PCount is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3. PCVal<63:0> is the EL1 physical timer compare value for this timer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [11:8]

Reserved, RES0.

EVNTI, bits [7:4]

Selects which bit of [CNTPCT_EL0](#), as seen from EL2, is the trigger for the event stream generated from that counter when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of [CNTPCT_EL0](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of [CNTPCT_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the [CNTPCT_EL0](#) trigger bit, as seen from EL2 and defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from [CNTPCT_EL0](#) as seen from EL2.

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCEN, bit [1]

Traps EL0 and EL1 accesses to the EL1 physical timer registers to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [CNTP_CTL_EL0](#), [CNTP_CVAL_EL0](#), [CNTP_TVAL_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x3 and MRRC and MCRR accesses are trapped to EL2, reported using EC syndrome value 0x04:
 - [CNTP_CTL](#), [CNTP_CVAL](#), [CNTP_TVAL](#).

EL1PCEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTP_CTL_EL0 , CNTP_CVAL_EL0 , and CNTP_TVAL_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PTEN . From AArch32 state: EL0 and EL1 accesses to the CNTP_CTL , CNTP_CVAL , and CNTP_TVAL are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PTEN or CNTKCTL.PL0PTEN .
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCTEN, bit [0]

Traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [CNTPCT_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to [CNTPCT](#) are trapped to EL2, reported using EC syndrome value 0x04.

EL1PCTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTPCT_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN . From AArch32 state: EL0 and EL1 accesses to the CNTPCT are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN .
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHCTL_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHCTL_EL2](#) or [CNTKCTL_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTHCTL_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0001	0b000

CNTPS_CTL_EL1, Counter-timer Physical Secure Timer Control register

The CNTPS_CTL_EL1 characteristics are:

Purpose

Control register for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to CNTPS_CTL_EL1 are undefined.

Attributes

CNTPS_CTL_EL1 is a 64-bit register.

Field descriptions

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTPS_TVAL_EL1](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPS_CTL_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTPS_CTL_EL1

op0	op1	CRn	CRm	op2
0b11	0b111	0b1110	0b0010	0b001

CNTPS_CVAL_EL1, Counter-timer Physical Secure Timer CompareValue register

The CNTPS_CVAL_EL1 characteristics are:

Purpose

Holds the compare value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to CNTPS_CVAL_EL1 are undefined.

Attributes

CNTPS_CVAL_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CompareValue, bits [63:0]

Holds the secure physical timer CompareValue.

When CNTPS_CTL_EL1.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTPS_CTL_EL1.ISTATUS is set to 1.
- If CNTPS_CTL_EL1.IMASK is 0, an interrupt is generated.

When CNTPS_CTL_EL1.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPS_CVAL_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTPS_CVAL_EL1

op0	op1	CRn	CRm	op2

The CNTPS_TVAL_EL1 characteristics are:

Purpose

Holds the timer value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to CNTPS TVAL EL1 are **UNDEFINED**.

Attributes

CNTPS_TVAL_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TimerValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the secure physical timer.

On a read of this register:

- If `CNTPS_CTL_EL1.ENABLE` is 0, the value returned is `UNKNOWN`.
- If `CNTPS_CTL_EL1.ENABLE` is 1, the value returned is `(CNTPS_CVAL_EL1 - CNTPCT_EL0)`.

On a write of this register, [CNTPS_CVAL_EL1](#) is set to ([CNTPCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When `CNTPS_CTL_EL1.ENABLE` is 1, the timer condition is met when `(CNTPCT_ELO - CNTPS_CVAL_EL1)` is greater than or equal to zero. This means that `TimerValue` acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTPS_CTL_EL1](#).ISTATUS is set to 1.
- If [CNTPS_CTL_EL1](#).IMASK is 0, an interrupt is generated.

When `CNTPS_CTL_EL1.ENABLE` is 0, the timer condition is not met, but `CNTPCT_EL0` continues to count, so the `TimerValue` view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPS_TVAL_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTPS_TVAL_EL1

op0	op1	CRn	CRm	op2
0b11	0b111	0b1110	0b0010	0b000

CONTEXTIDR_EL1, Context ID Register (EL1)

The CONTEXTIDR_EL1 characteristics are:

Purpose

Identifies the current Process Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

Configuration

AArch64 System register CONTEXTIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CONTEXTIDR\[31:0\]](#).

Attributes

CONTEXTIDR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																PROCID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

Note

In AArch32 state, when [TTBCR](#).EAE is set to 0, [CONTEXTIDR](#).ASID holds the ASID.

In AArch64 state, CONTEXTIDR_EL1 is independent of the ASID, and for the EL1&0 translation regime either [TTBR0_EL1](#) or [TTBR1_EL1](#) holds the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CONTEXTIDR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic [CONTEXTIDR_EL1](#) or [CONTEXTIDR_EL12](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CONTEXTIDR_EL1

op0	op1	CRn	CRm	op2

CONTEXTIDR_EL2, Context ID Register (EL2)

The CONTEXTIDR_EL2 characteristics are:

Purpose

Identifies the current Process Identifier for EL2.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

Configuration

This register is present only when FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented. Otherwise, direct accesses to CONTEXTIDR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

CONTEXTIDR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																PROCID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CONTEXTIDR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CONTEXTIDR_EL2 or CONTEXTIDR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CONTEXTIDR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1101	0b0000	0b001

COSP RCTX, Clear Other Speculative Restriction by Context

The COSP RCTX characteristics are:

Purpose

Clear Other Speculative Prediction Restriction by Context applies to all prediction resources not managed by another of the speculation restriction System instructions.

The actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control any predictions occurring after the instruction is complete and synchronized.

This instruction applies to all speculative access except:

- Cache Prefetch predictions.
- Data Value predictions.
- Control Flow predictions.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when FEAT_SPECRES2 is implemented. Otherwise, direct accesses to COSP RCTX are UNDEFINED.

Attributes

COSP RCTX is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0															GVMID	VMID																
RES0				NSE	NS	EL		RES0							GASID	ASID																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 and EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:28]

Reserved, RES0.

NSE, bit [27]**When FEAT_RME is implemented:**

Together with the NS field, selects the Security state.

For a description of the values derived by evaluating NS and NSE together, see [COSP_RCTX.NS](#).

Otherwise:

Reserved, RES0.

NS, bit [26]**When FEAT_RME is implemented:**

Together with the NSE field, selects the Security state. Defined values are:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Some Effective values are determined by the current Security state:

- When executed in Secure state, the Effective value of NSE is 0.
- When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.
- When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

This instruction is treated as a NOP when executed at EL3 and either:

- COSP_RCTX.{NSE, NS} selects a reserved value.
- COSP_RCTX.{NSE, NS} == {1, 0} and COSP_RCTX.EL has a value other than 0b11.

Otherwise:

Security State. Defined values are:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing COSP RCTX

Accesses to this instruction use the following encodings in the System instruction encoding space:

COSP RCTX, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b110

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTL_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && IsFeatureImplemented(FEAT_FGT) &&
(!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.COSPRCTX == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && SCTL_EL2.EnRCTX == '0' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.RestrictPrediction(X[t, 64], RestrictType_Other);
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.NV == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1')
&& HFGITR_EL2.COSPRCTX == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.RestrictPrediction(X[t, 64], RestrictType_Other);
    elsif PSTATE.EL == EL2 then
        AArch64.RestrictPrediction(X[t, 64], RestrictType_Other);
    elsif PSTATE.EL == EL3 then
        AArch64.RestrictPrediction(X[t, 64], RestrictType_Other);

```

CPACR_EL1, Architectural Feature Access Control Register

The CPACR_EL1 characteristics are:

Purpose

Controls access to trace, SME, Streaming SVE, SVE, and Advanced SIMD and floating-point functionality.

Configuration

AArch64 System register CPACR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CPACR\[31:0\]](#).

When EL2 is implemented and enabled in the current Security state and [HCR_EL2](#).{E2H, TGE} == {1, 1}, the fields in this register have no effect on execution at EL0 and EL1. In this case, the controls provided by [CPTR_EL2](#) are used.

Attributes

CPACR_EL1 is a 64-bit register.

Field descriptions

Bits [63:3029]

Reserved, RES0.

EOPOE, bit [29]

When FEAT_S1POE is implemented:

Enable access to [POR_EL0](#).

Traps EL0 accesses to [POR_EL0](#), from AArch64 state only to EL1, or to EL2 when it is implemented and enabled in the current Security state and [HCR_EL2](#).TGE is 1. The exception is reported using ESR_ELx.EC value 0x18.

EOPOE	Meaning
0b0	This control causes EL0 access to POR_EL0 to be trapped.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTA, bit [28]

Traps EL0 and EL1 System register accesses to all implemented trace registers from both Execution states to EL1, or to EL2 when it is implemented and enabled in the current Security state and [HCR_EL2.TGE](#) is 1, as follows:

- In AArch64 state, accesses to trace registers are trapped, reported using [ESR_ELx.EC](#) value 0x18.
- In AArch32 state, MRC and MCR accesses to trace registers are trapped, reported using [ESR_ELx.EC](#) value 0x05.
- In AArch32 state, MRRC and MCRR accesses to trace registers are trapped, reported using [ESR_ELx.EC](#) value 0x0C.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	This control causes EL0 and EL1 System register accesses to all implemented trace registers to be trapped.

Note

- The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of [CPACR_EL1.TTA](#) is 1.
- The Arm architecture does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not implemented, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

SMEN, bits [25:24]**When FEAT_SME is implemented:**

Traps execution at EL1 and EL0 of SME instructions, SVE instructions when FEAT_SVE is not implemented or the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#) or [SMCR_EL1](#) System registers to EL1, or to EL2 when EL2 is implemented and enabled in the current Security state and [HCR_EL2.TGE](#) is 1.

When instructions that directly access the [SVCR](#) System register are trapped with reference to this control, the MSR_SVCRSM, MSR_SVCRZA, and MSR_SVCRSMZA instructions are also trapped.

The exception is reported using [ESR_ELx.EC](#) value of 0x1D, with an ISS code of 0x00000000.

This field does not affect whether Streaming SVE or SME register values are valid.

A trap taken as a result of CPACR_EL1.SMEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

SMEN	Meaning
0b00	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b01	This control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL1 to be trapped.
0b10	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:22]

Reserved, RES0.

FPEN, bits [21:20]

Traps execution at EL1 and EL0 of instructions that access the Advanced SIMD and floating-point registers from both Execution states to EL1, reported using ESR_ELx.EC value 0x07, or to EL2 reported using ESR_ELx.EC value 0x00 when EL2 is implemented and enabled in the current Security state and [HCR_EL2.TGE](#) is 1, as follows:

- In AArch64 state, accesses to [FPCR](#), [FPSR](#), any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- In AArch32 state, [FPSCR](#), and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers.

Traps execution at EL1 and EL0 of SME and SVE instructions to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1. The exception is reported using ESR_ELx.EC value 0x07.

A trap taken as a result of CPACR_EL1.SMEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

A trap taken as a result of CPACR_EL1.ZEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

FPEN	Meaning
0b00	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b01	This control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL1 to be trapped.
0b10	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

Writes to [MVFR0](#), [MVFR1](#), and [MVFR2](#) from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

Note

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), and [FPEXC](#) are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR_EL1.FPEN is not 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:18]

Reserved, RES0.

ZEN, bits [17:16]**When FEAT_SVE is implemented:**

Traps execution at EL1 and EL0 of SVE instructions when the PE is not in Streaming SVE mode, and instructions that directly access the [ZCR_EL1](#) System register to EL1, or to EL2 when EL2 is implemented and enabled in the current Security state and [HCR_EL2](#).TGE is 1.

The exception is reported using ESR_ELx.EC value 0x19.

A trap taken as a result of CPACR_EL1.ZEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

ZEN	Meaning
0b00	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b01	This control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL1 to be trapped.
0b10	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:0]

Reserved, RES0.

Accessing CPACR_EL1

When [HCR_EL2](#).E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CPACR_EL1 or CPACR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CPACR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;

CPP RCTX, Cache Prefetch Prediction Restriction by Context

The CPP RCTX characteristics are:

Purpose

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

The actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control cache prefetch predictions occurring after the instruction is complete and synchronized.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when FEAT_SPECRES is implemented. Otherwise, direct accesses to CPP RCTX are UNDEFINED.

Attributes

CPP RCTX is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0															GVMID	VMID															
RES0					NSE	NS	EL	RES0							GASID	ASID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 and EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:28]

Reserved, RES0.

NSE, bit [27]**When FEAT_RME is implemented:**

Together with the NS field, selects the Security state.

For a description of the values derived by evaluating NS and NSE together, see [CPP_RCTX.NS](#).

Otherwise:

Reserved, RES0.

NS, bit [26]**When FEAT_RME is implemented:**

Together with the NSE field, selects the Security state. Defined values are:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Some Effective values are determined by the current Security state:

- When executed in Secure state, the Effective value of NSE is 0.
- When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.
- When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

This instruction is treated as a NOP when executed at EL3 and either:

An instruction with an EL field that has a value other than 0b11 (EL3) is treated as a NOP when executed at EL3 with CPP_RCTX.{NSE, NS} == {1, 0}.

- CPP_RCTX.{NSE, NS} selects a reserved value.
- CPP_RCTX.{NSE, NS} == {1, 0} and CPP_RCTX.EL has a value other than 0b11.

Otherwise:

Security State. Defined values are:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing the CPP RCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

CPP RCTX, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b111

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTL_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && IsFeatureImplemented(FEAT_FGT) &&

CPTR_EL2, Architectural Feature Trap Register (EL2)

The CPT_R_EL2 characteristics are:

Purpose

Controls trapping to EL2 of accesses to [CPACR](#), [CPACR_EL1](#), trace, Activity Monitor, SME, Streaming SVE, SVE, and Advanced SIMD and floating-point functionality.

Configuration

AArch64 System register CPT_R_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HCPTR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

CPTR_EL2 is a 64-bit register.

Field descriptions

When FEAT_VHE is implemented and HCR_EL2.E2H == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TCPAC	TAM	EOP	RES0	TTA	RES0	SMEN	RES0	FPEN	RES0	ZEN	RES0																				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

In AArch64 state, traps accesses to [CPACR_EL1](#) from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x18.

In AArch32 state, traps accesses to [CPACR](#) from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x03.

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to CPACR_EL1 and CPACR are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

Note

[CPACR_EL1](#) and [CPACR](#) are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]**When FEAT_AMUv1 is implemented:**

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value 0x18:
 - [AMUSERENR_EL0](#), [AMCFGR_EL0](#), [AMCGCR_EL0](#), [AMCNTENCLR0_EL0](#), [AMCNTENCLR1_EL0](#), [AMCNTENSET0_EL0](#), [AMCNTENSET1_EL0](#), [AMCR_EL0](#), [AMEVCNTR0<n>_EL0](#), [AMEVCNTR1<n>_EL0](#), [AMEVTYPER0<n>_EL0](#), and [AMEVTYPER1<n>_EL0](#).
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using ESR_ELx.EC value 0x03:
 - [AMUSERENR](#), [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVTYPER0<n>](#), and [AMEVTYPER1<n>](#).
- In AArch32 state, MRRC or MCRR accesses to [AMEVCNTR0<n>](#) and [AMEVCNTR1<n>](#), are trapped to EL2, reported using ESR_ELx.EC value 0x04.

TAM	Meaning
0b0	Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0POE, bit [29]**When FEAT_S1POE is implemented:**

Enable access to [POR_EL0](#).

Traps EL0 accesses to [POR_EL0](#) to EL2, from AArch64 state only. The exception is reported using ESR_ELx.EC value 0x18.

E0POE	Meaning
0b0	This control causes EL0 access to POR_EL0 to be trapped.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTA, bit [28]

Traps System register accesses to all implemented trace registers from both Execution states to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x05.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at EL0, EL1 or EL2, to execute a System register access to an implemented trace register is trapped to EL2, when EL2 is enabled in the current Security state, unless HCR_EL2.TGE is 0 and it is trapped by CPACR.NSTRCDIS or CPACR_EL1.TTA . When HCR_EL2.TGE is 1, any attempt at EL0 or EL2 to execute a System register access to an implemented trace register is trapped to EL2, when EL2 is enabled in the current Security state.

Note

The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the trace unit implements FEAT_ETMv4 or ETE, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.TTA is 1.

EL2 does not provide traps on trace register accesses through the optional Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

SMEN, bits [25:24]

When FEAT_SME is implemented:

Traps execution at EL2, EL1, and EL0 of SME instructions, SVE instructions when FEAT_SVE is not implemented or the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#), [SMCR_EL1](#), or [SMCR_EL2](#) System registers to EL2, when EL2 is enabled in the current Security state.

When instructions that directly access the [SVCR](#) System register are trapped with reference to this control, the MSR_SVCRSM, MSR_SVCRZA, and MSR_SVCRSMZA instructions are also trapped.

The exception is reported using ESR_EL2.EC value of 0x1D, with an ISS code of 0x0000000.

This field does not affect whether Streaming SVE or SME register values are valid.

A trap taken as a result of CPTR_EL2.SMEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

SMEN	Meaning
0b00	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b01	When HCR_EL2.TGE is 0, this control does not cause execution of any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL2 to be trapped.
0b10	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:22]

Reserved, RES0.

FPEN, bits [21:20]

Traps execution at EL2, EL1, and EL0 of instructions that access the Advanced SIMD and floating-point registers from both Execution states to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x07.

Traps execution at EL2, EL1, and EL0 of SME and SVE instructions to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x07.

A trap taken as a result of CPTR_EL2.SMEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

A trap taken as a result of CPTR_EL2.ZEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

FPEN	Meaning
0b00	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b01	When HCR_EL2.TGE is 0, this control does not cause execution of any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL2 to be trapped.
0b10	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

Writes to [MVFR0](#), [MVFR1](#), and [MVFR2](#) from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

Note

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), and [FPEXC](#) are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.FPEN is not 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:18]

Reserved, RES0.

ZEN, bits [17:16]**When FEAT_SVE is implemented:**

Traps execution at EL2, EL1, and EL0 of SVE instructions when the PE is not in Streaming SVE mode, and instructions that directly access the [ZCR_EL1](#) or [ZCR_EL2](#) System registers to EL2, when EL2 is enabled in the current Security state.

The exception is reported using ESR_ELx.EC value 0x19.

A trap taken as a result of CPTR_EL2.ZEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

ZEN	Meaning
0b00	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b01	When HCR_EL2.TGE is 0, this control does not cause execution of any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL2 to be trapped.
0b10	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

In AArch64 state, traps accesses to [CPACR_EL1](#) from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x18.

In AArch32 state, traps accesses to [CPACR](#) from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x03.

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the following registers are trapped to EL2, when EL2 is enabled in the current Security state: <ul style="list-style-type: none"> • CPACR_EL1. • CPACR.

When [HCR_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

Note

[CPACR_EL1](#) and [CPACR](#) are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value 0x18:
 - [AMUSERENR_EL0](#), [AMCFGR_EL0](#), [AMCGCR_EL0](#), [AMCNTENCLR0_EL0](#), [AMCNTENCLR1_EL0](#), [AMCNTENSET0_EL0](#), [AMCNTENSET1_EL0](#), [AMCR_EL0](#), [AMEVCNTR0<n>_EL0](#), [AMEVCNTR1<n>_EL0](#), [AMEVTYPER0<n>_EL0](#), and [AMEVTYPER1<n>_EL0](#).
- In AArch32 state, MCR or MRC accesses to the following registers are trapped to EL2 and reported using ESR_ELx.EC value 0x03:
 - [AMUSERENR](#), [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVTYPER0<n>](#), and [AMEVTYPER1<n>](#).
- In AArch32 state, MCRR or MRRC accesses to [AMEVCNTR0<n>](#) and [AMEVCNTR1<n>](#), are trapped to EL2, reported using ESR_ELx.EC value 0x04.

TAM	Meaning
0b0	Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps System register accesses to all implemented trace registers from both Execution states to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x18.

- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x05.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at EL0, EL1, or EL2, to execute a System register access to an implemented trace register is trapped to EL2, when EL2 is enabled in the current Security state, unless it is trapped by one of the following controls: <ul style="list-style-type: none"> • CPACR_EL1.TTA • CPACR.TRCDIS

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of [CPTR_EL2.TTA](#) is 1.
- EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

Bit [13]

Reserved, RES1.

TSM, bit [12]**When FEAT_SME is implemented:**

Traps execution at EL2, EL1, and EL0 of SME instructions, SVE instructions when FEAT_SVE is not implemented or the PE is in Streaming SVE mode, and instructions that directly access the [SVCRR](#), [SMCR_EL1](#), or [SMCR_EL2](#) System registers to EL2, when EL2 is enabled in the current Security state.

When instructions that directly access the [SVCRR](#) System register are trapped with reference to this control, the MSR_SVCRSM, MSR_SVCRZA, and MSR_SVCRSMZA instructions are also trapped.

The exception is reported using ESR_EL2.EC value of 0x1D, with an ISS code of 0x0000000.

This field does not affect whether Streaming SVE or SME register values are valid.

A trap taken as a result of CPTR_EL2.TSM has precedence over a trap taken as a result of CPTR_EL2.TFP.

TSM	Meaning
0b0	This control does not cause execution of any instructions to be trapped.
0b1	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [11]

Reserved, RES0.

TFP, bit [10]

Traps execution of instructions which access the Advanced SIMD and floating-point functionality, from both Execution states to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value 0x07:
 - [FPCR](#), [FPSR](#), [FPEXC32_EL2](#), any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value 0x07:
 - [MVFR0](#), [MVFR1](#), [MVFR2](#), [FPSCR](#), [FPEXC](#), and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers. For the purposes of this trap, the architecture defines a VMSR access to [FPSID](#) from EL1 or higher as an access to a SIMD and floating-point register. Otherwise, permitted VMSR accesses to [FPSID](#) are ignored.

Traps execution at the same Exception levels of SME and SVE instructions to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x07.

A trap taken as a result of CPTR_EL2.TSM has precedence over a trap taken as a result of CPTR_EL2.TFP.

A trap taken as a result of CPTR_EL2.TZ has precedence over a trap taken as a result of CPTR_EL2.TFP.

TFP	Meaning
0b0	This control does not cause execution of any instructions to be trapped.
0b1	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.

Note

[FPEXC32_EL2](#) is not accessible from EL0 using AArch64.

[FPSID](#), [MVFR0](#), [MVFR1](#), and [FPEXC](#) are not accessible from EL0 using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES1.

TZ, bit [8]**When FEAT_SVE is implemented:**

Traps execution at EL2, EL1, and EL0 of SVE instructions when the PE is not in Streaming SVE mode, and instructions that directly access the [ZCR_EL2](#) or [ZCR_EL1](#) System registers to EL2, when EL2 is enabled in the current Security state.

The exception is reported using ESR_ELx.EC value 0x19.

A trap taken as a result of CPTR_EL2.TZ has precedence over a trap taken as a result of CPTR_EL2.TFP.

TZ	Meaning
0b0	This control does not cause execution of any instructions to be trapped.
0b1	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [7:0]

Reserved, RES1.

CPTR_EL3, Architectural Feature Trap Register (EL3)

The CPT_R_EL3 characteristics are:

Purpose

Controls trapping to EL3 of accesses to [CPACR](#), [CPACR_EL1](#), [HCPTR](#), [CPTR_EL2](#), trace, Activity Monitor, SME, Streaming SVE, SVE, and Advanced SIMD and floating-point functionality.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to CPT_R_EL3 are UNDEFINED.

Attributes

CPT_R_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																			
TCPAC	TAM	RES0										TTA	RES0								ESM	RES0	TFP	RES0	EZ	RES0									
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

Traps all of the following to EL3, from both Execution states and any Security state.

- EL2 accesses to [CPTR_EL2](#), reported using ESR_ELx.EC value 0x18, or [HCPTR](#), reported using ESR_ELx.EC value 0x03.
- EL2 and EL1 accesses to [CPACR_EL1](#) reported using ESR_ELx.EC value 0x18, or [CPACR](#) reported using ESR_ELx.EC value 0x03.

When CPT_R_EL3.TCPAC is:

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 accesses to the CPTR_EL2 or HCPTR , and EL2 and EL1 accesses to the CPACR_EL1 or CPACR , are trapped to EL3, unless they are trapped by CPTR_EL2 .TCPAC.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL2, EL1, and EL0 accesses to all Activity Monitor registers to EL3.

Accesses to the Activity Monitors registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported with ESR_ELx.EC value 0x18:
 - [AMUSERENR_EL0](#), [AMCFGR_EL0](#), [AMCGCR_EL0](#), [AMCNTENCLR0_EL0](#), [AMCNTENCLR1_EL0](#), [AMCNTENSET0_EL0](#), [AMCNTENSET1_EL0](#), [AMCR_EL0](#), [AMEVCNTR0<n>_EL0](#), [AMEVCNTR1<n>_EL0](#), [AMEVTYPER0<n>_EL0](#), and [AMEVTYPER1<n>_EL0](#).
- In AArch32 state, accesses with MRC or MCR to the following registers reported with ESR_ELx.EC value 0x03:
 - [AMUSERENR](#), [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVTYPER0<n>](#), and [AMEVTYPER1<n>](#).
- In AArch32 state, accesses with MRRC or MCRR to the following registers, reported with ESR_ELx.EC value 0x04:
 - [AMEVCNTR0<n>](#), [AMEVCNTR1<n>](#).

TAM	Meaning
0b0	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are trapped to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps System register accesses. Accesses to the trace registers, from all Exception levels, any Security state, and both Execution states are trapped to EL3 as follows:

- In AArch64 state, Trace registers with op0=2, op1=1, and CRn<0b1000 are trapped to EL3 and reported using EC syndrome value 0x18.
- In AArch32 state, accesses using MCR or MRC to the Trace registers with cpnum=14, opc1=1, and CRn<0b1000 are reported using EC syndrome value 0x05.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any System register access to the trace registers is trapped to EL3, unless it is trapped by CPACR.TRCDIS , CPACR_EL1.TTA , or CPTR_EL2.TTA .

If System register access to trace functionality is not supported, this bit is RES0.

Note

The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than this trap exception.

EL3 does not provide traps on trace register accesses through the Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, no side-effects occur before the exception is taken, see '[Configurable Traps instructions controls instructions](#)'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:13]

Reserved, RES0.

ESM, bit [12]

When FEAT_SME is implemented:

Traps execution of SME instructions, SVE instructions when FEAT_SVE is not implemented or the PE is in Streaming SVE mode, and instructions that directly access the [SMCR_EL1](#), [SMCR_EL2](#), [SMCR_EL3](#), [SMPRI_EL1](#), [SMPRIMAP_EL2](#), or [SVCR](#) System registers, from all Exception levels and any Security state, to EL3.

When instructions that directly access the [SVCR](#) System register are trapped with reference to this control, the MSR SVCRSM, MSR SVCRZA, and MSR SVCRSMZA instructions are also trapped.

When direct accesses to [SMPRI_EL1](#) and [SMPRIMAP_EL2](#) are trapped, the exception is reported using an [ESR_EL3](#).EC value of 0x18. Otherwise, the exception is reported using an [ESR_EL3](#).EC value of 0x1D, with an ISS code of 0x0000000.

This field does not affect whether Streaming SVE or SME register values are valid.

A trap taken as a result of CPTR_EL3.ESM has precedence over a trap taken as a result of CPTR_EL3.TFP.

ESM	Meaning
0b0	This control causes execution of these instructions at all Exception levels to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES0.

TFP, bit [10]

Traps execution of instructions which access the Advanced SIMD and floating-point functionality, from all Exception levels, any Security state, and both Execution states, to EL3.

This includes the following registers, all reported using ESR_ELx.EC value 0x07:

- [FPCR](#), [FPSR](#), [FPEXC32_EL2](#), and any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-S31 registers.
- [MVFR0](#), [MVFR1](#), [MVFR2](#), [FPSCR](#), [FPEXC](#), and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers.
- VMSR accesses to [FPSID](#).

Permitted VMSR accesses to [FPSID](#) are ignored, but for the purposes of this trap the architecture defines a VMSR access to the [FPSID](#) from EL1 or higher as an access to a SIMD and floating-point register.

Traps execution at all Exception levels of SME and SVE instructions to EL3 from any Security state. The exception is reported using ESR_ELx.EC value 0x07.

A trap taken as a result of CPTR_EL3.ESM has precedence over a trap taken as a result of CPTR_EL3.TFP.

A trap taken as a result of CPTR_EL3.EZ has precedence over a trap taken as a result of CPTR_EL3.TFP.

Defined values are:

TFP	Meaning
0b0	This control does not cause execution of any instructions to be trapped.
0b1	This control causes execution of these instructions at all Exception levels to be trapped.

Note

[FPEXC32_EL2](#) is not accessible from EL0 using AArch64.

[FPSID](#), [MVFR0](#), [MVFR1](#), and [FPEXC](#) are not accessible from EL0 using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

EZ, bit [8]

When FEAT_SVE is implemented:

Traps execution of SVE instructions when the PE is not in Streaming SVE mode, and instructions that directly access the [ZCR_EL3](#), [ZCR_EL2](#), or [ZCR_EL1](#) System registers, from all Exception levels and any Security state, to EL3.

The exception is reported using ESR_ELx.EC value 0x19.

A trap taken as a result of CPTR_EL3.EZ has precedence over a trap taken as a result of CPTR_EL3.TFP.

EZ	Meaning
0b0	This control causes execution of these instructions at all Exception levels to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [7:0]

Reserved, RES0.

Accessing CPTR_EL3

Accesses to this register use the following encodings in the System register encoding space:

CSSELR_EL1, Cache Size Selection Register

The CSSELR_EL1 characteristics are:

Purpose

Selects the current Cache Size ID Register, [CCSIDR_EL1](#), by specifying the required cache level and the cache type (either instruction or data cache).

Configuration

AArch64 System register CSSELR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CSSELR\[31:0\]](#).

Attributes

CSSELR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:5]

Reserved, RES0.

TnD, bit [4]

When FEAT_MTE2 is implemented:

Allocation Tag not Data bit.

TnD	Meaning
0b0	Data, Instruction or Unified cache.
0b1	Separate Allocation Tag cache.

When CSSELR_EL1.InD == 1, this bit is RES0.

If CSSELR_EL1.{TnD, Level, InD} is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR_EL1 is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Level, bits [3:1]

Cache level of required cache.

Level	Meaning
0b000	Level 1 cache.
0b001	Level 2 cache.
0b010	Level 3 cache.
0b011	Level 4 cache.
0b100	Level 5 cache.
0b101	Level 6 cache.
0b110	Level 7 cache.

All other values are reserved.

If CSSELR_EL1.{TnD, Level, InD} is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR_EL1 is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [0]

Instruction not Data bit.

InD	Meaning
0b0	Data or unified cache.
0b1	Instruction cache.

If CSSELR_EL1.{TnD, Level, InD} is programmed to a cache level that is not implemented, then a read of CSSELR_EL1 is CONSTRAINED UNPREDICTABLE, and returns UNKNOWN values for CSSELR_EL1.{Level, InD}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CSSELR_EL1

Accesses to this register use the following encodings in the System register encoding space:

CTR_EL0, Cache Type Register

The CTR_EL0 characteristics are:

Purpose

Provides information about the architecture of the caches.

Configuration

AArch64 System register CTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [CTR\[31:0\]](#).

Attributes

CTR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																								TminLine							
RES1	RES0	DIC	IDC	CWG				ERG				DminLine				L1lp	RES0								lminLine						
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:38]

Reserved, RES0.

TminLine, bits [37:32]

When FEAT_MTE2 is implemented:

Tag minimum Line. Log₂ of the number of words covered by Allocation Tags in the smallest cache line of all caches which can contain Allocation tags that are controlled by the PE.

Note

- For an implementation with cache lines containing 64 bytes of data and 4 Allocation Tags, this will be $\log_2(64/4) = 4$.
- For an implementation with Allocations Tags in separate cache lines of 128 Allocation Tags per line, this will be $\log_2(128*16/4) = 9$.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

Bit [30]

Reserved, RES0.

DIC, bit [29]

Instruction cache invalidation requirements for data to instruction coherence.

DIC	Meaning
0b0	Instruction cache invalidation to the Point of Unification is required for data to instruction coherence.
0b1	Instruction cache invalidation to the Point of Unification is not required for data to instruction coherence.

IDC, bit [28]

Data cache clean requirements for instruction to data coherence. The meaning of this bit is:

IDC	Meaning
0b0	Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR_EL1.LoC == 0b000 or (CLIDR_EL1.LoUIS == 0b000 && CLIDR_EL1.LoUU == 0b000).
0b1	Data cache clean to the Point of Unification is not required for instruction to data coherence.

CWG, bits [27:24]

Cache writeback granule. Log₂ of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of 0b0000 indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than 0b1001 are reserved.

Arm recommends that an implementation that does not support cache write-back implements this field as 0b0001. This applies, for example, to an implementation that supports only write-through caches.

ERG, bits [23:20]

Exclusives reservation granule, and, if FEAT_TME is implemented, transactional reservation granule. Log₂ of the number of words of the maximum size of the reservation granule for the Load-Exclusive and Store-Exclusive instructions, and, if FEAT_TME is implemented, for detecting transactional conflicts.

A value of 0b0000 indicates that this register does not provide granule information and the architectural maximum of 512 words (2KB) must be assumed.

Value 0b0001 and values greater than 0b1001 are reserved.

DminLine, bits [19:16]

Log₂ of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

L1Ip, bits [15:14]

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:

L1Ip	Meaning	Applies when
0b00	VMID aware Physical Index, Physical tag (VPIPT).	When FEAT_VPIPT is implemented
0b01	ASID-tagged Virtual Index, Virtual Tag (AIVIVT).	
0b10	Virtual Index, Physical Tag (VIPT).	
0b11	Physical Index, Physical Tag (PIPT).	

From Armv8, the value 0b01 is reserved.

The value 0b00 is permitted only in an implementation that includes FEAT_VPIPT.

Bits [13:4]

Reserved, RES0.

IminLine, bits [3:0]

Log₂ of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

Accessing CTR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CTR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b0000	0b0000	0b001

```

Bits [63:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.
0b10	Implemented and disabled. ExternalRootInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalRootInvasiveDebugEnabled() == TRUE.

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 00. 0b00.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.
0b10	Implemented and disabled. ExternalRealmInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalRealmInvasiveDebugEnabled() == TRUE.

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is ~~00~~, 0b00.

Bits [11:8]

Reserved, RES0.

SNID, bits [7:6]**When FEAT_Debugv8p4 is implemented:**

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

Secure non-invasive debug.

SNID	Meaning
0b00	Not implemented. One EL3 is not implemented and the following Effective is value true: of SCR_EL3.NS is 1. <ul style="list-style-type: none"> EL3 is not implemented and the Effective value of SCR_EL3.NS is 1. FEAT_RME is implemented without Secure state.
0b10	Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

SID	Meaning
0b00	Not implemented. One EL3 of is not implemented and the following Effective is value true: of SCR_EL3.NS is 1. <ul style="list-style-type: none"> EL3 is not implemented and the Effective value of SCR_EL3.NS is 1. FEAT_RME is implemented without Secure state.
0b10	Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSNID, bits [3:2]

When FEAT_Debugv8p4 is implemented:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b11	Implemented and enabled. EL3 is implemented or the Effective value of SCR_EL3.NS is 1.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10	Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

NSID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10	Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>_EL1](#).

Configuration

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBCR<n>\[31:0\]](#).

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to External register [DBGBCR<n>_EL1\[31:0\]](#).

If breakpoint n is not implemented, accesses to this register are UNDEFINED.

Attributes

DBGBCR<n>_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
LBNX	RES0	SSCE	MASK	RES0	BT				LBN			SSC	HMC	RES0			BAS			RES0	BT2	PMC	PMCE	E							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32:30]

Reserved, RES0.

LBNX, bits [31:30]

When FEAT_Debugv8p9 is implemented:

Linked Breakpoint Number.

For Linked address matching breakpoints, with DBGBCR<n>_EL1.LBN, specifies the index of the breakpoint linked to.

For all other breakpoint types, this field is ignored and reads of the register return an UNKNOWN value.

This field extends DBGBCR<n>_EL1.LBN to support up to 64 implemented breakpoints.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSCE, bit [29]**When FEAT_RME is implemented:**

Security State Control Extended.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MASK, bits [28:24]**When FEAT_ABLE is implemented:**

Address Mask. Only address ranges up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00001	Reserved.
0b00010	Reserved.
0b00011..0b11111	Number of address bits masked.

Indicates the number of masked address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

With DBGBCR<n>_EL1.BT2 when implemented, specifies breakpoint type.

BT	Meaning	Applies when
0b0000	Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.	
0b0001	Linked instruction address match. As 0b0000, but linked to a breakpoint that has linking enabled.	
0b0010	Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, and if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value.	When breakpoint n is context-aware
0b0011	As 0b0010, with linking enabled.	When breakpoint n is context-aware
0b0100	Unlinked instruction address mismatch. CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1 is the address of an instruction.	When FEAT_ABLE is implemented
0b0101	Linked instruction address mismatch. As 0b0100, but linked to a breakpoint that has linking enabled.	When FEAT_ABLE is implemented
0b0110	Unlinked VMID match. CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1.VTBR_EL2.VMID .	When FEAT_VHE is implemented and breakpoint n is context-aware
0b0111	As 0b0110, with linking enabled.	When FEAT_VHE is implemented and breakpoint n is context-aware
0b1000	Unlinked VMID and Context ID match. DBGBVR<n>_EL1.VMID is a VMID compared against CONTEXTIDR_EL1 , and DBGBVR<n>_EL1.VMID is a VMID compared against VTBR_EL2.VMID .	When EL2 is implemented and breakpoint n is context-aware
0b1001	As 0b1000, with linking enabled.	When EL2 is implemented and breakpoint n is context-aware
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>_EL1.CONTEXTIDR_EL2 is a Context ID compared against CONTEXTIDR_EL1 , and DBGBVR<n>_EL1.VMID is a VMID compared against VTBR_EL2.CONTEXTIDR_EL2.VMID .	When EL2 is implemented and breakpoint n is context-aware
0b1011	As 0b1010, with linking enabled.	When EL2 is implemented and breakpoint n is context-aware
0b1100	Unlinked Full Context ID match. ContextID is compared against CONTEXTIDR_EL1.CONTEXTIDR_EL2 .	When FEAT_VHE is implemented

	match., and DBGBCR<n>_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2.	implemented and breakpoint n is context-aware. When FEAT_VHE is implemented and breakpoint n is context-aware. When FEAT_VHE is implemented and breakpoint n is context-aware.
0b11010b1111	As 0b11000b1110, with linking enabled.	
0b1110	Unlinked Full Context ID match. DBGBCR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1, and DBGBCR<n>_EL1.ContextID2 is compared against CONTEXTIDR_EL2.	
0b1111	As 0b1110, with linking enabled.	

All other values are reserved. Constraints on breakpoint programming mean other values are reserved under some conditions.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved value, see 'Reserved DBGBCR<n>_EL1.BT values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For Linked address matching breakpoints, with DBGBCR<n>_EL1.LBNX when implemented, specifies the index of the breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

For This all other breakpoint types, this field is ignored and when read the value of the DBGBCR<n>_EL1.E register is return an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>_EL1.SSC.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When AArch32 is supported:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions

All other values are reserved. For more information, see 'Reserved DBGBCR<n>_EL1.BAS values'.

For more information on using the BAS field in address match breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

BitBits [4:3]

Reserved, RES0.

BT2, bit [3]

When FEAT_ABLE is implemented:

Breakpoint Type 2. With DBGBCR<n>_EL1.BT, specifies breakpoint type.

BT2	Meaning
0b0	As DBGBCR<n>_EL1.BT.
0b1	As DBGBCR<n>_EL1.BT, but with linking enabled. This value is only defined for the following DBGBCR<n>_EL1.BT values: 0b0000, 0b0001, 0b0100, and 0b0101. All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>_EL1.SSC.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint [n.DBGBVR<n>_EL1](#).

E	Meaning
0b0	Breakpoint n disabled.
0b1	Breakpoint n enabled.

This bit is ignored by the PE and treated as zero when all of the following are true:

- FEAT_Debugv8p9 is implemented.
- Any of the following are true:
 - HaltOnBreakpointOrWatchpoint() is FALSE and the Effective value of [MDSCR_EL1.EBWE](#) is 0.
 - HaltOnBreakpointOrWatchpoint() is TRUE and the Effective value of [EDSCR2.EBWE](#) is 0.
- [n](#) > 16.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>_EL1

When FEAT_Debugv8p9 is implemented, a PE is permitted to support up to 64 implemented breakpoints.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGBCR<m>_EL1 ; Where m = 0-15

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	m[3:0]	0b101

```
integer m = UInt(CRm<3:0>);

if m >= NUM_BREAKPOINTS then
    UNDEFINED;
elseif PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then

DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register [DBGBCR<n>_EL1](#).

Configuration

AArch64 System register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBVR<n>\[31:0\]](#).

AArch64 System register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register [DBGXVR<n>\[31:0\]](#).

AArch64 System register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to External register [DBGBVR<n>_EL1\[63:0\]](#).

How this register is interpreted depends on the value of [DBGBCR<n>_EL1](#).BT.

- When [DBGBCR<n>_EL1](#).BT is 0b000x, this register holds a virtual address.
- When [DBGBCR<n>_EL1](#).BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When [DBGBCR<n>_EL1](#).BT is 0b100x, this register holds a VMID.
- When [DBGBCR<n>_EL1](#).BT is 0b101x, this register holds a VMID and a Context ID.
- When [DBGBCR<n>_EL1](#).BT is 0b111x, this register holds two Context ID values.

For other values of [DBGBCR<n>_EL1](#).BT, this register is RES0.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGBVR<n>_EL1 is a 64-bit register.

Field descriptions

When DBGBCR<n>_EL1.BT == 0b000x:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32								
RESS[14:8]								RESS[14:4]				Bits[56:53]				Bits[52:49]				VA[48:2]																			
																				VA[48:2]																RES0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0								

RESS[14:84], bits [63:5753]

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONSTRAINED UNPREDICTABLE whether the PE ignores this field when comparing an address.
- If the breakpoint is not context-aware, it is IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

Bits[56:53]

When FEAT_LVA3 is implemented:

VA[56:53], bits [3:0] of bits [56:53]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[7:4], bits [3:0] of bits [56:53]

Extension to RESS[14:8]. For more information, see RESS[14:8].

Bits[52:49]

When FEAT_LVA is implemented:

VA[52:49], bits [3:0] of bits [52:49]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0], bits [3:0] of bits [52:49]

Extension to RESS[14:84]. For more information, see RESS[14:84].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA3 is implemented, (VA[56:53]:VA[52:49]) forms the upper part of the address value. Otherwise, bits [56:53] are part of the RESS field.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits [52:49] are part of the RESS field.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b001x:

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR_EL2](#) when (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented), [HCR_EL2.E2H](#) is 1, and either:

- The PE is executing at EL2.
- [HCR_EL2.TGE](#) is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against [CONTEXTIDR_EL1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b011x:

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b100x and EL2 is implemented:

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented, VTCR_EL2.VS == 1 and EL2 is using AArch64:

Extension to VMID[7:0]. For more information, see [DBGBVR<n>_EL1.VMID\[7:0\]](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR_EL2.VS](#) is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b101x and EL2 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																VMID[15:8]								VMID[7:0]							
ContextID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented, VTCR_EL2.VS == 1 and EL2 is using AArch64:

Extension to VMID[7:0]. For more information, see DBGBCR<n>_EL1.VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR_EL2.VS](#) is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b110x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR_EL2](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b111x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR_EL2](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBVR<n>_EL1

When FEAT_Debugv8p9 is implemented, a PE is permitted to support up to 64 implemented breakpoints.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGBVR<m>_EL1 ; Where m = 0-15

op0	op1	CRn	CRm	op2

DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET_EL1](#) register.

Configuration

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMCLR\[31:0\]](#).

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to External register [DBGCLAIMCLR_EL1\[31:0\]](#).

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32					
																RES0																				
																								CLAIM

Bits [63:32]

Reserved, RES0.

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing DBGCLAIMCLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Otherwise:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR.COREPURQ](#) on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in [EDPRCR.COREPURQ](#).

Accessing DBGPRCR_EL1

DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>_EL1](#).

Configuration

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWCR<n>\[31:0\]](#).

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to External register [DBGWCR<n>_EL1\[31:0\]](#).

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWCR<n>_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
LBNX	RES0	SSCE	MASK				RES0				WT	LBN				SSC	HMC	BAS								LSC	PAC	E			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32:30]

Reserved, RES0.

LBNX, bits [31:30]

When FEAT_Debugv8p9 is implemented:

Linked Breakpoint Number.

For Linked data address watchpoints, with DBGWCR<n>_EL1.LBN, specifies the index of the breakpoint linked to.

For all other watchpoint types, this field is ignored and reads of the register return an UNKNOWN value.

This field extends DBGWCR<n>_EL1.LBN to support up to 64 implemented breakpoints.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSCE, bit [29]**When FEAT_RME is implemented:**

Security State Control Extended.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MASK, bits [28:24]

Address **Mask, mask**. Only objects up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00001	Reserved.
0b00010	Reserved.
0b00011..0b11111	Number of address bits masked.

Indicates the number of masked address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked ~~Breakpoint~~ ~~breakpoint~~ ~~Number~~ ~~number~~. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

For Linked data address watchpoints, with DBGWCR<n>_EL1.LBNX when implemented, specifies the index of the breakpoint linked to.

For all other watchpoint types, this field is ignored and reads of the register return an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

For more information on the effect of programming the fields to a reserved value, see 'Reserved DBGWCR<n>_EL1.{SSC, HMC, PAC} values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>_EL1](#) is being watched.

BAS	Description
xxxxxxx1	Match byte at DBGWVR<n>_EL1
xxxxxx1x	Match byte at DBGWVR<n>_EL1 + 1
xxxxx1xx	Match byte at DBGWVR<n>_EL1 + 2
xxx1xxx	Match byte at DBGWVR<n>_EL1 + 3

In cases where [DBGWVR<n>_EL1](#) addresses a double-word:

BAS	Description, if DBGWVR<n>_EL1[2] == 0
xxx1xxxx	Match byte at DBGWVR<n>_EL1 + 4
xx1xxxxx	Match byte at DBGWVR<n>_EL1 + 5
x1xxxxxx	Match byte at DBGWVR<n>_EL1 + 6
1xxxxxxx	Match byte at DBGWVR<n>_EL1 + 7

If [DBGWVR<n>_EL1\[2\]](#) == 1, only BAS[3:0] are used and BAS[7:4] are ignored. Arm deprecates setting [DBGWVR<n>_EL1\[2\]](#) == 1.

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>_EL1.BAS values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n. ~~Possible values are:~~

E	Meaning
0b0	Watchpoint n disabled.
0b1	Watchpoint n enabled.

This bit is ignored by the PE and treated as zero when all of the following are true:

- FEAT_Debugv8p9 is implemented.
- Any of the following are true:
 - HaltOnBreakpointOrWatchpoint() is FALSE and the Effective value of [MDSCR_EL1.EBWE](#) is 0.
 - HaltOnBreakpointOrWatchpoint() is TRUE and the Effective value of [EDSCR2.EBWE](#) is 0.
- n > 16.**

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGWCR<n>_EL1

When FEAT_Debugv8p9 is implemented, a PE is permitted to support up to 64 implemented watchpoints.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGWCR<m>_EL1 ; Where m = 0-15

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	m[3:0]	0b111

DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>_EL1](#).

Configuration

AArch64 System register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWVR<n>\[31:0\]](#).

AArch64 System register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to External register [DBGWVR<n>_EL1\[63:0\]](#).

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RESS[14:8]				RESS[14:4]				Bits[56:53]				Bits[52:49]				Bits[52:49]				VA[48:2]				VA[48:2]											
VA[48:2]																																RES0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

RESS[14:8], bits [63:57]

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONSTRAINED UNPREDICTABLE whether the PE ignores this field when comparing an address.
- It is IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

Bits[56:53]

When FEAT_LVA3 is implemented:

VA[56:53], bits [3:0] of bits [56:53]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:**RESS[7:4], bits [3:0] of bits [56:53]**

Extension to RESS[14:8]. For more information, see RESS[14:8].

Bits[52:49]**When FEAT_LVA is implemented:****VA[52:49], bits [3:0] of bits [52:49]**

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:**RESS[3:0], bits [3:0] of bits [52:49]**

Extension to RESS[14:84]. For more information, see RESS[14:84].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA3 is implemented, (VA[56:53]:VA[52:49]) forms the upper part of the address value. Otherwise, bits [56:53] are part of the RESS field.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits [52:49] are part of the RESS field.

Arm deprecates setting `DBGWVR<n>_EL1[2] == 1`.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGWVR<n>_EL1

When FEAT_Debugv8p9 is implemented, a PE is permitted to support up to 64 implemented watchpoints.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGWVR<m>_EL1 ; Where m = 0-15

op0	op1	CRn	CRm	op2

DC CGDSW, Clean of Data and Allocation Tags by Set/Way

The DC CGDSW characteristics are:

Purpose

Clean data and Allocation Tags in data cache by set/way.

Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC CGDSW are UNDEFINED.

Attributes

DC CGDSW is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																																
SetWay																															Level	RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$, $L = \text{Log}_2(\text{LINELEN})$, $B = (L + S)$, $S = \text{Log}_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DC CGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC CGDSW, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1010	0b110

```

if PSTATE.EL == EL0 then

DC CGVAP, Clean of Allocation Tags by VA to PoP

The DC CGVAP characteristics are:

Purpose

Clean Allocation Tags in data cache by address to Point of Persistence.

If the memory system does not identify a Point of Persistence, then this instruction behaves as a [DC CGVAC](#).

Configuration

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC CGVAP are UNDEFINED.

Attributes

DC CGVAP is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
												VA Virtual address to use

VA, bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC CGVAP instruction

If EL0 access is enabled, when executed at EL0, this instruction may require a read access permission to the VA, subject to the constraints described in 'MMU Permission faults generated by cache maintenance operations fault'. Otherwise, it generates a fault, see 'Permission faults generated by cache maintenance operations fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC CGVAP, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b1100	0b011

DC CIGDPAPA, Clean and Invalidate of Data and Allocation Tags by PA to PoPA

The DC CIGDPAPA characteristics are:

Purpose

Clean and Invalidate data and Allocation Tags in data cache by physical address to the Point of Physical Aliasing.

Note

This instruction cleans and invalidates all copies of the Location specified in the Xt argument, irrespective of any MECID associated with the Location. Memory accesses resulting from the Clean operation use the MECID associated with the cache entry.

Configuration

This instruction is present only when FEAT_RME is implemented and FEAT_MTE2 is implemented. Otherwise, direct accesses to DC CIGDPAPA are UNDEFINED.

Attributes

DC CIGDPAPA is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

NS, bit [63]

Together with the NSE field, this field specifies the target physical address space.

NSE	NS	Meaning
0b0	0b0	Secure.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

If FEAT_SEL2 is not implemented, and {NSE, NS} == {0b0, 0b0}, then no cache entries are required to be cleaned or invalidated

NSE, bit [62]

Together with the NS field, this field specifies the target physical address space.

For a description of the values derived by evaluating NS and NSE together, see DC CIGDPAPA.NS.

DC CIGDSW, Clean and Invalidate of Data and Allocation Tags by Set/Way

The DC CIGDSW characteristics are:

Purpose

Clean and Invalidate data and Allocation Tags in data cache by set/way.

Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC CIGDSW are UNDEFINED.

Attributes

DC CIGDSW is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
SetWay																												Level			RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$, $L = \text{Log}_2(\text{LINELEN})$, $B = (L + S)$, $S = \text{Log}_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

DC CIPAPA, Data or unified Cache line Clean and Invalidate by PA to PoPA

The DC CIPAPA characteristics are:

Purpose

Clean and Invalidate data cache by physical address to the Point of Physical Aliasing.

Note

This instruction cleans and invalidates all copies of the Location specified in the Xt argument, irrespective of any MECID associated with the Location. Memory accesses resulting from the Clean operation use the MECID associated with the cache entry.

Configuration

This instruction is present only when FEAT_RME is implemented. Otherwise, direct accesses to DC CIPAPA are UNDEFINED.

Attributes

DC CIPAPA is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

NS, bit [63]

Together with the NSE field, this field specifies the target physical address space.

NSE	NS	Meaning
0b0	0b0	Secure.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

If FEAT_SEL2 is not implemented, and {NSE, NS} == {0b0, 0b0}, then no cache entries are required to be cleaned or invalidated

NSE, bit [62]

Together with the NS field, this field specifies the target physical address space.

For a description of the values derived by evaluating NS and NSE together, see DC CIPAPA.NS.

DC CISW, Data or unified Cache line Clean and Invalidate by Set/Way

The DC CISW characteristics are:

Purpose

Clean and Invalidate data cache by set/way.

Configuration

AArch64 System instruction DC CISW performs the same function as AArch32 System instruction [DCCISW](#).

Attributes

DC CISW is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$, $L = \text{Log}_2(\text{LINELEN})$, $B = (L + S)$, $S = \text{Log}_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

DC CIVAC, Data or unified Cache line Clean and Invalidate by VA to PoC

The DC CIVAC characteristics are:

Purpose

Clean and Invalidate data cache by address to Point of Coherency.

Configuration

AArch64 System instruction DC CIVAC performs the same function as AArch32 System instruction [DCCIMVAC](#).

Attributes

DC CIVAC is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual address to use																															
Virtual address to use																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC CIVAC instruction

If EL0 access is enabled, when executed at EL0, the instruction may generate a Permission fault, subject to the constraints described in 'MMU faults generated by cache maintenance operations'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission fault.

For more information, see 'Permission fault'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC CIVAC, <Xt>

DC CVAU, Data or unified Cache line Clean by VA to PoU

The DC CVAU characteristics are:

Purpose

Clean data cache by address to Point of Unification.

Configuration

AArch64 System instruction DC CVAU performs the same function as AArch32 System instruction [DCCMVAU](#).

Attributes

DC CVAU is a 64-bit System instruction.

Field descriptions

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC CVAU instruction

If EL0 access is enabled, when executed at EL0, ~~the this instruction may require~~ **generates read access permission to the VA, otherwise it generates** a Permission fault, subject to the constraints described in **'MMU Permission faults generated by cache maintenance operations fault'**.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC CVAU, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b1011	0b001

```

if PSTATE.EL == EL0 then

DC GVA, Data Cache set Allocation Tag by VA

The DC GVA characteristics are:

Purpose

Write a value to the Allocation Tags of a naturally aligned block of N bytes, where the size of N is identified in [DCZID_EL0](#). The Allocation Tag used is determined by the input address.

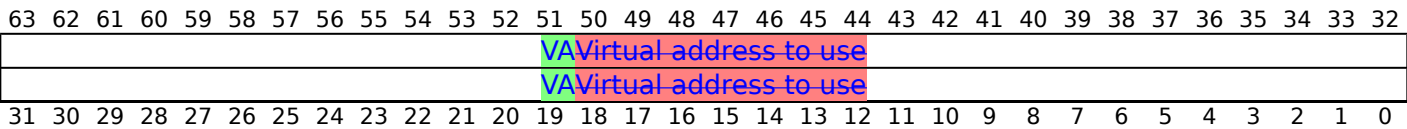

Configuration

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC GVA are UNDEFINED.

Attributes

DC GVA is a 64-bit System instruction.

Field descriptions

VA, bitsBits [63:0]

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

Executing the DC GVA instruction

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is not set.

If the memory region being modified is any type of Device memory, this instruction can give an alignment fault that is prioritized in the same way as other alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of stores to each Allocation Tag within the block being accessed, and so it:

- Generates a Permission fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC GVA, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0100	0b011

```

DC IGDSW, Invalidate of Data and Allocation Tags by Set/Way

The DC IGDSW characteristics are:

Purpose

Invalidate data and Allocation Tags in data cache by set/way.

Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC IGDSW are UNDEFINED.

Attributes

DC IGDSW is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
SetWay																													Level		RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$, $L = \text{Log}_2(\text{LINELEN})$, $B = (L + S)$, $S = \text{Log}_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

DC ISW, Data or unified Cache line Invalidate by Set/Way

The DC ISW characteristics are:

Purpose

Invalidate data cache by set/way.

When FEAT_MTE2 is implemented, this instruction might invalidate Allocation Tags from caches. When it invalidates Allocation Tags from caches, it also cleans them.

Configuration

AArch64 System instruction DC ISW performs the same function as AArch32 System instruction [DCISW](#).

Attributes

DC ISW is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																																	
SetWay																															Level		RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$, $L = \text{Log}_2(\text{LINELEN})$, $B = (L + S)$, $S = \text{Log}_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DC ISW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC ISW, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0110	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TSW == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1')
    && HFGITR_EL2.DCISW == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        AArch64.DC(X[t, 64], CacheType_Data, CacheOp_Invalidate, CacheOpScope_SetWay);
elsif PSTATE.EL == EL2 then
    AArch64.DC(X[t, 64], CacheType_Data, CacheOp_Invalidate, CacheOpScope_SetWay);
elsif PSTATE.EL == EL3 then
    AArch64.DC(X[t, 64], CacheType_Data, CacheOp_Invalidate, CacheOpScope_SetWay);

```

DC IVAC, Data or unified Cache line Invalidate by VA to PoC

The DC IVAC characteristics are:

Purpose

Invalidate data cache by address to Point of Coherency.

When FEAT_MTE2 is implemented, this instruction might invalidate Allocation Tags from caches. When it invalidates Allocation Tags from caches, it also cleans them.

Configuration

AArch64 System instruction DC IVAC performs the same function as AArch32 System instruction [DCIMVAC](#).

Attributes

DC IVAC is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual address to use																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC IVAC instruction

When the instruction is executed, it can generate a watchpoint, which is prioritized in the same way as other watchpoints. If a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 1.

If this EL0 instruction access requires is write enabled, access when permission executed to at the EL0 VA, the otherwise instruction it may generate generates a Permission fault, subject to the constraints described in 'MMU Permission faults generated by cache maintenance operations fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC IVAC, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0110	0b001

```

if PSTATE.EL == EL0 then

DC ZVA, Data Cache Zero by VA

The DC ZVA characteristics are:

Purpose

Zero data cache by address. Zeroes a naturally aligned block of N bytes, where the size of N is identified in [DCZID_EL0](#).

Configuration

There are no configuration notes.

Attributes

DC ZVA is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual address to use																															
Virtual address to use																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

Executing the DC ZVA instruction

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 0.

If the memory region being zeroed is any type of Device memory, this instruction can give an Alignment fault which is prioritized in the same way as other Alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of Stores to each byte within the block being accessed, and so it:

- Generates a Permission fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC ZVA, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0100	0b001

```

DSPSR_EL0, Debug Saved Program Status Register

The DSPSR_EL0 characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configuration

AArch64 System register DSPSR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DSPSR\[31:0\]](#).

Attributes

DSPSR_EL0 is a 64-bit register.

Field descriptions

When AArch32 is supported and exiting Debug state to AArch32 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]	DIT	SSBS	PAN	SS	IL	GE				IT[7:2]				E	A	I	F	T	M[4]		M[3:0]					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Copied to PSTATE.N on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Copied to PSTATE.Z on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Copied to PSTATE.C on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Copied to PSTATE.V on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Copied to PSTATE.Q on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Copied to PSTATE.IT on exiting Debug state.

DSPSR_EL0.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is DSPSR_EL0[26:25].
- IT[7:2] is DSPSR_EL0[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]**When FEAT_DIT is implemented:**

Data Independent Timing. Copied to PSTATE.DIT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]**When FEAT_SSBS is implemented:**

Speculative Store Bypass. Copied to PSTATE.SSBS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Copied to PSTATE.PAN on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Copied to PSTATE.SS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Copied to PSTATE.IL on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Copied to PSTATE.GE on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DPSR_EL0.E is RES0. If the implementation does not support little-endian operation, DPSR_EL0.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DPSR_EL0.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DPSR_EL0.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Copied to PSTATE.A on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Copied to PSTATE.I on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Copied to PSTATE.F on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Copied to PSTATE.T on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Copied to PSTATE.nRW on exiting Debug state.

M[4]	Meaning
0b1	AArch32 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Copied to PSTATE.M[3:0] on exiting Debug state.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0110	Monitor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If DPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When AArch64 is supported and entering or exiting Debug state from or to AArch64 state:

Bits [63:34:32]

Reserved, RES0.

PPEND, bit [33]**When FEAT_SEBEP is implemented:**

PMU exception pending bit. Set to the value of PSTATE.PPEND on entering Debug state, and conditionally copied to PSTATE.PPEND on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PM, bit [32]**When FEAT_EBEP is implemented:**

PMU exception mask bit. Set to the value of PSTATE.PM on entering Debug state, and copied to PSTATE.PM on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on entering Debug state, and copied to PSTATE.TCO on exiting Debug state.

When FEAT_MTE2 is not implemented, it is CONSTRAINED UNPREDICTABLE whether this field is RES0 or behaves as if FEAT_MTE2 is implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

ALLINT, bit [13]

When FEAT_NMI is implemented:

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on entering Debug state, and copied to PSTATE.ALLINT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYP, bits [11:10]**When FEAT_BTI is implemented:**

Branch Type Indicator. Set to the value of PSTATE.BTYPE on entering Debug state, and copied to PSTATE.BTYPE on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on entering Debug state, and copied to PSTATE.D on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on entering Debug state from AArch64 state, and copied to PSTATE.nRW on exiting Debug state.

M[4]	Meaning
0b0	AArch64 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.
0b1000	EL2t.
0b1001	EL2h.
0b1100	EL3t.
0b1101	EL3h.

Other values are reserved. If DPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on entering Debug state and copied to PSTATE.EL on exiting Debug state.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on entering Debug state and copied to PSTATE.SP on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DPSR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DPSR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    X[t, 64] = DPSR_EL0;
```

MSR DPSR_EL0, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    DPSR_EL0 = X[t, 64];
```

DVP RCTX, Data Value Prediction Restriction by Context

The DVP RCTX characteristics are:

Purpose

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Data value predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when FEAT_SPECRES is implemented. Otherwise, direct accesses to DVP RCTX are UNDEFINED.

Attributes

DVP RCTX is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0															GVMID	VMID															
RES0				NSEN	NS	EL	RES0								GASID	ASID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:28]

Reserved, RES0.

NSE, bit [27]

When FEAT_RME is implemented:

Together with the NS field, selects the Security state.

For a description of the values derived by evaluating NS and NSE together, see DVP_RCTX.NS.

Otherwise:

Reserved, RES0.

NS, bit [26]

When FEAT_RME is implemented:

Together with the NSE field, selects the Security state. Defined values are:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Some Effective values are determined by the current Security state:

- When executed in Secure state, the Effective value of NSE is 0.
- When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.

- When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

This instruction is treated as a NOP when executed at EL3 and either:

An instruction with an EL field that has a value other than 0b11 (EL3) is treated as a NOP when executed at EL3 with DVP_RCTX.{NSE, NS} == {1, 0}.

- DVP_RCTX.{NSE, NS} selects a reserved value.
- DVP_RCTX.{NSE, NS} == {1, 0} and DVP_RCTX.EL has a value other than 0b11.

Otherwise:

Security State. Defined values are:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing the DVP RCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

DVP RCTX, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b101

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLR_EL1.EnRCTX == '0' then

ERRIDR_EL1, Error Record ID Register

The ERRIDR_EL1 characteristics are:

Purpose

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

Configuration

AArch64 System register ERRIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERRIDR\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRIDR_EL1 are UNDEFINED.

Attributes

ERRIDR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0															
RES0																NUM															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

Accessing ERRIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERRIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0011	0b000

ERRSELR_EL1, Error Record Select Register

The ERRSELR_EL1 characteristics are:

Purpose

Selects an error record to be accessed through the Error Record System registers.

Configuration

AArch64 System register ERRSELR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERRSELR\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRSELR_EL1 are UNDEFINED.

If [ERRIDR_EL1](#) indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR_EL1 is UNDEFINED or RES0.

Attributes

ERRSELR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																SEL															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:16]

Reserved, RES0.

SEL, bits [15:0]

Selects the error record accessed through the ERX registers.

For example, if ERRSELR_EL1.SEL is 0x0004, then direct reads and writes of [ERXSTATUS_EL1](#) access ERR4STATUS.

If ERRSELR_EL1.SEL is greater than or equal to [ERRIDR_EL1](#).NUM, then all of the following apply:

- The value read back from ERRSELR_EL1.SEL is UNKNOWN.
- One of the following occurs:
 - An UNKNOWN error record is selected.
 - The ERX*_EL1 registers are RAZ/WI.
 - ERX*_EL1 register reads and writes are NOPS.
 - ERX*_EL1 register reads and writes are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ERRSELR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERRSELR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0011	0b001

```

if PSTATE.EL == EL0 then

ERXADDR_EL1, Selected Error Record Address Register

The ERXADDR_EL1 characteristics are:

Purpose

Accesses [ERR<n>ADDR](#) for the error record <n> selected by [ERRSELR_EL1](#).SEL.

Configuration

AArch64 System register ERXADDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERXADDR\[31:0\]](#).

AArch64 System register ERXADDR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ERXADDR2\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR_EL1 are UNDEFINED.

Attributes

ERXADDR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
														ERR<n>ADDR																		
														ERR<n>ADDR																		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:0]

ERXADDR_EL1 accesses [ERR<n>ADDR](#), where <n> is the value in [ERRSELR_EL1](#).SEL.

Accessing ERXADDR_EL1

If [ERRIDR_EL1](#).NUM is 0x0000 or [ERRSELR_EL1](#).SEL is greater than or equal to [ERRIDR_EL1](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR_EL1 is RAZ/WI.
- Direct reads and writes of ERXADDR_EL1 are NOPs.
- Direct reads and writes of ERXADDR_EL1 are UNDEFINED.

[ERR<n>ADDR](#) describes additional constraints that also apply when [ERR<n>ADDR](#) is accessed through ERXADDR_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERXADDR_EL1

op0	op1	CRn	CRm	op2

ERXCTLR_EL1, Selected Error Record Control Register

The ERXCTLR_EL1 characteristics are:

Purpose

Accesses [ERR<n>CTLR](#) for the error record <n> selected by [ERRSELR_EL1.SEL](#).

Configuration

AArch64 System register ERXCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERXCTLR\[31:0\]](#).

AArch64 System register ERXCTLR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ERXCTLR2\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTLR_EL1 are UNDEFINED.

Attributes

ERXCTLR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ERR<n>CTLR																															
ERR<n>CTLR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

ERXCTLR_EL1 accesses [ERR<n>CTLR](#), where <n> is the value in [ERRSELR_EL1.SEL](#).

Accessing ERXCTLR_EL1

If [ERRIDR_EL1.NUM](#) is 0x0000 or [ERRSELR_EL1.SEL](#) is greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTLR_EL1 is RAZ/WI.
- Direct reads and writes of ERXCTLR_EL1 are NOPs.
- Direct reads and writes of ERXCTLR_EL1 are UNDEFINED.

If [ERRSELR_EL1.SEL](#) is not the index of the first error record owned by a node, then [ERR<n>CTLR](#) is not present, meaning reads and writes of ERXCTLR_EL1 are RES0.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERXCTLR_EL1

ERXMISC2_EL1, Selected Error Record Miscellaneous Register 2

The ERXMISC2_EL1 characteristics are:

Purpose

Accesses [ERR<n>MISC2](#) for the error record <n> selected by [ERRSEL_R_EL1](#).SEL.

Configuration

AArch64 System register ERXMISC2_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERXMISC4\[31:0\]](#).

AArch64 System register ERXMISC2_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ERXMISC5\[31:0\]](#).

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC2_EL1 are UNDEFINED.

Attributes

ERXMISC2_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																ERR<n>MISC2															
																ERR<n>MISC2															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

ERXMISC2_EL1 accesses [ERR<n>MISC2](#), where <n> is the value in [ERRSEL_R_EL1](#).SEL.

Accessing ERXMISC2_EL1

If [ERRIDR_EL1](#).NUM is 0x0000 or [ERRSEL_R_EL1](#).SEL is greater than or equal to [ERRIDR_EL1](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC2_EL1 is RAZ/WI.
- Direct reads and writes of ERXMISC2_EL1 are NOPs.
- Direct reads and writes of ERXMISC2_EL1 are UNDEFINED.

[ERR<n>MISC2](#) describes additional constraints that also apply when [ERR<n>MISC2](#) is accessed through ERXMISC2_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERXMISC2_EL1

op0	op1	CRn	CRm	op2
-----	-----	-----	-----	-----

0b11	0b000	0b0101	0b0101	0b010

ERXPFGCDN_EL1, Selected Pseudo-fault Generation Countdown register

The ERXPFGCDN_EL1 characteristics are:

Purpose

Accesses [ERR<n>PFGCDN](#) for the error record <n> selected by [ERRSELR_EL1](#).SEL.

Configuration

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXPFGCDN_EL1 are UNDEFINED.

Attributes

ERXPFGCDN_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ERR<n>PFGCDN																															
ERR<n>PFGCDN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

ERXPFGCDN_EL1 accesses [ERR<n>PFGCDN](#), where <n> is the value in [ERRSELR_EL1](#).SEL.

Accessing ERXPFGCDN_EL1

If [ERRIDR_EL1](#).NUM is 0x0000 or [ERRSELR_EL1](#).SEL is greater than or equal to [ERRIDR_EL1](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFGCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.

If [ERRSELR_EL1](#).SEL selects an error record owned by a node that does not implement the Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.

Note

A node does not implement the Common Fault Injection Model Extension if [ERR<q>FR](#).INJ reads as 0b00. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in [ERRSELR_EL1](#).SEL. If the node owns a single record, then q = n.

If [ERRSEL_EL1.SEL](#) is not the index of the first error record owned by a node, then [ERR<n>PFGCDN](#) is not present, meaning reads and writes of ERXPFPGCDN_EL1 are RES0.

[ERR<n>PFGCDN](#) describes additional constraints that also apply when [ERR<n>PFGCDN](#) is accessed through ERXPFPGCDN_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERXPFPGCDN_EL1

ERXPFGCTL_EL1, Selected Pseudo-fault Generation Control register

The ERXPFGCTL_EL1 characteristics are:

Purpose

Accesses [ERR<n>PFGCTL](#) for the error record <n> selected by [ERRSELR_EL1](#).SEL.

Configuration

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXPFGCTL_EL1 are UNDEFINED.

Attributes

ERXPFGCTL_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ERR<n>PFGCTL																															
ERR<n>PFGCTL																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

ERXPFGCTL_EL1 accesses [ERR<n>PFGCTL](#), where <n> is the value in [ERRSELR_EL1](#).SEL.

Accessing ERXPFGCTL_EL1

If [ERRIDR_EL1](#).NUM is 0x0000 or [ERRSELR_EL1](#).SEL is greater than or equal to [ERRIDR_EL1](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFGCTL_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCTL_EL1 are NOPs.
- Direct reads and writes of ERXPFGCTL_EL1 are UNDEFINED.

If [ERRSELR_EL1](#).SEL selects an error record owned by a node that does not implement the Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGCTL_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCTL_EL1 are NOPs.
- Direct reads and writes of ERXPFGCTL_EL1 are UNDEFINED.

Note

A node does not implement the Common Fault Injection Model Extension if [ERR<q>FR](#).INJ reads as 0b00. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in [ERRSELR_EL1](#).SEL. If the node owns a single record, then q = n.

If [ERRSEL_EL1.SEL](#) is not the index of the first error record owned by a node, then [ERR<n>PFGCTL](#) is not present, meaning reads and writes of ERXPFPGCTL_EL1 are RES0.

[ERR<n>PFGCTL](#) describes additional constraints that also apply when [ERR<n>PFGCTL](#) is accessed through ERXPFPGCTL_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERXPFPGCTL_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0100	0b101

ESR_EL1, Exception Syndrome Register (EL1)

The ESR_EL1 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL1.

Configuration

AArch64 System register ESR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DFSR\[31:0\]](#).

Attributes

ESR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								ISS2																							
EC						IL	ISS																								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ESR_EL1 is made UNKNOWN as a result of an exception return from EL1.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL1, the value of ESR_EL1 is UNKNOWN. The value written to ESR_EL1 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:5637]

Reserved, RES0.

Otherwise:

Reserved, RES0.

ISS2, bits [55:32]

ISS2, bits [36:32]

When FEAT_LS64 is implemented:

ISS2 encoding for an exception, the bit assignments are:

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

Otherwise, this field is RES0.

ISS2 encoding for an exception from a Data Abort (EC == 0b100100 or EC == 0b100101)

Bits [23:10]

Reserved, RES0.

TagAccess, bit [9]

When FEAT_MTE_PERM is implemented:

NoTagAccess fault.

If a memory access generates a Data Abort for a Permission fault, this field indicates whether the fault is due to the NoTagAccess memory attribute.

TagAccess	Meaning
0b0	Permission fault is not due to the NoTagAccess memory attribute.
0b1	Permission fault is due to the NoTagAccess memory attribute.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:7]

Reserved, RES0.

Overlay, bit [6]

When FEAT_S1POE is implemented:

Overlay flag.

If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]**When FEAT_S1PIE is implemented:**

DirtyBit flag.

If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Xs, bits [4:0]**When FEAT_LS64 is implemented:**

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

Otherwise, this field is RES0.

Otherwise:

Reserved, RES0.

ISS2 encoding for an exception from an Instruction Abort (EC == 0b100000 or EC == 0b100001)**Bits [23:7]**

Reserved, RES0.

Overlay, bit [6]**When FEAT_S1POE is implemented or FEAT_S2POE is implemented:**

Overlay flag.

If a memory access generates a Instruction Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Instruction Abort is not due to Overlay Permissions.
0b1	Instruction Abort due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:0]

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WF* instruction	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: <ul style="list-style-type: none"> An STC to write data to memory from DBGDTRRXint. An LDC to read data from memory to DBGDTRTXint. 	ISS encoding for an exception from an LDC or STC instruction	When AArch32 is supported
0b000111	Access to SME, SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN , CPTR_EL2.FPEN , CPTR_EL2.TFP , or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000.	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality resulting from the FPEN and TFP traps	
0b001010	Trapped execution of an LD64B or ST64B* instruction.	ISS encoding for an exception from an LD64B or ST64B* instruction	When FEAT_LS64 is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for an exception	When AArch32 is supported

0b001101	Branch Target Exception.	from an MCRR or MRRC access ISS encoding for an exception from Branch Target Identification instruction	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b010001	SVC instruction execution in AArch32 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch32 is supported
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001, or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	When AArch64 is supported
0b010100	Trapped MSRR, MRRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000.	ISS encoding for an exception from MSRR, MRRS, or 128-bit System instruction execution in AArch64 state	When FEAT_SYSREG128 is implemented or FEAT_SYSINSTR128 is implemented
0b011001	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.	ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	When FEAT_SVE is implemented
0b011011	Exception from an access to a TSTART instruction at EL0 when SCTLR_EL1.TME0 == 0, EL0 when	ISS encoding for an exception from a TSTART instruction	When FEAT_TME is implemented

	SCTLR_EL2.TME0 == 0, at EL1 when SCTLR_EL1.TME == 0, at EL2 when SCTLR_EL2.TME == 0 or at EL3 when SCTLR_EL3.TME == 0.		
0b011100	Exception from a Pointer Authentication instruction authentication failure	ISS encoding for an exception from a Pointer Authentication instruction authentication failure	When FEAT_FPAC is implemented
0b011101	Access to SME functionality trapped as a result of CPACR_EL1.SMEN , CPTR_EL2.SMEN , CPTR_EL2.TSM , CPTR_EL3.ESM , or an attempted execution of an instruction that is illegal because of the value of PSTATE.SM or PSTATE.ZA, that is not reported using EC 0b000000.	ISS encoding for an exception due to SME functionality	When FEAT_SME is implemented
0b011110	Exception from a Granule Protection Check	ISS encoding for an exception from a Granule Protection Check	When FEAT_RME is implemented
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100010	PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	

0b100100	Data Abort exception from a lower Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	
0b100101	Data Abort exception taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100111	Memory Operation Exception.	ISS encoding for an exception from the Memory Copy and Memory Set instructions	When FEAT_MOPS is implemented
0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	When AArch32 is supported

0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	When AArch64 is supported
0b101111	SError interrupt.	ISS encoding for an SError interrupt	
0b110000	Breakpoint exception from a lower Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110001	Breakpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110010	Software Step exception from a lower Exception level.	ISS encoding for an exception from a Software Step exception	
0b110011	Software Step exception taken without a change in Exception level.	ISS encoding for an exception from a Software Step exception	
0b110100	Watchpoint exception from a lower Exception level.	ISS encoding for an exception from a Watchpoint exception	
0b110101	Watchpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Watchpoint exception	
0b111000	BKPT instruction execution in AArch32 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch32 is supported
0b111100	BRK instruction execution in AArch64 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch64 is supported
0b111101	PMU exception	ISS encoding for a PMU exception	When FEAT_EBEP is implemented

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.

- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: <ul style="list-style-type: none"> An SError interrupt. An Instruction Abort exception. A PC alignment fault exception. An SP alignment fault exception. A Data Abort exception for which the value of the ISV bit is 0. An Illegal Execution state exception. Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: <ul style="list-style-type: none"> 0b0: 16-bit T32 BKPT instruction. 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction. An exception reported using EC value 0b000000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not **UNPREDICTABLE**, the field takes the value 0b11111.
- If the instruction that generated the exception was **UNPREDICTABLE**, the field takes an **UNKNOWN** value that must be either:
 - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
 - The value 0b11111.

ISS encoding for exceptions with an unknown reason

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
 - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
 - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
 - Instruction encodings that are unallocated.
 - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR_EL1](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
 - An HVC instruction when disabled by [HCR_EL2](#).HCD or [SCR_EL3](#).HCE.
 - An SMC instruction when disabled by [SCR_EL3](#).SMD.
 - An HLT instruction when disabled by [EDSCR](#).HDE.
- Attempted execution of an MSR or MRS instruction to access [SP_EL0](#) when the value of [SPSel](#).SP is 0.
- Attempted execution of an MSR or MRS instruction using a [_EL12](#) register name when [HCR_EL2](#).E2H == 0.
- Attempted execution, in Debug state, of:
 - A DCPS1 instruction when the value of [HCR_EL2](#).TGE is 1 and EL2 is disabled or not implemented in the current Security state.
 - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
 - A DCPS3 instruction when the value of [EDSCR](#).SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using [R13_mon](#).
- In Debug state when the value of [EDSCR](#).SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to [SPSR_mon](#), [SP_mon](#), or [LR_mon](#).
- An exception that is taken to EL2 because the value of [HCR_EL2](#).TGE is 1 that, if the value of [HCR_EL2](#).TGE was 0 would have been reported with an [ESR_ELx](#).EC value of 0b000111.
- In Non-transactional state, attempted execution of a TCOMMIT instruction.

ISS encoding for an exception from a WF* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0										RN			RES0		RV	TI			

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:10]

Reserved, RES0.

RN, bits [9:5]

When FEAT_WFxT is implemented:

Register Number. Indicates the register number supplied for a WFET or WFIT instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

RV, bit [2]**When FEAT_WFxT is implemented:**

Register field Valid.

If TI[1] == 1, then this field indicates whether RN holds a valid register number for the register argument to the trapped WFET or WFIT instruction.

RV	Meaning
0b0	Register field invalid.
0b1	Register field valid.

If TI[1] == 0, then this field is RES0.

This field is set to 1 on a trap on WFET or WFIT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFxT is implemented
0b11	WFET trapped.	When FEAT_WFxT is implemented

When FEAT_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- [SCTLR_EL1](#).{nTWE, nTWI}.
- [HCR_EL2](#).{TWE, TWI}.
- [SCR_EL3](#).{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc2		Opc1		CRn				Rt				CRm				Direction			

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

If the Rt value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- If FEAT_TIDCP1 is implemented, [SCTLR_EL1](#).TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1.
- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- [HCR_EL2](#).TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- If FEAT_TIDCP1 is implemented, [SCTLR_EL2](#).TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TCPAC, for accesses to [CPACR_EL1](#) or [CPACR](#) using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HSTR_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL_EL2](#).EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL3](#).TCPAC, for accesses to [CPACR](#) from EL1 and EL2, and accesses to [HCPTR](#) from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- If FEAT_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [CPACR_EL1](#).TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDSCR_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [HCR_EL2](#).TID0, for accesses to the [JIDR](#) register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL2](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and [DBGDSAR](#) using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL3](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR_EL3](#).TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR_EL3](#).TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- [HCR_EL2](#).TID0, for accesses to the [FPSID](#) register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- [HCR_EL2](#).TID3, for accesses to registers in ID group 3 including [MVFR0](#), [MVFR1](#) and [MVFR2](#), VMRS access trapped to EL2.

ISS encoding for an exception from an LD64B or ST64B* instruction

ISS, bits [24:0]

ISS	Meaning	Applies when
0b000000000000000000000000	ST64BV instruction trapped.	When FEAT_LS64_V is implemented
0b000000000000000000000001	ST64BV0 instruction trapped.	When FEAT_LS64_ACCDATA is implemented
0b000000000000000000000010	LD64B or ST64B instruction trapped.	When FEAT_LS64 is implemented

All other values are reserved.

ISS encoding for an exception from an MCRR or MRRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc1				RES0	Rt2				Rt				CRm				Direction		

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these

definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

If the Rt2 value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt2 value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

If the Rt value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [HSTR_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT_FGT is implemented, [HDFGRTR_EL2](#).PMCCNTR_EL0 for MRRC access and [HDFGWTR_EL2](#).PMCCNTR_EL0 for MCRR access to [PMCCNTR](#) at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- [MDSCR_EL1](#).TDCC, for accesses to the Debug ROM registers [DBGDSAR](#) and [DBGDRAR](#) at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and [DBGDSAR](#) using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL3](#).TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- [CPACR_EL1](#).TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [CPTR_EL2](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL3](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

ISS encoding for an exception from an LDC or STC instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				imm8								RES0	Rn				Offset	AM		Direction			

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer.

If the Rn value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rn value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- [MDSCR_EL1](#).TDCC, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) trapped to EL1 or EL2.
- [MDCR_EL2](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL2.
- [MDCR_EL3](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL3.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPE and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.
- Execution of SME instructions.

For an implementation that does not include either SVE or support for Advanced SIMD and floating-point, the exception is reported using the EC value 0b000000.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000111:

- [CPACR_EL1.FPEN](#), for accesses to SIMD and floating-point registers trapped to EL1.
- [CPTR_EL2.FPEN](#) and [CPTR_EL2.TFP](#), for accesses to SIMD and floating-point registers trapped to EL2.
- [CPTR_EL3.TFP](#), for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTTR_EL2.ZEN, CPTTR_EL2.TZ, or CPTTR_EL3.EZ

The accesses covered by this trap include:

- Execution of SVE instructions when the PE is not in Streaming SVE mode.
- Accesses to the SVE System registers, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

Bits [24:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b011001:

- [CPACR_EL1.ZEN](#), for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL1.
- [CPTR_EL2.ZEN](#) and [CPTR_EL2.TZ](#), for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR_EL3.EZ](#), for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

ISS encoding for a PMU exception

Bits [24:1]

Reserved, RES0.

SYNC, bit [0]

Indicates whether the exception was taken synchronously or asynchronously.

SYNC	Meaning	Applies when
0b0	The exception was taken asynchronously because an overflow status flag was set.	
0b1	The exception was taken synchronously because PSTATE.PPEND was set.	When FEAT_SEBEP is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about PC alignment fault exceptions, see 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from the Memory Copy and Memory Set instructions

MemInst, bit [24]

Indicates the memory instruction class causing the exception.

MemInst	Meaning
0b0	CPYFE*, CPYFM*, CPYE*, and CPYM* instructions.
0b1	SETE*, SETM*, SETGE*, and SETGM* instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

isSETG, bit [23]

Indicates whether the instruction belongs to SETGM* or SETGE* class of instruction.

isSETG	Meaning
0b0	Not a SETGM* or SETGE* instruction.
0b1	SETGM* or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Options, bits [22:19]

Options : the Options field of the instruction.

For Memory Copy instructions, bits[22:19] forms the Options field, which holds the bits[15:12] of the instruction.

For Memory Set instructions:

- Bits[22:21] are RES0.
- Bits[20:19] form the Options field, which holds the bits[13:12] of the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FromEpilogue, bit [18]

Indicates whether the instruction belongs to the epilogue class of Memory Copy or Memory Set instructions.

FromEpilogue	Meaning
0b0	Not an epilogue instruction.
0b1	CPYE*, CPYFE*, SETE*, or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WrongOption, bit [17]

Algorithm option.

WrongOption	Meaning
0b0	WrongOption is false.
0b1	WrongOption is true.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OptionA, bit [16]

Algorithm type indicated by the PSTATE.C bit.

OptionA	Meaning
0b0	OptionB indicated by PSTATE.C is 0.
0b1	OptionA indicated by PSTATE.C is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

destreg, bits [14:10]

The destination register value from the issued instruction, containing the destination address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

srcreg, bits [9:5]

The source register value from the issued instruction, containing either the source address or the source data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

sizereg, bits [4:0]

The size register value from the issued instruction, containing the number of bytes to be transferred or set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from HVC or SVC instruction execution

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										imm16														

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
 - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
 - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, [HFGITR_EL2](#).{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				Op0		Op2		Op1		CRn			Rt			CRm			Direction					

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- If FEAT_TIDCP1 is implemented, [SCTLR_EL1](#).TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL1.
- [SCTLR_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).UCT, for accesses to [CTR_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.

- [HCR_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- If FEAT_TIDCP1 is implemented, [SCTLR_EL2](#).TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TCPAC, for accesses to [CPACR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TTRF, for accesses to the trace filter control register, [TRFCR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR_EL2](#).AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR_EL3](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR_EL3](#).ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR_EL3](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TCPAC, for accesses to [CPTR_EL2](#) and [CPACR_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TTRF, for accesses to the trace filter control registers, [TRFCR_EL1](#) and [TRFCR_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
 - [HCR_EL2](#).{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
 - [HCR2](#).{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT_FGT is implemented:
 - [SCR_EL3](#).FGTE, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
 - [HFGTR_EL2](#) for reads and [HFGWTR_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
 - [HFGITR_EL2](#) for execution of system instructions, MSR or MRS access trapped to EL2
 - [HDFGTR_EL2](#) for reads and [HDFGWTR_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
 - [HAFGTR_EL2](#) for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.
- If FEAT_RNG_TRAP is implemented:
 - [SCR_EL3](#).TRNDR for reads of [RNDR](#) and [RNDRRS](#) using AArch64 state, MRS access trapped to EL3.
- If FEAT_SME is implemented:

- [CPTR_EL3](#).ESM, for MSR or MRS accesses to [SMPRI_EL1](#) at EL1, EL2, and EL3, trapped to EL3.
- [CPTR_EL3](#).ESM, for MSR or MRS accesses to [SMPRMAP_EL2](#) at EL2 and EL3, trapped to EL3.
- [SCTLR_EL1](#).EnTP2, for MSR or MRS accesses to [TPIDR2_EL0](#) at EL0, trapped to EL1 or EL2.
- [SCTLR_EL2](#).EnTP2, for MSR or MRS accesses to [TPIDR2_EL0](#) at EL0, trapped to EL2.
- [SCR_EL3](#).EnTP2, for MSR or MRS accesses to [TPIDR2_EL0](#) at EL0, EL1, and EL2, trapped to EL3.
- If FEAT_NMI is implemented, [HCRX_EL2](#).TALLINT, for MSR writes of [ALLINT](#) at EL1, trapped to EL2.

ISS encoding for an exception from MSRR, an MRRS, Instruction or 128-bit System instruction execution in AArch64 state Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0		Op0SET		Op2FnV		Op1EA		CRnRES0		RtS1PTW		RES0		CRmIFSC		Direction								

Bits [24:22:13]

Reserved, RES0.

Op0, bits [21:20]

SET, bits [12:11]

When FEAT_RAS is implemented:

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The Op0 value from the issued instruction.

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

Otherwise:

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:6]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

Note

This value represents register pair of X[Rt:0], X[Rt:1].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk.

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is

0b011111	hardware update of translation table, level 2. Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	not implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RAS is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address-size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRmFnV, bits[4:110]

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The FAR CRmnot valueValid, fromfor thea issuedsynchronous instruction.External abort other than a synchronous External abort on a translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DirectionEA, bit [09]

Indicates the direction of the trapped instruction.

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

Direction	Meaning
0b0	Write access, MSRR instructions.
0b1	Read access, MRRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from due ante InstructionSME Abortfunctionality

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												SET	SMTC	FnV	EA	RES0	S1PTW	RES0	IFSC					

- Execution of SME instructions.
- Execution of SVE and Advanced SIMD instructions, when the PE is in Streaming SVE mode.
- Direct accesses of [SVCR](#), [SMCR_EL1](#), [SMCR_EL2](#), [SMCR_EL3](#).

WhenThe accesses covered by this trap include: FEAT_S1POE or FEAT_S2POE is implemented, if a memory access generates a Instruction Abort due to a Permission fault, the ISS2 encoding for an exception from an Instruction Abort includes further information about the exception.

Bits [24:133]

Reserved, RES0.

SETSMTC, bits [122:110]**When FEAT_RAS is implemented:**

SynchronousSME ErrorTrap Type.Code. WhenIdentifies IFSCthe isreason for instruction trapping. 0b010000, describes the PE error state after taking the Instruction Abort exception.

0b011	SME instruction trapped because PSTATE.ZA is 0.
SETSMTC	Meaning
0b000b000	Recoverable state (UER). Access to SME functionality trapped as a result of CPACR_EL1 .SMEN, CPTR_EL2 .SMEN, CPTR_EL2 .TSM, or CPTR_EL3 .ESM, that is not reported using EC 0b000000.
0b100b001	UncontainableAdvanced (UC).SIMD, SVE, or SVE2 instruction trapped because PSTATE.SM is 1.
0b110b010	RestartableSME stateinstruction (UEO).trapped because PSTATE.SM is 0.

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using the EC value 0b011101:

- CPACR_EL1.SMEN**, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access **SVCR** and **SMCR_EL1** System registers at EL1 and EL0, trapped to EL1 or EL2.
- CPTR_EL2.SMEN** and **CPTR_EL2.TSM**, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access **SVCR**, **SMCR_EL1**, **SMCR_EL2** at EL2, EL1, or EL0, trapped to EL2.
- CPTR_EL3.ESM**, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access **SVCR**, **SMCR_EL1**, **SMCR_EL2**, **SMCR_EL3** from all Exception levels and any Security state, trapped to EL3.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is not implemented

0b011110	hardware update of translation table, level 1. Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The lookup level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:22]

The accesses covered by this trap include:

- Execution of SME instructions.
- Execution of SVE and Advanced SIMD instructions, when the PE is in Streaming SVE mode.
- Direct accesses of [SVCR](#), [SMCR_EL1](#), [SMCR_EL2](#), [SMCR_EL3](#).

Bits [24:3]

Reserved, RES0.

SMTC S2PTW, bits [2:0]

SMTC indicates whether Code the Identifies Granule the Protection reason Check exception was on an access made for instruction a trapping stage 2 translation table walk.

SMTC S2PTW	Meaning	Applies when
0b0000b0	Access Fault to not SME on functionality a trapped stage as 2 a translation result table of walk. CPACR_EL1.SMEN , CPTR_EL2.SMEN , CPTR_EL2.TSM , or CPTR_EL3.ESM , that is not reported using EC 0b000000.	
0b0010b1	Advanced Fault SIMD, on SVE, a or stage SVE2 instruction translation trapped table because PSTATE.SM is 1. walk.	
0b010	SME instruction trapped because PSTATE.SM is 0.	
0b011	SME instruction trapped because PSTATE.ZA is 0.	
0b100	Access to the SME2 ZT0 register trapped as a result of SMCR_EL1.EZT0 , SMCR_EL2.EZT0 , or SMCR_EL3.EZT0 .	When FEAT_SME2 is implemented

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

All The other reset values behavior are of reserved. this field is:

InD, bit [20]

Indicates whether the Granule Protection Check exception was on an instruction or data access.

InD	Meaning
0b0	Data access.
0b1	Instruction access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GPCSC, bits [19:14]

Granule Protection Check Status Code.

GPCSC	Meaning
0b000000	GPT address size fault at level 0.
0b000100	GPT walk fault at level 0.
0b000101	GPT walk fault at level 1.
0b001100	Granule protection fault at level 0.
0b001101	Granule protection fault at level 1.
0b010100	Synchronous External abort on GPT fetch at level 0.
0b010101	Synchronous External abort on GPT fetch at level 1.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VNCR, bit [13]**When FEAT_NV2 is implemented:**

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

When InD is '1', this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction.

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

Indicates whether the Granule Protection Check exception was on an access for stage 2 translation for a stage 1 translation table walk.

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

When InD is '1', this field is RES0.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

xFSC, bits [5:0]

Instruction or Data Fault Status Code.

xFSC	Meaning	Applies when
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using the EC value 0b011101:

- CPACR_EL1.SMEN**, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access **SVCR** and **SMCR_EL1** System registers at EL1 and EL0, trapped to EL1 or EL2.
- CPTR_EL2.SMEN** and **CPTR_EL2.TSM**, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access **SVCR**, **SMCR_EL1**, **SMCR_EL2** at EL2, EL1, or EL0, trapped to EL2.
- CPTR_EL3.ESM**, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access **SVCR**, **SMCR_EL1**, **SMCR_EL2**, **SMCR_EL3** from all Exception levels and any Security state, trapped to EL3.
- If FEAT_SME2 is implemented:
 - SMCR_EL1.EZT0**, for accesses to ZT0 at EL1 and EL0, trapped to EL1 or EL2.
 - SMCR_EL2.EZT0**, for accesses to ZT0 at EL2, EL1, and EL0, trapped to EL2.
 - SMCR_EL3.EZT0**, for accesses to ZT0 at any Exception level, trapped to EL3.

ISS encoding for an exception from a GranuleData Protection CheckAbort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	S2PTW	Ind					GPCSC			VNCR		RES0		CM	S1PTW	WnR								
24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	SSE				SRT			Bit[15]	AR	VNCR	Bits[12:11]	FnV	EA	CM	S1PTW	WnR							DFSC

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
 - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
 - Is not performing register writeback.
 - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_MOPS is implemented, for a synchronous Data Abort on a Memory Copy and Memory Set instruction, ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]**When ISV == 1:**

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:**Bits [24:22]**

Reserved, RES0.

Otherwise:

Reserved, RES0.

Bit[15]**When ISV == 1:****SF, bit [0] of bit [15]**

Sixty Four bit general-purpose register transfer. Width of the register accessed by the instruction is 64-bit.

SF	Meaning
0b0	Instruction loads/stores a 32-bit general-purpose register.
0b1	Instruction loads/stores a 64-bit general-purpose register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ISV == 0 and FEAT_SME is implemented:

FnP, bit [0] of bit [15]

FAR not Precise.

FnP	Meaning
0b0	The FAR holds the faulting virtual address that generated the Data Abort.
0b1	The FAR holds any virtual address within the naturally-aligned granule that contains the faulting virtual address that generated a Data Abort due to an SVE contiguous vector load/store instruction in Streaming SVE mode, or an SME load/store instruction. For more information about the naturally-aligned fault granule, see FAR_ELx (for example, FAR_EL1).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AR, bit [14]

When ISV == 1:

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S2PTW, bit [21]**SSE, bit [21]****When ISV == 1:**

Indicates Syndrome whether Sign the Extend. Granule For Protection a Check byte, exception halfword, was or on word an load access operation, made indicates for whether a the stage data 2 item translation must table be walk sign extended.

S2PTWSSE	Meaning
0b0	Fault Sign-extension not on a stage 2 translation table walk required.
0b1	Fault Data on item a must stage be 2 translation table walk sign extended.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [20]**Otherwise:**

Indicates whether the Granule Protection Check exception was on an instruction or data access.

Reserved, RES0.

InD	Meaning
0b0	Data access.
0b1	Instruction access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GPCSC, bits [19:14]**SRT, bits [20:16]****When ISV == 1:**

GranuleSyndrome ProtectionRegister CheckTransfer. StatusThe Code.register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

GPCSC	Meaning
0b000000	GPT address size fault at level 0.
0b000100	GPT walk fault at level 0.
0b000101	GPT walk fault at level 1.
0b001100	Granule protection fault at level 0.
0b001101	Granule protection fault at level 1.
0b010100	Synchronous External abort on GPT fetch at level 0.
0b010101	Synchronous External abort on GPT fetch at level 1.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VNCR, bit [13]**When FEAT_NV2 is implemented:**

Indicates that the fault came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

When InD is '1', this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LST, bits [1:0] of bits [12:11]

Load/Store Type. Used when a Translation fault, Access flag fault, or Permission fault generates a Data Abort.

LST	Meaning	Applies when
0b00	The instruction that generated the Data Abort is not specified.	
0b01	An ST64BV instruction generated the Data Abort.	When FEAT_LS64_V is implemented
0b10	An LD64B or ST64B instruction generated the Data Abort.	When FEAT_LS64 is implemented
0b11	An ST64BV0 instruction generated the Data Abort.	When FEAT_LS64_ACCDATA is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RAS is implemented and DFSC == 0b010000:

SET, bits [1:0] of bits [12:11]

Synchronous Error Type. Used when a Synchronous External abort, not on a Translation table walk or hardware update of the Translation table, generated the Data Abort. Describes the PE error state after taking the Data Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Bits [12:9]

Bits[12:11]

When (DFSC == 0b00xxxx || DFSC == 0b101011) && DFSC != 0b0000xx:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

IndicatesFor a stage 2 fault, indicates whether the Granulefault Protectionwas Checka exceptionstage was2 fault on an access for stage 2 translationmade for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

When InD is '1', this field is RES0.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

xFSCDFSC, bits [5:0]

Instruction or Data Fault Status Code.

0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented

0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
xFSCDFSC	Meaning	Applies when
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The **lookup** level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	SSE				SRT			Bit[15]	AR	VNCR	Bits[12:11]	FnV	EACM	S1PTW	WnR						DFSC		

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, this ISS encoding includes ISS2, bits[36:32].

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, this ISS encoding includes ISS2, bits[36:32].

When FEAT_S1POE is implemented, if a memory access generates a Data Abort due to a Permission fault, the ISS2 encoding for an exception from a Data Abort includes further information about the exception.

When FEAT_S1PIE is implemented, if a memory write access generates a Data Abort due to a Permission fault, the ISS2 encoding for an exception from a Data Abort includes further information about the exception.

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
 - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
 - Is not performing register writeback.
 - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_MTE2 is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FnV is 0 and FAR_ELx is valid.

When FEAT_MOPS is implemented, for a synchronous Data Abort on a Memory Copy and Memory Set instruction, ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

When ISV == 1:

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSE, bit [21]

When ISV == 1:

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SRT, bits [20:16]

When ISV == 1:

Syndrone Register Transfer. The register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[15]

When ISV == 1:

SF, bit [0] of bit [15]

Sixty Four bit general-purpose register transfer. Width of the register accessed by the instruction is 64-bit.

SF	Meaning
0b0	Instruction loads/stores a 32-bit general-purpose register.
0b1	Instruction loads/stores a 64-bit general-purpose register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ISV == 0:

FnP, bit [0] of bit [15]

FAR not Precise.

FnP	Meaning	Applies when
0b0	The FAR holds the faulting virtual address that generated the Data Abort.	
0b1	The FAR holds any virtual address within the naturally-aligned granule that contains the faulting virtual address that generated a Data Abort due to an SVE contiguous vector load/store instruction, or an SME load/store instruction. For more information about the naturally-aligned fault granule, see FAR_ELx (for example, FAR_EL1).	When FEAT_SME is implemented or FEAT_SVE is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AR, bit [14]

When ISV == 1:

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VNCR, bit [13]**When FEAT_NV2 is implemented:**

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits[12:11]**When (DFSC == 0b00xxxx || DFSC == 0b101011) && DFSC != 0b0000xx:****LST, bits [1:0] of bits [12:11]**

Load/Store Type. Used when a Translation fault, Access flag fault, or Permission fault generates a Data Abort.

LST	Meaning	Applies when
0b00	The instruction that generated the Data Abort is not specified.	
0b01	An ST64BV instruction generated the Data Abort.	When FEAT_LS64_V is implemented
0b10	An LD64B or ST64B instruction generated the Data Abort.	When FEAT_LS64 is implemented
0b11	An ST64BV0 instruction generated the Data Abort.	When FEAT_LS64_ACCDATA is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RAS is implemented and DFSC == 0b010000:**SET, bits [1:0] of bits [12:11]**

Synchronous Error Type. Used when a Synchronous External abort, not on a Translation table walk or hardware update of the Translation table, generated the Data Abort. Describes the PE error state after taking the Data Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction.

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented

0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The lookup level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV							RES0						VECITR	IDF	RES0	IXF	UFF	OFF	DZF	IOF			

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from an instruction that is performing floating-point operations on more than one lane of a vector.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from an instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the [FPSCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDS	RES0										IESB	AET		EA	RES0		DFSC							

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
Note If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]**When FEAT_IESB is implemented and DFSC == 0b010001:**

Implicit error synchronization event.

IESB	Meaning
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]**When FEAT_RAS is implemented and DFSC == 0b010001:**

Asynchronous Error Type.

Describes the PE error state after taking the SError interrupt exception.

AET	Meaning
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]**When FEAT_RAS is implemented and DFSC == 0b010001:**

External abort type. Provides an IMPLEMENTATION DEFINED classification of External aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]**When FEAT_RAS is implemented:**

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			IFSC					

Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

ISS encoding for an exception from a Software Step exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
ISV		RES0																EX		IFSC					

ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Software Step exceptions'.

ISS encoding for an exception from a Watchpoint exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	WPT					WPTV		WPF	FnP	RES0	VNCR	RES0	FnV	RES0	CM	RES0	WnR	DFSC						

Bit [24]

Reserved, RES0.

WPT, bits [23:18]

When FEAT_SME is implemented or FEAT_Debugv8p9 is implemented:

Watchpoint **number**. ~~number, 0 to 15 inclusive.~~

All other values are reserved.

Otherwise:

Reserved, RES0.

WPTV, bit [17]

When FEAT_SME is implemented or FEAT_Debugv8p9 is implemented:

Watchpoint number Valid.

WPTV	Meaning	Applies when
0b0	The WPT field is invalid, and holds an UNKNOWN value.	When FEAT_SME is implemented and FEAT_Debugv8p9 is not implemented
0b1	The WPT field is valid, and holds the number of a watchpoint that triggered a Watchpoint exception.	

When a Watchpoint exception is triggered by a watchpoint match:

- If the PE sets any of FnV, FnP, or WPF to 1, then the PE sets WPTV to 1.
- If the PE sets all of FnV, FnP, and WPF to 0, then the PE sets WPTV to an IMPLEMENTATION DEFINED value, 0 or 1.

Otherwise:

Reserved, RES0.

WPF, bit [16]

When FEAT_SME is implemented or FEAT_Debugv8p9 is implemented:

Watchpoint might be false-positive.

WPF	Meaning	Applies when
0b0	The watchpoint matched the original address of the access or set of contiguous accesses.	
0b1	The watchpoint matched an access or set of contiguous accesses where the lowest accessed address was rounded down to the nearest multiple of 16 bytes and the highest accessed address was rounded up to the nearest multiple of 16 bytes minus 1, but the watchpoint might not have matched the original address of the access or set of contiguous accesses.	When (FEAT_SVE is implemented and FEAT_Debugv8p9 is implemented) or FEAT_SME is implemented

Otherwise:

Reserved, RES0.

FnP, bit [15]**When FEAT_SME is implemented or FEAT_Debugv8p9 is implemented:**

FAR not Precise.

This field only has meaning if the FAR is valid; that is, when the FnV field is 0. If the FnV field is 1, the FnP field is 0.

FnP	Meaning	Applies when
0b0	If the FnV field is 0, the FAR holds the virtual address of an access or set of contiguous accesses that triggered a Watchpoint exception.	
0b1	The FAR holds any address within the smallest implemented translation granule that contains the virtual address of an access or set of contiguous accesses that triggered a Watchpoint exception.	When (FEAT_SVE is implemented and FEAT_Debugv8p9 is implemented) or FEAT_SME is implemented

Otherwise:

Reserved, RES0.

Bit [14]

Reserved, RES0.

VNCR, bit [13]**When FEAT_NV2 is implemented:**

Indicates that the watchpoint came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:11]

Reserved, RES0.

FnV, bit [10]

When FEAT_SME is implemented or FEAT_Debugv8p9 is implemented:

FAR not Valid.

FnV	Meaning	Applies when
0b0	The FAR is valid, and its value is as described by the FnP field.	
0b1	The FAR is invalid, and holds an UNKNOWN value.	When (FEAT_SVE is implemented and FEAT_Debugv8p9 is implemented) or FEAT_SME is implemented

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by the execution of a cache maintenance instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

ISS encoding for an exception from execution of a Breakpoint instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										Comment														

Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

ISS encoding for an exception from a TSTART instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0															Rd			RES0						

Bits [24:10]

Reserved, RES0.

Rd, bits [9:5]

The Rd value from the issued instruction, the general purpose register used for the destination.

Bits [4:0]

Reserved, RES0.

ISS encoding for an exception from Branch Target Identification instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																						BTTYPE		

Bits [24:2]

Reserved, RES0.

BTTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																						Exception as a result of an Instruction key or a Data key		Exception as a result of an A key or a B key

Bits [24:2]

Reserved, RES0.

Bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

Meaning	
0b0	Instruction Key.
0b1	Data Key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

Meaning	
0b0	A key.
0b1	B key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a Translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing ESR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic ESR_EL1 or ESR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ESR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0010	0b000

```

The ESR_EL2 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL2.

Configuration

AArch64 System register ESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HSR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ESR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								ISS2																							
EC						IL		ISS																							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ESR_EL2 is made UNKNOWN as a result of an exception return from EL2.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of ESR_EL2 is UNKNOWN. The value written to ESR_EL2 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:56~~37~~]

Reserved, RES0.

Otherwise:

~~Reserved, RES0.~~

ISS2, bits [55:32]

ISS2, bits [36:32]

When FEAT LS64 is implemented:

ISS2 encoding for an exception, the bit assignments are:

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

Otherwise, this field is RES0.

ISS2 encoding for an exception from a Data Abort (EC == 0b100100 or EC == 0b100101)

23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
														RES0	TagAccess	RES0	AssuredOnly	Overlay	DirtyBit			Xs	

Bits [23:10]

Reserved, RES0.

TagAccess, bit [9]

When FEAT_MTE_PERM is implemented:

NoTagAccess fault.

If a memory access generates a Data Abort for a Permission fault, this field indicates whether the fault is due to the NoTagAccess memory attribute.

TagAccess	Meaning
0b0	Permission fault is not due to the NoTagAccess memory attribute.
0b1	Permission fault is due to the NoTagAccess memory attribute.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

AssuredOnly, bit [7]

When FEAT_THE is implemented:

AssuredOnly flag.

If a memory access generates a Stage 2 Data Abort, this field holds information about the fault.

AssuredOnly	Meaning
0b0	The Data Abort is not due to AssuredOnly.
0b1	The Data Abort is due to AssuredOnly.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [6]**When FEAT_S1POE is implemented or FEAT_S2POE is implemented:**

Overlay flag.

If a memory access generates a Data Abort for a Permission fault, this field holds information about the fault.

Overlay	Meaning
0b0	The Data Abort is due to Base Permissions.
0b1	The Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]**When FEAT_S1PIE is implemented or FEAT_S2PIE is implemented:**

DirtyBit flag.

If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Xs, bits [4:0]**When FEAT_LS64 is implemented:**

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

Otherwise, this field is RES0.

Otherwise:

Reserved, RES0.

ISS2 encoding for an exception from an Instruction Abort (EC == 0b100000 or EC == 0b100001)**Bits [23:8]**

Reserved, RES0.

AssuredOnly, bit [7]**When FEAT_THE is implemented:**

AssuredOnly flag.

If a memory access generates a Instruction Abort for a Permission fault, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Instruction Abort is not due to AssuredOnly.
0b1	Instruction Abort is due to stage 2 AssuredOnly attribute.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [6]**When FEAT_S1POE is implemented or FEAT_S2POE is implemented:**

Overlay flag.

If a memory access generates a Instruction Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Instruction Abort is not due to Overlay Permissions.
0b1	Instruction Abort due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:0]

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WF* instruction	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: <ul style="list-style-type: none"> An STC to write data to memory from DBGDTRRXint. An LDC to read data from memory to DBGDTRTXint. 	ISS encoding for an exception from an LDC or STC instruction	When AArch32 is supported
0b000111	Access to SME, SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN , CPTR_EL2.FPEN , CPTR_EL2.TFP , or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000.	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality resulting from the FPEN and TFP traps	
0b001000	Trapped VMRS access, from ID group trap, that is not reported using EC 0b000111.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b001001	Trapped use of a Pointer	ISS encoding for an exception	When FEAT_PAuth

	authentication instruction because HCR_EL2.API == 0 SCR_EL3.API == 0 .	from a Pointer Authentication instruction when HCR_EL2.API == 0 SCR_EL3.API == 0	is implemented
0b001010	An exception from an LD64B or ST64B* instruction.	ISS encoding for an exception from an LD64B or ST64B* instruction	When FEAT_LS64 is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported
0b001101	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b010001	SVC instruction execution in AArch32 state. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TGE is 1.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch32 is supported
0b010010	HVC instruction execution in AArch32 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch32 is supported
0b010011	SMC instruction execution in AArch32 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.	ISS encoding for an exception from SMC instruction execution in AArch32 state	When AArch32 is supported
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported
0b010110	HVC instruction execution in AArch64 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported
0b010111	SMC instruction execution in AArch64 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because	ISS encoding for an exception from SMC instruction execution in AArch64 state	When AArch64 is supported

0b011000	<p>the value of HCR_EL2.TSC is 1. Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.</p>	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	When AArch64 is supported
0b011001	<p>Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.</p>	ISS encoding for an exception from an access to SVE functionality resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	When FEAT_SVE is implemented
0b011010	<p>Trapped ERET, ERETAA, or ERETAB instruction execution.</p>	ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction	When FEAT_PAuth is implemented and FEAT_NV is implemented
0b011011	<p>Exception from an access to a TSTART instruction at EL0 when SCTLR_EL1.TME0 == 0, EL0 when SCTLR_EL2.TME0 == 0, at EL1 when SCTLR_EL1.TME == 0, at EL2 when SCTLR_EL2.TME == 0 or at EL3 when SCTLR_EL3.TME == 0.</p>	ISS encoding for an exception from a TSTART instruction	When FEAT_TME is implemented
0b011100	<p>Exception from a Pointer Authentication instruction authentication failure</p>	ISS encoding for an exception from a Pointer Authentication instruction authentication failure	When FEAT_FPAC is implemented
0b011101	<p>Access to SME functionality trapped as a result of CPACR_EL1.SMEN, CPTR_EL2.SMEN, CPTR_EL2.TSM,</p>	ISS encoding for an exception due to SME functionality	When FEAT_SME is implemented

	CPTR_EL3 .ESM, or an attempted execution of an instruction that is illegal because of the value of PSTATE.SM or PSTATE.ZA, that is not reported using EC 0b000000.		
0b011110	Exception from a Granule Protection Check	ISS encoding for an exception from a Granule Protection Check	When FEAT_RME is implemented
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100010	PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100100	Data Abort exception from a lower Exception level, excluding Data Abort exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. These Data Abort exceptions might be generated from Exception levels in any Execution state. Used for MMU faults generated by data accesses, alignment faults other than those	ISS encoding for an exception from a Data Abort	

	caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.		
0b100101	Data Abort exception without a change in Exception level, or Data Abort exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100111	Memory Operation Exception.	ISS encoding for an exception from the Memory Copy and Memory Set instructions	When FEAT_MOPS is implemented
0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	When AArch32 is supported

0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	When AArch64 is supported
0b101111	SError interrupt.	ISS encoding for an SError interrupt	
0b110000	Breakpoint exception from a lower Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110001	Breakpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110010	Software Step exception from a lower Exception level.	ISS encoding for an exception from a Software Step exception	
0b110011	Software Step exception taken without a change in Exception level.	ISS encoding for an exception from a Software Step exception	
0b110100	Watchpoint from a lower Exception level, excluding Watchpoint Exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. These Watchpoint Exceptions might be generated from Exception levels using any Execution state.	ISS encoding for an exception from a Watchpoint exception	
0b110101	Watchpoint exceptions without a change in Exception level, or Watchpoint exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested	ISS encoding for an exception from a Watchpoint exception	

0b111000	virtualization support. BKPT instruction execution in AArch32 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch32 is supported
0b111010	Vector Catch exception from AArch32 state. The only case where a Vector Catch exception is taken to an Exception level that is using AArch64 is when the exception is routed to EL2 and EL2 is using AArch64.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	When AArch32 is supported
0b111100	BRK instruction execution in AArch64 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch64 is supported
0b111101	PMU exception	ISS encoding for a PMU exception	When FEAT_EBEP is implemented

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: <ul style="list-style-type: none"> • An SError interrupt. • An Instruction Abort exception. • A PC alignment fault exception. • An SP alignment fault exception. • A Data Abort exception for which the value of the ISV bit is 0. • An Illegal Execution state exception. • Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: <ul style="list-style-type: none"> ◦ 0b0: 16-bit T32 BKPT instruction. ◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction. • An exception reported using EC value 0b000000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
 - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
 - The value 0b11111.

ISS encoding for exceptions with an unknown reason**Bits [24:0]**

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
 - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
 - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
 - Instruction encodings that are unallocated.
 - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR_EL1](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
 - An HVC instruction when disabled by [HCR_EL2](#).HCD or [SCR_EL3](#).HCE.
 - An SMC instruction when disabled by [SCR_EL3](#).SMD.
 - An HLT instruction when disabled by [EDSCR](#).HDE.
- Attempted execution of an MSR or MRS instruction to access [SP_EL0](#) when the value of [SPSel](#).SP is 0.
- Attempted execution of an MSR or MRS instruction using a [_EL12](#) register name when [HCR_EL2](#).E2H == 0.
- Attempted execution, in Debug state, of:
 - A DCPS1 instruction when the value of [HCR_EL2](#).TGE is 1 and EL2 is disabled or not implemented in the current Security state.
 - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.

- A DCPS3 instruction when the value of [EDSCR.SDD](#) is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon.
- In Debug state when the value of [EDSCR.SDD](#) is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
- An exception that is taken to EL2 because the value of [HCR_EL2.TGE](#) is 1 that, if the value of [HCR_EL2.TGE](#) was 0 would have been reported with an ESR_ELx.EC value of 0b000111.
- In Non-transactional state, attempted execution of a TCOMMIT instruction.

ISS encoding for an exception from a WF* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0										RN			RES0		RV	TI			

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:10]

Reserved, RES0.

RN, bits [9:5]**When FEAT_WFxT is implemented:**

Register Number. Indicates the register number supplied for a WFET or WFIT instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

RV, bit [2]**When FEAT_WFxT is implemented:**

Register field Valid.

If TI[1] == 1, then this field indicates whether RN holds a valid register number for the register argument to the trapped WFET or WFIT instruction.

RV	Meaning
0b0	Register field invalid.
0b1	Register field valid.

If TI[1] == 0, then this field is RES0.

This field is set to 1 on a trap on WFET or WFIT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFxT is implemented
0b11	WFET trapped.	When FEAT_WFxT is implemented

When FEAT_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- [SCTLR_EL1](#).{nTWE, nTWI}.
- [HCR_EL2](#).{TWE, TWI}.
- [SCR_EL3](#).{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc2		Opc1		CRn				Rt				CRm				Direction			

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

If the Rt value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- If FEAT_TIDCP1 is implemented, [SCTLR_EL1](#).TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1.
- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- If FEAT_TIDCP1 is implemented, [SCTLR_EL2](#).TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TCPAC, for accesses to [CPACR_EL1](#) or [CPACR](#) using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HSTR_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL_EL2](#).EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL3](#).TCPAC, for accesses to [CPACR](#) from EL1 and EL2, and accesses to [HCPTR](#) from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- If FEAT_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [CPACR_EL1](#).TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDSCR_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [HCR_EL2](#).TID0, for accesses to the [JIDR](#) register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.

- [CPTR_EL2](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and [DBGDSAR](#) using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL3](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR_EL3](#).TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR_EL3](#).TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- [HCR_EL2](#).TID0, for accesses to the [FPSID](#) register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- [HCR_EL2](#).TID3, for accesses to registers in ID group 3 including [MVFR0](#), [MVFR1](#) and [MVFR2](#), VMRS access trapped to EL2.

ISS encoding for an exception from an LD64B or ST64B* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISS																								

ISS, bits [24:0]

ISS	Meaning	Applies when
0b000000000000000000000000000000	ST64BV instruction trapped.	When FEAT_LS64_V is implemented
0b000000000000000000000000000001	ST64BV0 instruction trapped.	When FEAT_LS64_ACCDATA is implemented
0b000000000000000000000000000010	LD64B or ST64B instruction trapped.	When FEAT_LS64 is implemented

All other values are reserved.

ISS encoding for an exception from an MCRR or MRRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc1				RES0	Rt2				Rt				CRm				Direction		

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.

- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

If the Rt2 value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt2 value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b1111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b1111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

If the Rt value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [HSTR_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.

- [CNTHCTL_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT_FGT is implemented, [HDFGRTR_EL2](#).PMCCNTR_EL0 for MRRC access and [HDFGWTR_EL2](#).PMCCNTR_EL0 for MCRR access to [PMCCNTR](#) at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- [MDSCR_EL1](#).TDCC, for accesses to the Debug ROM registers [DBGDSAR](#) and [DBGDRAR](#) at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and [DBGDSAR](#) using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL3](#).TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- [CPACR_EL1](#).TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [CPTR_EL2](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL3](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

ISS encoding for an exception from an LDC or STC instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				imm8								RES0		Rn				Offset		AM		Direction	

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer.

If the Rn value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rn value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b1111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b1111.

See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- [MDSCR_EL1](#).TDCC, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) trapped to EL1 or EL2.
- [MDCR_EL2](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL2.
- [MDCR_EL3](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL3.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPE and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.
- Execution of SME instructions.

For an implementation that does not include either SVE or support for Advanced SIMD and floating-point, the exception is reported using the EC value 0b000000.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000111:

- [CPACR_EL1.FPEN](#), for accesses to SIMD and floating-point registers trapped to EL1.
- [CPTR_EL2.FPEN](#) and [CPTR_EL2.TFP](#), for accesses to SIMD and floating-point registers trapped to EL2.
- [CPTR_EL3.TFP](#), for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

The accesses covered by this trap include:

- Execution of SVE instructions when the PE is not in Streaming SVE mode.
- Accesses to the SVE System registers, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

Bits [24:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b011001:

- [CPACR_EL1.ZEN](#), for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL1.
- [CPTR_EL2.ZEN](#) and [CPTR_EL2.TZ](#), for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR_EL3.EZ](#), for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

ISS encoding for a PMU exception

**Bits [24:1]**

Reserved, RES0.

SYNC, bit [0]

Indicates whether the exception was taken synchronously or asynchronously.

SYNC	Meaning	Applies when
0b0	The exception was taken asynchronously because an overflow status flag was set.	
0b1	The exception was taken synchronously because PSTATE.PPEND was set.	When FEAT_SEBEP is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about PC alignment fault exceptions, see 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from the Memory Copy and Memory Set instructions

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																									
MemInst					isSETG					Options					FromEpilogue					WrongOption					OptionA					RES0					destreg					srcreg					sizereg				

MemInst, bit [24]

Indicates the memory instruction class causing the exception.

MemInst	Meaning
0b0	CPYFE*, CPYFM*, CPYE*, and CPYM* instructions.
0b1	SETE*, SETM*, SETGE*, and SETGM* instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

isSETG, bit [23]

Indicates whether the instruction belongs to SETGM* or SETGE* class of instruction.

isSETG	Meaning
0b0	Not a SETGM* or SETGE* instruction.
0b1	SETGM* or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Options, bits [22:19]

Options : the Options field of the instruction.

For Memory Copy instructions, bits[22:19] forms the Options field, which holds the bits[15:12] of the instruction.

For Memory Set instructions:

- Bits[22:21] are RES0.
- Bits[20:19] form the Options field, which holds the bits[13:12] of the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FromEpilogue, bit [18]

Indicates whether the instruction belongs to the epilogue class of Memory Copy or Memory Set instructions.

FromEpilogue	Meaning
0b0	Not an epilogue instruction.
0b1	CPYE*, CPYFE*, SETE*, or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WrongOption, bit [17]

Algorithm option.

WrongOption	Meaning
0b0	WrongOption is false.
0b1	WrongOption is true.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OptionA, bit [16]

Algorithm type indicated by the PSTATE.C bit.

OptionA	Meaning
0b0	OptionB indicated by PSTATE.C is 0.
0b1	OptionA indicated by PSTATE.C is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

destreg, bits [14:10]

The destination register value from the issued instruction, containing the destination address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

srcreg, bits [9:5]

The source register value from the issued instruction, containing either the source address or the source data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

sizereg, bits [4:0]

The size register value from the issued instruction, containing the number of bytes to be transferred or set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from HVC or SVC instruction execution

**Bits [24:16]**

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
 - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
 - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, [HFGITR_EL2](#).{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				CCKNOWNPASS				RES0															

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR_EL2.TSC](#) is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

Note

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

[HCR_EL2](#).TSC describes the configuration settings for trapping SMC instructions to EL2.

ISS encoding for an exception from SMC instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										imm16														

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

[HCR_EL2](#).TSC describes the configuration settings for trapping SMC from EL1 modes.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
RES0		Op0		Op2		Op1		CRn		Rt		CRm		Direction											

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- If FEAT_TIDCP1 is implemented, [SCTLR_EL1](#).TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL1.
- [SCTLR_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).UCT, for accesses to [CTR_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TLTB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- If FEAT_TIDCP1 is implemented, [SCTLR_EL2](#).TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TCPAC, for accesses to [CPACR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TTRF, for accesses to the trace filter control register, [TRFCR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR_EL2](#).AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.

- [HCR_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR_EL3](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR_EL3](#).ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR_EL3](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TCPAC, for accesses to [CPTR_EL2](#) and [CPACR_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TTRF, for accesses to the trace filter control registers, [TRFCR_EL1](#) and [TRFCR_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
 - [HCR_EL2](#).{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
 - [HCR2](#).{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT_FGT is implemented:
 - [SCR_EL3](#).FGTE, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
 - [HFGTR_EL2](#) for reads and [HFGWTR_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
 - [HFGITR_EL2](#) for execution of system instructions, MSR or MRS access trapped to EL2
 - [HDFGTR_EL2](#) for reads and [HDFGWTR_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
 - [HAFGTR_EL2](#) for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.
- If FEAT_RNG_TRAP is implemented:
 - [SCR_EL3](#).TRNDR for reads of [RNDR](#) and [RNDRRS](#) using AArch64 state, MRS access trapped to EL3.
- If FEAT_SME is implemented:
 - [CPTR_EL3](#).ESM, for MSR or MRS accesses to [SMPRI_EL1](#) at EL1, EL2, and EL3, trapped to EL3.
 - [CPTR_EL3](#).ESM, for MSR or MRS accesses to [SMPRMAP_EL2](#) at EL2 and EL3, trapped to EL3.
 - [SCTLR_EL1](#).EnTP2, for MSR or MRS accesses to [TPIDR2_EL0](#) at EL0, trapped to EL1 or EL2.
 - [SCTLR_EL2](#).EnTP2, for MSR or MRS accesses to [TPIDR2_EL0](#) at EL0, trapped to EL2.
 - [SCR_EL3](#).EnTP2, for MSR or MRS accesses to [TPIDR2_EL0](#) at EL0, EL1, and EL2, trapped to EL3.
- If FEAT_NMI is implemented, [HCRX_EL2](#).TALLINT, for MSR writes of [ALLINT](#) at EL1, trapped to EL2.

ISS encoding for an exception from MSRR, an MRRS, Instruction or 128-bit System instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0		Op0SET		Op2FnV		Op1EA		CRnRES0		RtS1PTW		RES0		CRmIFSC		Direction								

Bits [24:22:13]

Reserved, RES0.

Op0, bits [21:20]**SET, bits [12:11]****When FEAT_RAS is implemented:**

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The Op0 value from the issued instruction.

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]**Otherwise:**

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:6]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

Note

This value represents register pair of X[Rt:0], X[Rt:1].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is

0b011111	hardware update of translation table, level 2. Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	not implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RAS is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address-size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRmFnV, bitsbit [4:110]

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The FAR CRmnot valueValid, fromfor thea issuedsynchronous instruction.External abort other than a synchronous External abort on a translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DirectionEA, bit [09]

Indicates the direction of the trapped instruction.

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

Direction	Meaning
0b0	Write access, MSRR instructions.
0b1	Read access, MRRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from due ante InstructionSME Abortfunctionality

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TopLevelSMTC			RES0				SET	FnV	EARES0	S1PTW	RES0										IFSC		

WhenThe accesses covered by this trap include: FEAT_THE is implemented, if a memory access generates an Instruction Abort for AssuredOnly, the ISS2 encoding for an exception from an Instruction Abort includes further information about the exception.

- Execution of SME instructions.
- Execution of SVE and Advanced SIMD instructions, when the PE is in Streaming SVE mode.
- Direct accesses of [SVCR](#), [SMCR_EL1](#), [SMCR_EL2](#), [SMCR_EL3](#).

When FEAT_S1POE or FEAT_S2POE is implemented, if a memory access generates an Instruction Abort due to a Permission fault, the ISS2 encoding for an exception from an Instruction Abort includes further information about the exception.

Bits [24:223]

Reserved, RES0.

TopLevelSMTC, bitbits [212:0]**When FEAT_THE is implemented:**

IndicatesSME ifTrap Code. Identifies the faultreason wasfor dueinstruction to TopLevel.trapping.

0b010	SME instruction trapped because PSTATE.SM is 0.
0b011	SME instruction trapped because PSTATE.ZA is 0.
TopLevelSMTC	Meaning
0b00b000	Fault is not due to VTCR_EL2.TL0 or VTCR_EL2.TL1 Access to SME functionality trapped as a result of CPACR_EL1.SMEN , CPTR_EL2.SMEN , CPTR_EL2.TSM , or CPTR_EL3.ESM , that is not reported using EC 0b000000.
0b10b001	FaultAdvanced SIMD, SVE, or SVE2 instruction trapped because PSTATE.SM is due to 1, VTCR_EL2.TL0 or VTCR_EL2.TL1

TheAll resetother behaviorvalues ofare this field is:reserved.

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using the EC value 0b011101:

- **CPACR_EL1.SMEN**, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access **SVCR** and **SMCR_EL1** System registers at EL1 and EL0, trapped to EL1 or EL2.
- **CPTR_EL2.SMEN** and **CPTR_EL2.TSM**, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access **SVCR**, **SMCR_EL1**, **SMCR_EL2** at EL2, EL1, or EL0, trapped to EL2.
- **CPTR_EL3.ESM**, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access **SVCR**, **SMCR_EL1**, **SMCR_EL2**, **SMCR_EL3** from all Exception levels and any Security state, trapped to EL3.

Otherwise:

Reserved, RES0.

Bits [20:13]

Reserved, RES0.

SET, bits [12:11]**When FEAT_RAS is implemented and IFSC == 0b010000:**

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]**When IFSC == 0b010000:**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is not implemented

0b011110	hardware update of translation table, level 1. Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The lookup level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception due from a SME Granule functionality Protection Check

Bits [24:22]

The accesses covered by this trap include:

- Execution of SME instructions.
- Execution of SVE and Advanced SIMD instructions, when the PE is in Streaming SVE mode.
- Direct accesses of [SVCR](#), [SMCR_EL1](#), [SMCR_EL2](#), [SMCR_EL3](#).

Bits [24:3]

Reserved, RES0.

SMTC S2PTW, bits [2:0]

SMTC indicates whether Code the Identifies Granule the Protection reason Check exception was on an access made for instruction a trapping stage 2 translation table walk.

SMTC S2PTW	Meaning	Applies when
0b0000b0	Access Fault to not SME on functionality a trapped stage as 2 a translation result table of walk. CPACR_EL1.SMEN , CPTR_EL2.SMEN , CPTR_EL2.TSM , or CPTR_EL3.ESM , that is not reported using EC 0b000000.	
0b0010b1	Advanced Fault SIMD, on SVE, a or stage SVE2 instruction translation trapped table because PSTATE.SM is 1. walk.	
0b010	SME instruction trapped because PSTATE.SM is 0.	
0b011	SME instruction trapped because PSTATE.ZA is 0.	
0b100	Access to the SME2 ZT0 register trapped as a result of SMCR_EL1.EZT0 , SMCR_EL2.EZT0 , or SMCR_EL3.EZT0 .	When FEAT_SME2 is implemented

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

All The other reset values behavior are of reserved. this field is:

InD, bit [20]

Indicates whether the Granule Protection Check exception was on an instruction or data access.

InD	Meaning
0b0	Data access.
0b1	Instruction access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GPCSC, bits [19:14]

Granule Protection Check Status Code.

GPCSC	Meaning
0b000000	GPT address size fault at level 0.
0b000100	GPT walk fault at level 0.
0b000101	GPT walk fault at level 1.
0b001100	Granule protection fault at level 0.
0b001101	Granule protection fault at level 1.
0b010100	Synchronous External abort on GPT fetch at level 0.
0b010101	Synchronous External abort on GPT fetch at level 1.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VNCR, bit [13]**When FEAT_NV2 is implemented:**

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

When InD is '1', this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction.

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

Indicates whether the Granule Protection Check exception was on an access for stage 2 translation for a stage 1 translation table walk.

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

When InD is '1', this field is RES0.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

xFSC, bits [5:0]

Instruction or Data Fault Status Code.

xFSC	Meaning	Applies when
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using the EC value 0b011101:

- CPACR_EL1.SMEN, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access [SVC](#)R and [SMCR_EL1](#) System registers at EL1 and EL0, trapped to EL1 or EL2.
- CPTR_EL2.SMEN and CPTL_EL2.TSM, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access [SVC](#)R, [SMCR_EL1](#), [SMCR_EL2](#) at EL2, EL1, or EL0, trapped to EL2.
- CPTR_EL3.ESM, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access [SVC](#)R, [SMCR_EL1](#), [SMCR_EL2](#), [SMCR_EL3](#) from all Exception levels and any Security state, trapped to EL3.
- If FEAT_SME2 is implemented:
 - [SMCR_EL1](#).EZT0, for accesses to ZT0 at EL1 and EL0, trapped to EL1 or EL2.
 - [SMCR_EL2](#).EZT0, for accesses to ZT0 at EL2, EL1, and EL0, trapped to EL2.
 - [SMCR_EL3](#).EZT0, for accesses to ZT0 at any Exception level, trapped to EL3.

ISS encoding for an exception from a GranuleData Protection CheckAbort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	S2PTW	Ind					GPCSC			VNCR		RES0		CM	S1PTW	WnR								
24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	SSE				SRT			Bit[15]	AR	VNCR	Bits[12:11]	FnV	EA	CM	S1PTW	WnR							DFSC

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
 - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
 - Is not performing register writeback.
 - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_MOPS is implemented, for a synchronous Data Abort on a Memory Copy and Memory Set instruction, ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]**When ISV == 1:**

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:**Bits [24:22]**

Reserved, RES0.

Otherwise:

Reserved, RES0.

Bit[15]**When ISV == 1:****SF, bit [0] of bit [15]**

Sixty Four bit general-purpose register transfer. Width of the register accessed by the instruction is 64-bit.

SF	Meaning
0b0	Instruction loads/stores a 32-bit general-purpose register.
0b1	Instruction loads/stores a 64-bit general-purpose register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ISV == 0 and FEAT_SME is implemented:

FnP, bit [0] of bit [15]

FAR not Precise.

FnP	Meaning
0b0	The FAR holds the faulting virtual address that generated the Data Abort.
0b1	The FAR holds any virtual address within the naturally-aligned granule that contains the faulting virtual address that generated a Data Abort due to an SVE contiguous vector load/store instruction in Streaming SVE mode, or an SME load/store instruction. For more information about the naturally-aligned fault granule, see FAR_ELx (for example, FAR_EL1).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AR, bit [14]

When ISV == 1:

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S2PTW, bit [21]**SSE, bit [21]****When ISV == 1:**

Indicates Syndrome whether Sign the Extend. Granule For Protection a Check byte, exception halfword, was or on word an load access operation, made indicates for whether a the staged data 2 item translation must table be walk sign extended.

S2PTWSSE	Meaning
0b0	Fault Sign-extension not on a stage 2 translation table walk required.
0b1	Fault Data on item a must stage be 2 translation table walk sign extended.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [20]**Otherwise:**

Indicates whether the Granule Protection Check exception was on an instruction or data access.

Reserved, RES0.

InD	Meaning
0b0	Data access.
0b1	Instruction access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GPCSC, bits [19:14]**SRT, bits [20:16]****When ISV == 1:**

GranuleSyndrome ProtectionRegister CheckTransfer. StatusThe Code.register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

GPCSC	Meaning
0b000000	GPT address size fault at level 0.
0b000100	GPT walk fault at level 0.
0b000101	GPT walk fault at level 1.
0b001100	Granule protection fault at level 0.
0b001101	Granule protection fault at level 1.
0b010100	Synchronous External abort on GPT fetch at level 0.
0b010101	Synchronous External abort on GPT fetch at level 1.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VNCR, bit [13]**When FEAT_NV2 is implemented:**

Indicates that the fault came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

When InD is '1', this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LST, bits [1:0] of bits [12:11]

Load/Store Type. Used when a Translation fault, Access flag fault, or Permission fault generates a Data Abort.

LST	Meaning	Applies when
0b00	The instruction that generated the Data Abort is not specified.	
0b01	An ST64BV instruction generated the Data Abort.	When FEAT_LS64_V is implemented
0b10	An LD64B or ST64B instruction generated the Data Abort.	When FEAT_LS64 is implemented
0b11	An ST64BV0 instruction generated the Data Abort.	When FEAT_LS64_ACCDATA is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RAS is implemented and DFSC == 0b010000:

SET, bits [1:0] of bits [12:11]

Synchronous Error Type. Used when a Synchronous External abort, not on a Translation table walk or hardware update of the Translation table, generated the Data Abort. Describes the PE error state after taking the Data Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Bits [12:9]

Bits[12:11]

When (DFSC == 0b00xxxx || DFSC == 0b101011) && DFSC != 0b0000xx:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

IndicatesFor a stage 2 fault, indicates whether the Granulefault Protectionwas Checka exceptionstage was2 fault on an access for stage 2 translationmade for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

When InD is '1', this field is RES0.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

xFSCDFSC, bits [5:0]

Instruction or Data Fault Status Code.

0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented

0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
xFSCDFSC	Meaning	Applies when
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The **lookup** level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	Bit[21]		SRT		Bit[15]	AR	VNCR	Bits[12:11]	FnV	EA	CM	S1PTW	WnR							DFSC			

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, this ISS encoding includes ISS2, bits[36:32].

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, this ISS encoding includes ISS2, bits[36:32].

When FEAT_THE is implemented, if a memory access generates a Data Abort for AssuredOnly, the ISS2 encoding for an exception from a Data Abort includes further information about the exception.

When FEAT_S1POE or FEAT_S2POE is implemented, if a memory access generates a Data Abort due to a Permission fault, the ISS2 encoding for an exception from a Data Abort includes further information about the exception.

When FEAT_S1PIE or FEAT_S2PIE is implemented, if a memory write access generates a Data Abort due to a Permission fault, the ISS2 encoding for an exception from a Data Abort includes further information about the exception.

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
 - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
 - Is not performing register writeback.
 - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_MOPS is implemented, for a synchronous Data Abort on a Memory Copy and Memory Set instruction, ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

When ISV == 1:

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[21]

When ISV == 1:

SSE, bit [0] of bit [21]

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ISV == 0 and FEAT_THE is implemented:

TopLevel, bit [0] of bit [21]

Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SRT, bits [20:16]

When ISV == 1:

Syndrome Register Transfer. The register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[15]**When ISV == 1:****SF, bit [0] of bit [15]**

Sixty Four bit general-purpose register transfer. Width of the register accessed by the instruction is 64-bit.

SF	Meaning
0b0	Instruction loads/stores a 32-bit general-purpose register.
0b1	Instruction loads/stores a 64-bit general-purpose register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ISV == 0:**FnP, bit [0] of bit [15]**

FAR not Precise.

FnP	Meaning	Applies when
0b0	The FAR holds the faulting virtual address that generated the Data Abort.	
0b1	The FAR holds any virtual address within the naturally-aligned granule that contains the faulting virtual address that generated a Data Abort due to an SVE contiguous vector load/store instruction, or an SME load/store instruction. For more information about the naturally-aligned fault granule, see FAR_ELx (for example, FAR_EL1).	When FEAT_SME is implemented or FEAT_SVE is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AR, bit [14]**When ISV == 1:**

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VNCR, bit [13]**When FEAT_NV2 is implemented:**

Indicates that the fault came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits[12:11]**When (DFSC == 0b00xxxx || DFSC == 0b101011) && DFSC != 0b0000xx:****LST, bits [1:0] of bits [12:11]**

Load/Store Type. Used when a Translation fault, Access flag fault, or Permission fault generates a Data Abort.

LST	Meaning	Applies when
0b00	The instruction that generated the Data Abort is not specified.	
0b01	An ST64BV instruction generated the Data Abort.	When FEAT_LS64_V is implemented
0b10	An LD64B or ST64B instruction generated the Data Abort.	When FEAT_LS64 is implemented
0b11	An ST64BV0 instruction generated the Data Abort.	When FEAT_LS64_ACCDATA is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RAS is implemented and DFSC == 0b010000:**SET, bits [1:0] of bits [12:11]**

Synchronous Error Type. Used when a Synchronous External abort, not on a Translation table walk or hardware update of the Translation table, generated the Data Abort. Describes the PE error state after taking the Data Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented

0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The lookup level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV							RES0						VECITR	IDF	RES0	IXF	UFF	OFF	DZF	IOF			

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from an instruction that is performing floating-point operations on more than one lane of a vector.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from an instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the [FPSCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDS	RES0										IESB	AET		EA	RES0		DFSC							

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
Note If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]**When FEAT_IESB is implemented and DFSC == 0b010001:**

Implicit error synchronization event.

IESB	Meaning
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]**When FEAT_RAS is implemented and DFSC == 0b010001:**

Asynchronous Error Type.

Describes the PE error state after taking the SError interrupt exception.

AET	Meaning
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]**When FEAT_RAS is implemented and DFSC == 0b010001:**

External abort type. Provides an IMPLEMENTATION DEFINED classification of External aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]**When FEAT_RAS is implemented:**

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
RES0																				IFSC							

Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

ISS encoding for an exception from a Software Step exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	RES0														EX		IFSC							

ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Software Step exceptions'.

ISS encoding for an exception from a Watchpoint exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	WPT					WPTV		WPF	FnP	RES0	VNCR	RES0	FnV	RES0	CM	RES0	WnR	DFSC						

Bit [24]

Reserved, RES0.

WPT, bits [23:18]

When FEAT_SME is implemented or FEAT_Debugv8p9 is implemented:

Watchpoint **number**. ~~number, 0 to 15 inclusive.~~

All other values are reserved.

Otherwise:

Reserved, RES0.

WPTV, bit [17]

When FEAT_SME is implemented or FEAT_Debugv8p9 is implemented:

Watchpoint number Valid.

WPTV	Meaning	Applies when
0b0	The WPT field is invalid, and holds an UNKNOWN value.	When FEAT_SME is implemented and FEAT_Debugv8p9 is not implemented
0b1	The WPT field is valid, and holds the number of a watchpoint that triggered a Watchpoint exception.	

When a Watchpoint exception is triggered by a watchpoint match:

- If the PE sets any of FnV, FnP, or WPF to 1, then the PE sets WPTV to 1.
- If the PE sets all of FnV, FnP, and WPF to 0, then the PE sets WPTV to an IMPLEMENTATION DEFINED value, 0 or 1.

Otherwise:

Reserved, RES0.

WPF, bit [16]

When FEAT_SME is implemented or FEAT_Debugv8p9 is implemented:

Watchpoint might be false-positive.

WPF	Meaning	Applies when
0b0	The watchpoint matched the original address of the access or set of contiguous accesses.	
0b1	The watchpoint matched an access or set of contiguous accesses where the lowest accessed address was rounded down to the nearest multiple of 16 bytes and the highest accessed address was rounded up to the nearest multiple of 16 bytes minus 1, but the watchpoint might not have matched the original address of the access or set of contiguous accesses.	When (FEAT_SVE is implemented and FEAT_Debugv8p9 is implemented) or FEAT_SME is implemented

Otherwise:

Reserved, RES0.

FnP, bit [15]**When FEAT_SME is implemented or FEAT_Debugv8p9 is implemented:**

FAR not Precise.

This field only has meaning if the FAR is valid; that is, when the FnV field is 0. If the FnV field is 1, the FnP field is 0.

FnP	Meaning	Applies when
0b0	If the FnV field is 0, the FAR holds the virtual address of an access or set of contiguous accesses that triggered a Watchpoint exception.	
0b1	The FAR holds any address within the smallest implemented translation granule that contains the virtual address of an access or set of contiguous accesses that triggered a Watchpoint exception.	When (FEAT_SVE is implemented and FEAT_Debugv8p9 is implemented) or FEAT_SME is implemented

Otherwise:

Reserved, RES0.

Bit [14]

Reserved, RES0.

VNCR, bit [13]**When FEAT_NV2 is implemented:**

Indicates that the watchpoint came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:11]

Reserved, RES0.

FnV, bit [10]

When FEAT_SME is implemented or FEAT_Debugv8p9 is implemented:

FAR not Valid.

FnV	Meaning	Applies when
0b0	The FAR is valid, and its value is as described by the FnP field.	
0b1	The FAR is invalid, and holds an UNKNOWN value.	When (FEAT_SVE is implemented and FEAT_Debugv8p9 is implemented) or FEAT_SME is implemented

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by the execution of a cache maintenance instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

ISS encoding for an exception from execution of a Breakpoint instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										Comment														

Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																							ERET	ERETA

This EC value applies when FEAT_FGT is implemented, or when [HCR_EL2.NV](#) is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETAA* instruction was trapped to EL2.

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [HCR_EL2.NV](#).

If FEAT_FGT is implemented, [HFGITR_EL2.ERET](#) controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

ISS encoding for an exception from a TSTART instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0															Rd					RES0				

Bits [24:10]

Reserved, RES0.

Rd, bits [9:5]

The Rd value from the issued instruction, the general purpose register used for the destination.

Bits [4:0]

Reserved, RES0.

ISS encoding for an exception from Branch Target Identification instruction**Bits [24:2]**

Reserved, RES0.

BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0**Bits [24:0]**

Reserved, RES0.

For more information about generating these exceptions, see:

- [HCR_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure**Bits [24:2]**

Reserved, RES0.

Bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

	Meaning
0b0	Instruction Key.
0b1	Data Key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a Translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing ESR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic ESR_EL2 or ESR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ESR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0010	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;

ESR_EL3, Exception Syndrome Register (EL3)

The ESR_EL3 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to ESR_EL3 are UNDEFINED.

Attributes

ESR_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0								ISS2																								
EC						IL	ISS																									
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

ESR_EL3 is made UNKNOWN as a result of an exception return from EL3.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL3, the value of ESR_EL3 is UNKNOWN. The value written to ESR_EL3 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:5637]

Reserved, RES0.

Otherwise:

Reserved, RES0.

ISS2, bits [55:32]

ISS2, bits [36:32]

When FEAT_LS64 is implemented:

ISS2 encoding for an exception, the bit assignments are:

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

Otherwise, this field is RES0.

ISS2 encoding for an exception from a Data Abort (EC == 0b100100 or EC == 0b100101)

Bits [23:10]

Reserved, RES0.

TagAccess, bit [9]

When FEAT_MTE_PERM is implemented:

NoTagAccess fault.

If a memory access generates a Data Abort for a Permission fault, this field indicates whether the fault is due to the NoTagAccess memory attribute.

TagAccess	Meaning
0b0	Permission fault is not due to the NoTagAccess memory attribute.
0b1	Permission fault is due to the NoTagAccess memory attribute.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:7]

Reserved, RES0.

Overlay, bit [6]

When FEAT_S1POE is implemented:

Overlay flag.

If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]**When FEAT_S1PIE is implemented:**

DirtyBit flag.

If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Xs, bits [4:0]**When FEAT_LS64 is implemented:**

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

Otherwise, this field is RES0.

Otherwise:

Reserved, RES0.

ISS2 encoding for an exception from an Instruction Abort (EC == 0b100000 or EC == 0b100001)**Bits [23:7]**

Reserved, RES0.

Overlay, bit [6]**When FEAT_S1POE is implemented or FEAT_S2POE is implemented:**

Overlay flag.

If a memory access generates a Instruction Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Instruction Abort is not due to Overlay Permissions.
0b1	Instruction Abort due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:0]

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WF* instruction	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: <ul style="list-style-type: none"> An STC to write data to memory from DBGDTRRXint. An LDC to read data from memory to DBGDTRTXint. 	ISS encoding for an exception from an LDC or STC instruction	When AArch32 is supported
0b000111	Access to SME, SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN , CPTR_EL2.FPEN , CPTR_EL2.TFP , or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000.	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps	
0b001001	Trapped use of a Pointer authentication instruction because HCR_EL2.API == 0 SCR_EL3.API == 0.	ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 SCR_EL3.API == 0	When FEAT_PAuth is implemented

0b001010	An exception from an LD64B or ST64B* instruction.	ISS encoding for an exception from an LD64B or ST64B* instruction	When FEAT_LS64 is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported
0b001101	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b010011	SMC instruction execution in AArch32 state, when SMC is not disabled.	ISS encoding for an exception from SMC instruction execution in AArch32 state	When AArch32 is supported
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported
0b010110	HVC instruction execution in AArch64 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported
0b010111	SMC instruction execution in AArch64 state, when SMC is not disabled.	ISS encoding for an exception from SMC instruction execution in AArch64 state	When AArch64 is supported
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	When AArch64 is supported
0b011001	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.	ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	When FEAT_SVE is implemented

0b011011	Exception from an access to a TSTART instruction at EL0 when SCTLR_EL1.TME0 == 0, EL0 when SCTLR_EL2.TME0 == 0, at EL1 when SCTLR_EL1.TME == 0, at EL2 when SCTLR_EL2.TME == 0 or at EL3 when SCTLR_EL3.TME == 0.	ISS encoding for an exception from a TSTART instruction	When FEAT_TME is implemented
0b011100	Exception from a Pointer Authentication instruction authentication failure	ISS encoding for an exception from a Pointer Authentication instruction authentication failure	When FEAT_FPAC is implemented
0b011101	Access to SME functionality trapped as a result of CPACR_EL1.SMEN , CPTR_EL2.SMEN , CPTR_EL2.TSM , CPTR_EL3.ESM , or an attempted execution of an instruction that is illegal because of the value of PSTATE.SM or PSTATE.ZA, that is not reported using EC 0b000000.	ISS encoding for an exception due to SME functionality	When FEAT_SME is implemented
0b011110	Exception from a Granule Protection Check	ISS encoding for an exception from a Granule Protection Check	When FEAT_RME is implemented
0b011111	IMPLEMENTATION DEFINED exception to EL3.	ISS encoding for an IMPLEMENTATION DEFINED exception to EL3	
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including	ISS encoding for an exception from an Instruction Abort	

0b100010	synchronous parity or ECC errors. Not used for debug-related exceptions. PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100100	Data Abort exception from a lower Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	
0b100101	Data Abort exception taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100111	Memory Operation Exception.	ISS encoding for an exception from the Memory Copy and Memory Set instructions	When FEAT_MOPS is implemented
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point	ISS encoding for an exception from a trapped floating-point exception	When AArch64 is supported

	implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.		
0b101111	SError interrupt.	ISS encoding for an SError interrupt	
0b111100	BRK instruction execution in AArch64 state. This is reported in ESR_EL3 only if a BRK instruction is executed in EL3. This is the only debug exception that can be taken to EL3 when EL3 is using AArch64.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch64 is supported
0b111101	PMU exception	ISS encoding for a PMU exception	When FEAT_EBEP is implemented

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: <ul style="list-style-type: none"> • An SError interrupt. • An Instruction Abort exception. • A PC alignment fault exception. • An SP alignment fault exception. • A Data Abort exception for which the value of the ISV bit is 0. • An Illegal Execution state exception. • Any debug exception except for Breakpoint instruction exceptions. • An exception reported using EC value 0b000000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
 - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
 - The value 0b11111.

ISS encoding for exceptions with an unknown reason

Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
 - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
 - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
 - Instruction encodings that are unallocated.
 - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR_EL1](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
 - An HVC instruction when disabled by [HCR_EL2](#).HCD or [SCR_EL3](#).HCE.
 - An SMC instruction when disabled by [SCR_EL3](#).SMD.
 - An HLT instruction when disabled by [EDSCR](#).HDE.
- Attempted execution of an MSR or MRS instruction to access [SP_EL0](#) when the value of [SPSel](#).SP is 0.
- Attempted execution of an MSR or MRS instruction using a [_EL12](#) register name when [HCR_EL2](#).E2H == 0.
- Attempted execution, in Debug state, of:
 - A DCPS1 instruction when the value of [HCR_EL2](#).TGE is 1 and EL2 is disabled or not implemented in the current Security state.
 - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
 - A DCPS3 instruction when the value of [EDSCR](#).SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using [R13_mon](#).
- In Debug state when the value of [EDSCR](#).SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to [SPSR_mon](#), [SP_mon](#), or [LR_mon](#).

- An exception that is taken to EL2 because the value of [HCR_EL2.TGE](#) is 1 that, if the value of [HCR_EL2.TGE](#) was 0 would have been reported with an ESR_ELx.EC value of 0b000111.
- In Non-transactional state, attempted execution of a TCOMMIT instruction.

ISS encoding for an exception from a WF* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0										RN				RES0		RV	TI		

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:10]

Reserved, RES0.

RN, bits [9:5]**When FEAT_WFxT is implemented:**

Register Number. Indicates the register number supplied for a WFET or WFIT instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

RV, bit [2]**When FEAT_WFxT is implemented:**

Register field Valid.

If TI[1] == 1, then this field indicates whether RN holds a valid register number for the register argument to the trapped WFET or WFIT instruction.

RV	Meaning
0b0	Register field invalid.
0b1	Register field valid.

If TI[1] == 0, then this field is RES0.

This field is set to 1 on a trap on WFET or WFIT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFxT is implemented
0b11	WFET trapped.	When FEAT_WFxT is implemented

When FEAT_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- [SCTLR_EL1](#).{nTWE, nTWI}.
- [HCR_EL2](#).{TWE, TWI}.

- [SCR_EL3](#).{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc2			Opc1			CRn			Rt			CRm			Direction				

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

If the Rt value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- If FEAT_TIDCP1 is implemented, [SCTLR_EL1](#).TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1.
- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- If FEAT_TIDCP1 is implemented, [SCTLR_EL2](#).TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TCPAC, for accesses to [CPACR_EL1](#) or [CPACR](#) using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HSTR_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL_EL2](#).EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL3](#).TCPAC, for accesses to [CPACR](#) from EL1 and EL2, and accesses to [HCPTR](#) from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- If FEAT_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [CPACR_EL1](#).TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDSCR_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [HCR_EL2](#).TID0, for accesses to the [JIDR](#) register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL2](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and [DBGDSAR](#) using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL3](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR_EL3](#).TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

- [MDCR_EL3](#).TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- [HCR_EL2](#).TID0, for accesses to the [FPSID](#) register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- [HCR_EL2](#).TID3, for accesses to registers in ID group 3 including [MVFR0](#), [MVFR1](#) and [MVFR2](#), VMRS access trapped to EL2.

ISS encoding for an exception from an LD64B or ST64B* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
													ISS											

ISS, bits [24:0]

ISS	Meaning	Applies when
0b000000000000000000000000000000	ST64BV instruction trapped.	When FEAT_LS64_V is implemented
0b000000000000000000000000000001	ST64BV0 instruction trapped.	When FEAT_LS64_ACCDATA is implemented
0b000000000000000000000000000010	LD64B or ST64B instruction trapped.	When FEAT_LS64 is implemented

All other values are reserved.

ISS encoding for an exception from an MCRR or MRRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc1			RES0	Rt2				Rt			CRm			Direction					

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

If the Rt2 value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt2 value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b1111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b1111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

If the Rt value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [HSTR_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT_FGT is implemented, [HDFGRTR_EL2](#).PMCCNTR_EL0 for MRRC access and [HDFGWTR_EL2](#).PMCCNTR_EL0 for MCRR access to [PMCCNTR](#) at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- [MDSCR_EL1](#).TDCC, for accesses to the Debug ROM registers [DBGDSAR](#) and [DBGDRAR](#) at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and [DBGDSAR](#) using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL3](#).TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- [CPACR_EL1](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [CPTR_EL2](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL3](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

ISS encoding for an exception from an LDC or STC instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				imm8								RES0			Rn				Offset		AM		Direction

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer.

If the Rn value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rn value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b1111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b1111.

See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- [MDSCR_EL1](#).TDCC, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) trapped to EL1 or EL2.
- [MDCR_EL2](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL2.
- [MDCR_EL3](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL3.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.
- Execution of SME instructions.

For an implementation that does not include either SVE or support for Advanced SIMD and floating-point, the exception is reported using the EC value 0b000000.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000111:

- [CPACR_EL1.FPEN](#), for accesses to SIMD and floating-point registers trapped to EL1.
- [CPTR_EL2.FPEN](#) and [CPTR_EL2.TFP](#), for accesses to SIMD and floating-point registers trapped to EL2.
- [CPTR_EL3.TFP](#), for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

The accesses covered by this trap include:

- Execution of SVE instructions when the PE is not in Streaming SVE mode.
- Accesses to the SVE System registers, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

Bits [24:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b011001:

- [CPACR_EL1.ZEN](#), for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL1.
- [CPTR_EL2.ZEN](#) and [CPTR_EL2.TZ](#), for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR_EL3.EZ](#), for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

ISS encoding for a PMU exception

Bits [24:1]

Reserved, RES0.

SYNC, bit [0]

Indicates whether the exception was taken synchronously or asynchronously.

SYNC	Meaning	Applies when
0b0	The exception was taken asynchronously because an overflow status flag was set.	
0b1	The exception was taken synchronously because PSTATE.PPEND was set.	When FEAT_SEBEP is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about PC alignment fault exceptions, see 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from the Memory Copy and Memory Set instructions

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MemInst	isSETG	Options	FromEpilogue	WrongOption	OptionA	RES0	destreg	srcreg	sizereg															

MemInst, bit [24]

Indicates the memory instruction class causing the exception.

MemInst	Meaning
0b0	CPYFE*, CPYFM*, CPYE*, and CPYM* instructions.
0b1	SETE*, SETM*, SETGE*, and SETGM* instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

isSETG, bit [23]

Indicates whether the instruction belongs to SETGM* or SETGE* class of instruction.

isSETG	Meaning
0b0	Not a SETGM* or SETGE* instruction.
0b1	SETGM* or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Options, bits [22:19]

Options : the Options field of the instruction.

For Memory Copy instructions, bits[22:19] forms the Options field, which holds the bits[15:12] of the instruction.

For Memory Set instructions:

- Bits[22:21] are RES0.
- Bits[20:19] form the Options field, which holds the bits[13:12] of the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FromEpilogue, bit [18]

Indicates whether the instruction belongs to the epilogue class of Memory Copy or Memory Set instructions.

FromEpilogue	Meaning
0b0	Not an epilogue instruction.
0b1	CPYE*, CPYFE*, SETE*, or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WrongOption, bit [17]

Algorithm option.

WrongOption	Meaning
0b0	WrongOption is false.
0b1	WrongOption is true.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OptionA, bit [16]

Algorithm type indicated by the PSTATE.C bit.

OptionA	Meaning
0b0	OptionB indicated by PSTATE.C is 0.
0b1	OptionA indicated by PSTATE.C is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

destreg, bits [14:10]

The destination register value from the issued instruction, containing the destination address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

srcreg, bits [9:5]

The source register value from the issued instruction, containing either the source address or the source data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

sizereg, bits [4:0]

The size register value from the issued instruction, containing the number of bytes to be transferred or set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from HVC or SVC instruction execution

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
 - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
 - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, [HFGITR_EL2](#).{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR_EL2](#).TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

Note

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

[HCR_EL2](#).TSC describes the configuration settings for trapping SMC instructions to EL2.

ISS encoding for an exception from SMC instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										imm16														

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

[HCR_EL2](#).TSC describes the configuration settings for trapping SMC from EL1 modes.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				Op0		Op2		Op1		CRn				Rt				CRm			Direction			

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- If FEAT_TIDCP1 is implemented, [SCTLR_EL1](#).TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL1.
- [SCTLR_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).UCT, for accesses to [CTR_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- [AMUSERENR_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- If FEAT_TIDCP1 is implemented, [SCTLR_EL2](#).TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TCPAC, for accesses to [CPACR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TTRF, for accesses to the trace filter control register, [TRFCR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR_EL2](#).AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR_EL3](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR_EL3](#).ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR_EL3](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TCPAC, for accesses to [CPTR_EL2](#) and [CPACR_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TTRF, for accesses to the trace filter control registers, [TRFCR_EL1](#) and [TRFCR_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
 - [HCR_EL2](#).{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
 - [HCR2](#).{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT_FGT is implemented:

- [SCR_EL3.FGTEn](#), for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
- [HFGTR_EL2](#) for reads and [HFGWTR_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
- [HFGITR_EL2](#) for execution of system instructions, MSR or MRS access trapped to EL2
- [HDFGTR_EL2](#) for reads and [HDFGWTR_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
- [HAFGRTR_EL2](#) for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.
- If FEAT_RNG_TRAP is implemented:
 - [SCR_EL3.TRNDR](#) for reads of [RNDR](#) and [RNDRRS](#) using AArch64 state, MRS access trapped to EL3.
- If FEAT_SME is implemented:
 - [CPTR_EL3.ESM](#), for MSR or MRS accesses to [SMPRI_EL1](#) at EL1, EL2, and EL3, trapped to EL3.
 - [CPTR_EL3.ESM](#), for MSR or MRS accesses to [SMPRMAP_EL2](#) at EL2 and EL3, trapped to EL3.
 - [SCTLR_EL1.EnTP2](#), for MSR or MRS accesses to [TPIDR2_EL0](#) at EL0, trapped to EL1 or EL2.
 - [SCTLR_EL2.EnTP2](#), for MSR or MRS accesses to [TPIDR2_EL0](#) at EL0, trapped to EL2.
 - [SCR_EL3.EnTP2](#), for MSR or MRS accesses to [TPIDR2_EL0](#) at EL0, EL1, and EL2, trapped to EL3.
- If FEAT_NMI is implemented, [HCRX_EL2.TALLINT](#), for MSR writes of [ALLINT](#) at EL1, trapped to EL2.

ISS encoding for an exception from MSRR, MRRS, or 128-bit System instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RES0				Op0			Op2			Op1			CRn			Rt			RES0			CRm			Direction	

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:6]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

Note

This value represents register pair of X[Rt:0], X[Rt:1].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, MSRR instructions.
0b1	Read access, MRRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																								

IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												SET	FnV	EA	RES0	S1PTW	RES0	IFSC						

When FEAT_S1POE or FEAT_S2POE is implemented, if a memory access generates a Instruction Abort due to a Permission fault, the ISS2 encoding for an exception from an Instruction Abort includes further information about the exception.

Bits [24:13]

Reserved, RES0.

SET, bits [12:11]**When FEAT_RAS is implemented:**

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is not implemented

0b011110	hardware update of translation table, level 1. Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The **lookup** level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception due to SME functionality

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																						SMTC		

The accesses covered by this trap include:

- Execution of SME instructions.
- Execution of SVE and Advanced SIMD instructions, when the PE is in Streaming SVE mode.
- Direct accesses of [SVCR](#), [SMCR_EL1](#), [SMCR_EL2](#), [SMCR_EL3](#).

Bits [24:3]

Reserved, RES0.

SMTC, bits [2:0]

SME Trap Code. Identifies the reason for instruction trapping.

SMTC	Meaning	Applies when
0b000	Access to SME functionality trapped as a result of CPACR_EL1 .SMEN, CPTR_EL2 .SMEN, CPTR_EL2 .TSM, or CPTR_EL3 .ESM, that is not reported using EC 0b000000.	
0b001	Advanced SIMD, SVE, or SVE2 instruction trapped because PSTATE.SM is 1.	
0b010	SME instruction trapped because PSTATE.SM is 0.	
0b011	SME instruction trapped because PSTATE.ZA is 0.	
0b100	Access to the SME2 ZT0 register trapped as a result of SMCR_EL1 .EZT0, SMCR_EL2 .EZT0, or SMCR_EL3 .EZT0.	When FEAT_SME2 is implemented

All other values are reserved.

The following fields describe the configuration settings for the traps that are reported using the EC value 0b011101:

- [CPACR_EL1](#).SMEN, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access [SVCR](#) and [SMCR_EL1](#) System registers at EL1 and EL0, trapped to EL1 or EL2.
- [CPTR_EL2](#).SMEN and [CPTR_EL2](#).TSM, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access [SVCR](#), [SMCR_EL1](#), [SMCR_EL2](#) at EL2, EL1, or EL0, trapped to EL2.
- [CPTR_EL3](#).ESM, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access [SVCR](#), [SMCR_EL1](#), [SMCR_EL2](#), [SMCR_EL3](#) from all Exception levels and any Security state, trapped to EL3.
- If FEAT_SME2 is implemented:
 - [SMCR_EL1](#).EZT0, for accesses to ZT0 at EL1 and EL0, trapped to EL1 or EL2.
 - [SMCR_EL2](#).EZT0, for accesses to ZT0 at EL2, EL1, and EL0, trapped to EL2.
 - [SMCR_EL3](#).EZT0, for accesses to ZT0 at any Exception level, trapped to EL3.

ISS encoding for an exception from a Granule Protection Check

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0		S2PTWInD		GPCSC				VNCR		RES0		CMS1PTW		WnR		xFSC								

Bits [24:22]

Reserved, RES0.

S2PTW, bit [21]

Indicates whether the Granule Protection Check exception was on an access made for a stage 2 translation table walk.

S2PTW	Meaning
0b0	Fault not on a stage 2 translation table walk.
0b1	Fault on a stage 2 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [20]

Indicates whether the Granule Protection Check exception was on an instruction or data access.

InD	Meaning
0b0	Data access.
0b1	Instruction access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GPCSC, bits [19:14]

Granule Protection Check Status Code.

GPCSC	Meaning
0b000000	GPT address size fault at level 0.
0b000100	GPT walk fault at level 0.
0b000101	GPT walk fault at level 1.
0b001100	Granule protection fault at level 0.
0b001101	Granule protection fault at level 1.
0b010100	Synchronous External abort on GPT fetch at level 0.
0b010101	Synchronous External abort on GPT fetch at level 1.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VNCR, bit [13]**When FEAT_NV2 is implemented:**

Indicates that the fault came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

When InD is '1', this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

Indicates whether the Granule Protection Check exception was on an access for stage 2 translation for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

When InD is '1', this field is RES0.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

xFSC, bits [5:0]

Instruction or Data Fault Status Code.

xFSC	Meaning	Applies when
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The **lookup** level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	SSE	SRT			Bit[15]			AR	VNCR	Bits[12:11]			FnV	EA	CM	S1PTW	WnR	DFSC					

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, **then** this ISS encoding includes ISS2, bits[36:32].

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, **then** this ISS encoding includes ISS2, bits[36:32].

When FEAT_S1POE is implemented, if a memory access generates a Data Abort due to a Permission fault, the ISS2 encoding for an exception from a Data Abort includes further information about the exception.

When FEAT_S1PIE is implemented, if a memory write access generates a Data Abort due to a Permission fault, the ISS2 encoding for an exception from a Data Abort includes further information about the exception.

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
 - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
 - Is not performing register writeback.
 - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_MTE2 is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FnV is 0 and FAR_ELx is valid.

When FEAT_MOPS is implemented, for a synchronous Data Abort on a Memory Copy and Memory Set instruction, ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

When ISV == 1:

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSE, bit [21]

When ISV == 1:

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SRT, bits [20:16]

When ISV == 1:

Syndrome Register Transfer. The register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[15]

When ISV == 1:

SF, bit [0] of bit [15]

Sixty Four bit general-purpose register transfer. Width of the register accessed by the instruction is 64-bit.

SF	Meaning
0b0	Instruction loads/stores a 32-bit general-purpose register.
0b1	Instruction loads/stores a 64-bit general-purpose register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ISV == 0 and FEAT_SME is implemented:

FnP, bit [0] of bit [15]

FAR not Precise.

FnP	Meaning	Applies when
0b0	The FAR holds the faulting virtual address that generated the Data Abort.	
0b1	The FAR holds any virtual address within the naturally-aligned granule that contains the faulting virtual address that generated a Data Abort due to an SVE contiguous vector load/store instruction in Streaming SVE mode, or an SME load/store instruction. For more information about the naturally-aligned fault granule, see FAR_ELx (for example, FAR_EL1).	When FEAT_SME is implemented or FEAT_SVE is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AR, bit [14]

When ISV == 1:

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VNCR, bit [13]**When FEAT_NV2 is implemented:**

Indicates that the fault came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits[12:11]**When (DFSC == 0b00xxxx || DFSC == 0b101011) && DFSC != 0b0000xx:****LST, bits [1:0] of bits [12:11]**

Load/Store Type. Used when a Translation fault, Access flag fault, or Permission fault generates a Data Abort.

LST	Meaning	Applies when
0b00	The instruction that generated the Data Abort is not specified.	
0b01	An ST64BV instruction generated the Data Abort.	When FEAT_LS64_V is implemented
0b10	An LD64B or ST64B instruction generated the Data Abort.	When FEAT_LS64 is implemented
0b11	An ST64BV0 instruction generated the Data Abort.	When FEAT_LS64_ACCDATA is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RAS is implemented and DFSC == 0b010000:**SET, bits [1:0] of bits [12:11]**

Synchronous Error Type. Used when a Synchronous External abort, not on a Translation table walk or hardware update of the Translation table, generated the Data Abort. Describes the PE error state after taking the Data Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented

ESR_EL3, Exception Syndrome Register (EL3)

0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The **lookup** level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV							RES0						VECITR	IDF	RES0	IXF	UFF	OFF	DZF	IOF			

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from an instruction that is performing floating-point operations on more than one lane of a vector.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from an instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the [FPSCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDS	RES0										IESB	AET		EA	RES0		DFSC							

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
Note If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]**When FEAT_IESB is implemented and DFSC == 0b010001:**

Implicit error synchronization event.

IESB	Meaning
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]**When FEAT_RAS is implemented and DFSC == 0b010001:**

Asynchronous Error Type.

Describes the PE error state after taking the SError interrupt exception.

AET	Meaning
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]**When FEAT_RAS is implemented and DFSC == 0b010001:**

External abort type. Provides an IMPLEMENTATION DEFINED classification of External aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]**When FEAT_RAS is implemented:**

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from execution of a Breakpoint instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										Comment														

Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

ISS encoding for an exception from a TSTART instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0															Rd					RES0				

Bits [24:10]

Reserved, RES0.

Rd, bits [9:5]

The Rd value from the issued instruction, the general purpose register used for the destination.

Bits [4:0]

Reserved, RES0.

ISS encoding for an exception from Branch Target Identification instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																						BTTYPE		

Bits [24:2]

Reserved, RES0.

BTTYPE, bits [1:0]

This field is set to the PSTATE.BTTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

Bits [24:0]

Reserved, RES0.

For more information about generating these exceptions, see:

- [HCR_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure

Bits [24:2]

Reserved, RES0.

Bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

Meaning	
0b0	Instruction Key.
0b1	Data Key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

Meaning	
0b0	A key.
0b1	B key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a Translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing ESR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ESR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = ESR_EL3;
```

MSR ESR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    ESR_EL3 = X[t, 64];
```

FAR_EL1, Fault Address Register (EL1)

The FAR_EL1 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction Abort exceptions, Data Abort exceptions, PC alignment fault exceptions and Watchpoint exceptions that are taken to EL1.

Configuration

AArch64 System register FAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DFAR\[31:0\]](#) (DFAR_NS).

AArch64 System register FAR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [IFAR\[31:0\]](#) (IFAR_NS).

Attributes

FAR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Faulting Virtual Address for synchronous exceptions taken to EL1																															
Faulting Virtual Address for synchronous exceptions taken to EL1																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL1. Exceptions that set the FAR_EL1 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). [ESR_EL1](#).EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL1 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if [ESR_EL1](#).FnV is 0, and FAR_EL1 is UNKNOWN if [ESR_EL1](#).FnV is 1.

If a memory fault that sets FAR_EL1, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL1 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by [DC ZVA](#).

If the exception that updates FAR_EL1 is taken from an Exception level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

When the PE sets [ESR_EL1.{ISV,FnP}](#) to {0,1} on taking a Data Abort exception, or sets [ESR_EL1.{FnV,FnP}](#) to {0,1} on taking a Watchpoint exception, the PE sets FAR_EL1 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Data Abort exception or Watchpoint exception.

~~When FEAT_SME is implemented, and the PE sets [ESR_EL1.ISV](#) to 0 and [ESR_EL1.FnP](#) to 1 on taking a Data Abort exception or Watchpoint exception, the PE sets FAR_EL1 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Data Abort or Watchpoint exception.~~

The naturally-aligned fault granule is one of:

- When ESR_EL1.DFSC is 0b010001, indicating a Synchronous Tag Check fault, it is a 16-byte tag granule.
- When ESR_EL1.DFSC is 0b11010x, indicating an IMPLEMENTATION DEFINED fault, it is an IMPLEMENTATION DEFINED granule.
- Otherwise, it is the smallest implemented translation granule.

When FEAT_MOPS is implemented, the value in FAR_EL1 on a synchronous exception from any of the Memory Copy and Memory Set instructions represents the first element that has not been copied or set, and is determined as follows:

- For a Data Abort generated by the MMU, the value is within the address range of the relevant translation granule, aligned to the size of the relevant translation granule of the address that generated the Data Abort. Bits[(n-1):0] of the value are UNKNOWN, where 2^n is the relevant translation granule size in bytes. For the purpose of calculating the relevant translation granule, if the MMU is disabled for a stage of translation, then the current translation granule size is equal to 2^{64} for stage 1, and the PARange for stage 2. The relevant translation granule is:
 - For MMU faults generated at stage 1, the current stage 1 translation granule.
 - For MMU faults generated at stage 2, the smaller of the current stage 1 translation granule and the current stage 2 translation granule.
 - If FEAT_RME is implemented, for a synchronous data abort generated as the result of a GPF, the smallest of the current stage 1 translation granule, the current stage 2 translation granule and the configured granule size in [GPCCR_EL3.PGS](#).
- For a Data Abort generated by a Tag Check failure, the value is the lowest address that failed the Tag Check within the block size of the load or store.
- For a Watchpoint exception, the value is an address range of the size defined by the [DCZID_ELO.BS](#) field. This address does not need to be the element with a watchpoint, but can be some earlier element.
- Otherwise, the value is the lowest address in the block size of the load or store.

For a Data Abort [exception](#) or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging [in AArch64 state](#)'.

[When FEAT_MTE_TAGGED_FAR is not implemented, on](#)~~For~~ a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL0 makes FAR_EL1 become UNKNOWN.

Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

For all other exceptions taken to EL1, FAR_EL1 is UNKNOWN.

FAR_EL1 is made UNKNOWN on an exception return from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FAR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic FAR_EL1 or FAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, FAR_EL1

op0	op1	CRn	CRm	op2

FAR_EL2, Fault Address Register (EL2)

The FAR_EL2 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction Abort exceptions, Data Abort exceptions, PC alignment fault exceptions and Watchpoint exceptions that are taken to EL2.

Configuration

AArch64 System register FAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HDFAR\[31:0\]](#).

AArch64 System register FAR_EL2 bits [63:32] are architecturally mapped to AArch32 System register [HIFAR\[31:0\]](#).

AArch64 System register FAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [DFAR\[31:0\]](#) (DFAR_S) when EL2 is implemented.

AArch64 System register FAR_EL2 bits [63:32] are architecturally mapped to AArch32 System register [IFAR\[31:0\]](#) (IFAR_S) when EL2 is implemented.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

FAR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Faulting Virtual Address for synchronous exceptions taken to EL2																															
Faulting Virtual Address for synchronous exceptions taken to EL2																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL2. Exceptions that set the FAR_EL2 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). [ESR_EL2](#).EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL2 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if [ESR_EL2](#).FnV is 0, and FAR_EL2 is UNKNOWN if [ESR_EL2](#).FnV is 1.

If a memory fault that sets FAR_EL2, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL2 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by [DC ZVA](#).

If the exception that updates FAR_EL2 is taken from an Exception level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

When the PE sets ESR_EL2.{ISV,FnP} to {0,1} on taking a Data Abort exception, or sets ESR_EL2.{FnV,FnP} to {0,1} on taking a Watchpoint exception, the PE sets FAR_EL2 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Data Abort exception or Watchpoint exception.

When FEAT_SME is implemented, and the PE sets ESR_EL2.ISV to 0 and ESR_EL2.FnP to 1 on taking a Data Abort exception or Watchpoint exception, the PE sets FAR_EL2 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Data Abort or Watchpoint exception.

The naturally-aligned fault granule is one of:

- When ESR_EL2.DFSC is 0b010001, indicating a Synchronous Tag Check fault, it is a 16-byte tag granule.
- When ESR_EL2.DFSC is 0b11010x, indicating an IMPLEMENTATION DEFINED fault, it is an IMPLEMENTATION DEFINED granule.
- Otherwise, it is the smallest implemented translation granule.

When FEAT_MOPS is implemented, the value in FAR_EL2 on a synchronous exception from any of the Memory Copy and Memory Set instructions represents the first element that has not been copied or set, and is determined as follows:

- For a Data Abort generated by the MMU, the value is within the address range of the relevant translation granule, aligned to the size of the relevant translation granule of the address that generated the Data Abort. Bits[(n-1):0] of the value are UNKNOWN, where 2^n is the relevant translation granule size in bytes. For the purpose of calculating the relevant translation granule, if the MMU is disabled for a stage of translation, then the current translation granule size is equal to 2^{64} for stage 1, and the PARange for stage 2. The relevant translation granule is:
 - For MMU faults generated at stage 1, the current stage 1 translation granule.
 - For MMU faults generated at stage 2, the smaller of the current stage 1 translation granule and the current stage 2 translation granule.
 - If FEAT_RME is implemented, for a synchronous data abort generated as the result of a GPF, the smallest of the current stage 1 translation granule, the current stage 2 translation granule and the configured granule size in GPCCR_EL3.PGS.
- For a Data Abort generated by a Tag Check failure, the value is the lowest address that failed the Tag Check within the block size of the load or store.
- For a Watchpoint exception, the value is an address range of the size defined by the DCZID_ELO.BS field. This address does not need to be the element with a watchpoint, but can be some earlier element.
- Otherwise, the value is the lowest address in the block size of the load or store.

For a Data Abort exception or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state'.

When FEAT_MTE_TAGGED_FAR is not implemented, on For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL1 or EL0 makes FAR_EL2 become UNKNOWN.

Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

For all other exceptions taken to EL2, FAR_EL2 is UNKNOWN.

FAR_EL2 is made UNKNOWN on an exception return from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FAR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic FAR_EL2 or FAR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

FAR_EL3, Fault Address Register (EL3)

The FAR_EL3 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction Abort exceptions, Data Abort exceptions and PC alignment fault exceptions that are taken to EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to FAR_EL3 are UNDEFINED.

Attributes

FAR_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Faulting Virtual Address for synchronous exceptions taken to EL3																															
Faulting Virtual Address for synchronous exceptions taken to EL3																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL3. Exceptions that set the FAR_EL3 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), and PC alignment faults (EC 0x22). [ESR_EL3](#).EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL3 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if [ESR_EL3](#).FnV is 0, and FAR_EL3 is UNKNOWN if [ESR_EL3](#).FnV is 1.

If a memory fault that sets FAR_EL3, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL3 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by [DC ZVA](#).

If the exception that updates FAR_EL3 is taken from an Exception level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

When the PE sets [ESR_EL3](#).{ISV,FnP} to {0,1} on taking a Data Abort exception, the PE sets FAR_EL3 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Data Abort exception.

When FEAT_SME is implemented, and the PE sets ESR_EL3.ISV to 0 and ESR_EL3.FnP to 1 on taking a Data Abort exception, the PE sets FAR_EL3 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Data Abort.

The naturally-aligned fault granule is one of:

- When ESR_EL3.DFSC is 0b010001, indicating a Synchronous Tag Check fault, it is a 16-byte tag granule.
- When ESR_EL3.DFSC is 0b11010x, indicating an IMPLEMENTATION DEFINED fault, it is an IMPLEMENTATION DEFINED granule.
- Otherwise, it is the smallest implemented translation granule.

When FEAT_MOPS is implemented, the value in FAR_EL3 on a synchronous exception from any of the Memory Copy and Memory Set instructions represents the first element that has not been copied or set, and is determined as follows:

- For a Data Abort generated by the MMU, the value is within the address range of the relevant translation granule, aligned to the size of the relevant translation granule of the address that generated the Data Abort. Bits[(n-1):0] of the value are UNKNOWN, where 2^n is the relevant translation granule size in bytes. For the purpose of calculating the relevant translation granule, if the MMU is disabled for a stage of translation, then the current translation granule size is equal to 2^{64} for stage 1, and the PARange for stage 2. The relevant translation granule is:
 - For MMU faults generated at stage 1, the current stage 1 translation granule.
 - For MMU faults generated at stage 2, the smaller of the current stage 1 translation granule and the current stage 2 translation granule.
 - If FEAT_RME is implemented, for a synchronous data abort generated as the result of a GPF, the smallest of the current stage 1 translation granule, the current stage 2 translation granule and the configured granule size in GPCCR_EL3.PGS.
- For a Data Abort generated by a Tag Check failure, the value is the lowest address that failed the Tag Check within the block size of the load or store.
- Otherwise, the value is the lowest address in the block size of the load or store.

For a Data Abort exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state'.

When FEAT_MTE_TAGGED_FAR is not implemented, on For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL2, EL1, or EL0 makes FAR_EL3 become UNKNOWN.

Note

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

For all other exceptions taken to EL3, FAR_EL3 is UNKNOWN.

FAR_EL3 is made UNKNOWN on an exception return from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FAR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, FAR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0110	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = FAR_EL3;
```

MSR FAR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0110	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    FAR_EL3 = X[t, 64];
```

3005/0907/2022 1517:5708; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

FPCR, Floating-point Control Register

The FPCR characteristics are:

Purpose

Controls floating-point behavior.

Configuration

AArch64 System register FPCR bits [26:15] are architecturally mapped to AArch32 System register [FPSCR\[26:15\]](#).

AArch64 System register FPCR bits [12:8] are architecturally mapped to AArch32 System register [FPSCR\[12:8\]](#).

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

Attributes

FPCR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32																																																
																RES0																																																															
RES0				AHP				DN				FZ				RMode				Stride				FZ16				Len				IDE				RES0				EBF				IXE				UFE				OFE				DZE				IOE				RES0				NEP				AH				FIZ			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																																																

Bits [63:27]

Reserved, RES0.

AHP, bit [26]

Alternative half-precision control bit.

AHP	Meaning
0b0	IEEE half-precision format selected.
0b1	Alternative half-precision format selected.

This bit is used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DN, bit [25]

Default NaN use for NaN propagation.

DN	Meaning
0b0	NaN operands propagate through to the output of a floating-point operation.
0b1	Any operation involving one or more NaNs returns the Default NaN. This bit has no effect on the output of FABS, FMAX*, FMIN*, and FNEG instructions, and a default NaN is never returned as a result of these instructions.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ, bit [24]

Flushing denormalized numbers to zero control bit.

FZ	Meaning
0b0	If FPCR.AH is 0, the flushing to zero of single-precision and double-precision denormalized inputs to, and outputs of, floating-point instructions not enabled by this control, but other factors might cause the input denormalized numbers to be flushed to zero. If FPCR.AH is 1, the flushing to zero of single-precision and double-precision denormalized outputs of floating-point instructions not enabled by this control, but other factors might cause the input denormalized numbers to be flushed to zero.
0b1	If FPCR.AH is 0, denormalized single-precision and double-precision inputs to, and outputs from, floating-point instructions are flushed to zero. If FPCR.AH is 1, denormalized single-precision and double-precision outputs from floating-point instructions are flushed to zero.

For more information, see 'Flushing denormalized numbers to zero' and the pseudocode of the floating-point instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RMode, bits [23:22]

Rounding Mode control field.

RMode	Meaning
0b00	Round to Nearest (RN) mode.
0b01	Round towards Plus Infinity (RP) mode.
0b10	Round towards Minus Infinity (RM) mode.
0b11	Round towards Zero (RZ) mode.

The specified rounding mode is used by both scalar and Advanced SIMD floating-point instructions.

If FPCR.AH is 1, then the following instructions use Round to Nearest mode regardless of the value of this bit:

- The FRECPPE, FRECPSP, FRECPXP, FRSQRTE, and FRSQRSTS instructions.
- The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Stride, bits [21:20]

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 [FPSCR](#).Stride field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ16, bit [19]**When FEAT_FP16 is implemented:**

Flushing denormalized numbers to zero control bit on half-precision data-processing instructions.

FZ16	Meaning
0b0	For some instructions, this bit disables flushing to zero of inputs and outputs that are half-precision denormalized numbers.
0b1	Flushing denormalized numbers to zero enabled. For some instructions that do not convert a half-precision input to a higher precision output, this bit enables flushing to zero of inputs and outputs that are half-precision denormalized numbers.

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations.

For more information, see 'Flushing denormalized numbers to zero' and the pseudocode of the floating-point instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Len, bits [18:16]

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 [FPSCR](#).Len field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDE, bit [15]

Input Denormal floating-point exception trap enable.

IDE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR .IDC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR .IDC bit.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled at the current Exception level, the value of FPCR.IDE is treated as 0 for all purposes other than a direct read or write of the FPCR.

The **Effective** value of this bit controls both scalar and vector floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [14]

Reserved, RES0.

EBF, bit [13]

When FEAT_EBF16 is implemented:

The value of this bit controls the numeric behaviors of BFloat16 dot product calculations performed by the BFDOT, BFMLLA, BFMOPA, and BFMOPS instructions. **If FEAT_SME2 is implemented, this also controls BFVDOT instruction.**

When [ID_AA64ISAR1_EL1](#).BF16 and [ID_AA64ZFR0_EL1](#).BF16 are 0b0010, the PE supports the FPCR.EBF field. Otherwise, FPCR.EBF is RES0.

EBF	Meaning
0b0	These instructions use the standard BFloat16 behaviors: <ul style="list-style-type: none"> • Ignoring the FPCR.RMode control and using the rounding mode defined for BFloat16. For more information, see 'Round to Odd mode'. • Flushing denormalized inputs and outputs to zero, as if the FPCR.FZ and FPCR.FIZ controls had the value '1'. • Performing unfused multiplies and additions with intermediate rounding of all products and sums.
0b1	These instructions use the extended BFloat16 behaviors: <ul style="list-style-type: none"> • Supporting all four IEEE 754 rounding modes selected by the FPCR.RMode control. • Optionally, flushing denormalized inputs and outputs to zero, as governed by the FPCR.FZ and FPCR.FIZ controls. • Performing a fused two-way sum-of-products for each pair of adjacent BFloat16 elements, without intermediate rounding of the products, but rounding the single-precision sum before addition to the accumulator. • Generating the default NaN as intermediate sum-of-products when any multiplier input is a NaN, or any product is infinity \times 0.0, or there are infinite products with differing signs. • Generating an intermediate sum-of-products of the same infinity when there are infinite products all with the same sign.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IXE, bit [12]

Inexact floating-point exception trap enable.

IXE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR .IXC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR .IXC bit.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled at the current Exception level, the value of FPCR.IXE is treated as 0 for all purposes other than a direct read or write of the FPCR.

The **Effective** value of this bit controls both scalar and vector floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFE, bit [11]

Underflow floating-point exception trap enable.

UFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.UFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs and Flush-to-zero is not enabled, the PE does not update the FPSR.UFC bit.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled at the current Exception level, the value of FPCR.UFE is treated as 0 for all purposes other than a direct read or write of the FPCR.

The **Effective** value of this bit controls both scalar and vector floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFE, bit [10]

Overflow floating-point exception trap enable.

OFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.OFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.OFC bit.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled at the current Exception level, the value of FPCR.OFE is treated as 0 for all purposes other than a direct read or write of the FPCR.

The **Effective** value of this bit controls both scalar and vector floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZE, bit [9]

Divide by Zero floating-point exception trap enable.

DZE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.DZC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.DZC bit.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled at the current Exception level, the value of FPCR.DZE is treated as 0 for all purposes other than a direct read or write of the FPCR.

The **Effective** value of this bit controls both scalar and vector floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOE, bit [8]

Invalid Operation floating-point exception trap enable.

IOE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR .IOC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR .IOC bit.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled at the current Exception level, the value of FPCR.IOE is treated as 0 for all purposes other than a direct read or write of the FPCR.

The **Effective** value of this bit controls both scalar and vector floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:3]

Reserved, RES0.

**NEP, bit [2]
When FEAT_AFP is implemented:**

Controls how the output elements other than the lowest element of the vector are determined for Advanced SIMD scalar instructions.

NEP	Meaning
0b0	Does not affect how the output elements other than the lowest are determined for Advanced SIMD scalar instructions.
0b1	<p>The output elements other than the lowest are taken from the following registers:</p> <ul style="list-style-type: none"> For 3-input scalar versions of the FMLA (by element) and FMLS (by element) instructions, the <Hd>, <Sd>, or <Dd> register. For 3-input versions of the FMADD, FMSUB, FNMADD, and FNMSUB instructions, the <Ha>, <Sa>, or <Da> register. For 2-input scalar versions of the FACGE, FACGT, FCMEQ (register), FCMGE (register), and FCMGT (register) instructions, the <Hm>, <Sm>, or <Dm> register. For 2-input scalar versions of the FABD, FADD (scalar), FDIV (scalar), FMAX (scalar), FMAXNM (scalar), FMIN (scalar), FMINNM (scalar), FMUL (by element), FMUL (scalar), FMULX (by element), FMULX, FNMUL (scalar), FRECPS, FRSQRTS, and FSUB (scalar) instructions, the <Hn>, <Sn>, or <Dn> register. For 1-input scalar versions of the following instructions, the <Hd>, <Sd>, or <Dd> register: <ul style="list-style-type: none"> The (vector) versions of the FCVTAS, FCVTAU, FCVTMS, FCVTMU, FCVTNS, FCVTNU, FCVTPS, and FCVTPU instructions. The (vector, fixed-point) and (vector, integer) versions of the FCVTZS, FCVTZU, SCVTF, and UCVTF instructions. The (scalar) versions of the FABS, FNEG, FRINT32X, FRINT32Z, FRINT64X, FRINT64Z, FRINTA, FRINTI, FRINTM, FRINTN, FRINTP, FRINTX, FRINTZ, and FSQRT instructions. The (scalar, fixed-point) and (scalar, integer) versions of the SCVTF and UCVTF instructions. The BFCVT, FCVT, FCVTXN, FRECPE, FRECPX, and FRSQRTE instructions.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled at the current Exception level, the value of FPCR.NEP is treated as 0 for all purposes other than a direct read or write of the FPCR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AH, bit [1]

When FEAT_AFP is implemented:

Alternate Handling. Controls alternate handling of floating-point numbers.

The Arm architecture supports two models for handling some of the corner cases of the floating-point behaviors, such as the nature of flushing of denormalized numbers, the detection of tininess and other exceptions and a range of other behaviors. The value of the FPCR.AH bit selects between these models.

For more information on the FPCR.AH bit, see 'Flushing denormalized numbers to zero', 'Floating-point exceptions and exception traps' and the pseudocode of the floating-point instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FIZ, bit [0]**When FEAT_AFP is implemented:**

Flush Inputs to Zero. Controls whether single-precision, double-precision and BFloat16 input operands that are denormalized numbers are flushed to zero.

FIZ	Meaning
0b0	The flushing to zero of single-precision and double-precision denormalized inputs to floating-point instructions not enabled by this control, but other factors might cause the input denormalized numbers to be flushed to zero.
0b1	Denormalized single-precision and double-precision inputs to most floating-point instructions flushed to zero.

For more information, see 'Flushing denormalized numbers to zero' and the pseudocode of the floating-point instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing FPCR

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, FPCR

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0100	0b000

```

if PSTATE.EL == EL0 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && CPTR_EL3.TFP == '1' then
        UNDEFINED;
    elsif !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CPACR_EL1.FPEN != '11' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x00);
        else
            AArch64.SystemAccessTrap(EL1, 0x07);

GPCCR_EL3, Granule Protection Check Control Register (EL3)

The GPCCR_EL3 characteristics are:

Purpose

The control register for Granule Protection Checks.

Configuration

This register is present only when FEAT_RME is implemented. Otherwise, direct accesses to GPCCR_EL3 are UNDEFINED.

Attributes

GPCCR_EL3 is a 64-bit register.

Field descriptions

Bits [63:24]

Reserved, RES0.

LOGPTSZ, bits [23:20]

Level 0 GPT entry size.

This field advertises the number of least-significant address bits protected by each entry in the level 0 GPT.

LOGPTSZ	Meaning
0b0000	30-bits. Each entry covers 1GB of address space.
0b0100	34-bits. Each entry covers 16GB of address space.
0b0110	36-bits. Each entry covers 64GB of address space.
0b1001	39-bits. Each entry covers 512GB of address space.

All other values are reserved.

Access to this field is **RO**.

BitBits [19:18]

Reserved, RES0.

TBGPCD, bit [18]**When FEAT_TRBE_EXT is implemented:**

Trace Buffer Granule Protection Check Disabled. Controls whether the Trace Buffer Unit accepts or rejects trace when Granule Protection Checks are disabled.

TBGPCD	Meaning
0b0	The Trace Buffer Unit rejects trace when GPCCR_EL3.GPC is 0.
0b1	The Trace Buffer Unit accepts trace when GPCCR_EL3.GPC is 0.

When the Trace Buffer Unit rejects trace, the trace might remain buffered by the trace unit until the Trace Buffer Unit is able to accept trace. When the Trace Buffer Unit accepts trace, the Trace Buffer Unit writes the trace to memory.

Note

Setting GPCCR_EL3.{TBGPCD, GPC} to {1, 0} means that the Trace Buffer Unit might write to memory without any Granule Protection Checks. The addresses that the Trace Buffer Unit writes to can be programmed by an external agent. The physical address spaces the Trace Buffer Unit can address are restricted by an IMPLEMENTATION DEFINED debug authentication interface.

Setting GPCCR_EL3.{TBGPCD, GPC} to {1, 1} means that GPCCR_EL3.{TBGPCD, GPC} will become {1, 0} on a Warm reset.

This field is ignored by the PE and treated as one when any of the following are true:

- GPCCR_EL3.GPC == 1.
- ExternalRootInvasiveDebugEnabled() == TRUE.

Otherwise:

Reserved, RES0.

GPCP, bit [17]

Granule Protection Check Priority.

This control governs behavior of granule protection checks on fetches of stage 2 Table descriptors.

GPCP	Meaning
0b0	GPC faults are all reported with a priority that is consistent with the GPC being performed on any access to physical address space.
0b1	A GPC fault for the fetch of a Table descriptor for a stage 2 translation table walk might not be generated or reported. All other GPC faults are reported with a priority consistent with the GPC being performed on all accesses to physical address spaces.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GPC, bit [16]

Granule Protection Check Enable.

GPC	Meaning
0b0	Granule protection checks are disabled. Accesses are not prevented by this mechanism.
0b1	All accesses to physical address spaces are subject to granule protection checks, except for fetches of GPT information and accesses governed by the GPCCR_EL3.GPCP control.

If any stage of translation is enabled, this bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

PGS, bits [15:14]

Physical Granule size.

PGS	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

All other values are reserved.

The value of this field is permitted to be cached in a TLB.

Granule sizes not supported for stage 1 and not supported for stage 2, as defined in [ID_AA64MMFR0_EL1](#), are reserved. For example, if [ID_AA64MMFR0_EL1.TGran16](#) == 0b0000 and [ID_AA64MMFR0_EL1.TGran16_2](#) == 0b0001, then the PGS encoding 0b10 is reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [13:12]

GPT fetch Shareability attribute

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

Fetches of GPT information are made with the Shareability attribute that is configured in this field.

If both ORGN and IRGN are configured with Non-cacheable attributes, it is invalid to configure this field to any value other than 0b10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN, bits [11:10]

GPT fetch Outer cacheability attribute.

ORGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

Fetches of GPT information are made with the Outer cacheability attributes configured in this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [9:8]

GPT fetch Inner cacheability attribute.

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

Fetches of GPT information are made with the Inner cacheability attributes configured in this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:3]

Reserved, RES0.

PPS, bits [2:0]

Protected Physical Address Size.

The size of the memory region protected by [GPTBR_EL3](#), in terms of the number of least-significant address bits.

PPS	Meaning
0b000	32 bits, 4GB protected address space.
0b001	36 bits, 64GB protected address space.
0b010	40 bits, 1TB protected address space.
0b011	42 bits, 4TB protected address space.
0b100	44 bits, 16TB protected address space.
0b101	48 bits, 256TB protected address space.
0b110	52 bits, 4PB protected address space.

All other values are reserved.

Configuration of this field to a value exceeding the implemented physical address size is invalid.

The value of this field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GPCCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, GPCCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0001	0b110

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = GPCCR_EL3;
```

MSR GPCCR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0001	0b110

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    GPCCR_EL3 = X[t, 64];

```

3005/0907/2022 1517:5807; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

(old)

htmldiff from-

(new)

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID5, bit [58]

When FEAT_MTE2 is implemented:

Trap ID group 5. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- [GMID_EL1](#).

TID5	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 5 registers are trapped to EL2.

When the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has an Effective value of 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DCT, bit [57]

When FEAT_MTE2 is implemented:

Default Cacheability Tagging. When HCR_EL2.DC is in effect, controls whether stage 1 translations are treated as Tagged or Untagged.

DCT	Meaning
0b0	Stage 1 translations are treated as Untagged.
0b1	Stage 1 translations are treated as Tagged.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [56]

When FEAT_MTE2 is implemented:

Allocation Tag Access. When HCR_EL2.{E2H,TGE} != {1,1}, controls access to Allocation Tags, System registers for Memory tagging, and prevention of Tag checking, at EL1 and EL0.

ATA	Meaning
0b0	Access to Allocation Tags is prevented at EL1 and EL0. Accesses at EL1 to GCR_EL1 , RGSRR_EL1 , TFSR_EL1 , or TFSR_EL2 , or TFSRE0_EL1 that are not UNDEFINED are trapped to EL2. Accesses at EL1 using MRS or MSR with the register name TFSR_EL2 that are not UNDEFINED are trapped to EL3. Memory accesses at EL1 and EL0 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL1 and EL0. This control does not prevent Tag checking at EL1 and EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBOS, bit [55]

When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Outer Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

[TLBI VMALLE1OS](#), [TLBI VAE1OS](#), [TLBI ASIDE1OS](#), [TLBI VAAE1OS](#), [TLBI VALE1OS](#), [TLBI VAALE1OS](#), [TLBI RVAE1OS](#), [TLBI RVAAE1OS](#), [TLBI RVALE1OS](#), and [TLBI RVAALE1OS](#).

TTLBOS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBIS, bit [54]

When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, [TLBI VMALLE1IS](#), [TLBI VAE1IS](#), [TLBI ASIDE1IS](#), [TLBI VAAE1IS](#), [TLBI VALE1IS](#), [TLBI VAALE1IS](#), [TLBI RVAE1IS](#), [TLBI RVAAE1IS](#), [TLBI RVALE1IS](#), and [TLBI RVAALE1IS](#).
- When EL1 is using AArch32, [TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAAIS](#), [TLBIMVALIS](#), and [TLBIMVAALIS](#).

TTLBIS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [53]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Enable Access to the [SCXTNUM_EL1](#) and [SCXTNUM_EL0](#) registers. The defined values are:

EnSCXT	Meaning
0b0	When HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, and EL2 is enabled in the current Security state, EL1 and EL0 access to SCXTNUM_EL0 and EL1 access to SCXTNUM_EL1 is disabled by this mechanism, causing an exception to EL2, and the values of these registers to be treated as 0. When HCR_EL2.{E2H, TGE} is {1, 1} and EL2 is enabled in the current Security state, EL0 access to SCXTNUM_EL0 is disabled by this mechanism, causing an exception to EL2, and the value of this register to be treated as 0.
0b1	This control does not cause accesses to SCXTNUM_EL0 or SCXTNUM_EL1 to be trapped.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TOCU, bit [52]

When FEAT_EVT is implemented:

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When [SCTLR_EL1](#).UCI is 1, HCR_EL2.{TGE, E2H} is not {1, 1}, and EL0 is using AArch64, [IC IVAU](#), [DC CVAU](#).
- When EL1 is using AArch64, [IC IVAU](#), [IC IALLU](#), [DC CVAU](#).
- When EL1 is using AArch32, [ICIMVAU](#), [IC IALLU](#), [DCCMVAU](#).

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- [IC IALLUIS](#) and [IC IALLU](#) are always UNDEFINED at EL0 using AArch64.
- [ICIMVAU](#), [IC IALLU](#), [IC IALLUIS](#), and [DCCMVAU](#) are always UNDEFINED at EL0 using AArch32.

TOCU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [51]

When FEAT_AMUv1p1 is implemented:

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Virtualization of the Activity Monitors is disabled. Indirect reads of the virtual offset registers are zero.
0b1	Virtualization of the Activity Monitors is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TICAB, bit [50]

When FEAT_EVT is implemented:

Trap ICIALLUIS/IC IALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, [IC IALLUIS](#).
- When EL1 is using AArch32, [ICIALLUIS](#).

TICAB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified instructions is trapped to EL2.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID4, bit [49]**When FEAT_EVT is implemented:**

Trap ID group 4. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- EL1 reads of [CCSIDR_EL1](#), [CCSIDR2_EL1](#), [CLIDR_EL1](#), and [CSSELR_EL1](#).
- EL1 writes to [CSSELR_EL1](#).

AArch32:

- EL1 reads of [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#).
- EL1 writes to [CSSELR](#).

TID4	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GPF, bit [48]**When FEAT_RME is implemented:**

Controls the reporting of Granule protection faults at EL0 and EL1.

GPF	Meaning
0b0	This control does not cause exceptions to be routed from EL0 and EL1 to EL2.
0b1	Instruction Abort exceptions and Data Abort exceptions due to GPFs from EL0 and EL1 are routed to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FIEN, bit [47]
When FEAT_RASv1p1 is implemented:

Fault Injection Enable. Unless this bit is set to 1, accesses to the [ERXPGCDN_EL1](#), [ERXPGCTL_EL1](#), and [ERXPFGF_EL1](#) registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

If EL2 is disabled in the current Security state, the Effective value of HCR_EL2.FIEN is 0b1.

If [ERRIDR_EL1](#).NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FWB, bit [46]
When FEAT_S2FWB is implemented:

Forced Write-Back. Defines the combined cacheability attributes in a 2 stage translation regime.

Note
When FEAT_MTE2 is implemented, if the stage 1 page or block descriptor specifies the Tagged attribute, the final memory type is Tagged only if the final cacheable memory type is Inner and Outer Write-back cacheable and the final allocation hints are Read-Allocate, Write-Allocate.

FWB	Meaning
0b0	<p>When this bit is 0, then:</p> <ul style="list-style-type: none"> The combination of stage 1 and stage 2 translations on memory type and cacheability attributes are as described in the Armv8.0 architecture. For more information, see 'Combining the stage 1 and stage 2 memory attributes, type EL1&0 attributes translation regime'. The encoding of the stage 2 memory type and cacheability attributes in bits[5:2] of the stage 2 page or block descriptors are as described in the Armv8.0 architecture.
0b1	<p>When this bit is 1, then:</p> <ul style="list-style-type: none"> Bit[5] of stage 2 page or block descriptor is RES0. When bit[4] of stage 2 page or block descriptor is 1 and when: <ul style="list-style-type: none"> Bits[3:2] of stage 2 page or block descriptor are 0b11, the resultant memory type and inner or outer cacheability attribute is the same as the stage 1 memory type and inner or outer cacheability attribute. Bits[3:2] of stage 2 page or block descriptor are 0b10, the resultant memory type and attribute is Normal Write-Back. Bits[3:2] of stage 2 page or block descriptor are 0b0x, the resultant memory type will be Normal Non-cacheable except where the stage 1 memory type was Device-<attr> the resultant memory type will be Device-<attr> When bit[4] of stage 2 page or block descriptor is 0 the memory type is Device, and when: <ul style="list-style-type: none"> Bits[3:2] of stage 2 page or block descriptor are 0b00, the stage 2 memory type is Device-nGnRnE. Bits[3:2] of stage 2 page or block descriptor are 0b01, the stage 2 memory type is Device-nGnRE. Bits[3:2] of stage 2 page or block descriptor are 0b10, the stage 2 memory type is Device-nGRE. Bits[3:2] of stage 2 page or block descriptor are 0b11, the stage 2 memory type is Device-GRE. If the stage 1 translation specifies a cacheable memory type, then the stage 1 cache allocation hint is applied to the final cache allocation hint where the final memory type is cacheable. If the stage 1 translation does not specify a cacheable memory type, then if the final memory type is cacheable, it is treated as read allocate, write allocate. For the more stage information, 1 see and stage 2 memory types are combined in the manner described in 'Stage Combining 2 the memory stage type 1 and Cacheability stage 2 attributes, when EL1&0 FEAT_S2FWB translation is enabled regime'.

In Secure state, this bit applies to both the Secure stage 2 translation and the Non-secure stage 2 translation.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV2, bit [45]**When FEAT_NV2 is implemented:**

Nested Virtualization. Changes the behaviors of HCR_EL2.{NV1, NV} to provide a mechanism for hardware to transform reads and writes from System registers into reads and writes from memory.

NV2	Meaning
0b0	This bit has no effect on the behavior of HCR_EL2.{NV1, NV}. The behavior of HCR_EL2.{NV1, NV} is as defined for FEAT_NV.
0b1	Redefines behavior of HCR_EL2{NV1, NV} to enable: <ul style="list-style-type: none"> Transformation of read/writes to registers into read/writes to memory. Redirection of EL2 registers to EL1 registers. Any exception taken from EL1 and taken to EL1 causes SPSR_EL1.M[3:2] to be set to 0b10 and not 0b01.

When HCR_EL2.NV is 0, the Effective value of this field is 0 and this field is treated as 0 for all purposes other than direct reads and writes of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AT, bit [44]**When FEAT_NV is implemented:**

Address Translation. EL1 execution of the following address translation instructions is trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- [AT S1E0R](#), [AT S1E0W](#), [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#).

AT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified instructions is trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV1, bit [43]**When FEAT_NV2 is implemented:**

Nested Virtualization.

NV1	Meaning
0b0	If HCR_EL2.{NV2, NV} are both 1, accesses executed from EL1 to implemented EL12, EL02, or EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0 or HCR_EL2.{NV2, NV} == {1, 0}, this control does not cause any instructions to be trapped.
0b1	If HCR_EL2.NV2 is 1, accesses executed from EL1 to implemented EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0, EL1 accesses to VBAR_EL1 , ELR_EL1 , SPSR_EL1 , and, when FEAT_CSV2_2 or FEAT_CSV2_1p2 is implemented, SCXTNUM_EL1 , are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If HCR_EL2.NV2 is 1, the value of HCR_EL2.NV1 defines which EL1 register accesses are transformed to loads and stores. These transformed accesses have priority over the trapping of registers.

The trapping of EL1 registers caused by other control bits has priority over the transformation of these accesses.

If a register is specified that is not implemented by an implementation, then access to that register are UNDEFINED.

For the list of registers affected, see 'Enhanced support for nested virtualization'.

If HCR_EL2.{NV1, NV} is {0, 1}, any exception taken from EL1, and taken to EL1, causes the [SPSR_EL1](#).M[3:2] to be set to 0b10, and not 0b01.

If HCR_EL2.{NV1, NV} is {1, 1}, then:

- The EL1 translation table Block and Page descriptors:
 - Bit[54] holds the PXN instead of the UXN.
 - Bit[53] is RES0.
 - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
 - Bit[61] is treated as 0 regardless of the actual value.
 - Bit[60] holds the PXNTable instead of the UXNTable.
 - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.{NV1, NV} are {1, 0}, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_NV is implemented:

Nested Virtualization. EL1 accesses to certain registers are trapped to EL2, when EL2 is enabled in the current Security state.

NV1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to VBAR_EL1 , ELR_EL1 , SPSR_EL1 , and, when FEAT_CSV2_2 or FEAT_CSV2_1p2 is implemented, SCXTNUM_EL1 , are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If HCR_EL2.NV is 1 and HCR_EL2.NV1 is 0, then the following effects also apply:

- Any exception taken from EL1, and taken to EL1, causes the [SPSR_EL1](#).M[3:2] to be set to 0b10, and not 0b01.

If HCR_EL2.NV and HCR_EL2.NV1 are both set to 1, then the following effects also apply:

- The EL1 translation table Block and Page descriptors:
 - Bit[54] holds the PXN instead of the UXN.
 - Bit[53] is RES0.
 - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
 - Bit[61] is treated as 0 regardless of the actual value.
 - Bit[60] holds the PXNTable instead of the UXNTable.
 - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.NV is 0 and HCR_EL2.NV1 is 1, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV, bit [42]

When FEAT_NV2 is implemented:

Nested Virtualization.

When HCR_EL2.NV2 is 1, redefines register accesses so that:

- Instructions accessing the Special purpose registers [SPSR_EL2](#) and [ELR_EL2](#) instead access [SPSR_EL1](#) and [ELR_EL1](#) respectively.
- Instructions accessing the System registers [ESR_EL2](#) and [FAR_EL2](#) instead access [ESR_EL1](#) and [FAR_EL1](#).

When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

NV	Meaning
0b0	When this bit is set to 0, then the PE behaves as if HCR_EL2.NV2 is 0 for all purposes other than reading this register. This control does not cause any instructions to be trapped. When HCR_EL2.NV2 is 1, no FEAT_NV2 functionality is implemented.
0b1	When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of 0x2. When HCR_EL2.NV2 is 1, this control redefines EL1 register accesses so that instructions accessing SPSR_EL2 , ELR_EL2 , ESR_EL2 , and FAR_EL2 instead access SPSR_EL1 , ELR_EL1 , ESR_EL1 , and FAR_EL1 respectively.

When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, then:

- The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:
 - Registers accessed using MRS or MSR with a name ending in _EL2, except [SP_EL2](#).
 - Registers accessed using MRS or MSR with a name ending in _EL12.
 - Registers accessed using MRS or MSR with a name ending in _EL02.
 - Special-purpose registers [SPSR_irq](#), [SPSR_abt](#), [SPSR_und](#) and [SPSR_fiq](#), accessed using MRS or MSR.
 - Special-purpose register [SP_EL1](#) accessed using the dedicated MRS or MSR instruction.
- The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:
 - EL2 translation regime Address Translation instructions and TLB maintenance instructions.
 - EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.
- The instructions for which the execution is trapped as follows:
 - SMC in an implementation that does not include EL3 and when HCR_EL2.TSC is 1. HCR_EL2.TSC bit is not RES0 in this case. This is reported using EC syndrome value 0x17.
 - The ERET, ERETAA, and ERETAB instructions, reported using EC syndrome value 0x1A.

Note

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_NV is implemented:

Nested Virtualization. Traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

NV	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of 0x2.

The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:

- Registers accessed using MRS or MSR with a name ending in _EL2, except [SP_EL2](#).

- Registers accessed using MRS or MSR with a name ending in `_EL12`.
- Registers accessed using MRS or MSR with a name ending in `_EL02`.
- Special-purpose registers [SPSR_irq](#), [SPSR_abt](#), [SPSR_und](#) and [SPSR_fiq](#), accessed using MRS or MSR.
- Special-purpose register [SP_EL1](#) accessed using the dedicated MRS or MSR instruction.

The instructions for which the execution is trapped and reported using EC syndrome value `0x18` are as follows:

- EL2 translation regime Address Translation instructions and TLB maintenance instructions.
- EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.

The execution of the ERET, ERETAA, and ERETAB instructions are trapped and reported using EC syndrome value `0x1A`.

Note

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is `0x1A`.

The execution of the SMC instructions in an implementation that does not include EL3 and when HCR_EL2.TSC is 1 are trapped and reported using EC syndrome value `0x17`. HCR_EL2.TSC bit is not RES0 in this case.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [41]

When FEAT_PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- In EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated [SCTLR_EL1.En<N><M>==1](#).
- In EL1, the associated [SCTLR_EL1.En<N><M>==1](#).

Traps are reported using EC syndrome value `0x09`. The Pointer Authentication instructions trapped are:

- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB.
- PACGA, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB.
- RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB, LDRAA, and LDRAB.

API	Meaning
0b0	<p>The instructions related to Pointer Authentication are trapped to EL2, when EL2 is enabled in the current Security state and the instructions are enabled for the EL1&0 translation regime, from:</p> <ul style="list-style-type: none"> • EL0 when HCR_EL2.TGE==0 or HCR_EL2.E2H==0. • EL1. <p>If HCR_EL2.NV is 1, the HCR_EL2.NV trap takes precedence over the HCR_EL2.API trap for the ERETAA and ERETAB instructions.</p> <p>If EL2 is implemented and enabled in the current Security state and HFGITR_EL2.ERET == 1, execution at EL1 using AArch64 of ERETAA or ERETAB instructions is reported with EC syndrome value <code>0x1A</code> with its associated ISS field, as the fine-grained trap has higher priority than the HCR_EL2.API == 0.</p>
0b1	This control does not cause any instructions to be trapped.

If FEAT_PAuth is implemented but EL2 is not implemented or disabled in the current Security state, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [40]

When FEAT_PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers from EL1 to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- [APIAKeyLo_EL1](#), [APIAKeyHi_EL1](#), [APIBKeyLo_EL1](#), [APIBKeyHi_EL1](#), [APDAKeyLo_EL1](#), [APDAKeyHi_EL1](#), [APDBKeyLo_EL1](#), [APDBKeyHi_EL1](#), [APGAKeyLo_EL1](#), and [APGAKeyHi_EL1](#).

APK	Meaning
0b0	Access to the registers holding "key" values for pointer authentication from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

Note

If FEAT_PAuth is implemented but EL2 is not implemented or is disabled in the current Security state, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [39]

When FEAT_TME is implemented:

Enables access to the TSTART, TCOMMIT, TTEST, and TCANCEL instructions at EL0 and EL1.

TME	Meaning
0b0	EL0 and EL1 accesses to TSTART, TCOMMIT, TTEST, and TCANCEL instructions are UNDEFINED.
0b1	This control does not cause any instruction to be UNDEFINED.

If EL2 is not implemented or is disabled in the current Security state, the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MIOCNCE, bit [38]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the EL1&0 translation regimes.

MIOCNCE	Meaning
0b0	For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.
0b1	For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

For more information, see 'Mismatched memory attributes'.

This field can be implemented as RAZ/WI.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TEA, bit [37]**When FEAT_RAS is implemented:**

Route synchronous External abort exceptions to EL2.

TEA	Meaning
0b0	This control does not cause exceptions to be routed from EL0 and EL1 to EL2.
0b1	Route synchronous External abort exceptions from EL0 and EL1 to EL2, when EL2 is enabled in the current Security state, if not routed to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [36]**When FEAT_RAS is implemented:**

Trap Error record accesses. Trap accesses to the RAS error registers from EL1 to EL2 as follows:

- If EL1 is using AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
 - [ERRIDR_EL1](#), [ERRSELR_EL1](#), [ERXADDR_EL1](#), [ERXCTLR_EL1](#), [ERXFR_EL1](#), [ERXMISC0_EL1](#), [ERXMISC1_EL1](#), and [ERXSTATUS_EL1](#).
 - When FEAT_RASv1p1 is implemented, [ERXMISC2_EL1](#), and [ERXMISC3_EL1](#).
- If EL1 is using AArch32 state, MCR or MRC accesses are trapped to EL2, reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped to EL2, reported using EC syndrome value 0x04:
 - [ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#).
 - When FEAT_RASv1p1 is implemented, [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

TERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses to the specified registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [35]

When FEAT_LOR is implemented:

Trap LOR registers. Traps Non-secure EL1 accesses to [LORSA_EL1](#), [LOREA_EL1](#), [LORN_EL1](#), [LORC_EL1](#), and [LORID_EL1](#) registers to EL2.

TLOR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 accesses to the LOR registers are trapped to EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2H, bit [34]

When FEAT_VHE is implemented:

EL2 Host. Enables a configuration where a Host Operating System is running in EL2, and the Host Operating System's applications are running in EL0.

E2H	Meaning
0b0	The facilities to support a Host Operating System at EL2 are disabled.
0b1	The facilities to support a Host Operating System at EL2 are enabled.

For information on the behavior of this bit see 'Behavior of HCR_EL2.E2H'.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ID, bit [33]

Stage 2 Instruction access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

ID	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime.
0b1	Forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CD, bit [32]

Stage 2 Data access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

CD	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime for data accesses and translation table walks.
0b1	Forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RW, bit [31]**When EL1 is capable of using AArch32:**

Execution state control for lower Exception levels:

RW	Meaning
0b0	Lower levels are all AArch32.
0b1	The Execution state for EL1 is AArch64. The Execution state for EL0 is determined by the current value of PSTATE.nRW when executing at EL0.

In an implementation that includes EL3, when EL2 is not enabled in Secure state, the PE behaves as if this bit has the same value as the [SCR_EL3.RW](#) bit for all purposes other than a direct read or write access of HCR_EL2.

The RW bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 1 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, EL1 accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x18 for MRS and 0x14 for MRRS:
 - SCTL_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, CONTEXTIDR_EL1.
 - SCTL_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, CONTEXTIDR_EL1.
 - If FEAT_AIE is implemented, MAIR2_EL1, AMAIR2_EL1.
 - If FEAT_S1PIE is implemented, PIRE0_EL1, PIR_EL1.
 - If FEAT_S1POE is implemented, POR_EL0, POR_EL1.
 - If FEAT_S2POE is implemented, S2POR_EL1.
 - If FEAT_TCR2 is implemented, TCR2_EL1.
 - If FEAT_SCTLR2 is implemented, SCTLR2_EL1.
- If HCR_EL2.{E2H, EL1 TGE} is not {1, 1}, and EL0 is using AArch64 state, EL0 accesses using MRC to the following registers are trapped to EL2 and reported using EC syndrome value 0x18 for accesses using MRC, accesses using MRRC are trapped to EL2 and reported using EC syndrome value 0x03 for accesses using MRRC are trapped to EL2 and reported using EC syndrome value 0x04:
 - SCTL_EL1, TTBR0_EL1, TTBR1_EL1, TTBCR_EL1, TTBCR2_EL1, DACR_EL1, DFSR_EL1, IFSR_EL1, DFAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR0_EL1, MAIR1_EL1, AMAIR0_EL1, AMAIR1_EL1, CONTEXTIDR_EL1, POR_EL0, TTBR0_EL1.
- If EL1 is using AArch32 state, EL1 accesses using MRC to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MRRC are trapped to EL2 and reported using EC syndrome value 0x04:
 - SCTL_EL1, TTBR0_EL1, TTBR1_EL1, TTBCR_EL1, TTBCR2_EL1, DACR_EL1, DFSR_EL1, IFSR_EL1, DFAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR0_EL1, MAIR1_EL1, AMAIR0_EL1, AMAIR1_EL1, CONTEXTIDR_EL1, POR_EL0, TTBR0_EL1.

TRVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Read EL1 read accesses to the specified Virtual Memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.{E2H, HCR_EL2.TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

EL2 provides a second stage of address translation, that a hypervisor can use to remap the address map defined by a Guest OS. In addition, a hypervisor can trap attempts by a Guest OS to write to the registers that control the memory system. A hypervisor might use this trap as part of its virtualization of memory management.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HCD, bit [29]**When EL3 is not implemented:**

HVC instruction disable. Disables EL1 execution of HVC instructions, from both Execution states, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x00.

HCD	Meaning
0b0	HVC instruction execution is enabled at EL2 and EL1.
0b1	HVC instructions are UNDEFINED at EL2 and EL1. Any resulting exception is taken to the Exception level at which the HVC instruction is executed.

Note

HVC instructions are always UNDEFINED at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDZ, bit [28]

Trap [DC ZVA](#) instructions. Traps EL0 and EL1 execution of [DC ZVA](#) instructions to EL2, when EL2 is enabled in the current Security state, from AArch64 state only, reported using EC syndrome value 0x18.

If FEAT_MTE is implemented, this trap also applies to [DC GVA](#) and [DC GZVA](#).

TDZ	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	In AArch64 state, any attempt to execute an instruction this trap applies to at EL1, or at EL0 when the instruction is not UNDEFINED at EL0, is trapped to EL2 when EL2 is enabled in the current Security state. Reading the DCZID_EL0 returns a value that indicates that the instructions this trap applies to are not supported.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TGE, bit [27]

Trap General Exceptions, from EL0.

TGE	Meaning
0b0	This control has no effect on execution at EL0.
0b1	<p>When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0.</p> <p>When EL2 is enabled in the current Security state, in all cases:</p> <ul style="list-style-type: none"> • All exceptions that would be routed to EL1 are routed to EL2. • If EL1 is using AArch64, the SCTLR_EL1.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR_EL1. • If EL1 is using AArch32, the SCTLR.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR. • All virtual interrupts are disabled. • Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled. • An exception return to EL1 is treated as an illegal exception return. • The MDCR_EL2.{TDRA, TDOSA, TDA, TDE} fields are treated as being 1 for all purposes other than returning the result of a direct read of MDCR_EL2. <p>In addition, when EL2 is enabled in the current Security state, if:</p> <ul style="list-style-type: none"> • HCR_EL2.E2H is 0, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 1. • HCR_EL2.E2H is 1, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 0. <p>For further information on the behavior of this bit when E2H is 1, see 'Behavior of HCR_EL2.E2H'.</p>

HCR_EL2.TGE must not be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TVM, bit [26]

Trap Virtual Memory controls. Traps [EL1](#) writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18 for [MSR](#) and 0x14 for [MSRR](#):
 - [SCTLR_EL1](#), [TTBR0_EL1](#), [TTBR1_EL1](#), [TCR_EL1](#), [ESR_EL1](#), [FAR_EL1](#), [AFSR0_EL1](#), [AFSR1_EL1](#), [MAIR_EL1](#), [AMAIR_EL1](#), [CONTEXTIDR_EL1](#).
 - [SCTLR_EL1](#), [TTBR0_EL1](#), [TTBR1_EL1](#), [TCR_EL1](#), [ESR_EL1](#), [FAR_EL1](#), [AFSR0_EL1](#), [AFSR1_EL1](#), [MAIR_EL1](#), [AMAIR_EL1](#), [CONTEXTIDR_EL1](#).
 - If FEAT_AIE is implemented, [MAIR2_EL1](#), [AMAIR2_EL1](#).
 - If FEAT_S1PIE is implemented, [PIRE0_EL1](#), [PIR_EL1](#).
 - If FEAT_S1POE is implemented, [POR_EL0](#), [POR_EL1](#).
 - If FEAT_S2POE is implemented, [S2POR_EL1](#).
 - If FEAT_TCR2 is implemented, [TCR2_EL1](#).
 - If FEAT_SCTLR2 is implemented, [SCTLR2_EL1](#).
- If HCR_EL2.{E2H, [EL1](#) TGE} is not {1, 1}, and EL0 is using [AArch64](#) [AArch32](#) state, [EL0](#) accesses [accesses using MCR](#) to the following registers are trapped to EL2 and reported using EC syndrome value 0x18 [0x03](#) for [accesses using MCRR](#) are trapped to EL2 and reported using EC syndrome value [MSR0X04](#):
 - [SCTLR](#) If FEAT_S1POE is implemented, [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIR0](#), [AMAIR1](#), [CONTEXTIDR](#), [POR_EL0](#), [TTBR0](#).

- If EL1 is using AArch32 state, EL1 accesses using MCR to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MCRR are trapped to EL2 and reported using EC syndrome value 0x04:
 - [SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIRO](#), [AMAIR1](#), [CONTEXTIDR](#).

TVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	WriteEL1 write accesses to the specified VirtualEL1 Memoryvirtual memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR_EL2.{E2H,HCR_EL2.TGE TGE}](#) is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TTLB, bit [25]

Trap TLB maintenance instructions. Traps EL1 execution of TLB maintenance instructions to EL2, when EL2 is enabled in the current Security state, as follows:

- When EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
 - [TLBI VMALLE1](#), [TLBI VAE1](#), [TLBI ASIDE1](#), [TLBI VAAE1](#), [TLBI VALE1](#), [TLBI VAALE1](#).
 - [TLBI VMALLE1IS](#), [TLBI VAE1IS](#), [TLBI ASIDE1IS](#), [TLBI VAAE1IS](#), [TLBI VALE1IS](#), [TLBI VAALE1IS](#).
 - If FEAT_TLBIOS is implemented, this trap applies to [TLBI VMALLE1OS](#), [TLBI VAE1OS](#), [TLBI ASIDE1OS](#), [TLBI VAAE1OS](#), [TLBI VALE1OS](#), [TLBI VAALE1OS](#).
 - If FEAT_TLBIRANGE is implemented, this trap applies to [TLBI RVAE1](#), [TLBI RVAAE1](#), [TLBI RVALE1](#), [TLBI RVALE1](#), [TLBI RVAE1IS](#), [TLBI RVAAE1IS](#), [TLBI RVALE1IS](#), [TLBI RVALE1IS](#).
 - If FEAT_TLBIOS and FEAT_TLBIRANGE are implemented, this trap applies to [TLBI RVAE1OS](#), [TLBI RVAAE1OS](#), [TLBI RVALE1OS](#), [TLBI RVALE1OS](#).
- When EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
 - [TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAASIS](#), [TLBIMVALIS](#), [TLBIMVAALIS](#).
 - [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [TLBIMVAA](#), [TLBIMVAL](#), [TLBIMVAAL](#).
 - [ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#).
 - [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#).

TTLB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

The TLB maintenance instructions are UNDEFINED at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of [SCTLR_EL1](#).UCI is not 0, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
 - [IC IVAU](#), [DC CVAU](#). If the value of [SCTLR_EL1](#).UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
 - [IC IVAU](#), [IC IALLU](#), [IC IALLUIS](#), [DC CVAU](#).
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
 - [ICIMVAU](#), [ICIALLU](#), [ICIALLUIS](#), [DCCMVAU](#).

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- [IC IALLUIS](#) and [IC IALLU](#) are always UNDEFINED at EL0 using AArch64.
- [ICIMVAU](#), [ICIALLU](#), [ICIALLUIS](#), and [DCCMVAU](#) are always UNDEFINED at EL0 using AArch32.

TPU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit[23]**When FEAT_DPB is implemented:****TPCP, bit [0] of bit [23]**

Trap data or unified cache maintenance instructions that operate to the Point of Coherency or Persistence. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of [SCTLR_EL1](#).UCI is not 0, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
 - [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#). If the value of [SCTLR_EL1](#).UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
 - [DC IVAC](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#).
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
 - [DCIMVAC](#), [DCCIMVAC](#), [DCCMVAC](#).

If FEAT_DPB2 is implemented, this trap also applies to [DC CVADP](#).

If FEAT_MTE is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC IGVAC](#), [DC IGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#) and [DC CGDVAP](#).

If FEAT_DPB2 and FEAT_MTE are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

Note

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
 - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
 - [DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are always UNDEFINED at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2, it is named TPCP.

TPCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If HCR_EL2.{E2H, TGE} is set to {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

TPC, bit [0] of bit [23]

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of [SCTLR_EL1](#).UCI is not 0, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
 - [DC CIVAC](#), [DC CVAC](#). However, if the value of [SCTLR_EL1](#).UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, accesses to [DC IVAC](#), [DC CIVAC](#), [DC CVAC](#) are trapped and reported using EC syndrome value 0x18.
- When EL1 is using AArch32, accesses to [DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are trapped and reported using EC syndrome value 0x03.

Note

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
 - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
 - [DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are always UNDEFINED at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2, it is named TPCP.

TPC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to [DC ISW](#), [DC CSW](#), [DC CISW](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL1 is using AArch32 state, accesses to [DCISW](#), [DCCSW](#), [DCCISW](#) are trapped to EL2, reported using EC syndrome value 0x03.

If FEAT_MTE2 is implemented, this trap also applies to [DC IGSW](#), [DC IGDSW](#), [DC CGSW](#), [DC CGDW](#), [DC CIGSW](#), and [DC CIGDSW](#).

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TSW	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TACR, bit [21]

Trap Auxiliary Control Registers. Traps EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, accesses to [ACTLR_EL1](#) to EL2, are trapped to EL2 and reported using EC syndrome value 0x18.
- If EL1 is using AArch32 state, accesses to [ACTLR](#) and, if implemented, [ACTLR2](#) are trapped to EL2 and reported using EC syndrome value 0x03.

TACR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

[ACTLR_EL1](#) is not accessible at EL0.

[ACTLR](#) and [ACTLR2](#) are not accessible at EL0.

The Auxiliary Control Registers are IMPLEMENTATION DEFINED registers that might implement global control bits for the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps EL1 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, access to any of the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome 0x18:
 - IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}.
 - IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the [S3_<op1>_<Cn>_<Cm>_<op2>](#) register name.
- In AArch32 state, MCR and MRC access to instructions with the following encodings are trapped and reported using EC syndrome 0x03:
 - All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}.
 - All coproc==p15, CRn==c10, opc1 == {0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}.
 - All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

When this functionality is accessed from EL0:

- If FEAT_TIDCP1 is implemented and the Effective value of [SCTLR_EL1.TIDCP](#) is 1, any accesses from EL0 are trapped to EL1.
- Otherwise, if FEAT_TIDCP1 is implemented and the Effective value of [SCTLR_EL2.TIDCP](#) is 1, any accesses from EL0 are trapped to EL2.
- Otherwise:
 - If HCR_EL2.TIDCP is 1, it is IMPLEMENTATION DEFINED whether any accesses from EL0 are trapped to EL2.
 - If HCR_EL2.TIDCP is 0, any accesses from EL0 are UNDEFINED and generate an exception that is taken to EL1 or EL2.

TIDCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to or execution of the specified encodings reserved for IMPLEMENTATION DEFINED functionality are trapped to EL2, when EL2 is enabled in the current Security state.

An implementation can also include IMPLEMENTATION DEFINED registers that provide additional controls, to give finer-grained control of the trapping of IMPLEMENTATION DEFINED features.

Note

The trapping of accesses to these registers from EL1 is higher priority than an exception resulting from the register access being UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TSC, bit [19]

Trap SMC instructions. Traps EL1 execution of SMC instructions to EL2, when EL2 is enabled in the current Security state.

If execution is in AArch64 state, the trap is reported using EC syndrome value 0x17.

If execution is in AArch32 state, the trap is reported using EC syndrome value 0x13.

Note

HCR_EL2.TSC traps execution of the SMC instruction. It is not a routing control for the SMC exception. Trap exceptions and SMC exceptions have different preferred return addresses.

TSC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	<p>If EL3 is implemented, then any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state, regardless of the value of SCR_EL3.SMD.</p> <p>If EL3 is not implemented, FEAT_NV is implemented, and HCR_EL2.NV is 1, then any attempt to execute an SMC instruction at EL1 using AArch64 is trapped to EL2, when EL2 is enabled in the current Security state.</p> <p>If EL3 is not implemented, and either FEAT_NV is not implemented or HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether:</p> <ul style="list-style-type: none"> Any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state. Any attempt to execute an SMC instruction is UNDEFINED.

In AArch32 state, the Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

SMC instructions are UNDEFINED at EL0.

If EL3 is not implemented, and either FEAT_NV is not implemented or HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether this bit is:

- RES0.
- Implemented with the functionality as described in HCR_EL2.TSC.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID3, bit [18]

Trap ID group 3. Traps EL1 reads of group 3 ID registers to EL2, when EL2 is enabled in the current Security state, as follows:

In AArch64 state:

- Reads of the following registers are trapped to EL2, reported using EC syndrome value 0x18:
 - [ID_PFR0_EL1](#), [ID_PFR1_EL1](#), [ID_PFR2_EL1](#), [ID_DFR0_EL1](#), [ID_AFR0_EL1](#), [ID_MMFR0_EL1](#), [ID_MMFR1_EL1](#), [ID_MMFR2_EL1](#), [ID_MMFR3_EL1](#), [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#), [ID_ISAR5_EL1](#), [MVFR0_EL1](#), [MVFR1_EL1](#), [MVFR2_EL1](#).
 - [ID_AA64PFR0_EL1](#), [ID_AA64PFR1_EL1](#), [ID_AA64DFR0_EL1](#), [ID_AA64DFR1_EL1](#), [ID_AA64ISAR0_EL1](#), [ID_AA64ISAR1_EL1](#), [ID_AA64MMFR0_EL1](#), [ID_AA64MMFR1_EL1](#), [ID_AA64AFR0_EL1](#), [ID_AA64AFR1_EL1](#).
 - [ID_MMFR4_EL1](#) and [ID_MMFR5_EL1](#) are trapped to EL2.
 - [ID_AA64MMFR2_EL1](#) and [ID_ISAR6_EL1](#) are trapped to EL2.
 - [ID_DFR1_EL1](#) is trapped to EL2.
 - [ID_AA64ZFR0_EL1](#) is trapped to EL2.
 - [ID_AA64SMFR0_EL1](#) is trapped to EL2.
 - [ID_AA64ISAR2_EL1](#) is trapped to EL2.
 - This field traps all MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.

ID_AA64MMFR3_EL1.**If FEAT_FGT is implemented:**

- - **ID_MMFR4_EL1** and **ID_MMFR5_EL1** are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to **ID_MMFR4_EL1** or **ID_MMFR5_EL1** are trapped to EL2.
 - **ID_AA64MMFR2_EL1** and **ID_ISAR6_EL1** are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to **ID_AA64MMFR2_EL1** or **ID_ISAR6_EL1** are trapped to EL2.
 - **ID_DFR1_EL1** is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to **ID_DFR1_EL1** are trapped to EL2.
 - **ID_AA64ZFR0_EL1** is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to **ID_AA64ZFR0_EL1** are trapped to EL2.
 - **ID_AA64SMFR0_EL1** is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to **ID_AA64SMFR0_EL1** are trapped to EL2.
 - **ID_AA64ISAR2_EL1** is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to **ID_AA64ISAR2_EL1** are trapped to EL2.
 - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.

ID_AA64PFR2_EL1.**If FEAT_FGT is not implemented:**

- **If FEAT_FGT is implemented:**
 - **ID_MMFR4_EL1** and **ID_MMFR5_EL1** are trapped to EL2.
 - **ID_AA64MMFR2_EL1** and **ID_ISAR6_EL1** are trapped to EL2.
 - **ID_DFR1_EL1** is trapped to EL2.
 - **ID_AA64ZFR0_EL1** is trapped to EL2.
 - **ID_AA64SMFR0_EL1** is trapped to EL2.
 - **ID_AA64ISAR2_EL1** is trapped to EL2.
 - This field traps all MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.
- **If FEAT_FGT is not implemented:**
 - **ID_MMFR4_EL1** and **ID_MMFR5_EL1** are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to **ID_MMFR4_EL1** or **ID_MMFR5_EL1** are trapped to EL2.
 - **ID_AA64MMFR2_EL1** and **ID_ISAR6_EL1** are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to **ID_AA64MMFR2_EL1** or **ID_ISAR6_EL1** are trapped to EL2.
 - **ID_DFR1_EL1** is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to **ID_DFR1_EL1** are trapped to EL2.
 - **ID_AA64ZFR0_EL1** is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to **ID_AA64ZFR0_EL1** are trapped to EL2.
 - **ID_AA64SMFR0_EL1** is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to **ID_AA64SMFR0_EL1** are trapped to EL2.
 - **ID_AA64ISAR2_EL1** is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to **ID_AA64ISAR2_EL1** are trapped to EL2.

- Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.

In AArch32 state:

- VMRS access to [MVFR0](#), [MVFR1](#), and [MVFR2](#), are trapped to EL2, reported using EC syndrome value 0x08, unless access is also trapped by [HCPTR](#) which takes priority.
- MRC access to the following registers are trapped to EL2, reported using EC syndrome value 0x03:
 - [ID_PFR0](#), [ID_PFR1](#), [ID_PFR2](#), [ID_DFR0](#), [ID_AFR0](#), [ID_MMFR0](#), [ID_MMFR1](#), [ID_MMFR2](#), [ID_MMFR3](#), [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), [ID_ISAR4](#), [ID_ISAR5](#).
 - If FEAT_FGT is implemented:
 - [ID_MMFR4](#) and [ID_MMFR5](#) are trapped to EL2.
 - [ID_ISAR6](#) is trapped to EL2.
 - [ID_DFR1](#) is trapped to EL2.
 - This field traps all MRC accesses to encodings in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.
 - If FEAT_FGT is not implemented:
 - [ID_MMFR4](#) and [ID_MMFR5](#) are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID_MMFR4](#) or [ID_MMFR5](#) are trapped.
 - [ID_ISAR6](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID_ISAR6](#) are trapped to EL2.
 - [ID_DFR1](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID_DFR1](#) are trapped to EL2.
 - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps all MRC accesses to registers in the following range not already mentioned in this field description with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

TID3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 3 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, reads of [CTR_EL0](#), [CCSIDR_EL1](#), [CCSIDR2_EL1](#), [CLIDR_EL1](#), and [CSSELR_EL1](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 is using AArch64 and the value of [SCTLR_EL1](#).UCT is not 0, reads of [CTR_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18. If the value of [SCTLR_EL1](#).UCT is 0, then EL0 reads of [CTR_EL0](#) are trapped to EL1 and the resulting exception takes precedence over this trap.
- If EL1 is using AArch64, writes to [CSSELR_EL1](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL1 is using AArch32, reads of [CTR](#), [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#) are trapped to EL2, reported using EC syndrome value 0x03.
- If EL1 is using AArch32, writes to [CSSELR](#) are trapped to EL2, reported using EC syndrome value 0x03.

TID2	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 2 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID1, bit [16]

Trap ID group 1. Traps EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, accesses of [REVIDR_EL1](#), [AIDR_EL1](#), [SMIDR_EL1](#), reported using EC syndrome value 0x18.
- In AArch32 state, accesses of [TCMTR](#), [TLBTR](#), [REVIDR](#), [AIDR](#), reported using EC syndrome value 0x03.

TID1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 1 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID0, bit [15]

When AArch32 is supported:

Trap ID group 0. Traps the following register accesses to EL2:

- EL1 reads of the [JIDR](#), reported using EC syndrome value 0x05.
- If the [JIDR](#) is RAZ from EL0, EL0 reads of the [JIDR](#), reported using EC syndrome value 0x05.
- EL1 accesses using VMRS of the [FPSID](#), reported using EC syndrome value 0x08.

Note

- It is IMPLEMENTATION DEFINED whether the [JIDR](#) is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0, then any resulting exception takes precedence over this trap.
- The [FPSID](#) is not accessible at EL0 using AArch32.
- Writes to the [FPSID](#) are ignored, and not trapped by this control.

TID0	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 0 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [14]

Traps EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE or SCTLR_EL1.nTWE .

In AArch32 state, the attempted execution of a conditional WFE instruction is trapped only if the instruction passes its condition code check.

Note

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TWI, bit [13]

Traps EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI or SCTLR_EL1.nTWI .

In AArch32 state, the attempted execution of a conditional WFI instruction is trapped only if the instruction passes its condition code check.

Note

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction

does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DC, bit [12]

Default Cacheability.

DC	Meaning
0b0	This control has no effect on the EL1&0 translation regime.
0b1	In any Security state: <ul style="list-style-type: none"> • When EL1 is using AArch64, the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of SCTLR_EL1. • When EL1 is using AArch32, the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of SCTLR. • The PE behaves as if the value of the HCR_EL2.VM field is 1 for all purposes other than returning the value of a direct read of HCR_EL2. • The memory type produced by stage 1 of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.

This field has no effect on the EL2, EL2&0, and EL3 translation regimes.

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BSU, bits [11:10]

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from EL1 or EL0:

BSU	Meaning
0b00	No effect.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0b00 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FB, bit [9]

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from EL1:

AArch32: [BPIALL](#), [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#), [ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#), [TLBIMVAA](#), [ICIALLU](#), [TLBIMVAL](#), [TLBIMVAAL](#).

AArch64: [TLBI VMALLE1](#), [TLBI VAE1](#), [TLBI ASIDE1](#), [TLBI VAAE1](#), [TLBI VALE1](#), [TLBI VAALE1](#), [IC IALLU](#), [TLBI RVAE1](#), [TLBI RVAAE1](#), [TLBI RVALE1](#), [TLBI RVAALE1](#).

FB	Meaning
0b0	This field has no effect on the operation of the specified instructions.
0b1	When one of the specified instruction is executed at EL1, the instruction is broadcast within the Inner Shareable shareability domain.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VSE, bit [8]

Virtual SError interrupt.

VSE	Meaning
0b0	This mechanism is not making a virtual SError interrupt pending.
0b1	A virtual SError interrupt is pending because of this mechanism.

The virtual SError interrupt is enabled only when the value of HCR_EL2.{TGE, AMO} is {0, 1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VI, bit [7]

Virtual IRQ Interrupt.

VI	Meaning
0b0	This mechanism is not making a virtual IRQ pending.
0b1	A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of HCR_EL2.{TGE, IMO} is {0, 1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VF, bit [6]

Virtual FIQ Interrupt.

VF	Meaning
0b0	This mechanism is not making a virtual FIQ pending.
0b1	A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR_EL2.{TGE, FMO} is {0, 1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AMO, bit [5]

Physical SError interrupt routing.

AMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> When the value of HCR_EL2.TGE is 0, Physical SError interrupts are not taken to EL2. When the value of HCR_EL2.TGE is 1, Physical SError interrupts are taken to EL2 unless they are routed to EL3. Virtual SError interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> Physical SError interrupts are taken to EL2, unless they are routed to EL3. When the value of HCR_EL2.TGE is 0, then virtual SError interrupts are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the AMO bit physical asynchronous External aborts and SError interrupts target EL2 unless they are routed to EL3.
- When FEAT_VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMO, bit [4]

Physical IRQ Routing.

IMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> When the value of HCR_EL2.TGE is 0, Physical IRQ interrupts are not taken to EL2. When the value of HCR_EL2.TGE is 1, Physical IRQ interrupts are taken to EL2 unless they are routed to EL3. Virtual IRQ interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> Physical IRQ interrupts are taken to EL2, unless they are routed to EL3. When the value of HCR_EL2.TGE is 0, then Virtual IRQ interrupts are enabled.

If EL2 is enabled in the current Security state, and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the IMO bit, physical IRQ Interrupts target EL2 unless they are routed to EL3.
- When FEAT_VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FMO, bit [3]

Physical FIQ Routing.

FMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> When the value of HCR_EL2.TGE is 0, Physical FIQ interrupts are not taken to EL2. When the value of HCR_EL2.TGE is 1, Physical FIQ interrupts are taken to EL2 unless they are routed to EL3. Virtual FIQ interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> Physical FIQ interrupts are taken to EL2, unless they are routed to EL3. When HCR_EL2.TGE is 0, then Virtual FIQ interrupts are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the FMO bit, physical FIQ Interrupts target EL2 unless they are routed to EL3.
- When FEAT_VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [2]

Protected Table Walk. In the EL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs, then the value of this bit determines the behavior:

PTW	Meaning
0b0	The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
0b1	The memory access generates a stage 2 Permission fault.

This bit is permitted to be cached in a TLB.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SWIO, bit [1]

Set/Way Invalidation Override. Causes EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way:

SWIO	Meaning
0b0	This control has no effect on the operation of data cache invalidate by set/way instructions.
0b1	Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When the value of this bit is 1:

AArch32: [DCISW](#) performs the same invalidation as a [DCCISW](#) instruction.

AArch64: [DC ISW](#) performs the same invalidation as a [DC CISW](#) instruction.

This bit can be implemented as RES1.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the EL1&0 translation regime, when EL2 is enabled in the current Security state.

VM	Meaning
0b0	EL1&0 stage 2 address translation disabled.
0b1	EL1&0 stage 2 address translation enabled.

When the value of this bit is 1, data cache invalidate instructions executed at EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR_EL2.SWIO bit.

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        X[t, 64] = NVMem[0x078];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    X[t, 64] = HCR_EL2;
elsif PSTATE.EL == EL3 then
    X[t, 64] = HCR_EL2;

```

MSR HCR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x078] = X[t, 64];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HCR_EL2 = X[t, 64];
elsif PSTATE.EL == EL3 then
    HCR_EL2 = X[t, 64];
```

3005/0907/2022 1517:5707: 21c5a6dd0fdaf10a712e2f2d6ffbd6d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

HCRX_EL2, Extended Hypervisor Configuration Register

The HCRX_EL2 characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

Configuration

This register is present only when FEAT_HCX is implemented. Otherwise, direct accesses to HCRX_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

The bits in this register behave as if they are 0 for all purposes other than direct reads of the register if:

- EL2 is not enabled in the current Security state.
- [SCR_EL3.HXEn](#) is 0.

Attributes

HCRX_EL2 is a 64-bit register.

Field descriptions

Reserved, RES0.

EnIDCP128, bit [21]

When FEAT_SYSREG128 is implemented and HCR_EL2.[E2H,TGE] != 0b11:

Enables access to IMPLEMENTATION DEFINED 128-bit System registers.

EnIDCP128	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, accesses at EL1, EL0 to IMPLEMENTATION DEFINED 128-bit System registers are trapped to EL2 using an ESR_EL2.EC value of 0x14, unless the access generates a higher priority exception. Disables the functionality of the 128-bit IMPLEMENTATION DEFINED System registers that are accessible at EL2.
0b1	No accesses are trapped by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSDERR, bit [20]**When FEAT_ADERR is implemented:**Enable Synchronous Device Read Error. Override [SCTLR2_EL1.EnADERR](#).

EnSDERR	Meaning
0b0	This field has no effect on External aborts on Device memory reads at EL1 and EL0.
0b1	External abort on Device memory reads generate synchronous Data Abort exceptions in the EL1&0 translation regime.

Setting this field to 1 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Device memory read in every case.

Setting this field to 1 might have a performance impact for Device memory reads.

This field is ignored by the PE and treated as zero when any of the following are true:

- [SCR_EL3.HXEn](#) == 0.
- EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [19]

Reserved, RES0.

EnSNERR, bit [18]**When FEAT_ANERR is implemented:**Enable Synchronous Normal Read Error. Override [SCTLR2_EL1.EnANERR](#).

EnSNERR	Meaning
0b0	This field has no effect on External aborts on Normal memory reads at EL1 and EL0.
0b1	External abort on Normal memory reads generate synchronous Data Abort exceptions in the EL1&0 translation regime.

Setting this field to 1 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Normal memory read in every case.

Setting this field to 1 might have a performance impact for Normal memory reads.

This field is ignored by the PE and treated as zero when any of the following are true:

- [SCR_EL3.HXEn](#) == 0.
- EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D128En, bit [17]**When FEAT_D128 is implemented:**

128-bit System Register trap control. Enable access to 128-bit System Registers via MRRS, MSRR instructions.

- If EL1 is using AArch64 state, accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x14:
 - TTBR0_EL1.
 - TTBR1_EL1.
 - If FEAT_THE is implemented, RCWMASK_EL1, RCWSMASK_EL1.
 - PAR_EL1.

D128En	Meaning
0b0	EL1 accesses to the specified registers are disabled, and trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [16]**When FEAT_THE is implemented:**

Permit Translation Table Walk Incoherence.

Permits RCWS instructions to have Reduced Coherence property.

PTTWI	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, write accesses generated by RCWS at EL1&0 do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS at EL1&0 have the Reduced Coherence property, if enabled by TCR2_EL1.PTTWI.

This bit is permitted to be cached in TLB.

This bit is permitted to be built as a read-only bit with a fixed value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCTLR2En, bit [15]**When FEAT_SCTLR2 is implemented:**

SCTLR2_EL1 Enable. In AArch64 state, accesses to **SCTLR2_EL1** are trapped to EL2 and reported using EC syndrome value 0x18.

SCTLR2En	Meaning
0b0	Accesses to SCTLR2_EL1 at EL1 are trapped to EL2, unless the access generates a higher priority exception. The value in SCTLR2_EL1 is treated as 0.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCR2En, bit [14]**When FEAT_TCR2 is implemented:**

TCR2_EL1 Enable. In AArch64 state, accesses to **TCR2_EL1** are trapped to EL2 and reported using EC syndrome value 0x18.

TCR2En	Meaning
0b0	Accesses to TCR2_EL1 at EL1 are trapped to EL2, unless the access generates a higher priority exception. The value in TCR2_EL1 is treated as 0.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [13:12]

Reserved, RES0.

MSCEn, bit [11]**When FEAT_MOPS is implemented:**

Memory Set and Memory Copy instructions Enable. Enables execution of the CPY*, SETG*, SETP*, SETM*, and SETE* instructions at EL1 or EL0.

MSCEn	Meaning
0b0	Execution of the Memory Copy and Memory Set instructions is UNDEFINED at EL1 or EL0.
0b1	This control does not cause any instructions to be UNDEFINED.

This bit behaves as if it is 1 if any of the following are true:

- EL2 is not implemented or enabled.
- The value of [HCR_EL2](#).{E2H, TGE} is {1, 1}.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MCE2, bit [10]

When FEAT_MOPS is implemented:

Controls Memory Copy and Memory Set exceptions generated as part of attempting to execute the Memory Copy and Memory Set instructions from EL1.

MCE2	Meaning
0b0	Memory Copy and Memory Set exceptions generated from EL1 are taken to EL1.
0b1	Memory Copy and Memory Set exceptions generated from EL1 are taken to EL2.

When the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this control does not affect any exceptions due to the higher priority [SCTLR_EL2](#).MSCEn control.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [9]

When FEAT_CMOW is implemented:

Controls cache maintenance instruction permission for the following instructions executed at EL1 or EL0.

- [IC IVAU](#), [DC CIVAC](#), [DC CIGDVAC](#) and [DC CIGVAC](#).
- [ICIMVAU](#), [DCCIMVAC](#).

CMOW	Meaning
0b0	These instructions executed at EL1 or EL0 with stage 2 read permission, but without stage 2 write permission do not generate a stage 2 permission fault.
0b1	These instructions executed at EL1 or EL0, if enabled as a result of SCTLR_EL1.UCI=1 , with stage 2 read permission, but without stage 2 write permission generate a stage 2 permission fault.

For this control, stage 2 has write permission if S2AP[1] is 1 or DBM is 1 in the stage 2 descriptor. The instructions do not cause an update to the dirty state.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VFNMI, bit [8]

When FEAT_NMI is implemented:

Virtual FIQ Interrupt with Superpriority. Enables signaling of virtual FIQ interrupts with Superpriority.

VFNMI	Meaning
0b0	When HCR_EL2.VF is 1, a signaled pending virtual FIQ interrupt does not have Superpriority.
0b1	When HCR_EL2.VF is 1, a signaled pending virtual FIQ interrupt has Superpriority.

When [HCR_EL2.VF](#) is 0, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

VINMI, bit [7]

When FEAT_NMI is implemented:

Virtual IRQ Interrupt with Superpriority. Enables signaling of virtual IRQ interrupts with Superpriority.

VINMI	Meaning
0b0	When HCR_EL2.VI is 1, a signaled pending virtual IRQ interrupt does not have Superpriority.
0b1	When HCR_EL2.VI is 1, a signaled pending virtual IRQ interrupt has Superpriority.

When [HCR_EL2.VI](#) is 0, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

TALLINT, bit [6]**When FEAT_NMI is implemented:**

Trap MSR writes of [ALLINT](#) at EL1 using AArch64 to EL2, when EL2 is implemented and enabled in the current Security state, reported using EC syndrome value 0x18.

TALLINT	Meaning
0b0	MSR writes of ALLINT are not trapped by this mechanism.
0b1	MSR writes of ALLINT at EL1 using AArch64 are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

SMPME, bit [5]**When FEAT_SME is implemented:**

Streaming Mode Priority Mapping Enable.

Controls mapping of the value of [SMPRI_EL1](#). Priority for streaming execution priority at EL0 or EL1.

SMPME	Meaning
0b0	The effective priority value is taken from SMPRI_EL1 .Priority.
0b1	The effective priority value is: <ul style="list-style-type: none"> • When the current Exception level is EL2 or EL3, the value of SMPRI_EL1.Priority. • When the current Exception level is EL0 or EL1, the value of the SMPRIMAP_EL2 field corresponding to the value of SMPRI_EL1.Priority.

When [SMIDR_EL1](#).SMPS is '0', this field is RES0.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTnXS, bit [4]**When FEAT_XS is implemented:**

Determines if the fine-grained traps in HFGITR_EL2 that apply to each of the TLBI maintenance instructions that are accessible at EL1 also apply to the corresponding TLBI maintenance instructions with the nXS qualifier.

FGTnXS	Meaning
0b0	The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 also applies to the corresponding TLBI instruction with the nXS qualifier at EL1.
0b1	The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 does not apply to the corresponding TLBI instruction with the nXS qualifier at EL1.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

FnXS, bit [3]**When FEAT_XS is implemented:**

Determines the behavior of TLBI instructions affected by the XS attribute.

This control bit also determines whether an AArch64 DSB instruction behaves as a DSB instruction with an nXS qualifier when executed at EL0 and EL1.

FnXS	Meaning
0b0	This control does not have any effect on the behavior of the TLBI maintenance instructions.
0b1	A TLBI maintenance instruction without the nXS qualifier executed at EL1 behaves in the same way as the corresponding TLBI maintenance instruction with the nXS qualifier. An AArch64 DSB instruction executed at EL1 or EL0 behaves in the same way as the corresponding DSB instruction with the nXS qualifier executed at EL1 or EL0.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

EnASR, bit [2]**When FEAT_LS64_V is implemented:**

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV instruction at EL0 or EL1 to EL2.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1 .EnASR. Execution of an ST64BV instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

EnALS, bit [1]**When FEAT_LS64 is implemented:**

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 or EL1 to EL2.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1 .EnALS. Execution of an LD64B or ST64B instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

EnAS0, bit [0]**When FEAT_LS64_ACCDATA is implemented:**

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV0 instruction at EL0 or EL1 to EL2.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnAS0 . Execution of an ST64BV0 instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

Accessing HCRX_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HCRX_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0010	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;

HDFGRTR2_EL2, Hypervisor Debug Fine-Grained Read Trap Register 2

The HDFGRTR2_EL2 characteristics are:

Purpose

Provides controls for traps of MRS and MRC reads of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

This register is present only when FEAT_FGT2 is implemented. Otherwise, direct accesses to HDFGRTR2_EL2 are UNDEFINED.

Attributes

HDFGRTR2_EL2 is a 64-bit register.

Field descriptions

6362616059585756555453	52	51	50	49	48	47
RES0	nTRCITECR_EL1	nPMDSFR_EL1	nSPMDEVAFF_EL1	nSPMID	nSPMSCR_EL1	nSPMACCESSR_EL1
3130292827262524232221	20	19	18	17	16	15

Bits [63:21]

Reserved, RES0.

nTRCITECR_EL1, bit [20] When FEAT_ITE is implemented:

Trap MRS reads of TRCITECR_EL1 at EL1 using AArch64 to EL2.

nTRCITECR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MRS reads of TRCITECR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TRCITECR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMDSFR_EL1, bit [19]**When FEAT_SPE_FDS is implemented:**

Trap MRS reads of [PMDSFR_EL1](#) at EL1 using AArch64 to EL2.

nPMDSFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MRS reads of PMDSFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMDSFR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMDEVAFF_EL1, bit [18]**When FEAT_SPMU is implemented:**

Trap MRS reads of [SPMDEVAFF_EL1](#) at EL1 using AArch64 to EL2.

nSPMDEVAFF_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MRS reads of SPMDEVAFF_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMDEVAFF_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMID, bit [17]**When FEAT_SPMU is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [SPMCEGR_EL1](#).
- [SPMCGCR<n>_EL1](#).
- [SPMDEVARCH_EL1](#).
- [SPMIIDR_EL1](#).

nSPMID	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMSCR_EL1, bit [16]**When FEAT_SPMU is implemented:**

Trap MRS reads of [SPMSCR_EL1](#) at EL1 using AArch64 to EL2.

nSPMSCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MRS reads of SPMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMSCR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMACCESSR_EL1, bit [15]**When FEAT_SPMU is implemented:**

Trap MRS reads of [SPMACCESSR_EL1](#) at EL1 using AArch64 to EL2.

nSPMACCESSR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MRS reads of SPMACCESSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMACCESSR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMCR_EL0, bit [14]

When FEAT_SPMU is implemented:

Trap MRS reads of [SPMCR_EL0](#) at EL1 and EL0 using AArch64 to EL2.

nSPMCR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MRS reads of SPMCR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMCR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMOVS, bit [13]

When FEAT_SPMU is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- [SPMOVSLR_EL0](#).
- [SPMOVSSET_EL0](#).

nSPMOVS	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn2 == 1, then MRS reads at EL1 and EL0 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMINTEN, bit [12]

When FEAT_SPMU is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [SPMINTENCLR_EL1](#).
- [SPMINTENSET_EL1](#).

nSPMINTEN	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn2 == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMCNTEN, bit [11]

When FEAT_SPMU is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- [SPMCNTENCLR_EL0](#).
- [SPMCNTENSET_EL0](#).

nSPMCNTEN	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn2 == 1, then MRS reads at EL1 and EL0 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMSELR_EL0, bit [10]

When FEAT_SPMU is implemented:

Trap MRS reads of [SPMSELR_EL0](#) at EL1 and EL0 using AArch64 to EL2.

nSPMSELR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn2 == 1, then MRS reads of SPMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMSELR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMEVTYPEPn_EL0, bit [9]

When FEAT_SPMU is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- [SPMEVTYPEP<n>_EL0](#).
- [SPMEVFILTR<n>_EL0](#).
- [SPMEVFILT2R<n>_EL0](#).

nSPMEVTYPE_{Rn}_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEN2 == 1, then MRS reads at EL1 and EL0 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the System registers listed above are not trapped by this mechanism.

Regardless of the value of this bit, if event counter n is not implemented, a read of [SPMEVTYPE_{R<n>_EL0}](#), [SPMEVFILTR<n>_EL0](#), or [SPMEVFILT2R<n>_EL0](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMEVCNTR_n_EL0, bit [8]

When FEAT_SPMU is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2: [SPMEVCNTR<n>_EL0](#).

nSPMEVCNTR_n_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEN2 == 1, then MRS reads at EL1 and EL0 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the System registers listed above are not trapped by this mechanism.

Regardless of the value of this bit, if event counter n is not implemented, a read of [SPMEVCNTR<n>_EL0](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSSCR_EL1, bit [7]

When FEAT_PMuV3_SS is implemented:

Trap MRS reads of [PMSSCR_EL1](#) at EL1 using AArch64 to EL2.

nPMSSCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MRS reads of PMSSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMSSCR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSSDATA, bit [6]

When FEAT_PMuV3_SS is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [PMCCNTSVR_EL1](#).
- [PMEVCNTSVR<n>_EL1](#).
- [PMICNTSVR_EL1](#), if FEAT_PMuV3_ICNTR is implemented.

nPMSSDATA	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nMDSELR_EL1, bit [5]

When FEAT_Debugv8p9 is implemented:

Trap MRS reads of [MDSELR_EL1](#) at EL1 using AArch64 to EL2.

nMDSELR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MRS reads of MDSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of MDSELR_EL1 are not trapped by this mechanism.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and [MDSELR_EL1](#) is implemented as RAZ/WI.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMUACR_EL1, bit [4]

When FEAT_PMuV3p9 is implemented:

Trap MRS reads of [PMUACR_EL1](#) at EL1 using AArch64 to EL2.

nPMUACR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MRS reads of PMUACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMUACR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMICFILTR_EL0, bit [3]

When FEAT_PMuV3_ICNTR is implemented:

Trap MRS reads of [PMICFILTR_EL0](#) at EL1 and EL0 using AArch64 to EL2.

nPMICFILTR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTE _{n2} == 1, then MRS reads of PMICFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMICFILTR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMICNTR_EL0, bit [2]

When FEAT_PMuV3_ICNTR is implemented:

Trap MRS reads of [PMICNTR_EL0](#) at EL1 and EL0 using AArch64 to EL2.

nPMICNTR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTE _{n2} == 1, then MRS reads of PMICNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMICNTR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMIAR_EL1, bit [1]

When FEAT_SEBEP is implemented:

Trap MRS reads of [PMIAR_EL1](#) at EL1 using AArch64 to EL2.

nPMIAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTE _{n2} == 1, then MRS reads of PMIAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMIAR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMECR_EL1, bit [0]

When FEAT_EBEP is implemented:

Trap MRS reads of [PMECR_EL1](#) at EL1 using AArch64 to EL2.

nPMECR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MRS reads of PMECR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMECR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HDFGRTR2_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDFGRTR2_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        X[t, 64] = NVMem[0x1A0];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    X[t, 64] = HDFGRTR2_EL2;
elsif PSTATE.EL == EL3 then
    X[t, 64] = HDFGRTR2_EL2;

```

MSR HDFGRTR2_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x1A0] = X[t, 64];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HDFGRTR2_EL2 = X[t, 64];
elsif PSTATE.EL == EL3 then
    HDFGRTR2_EL2 = X[t, 64];

```

HDFGRTR_EL2, Hypervisor Debug Fine-Grained Read Trap Register

The HDFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRS and MRC reads of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HDFGRTR_EL2 are UNDEFINED.

Attributes

HDFGRTR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56
PMBIDR_EL1	nPMSNEVFR_EL1	nBRBDATA	nBRBCTL	nBRBIDR	PMCEIDn_EL0	PMUSERENR_EL0	TRBTRG_EL1
PMSIRR_EL1	PMSIDR_EL1	PMSICR_EL1	PMSFCR_EL1	PMSEVFR_EL1	PMSCR_EL1	PMBSR_EL1	PMBPTR_EL1
31	30	29	28	27	26	25	24

PMBIDR_EL1, bit [63] **When FEAT_SPE is implemented:**

Trap MRS reads of [PMBIDR_EL1](#) at EL1 using AArch64 to EL2.

PMBIDR_EL1	Meaning
0b0	MRS reads of PMBIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nPMSNEVFR_EL1, bit [62] **When FEAT_SPEv1p2 is implemented:**

Trap MRS reads of [PMSNEVFR_EL1](#) at EL1 using AArch64 to EL2.

nPMSNEVFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSNEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMSNEVFR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nBRBDATA, bit [61]

When FEAT_BRBE is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [BRBINF<n>_EL1](#).
- [BRBINFINJ_EL1](#).
- [BRBSRC<n>_EL1](#).
- [BRBSRCINJ_EL1](#).
- [BRBTGT<n>_EL1](#).
- [BRBTGTINJ_EL1](#).
- [BRBTS_EL1](#).

nBRBDATA	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nBRBCTL, bit [60]

When FEAT_BRBE is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [BRBCR_EL1](#).
- [BRBFCR_EL1](#).

nBRBCTL	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nBRBIDR, bit [59]

When FEAT_BRBE is implemented:

Trap MRS reads of [BRBIDR0_EL1](#) at EL1 using AArch64 to EL2.

nBRBIDR	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of BRBIDR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of BRBIDR0_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCEIDn_EL0, bit [58]

When FEAT_PMUv3 is implemented:

Trap MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCEIDn_EL0	Meaning
0b0	MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MRC reads of PMCEID<n> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMUSERENR_EL0, bit [57]

When FEAT_PMuV3 is implemented:

Trap MRS reads of [PMUSERENR_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [PMUSERENR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMUSERENR_EL0	Meaning
0b0	MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMUSERENR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MRC reads of PMUSERENR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBTRG_EL1, bit [56]

When FEAT_TRBE is implemented:

Trap MRS reads of [TRBTRG_EL1](#) at EL1 using AArch64 to EL2.

TRBTRG_EL1	Meaning
0b0	MRS reads of TRBTRG_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBTRG_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBSR_EL1, bit [55]

When FEAT_TRBE is implemented:

Trap MRS reads of [TRBSR_EL1](#) at EL1 using AArch64 to EL2.

TRBSR_EL1	Meaning
0b0	MRS reads of TRBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBPTR_EL1, bit [54]

When FEAT_TRBE is implemented:

Trap MRS reads of [TRBPTR_EL1](#) at EL1 using AArch64 to EL2.

TRBPTR_EL1	Meaning
0b0	MRS reads of TRBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBMAR_EL1, bit [53]**When FEAT_TRBE is implemented:**

Trap MRS reads of [TRBMAR_EL1](#) at EL1 using AArch64 to EL2.

TRBMAR_EL1	Meaning
0b0	MRS reads of TRBMAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBMAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBLIMITR_EL1, bit [52]**When FEAT_TRBE is implemented:**

Trap MRS reads of [TRBLIMITR_EL1](#) at EL1 using AArch64 to EL2.

TRBLIMITR_EL1	Meaning
0b0	MRS reads of TRBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBIDR_EL1, bit [51]**When FEAT_TRBE is implemented:**

Trap MRS reads of [TRBIDR_EL1](#) at EL1 using AArch64 to EL2.

TRBIDR_EL1	Meaning
0b0	MRS reads of TRBIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBBASER_EL1, bit [50]

When FEAT_TRBE is implemented:

Trap MRS reads of [TRBBASER_EL1](#) at EL1 using AArch64 to EL2.

TRBBASER_EL1	Meaning
0b0	MRS reads of TRBBASER_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBBASER_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [49]

Reserved, RES0.

TRCVICTLR, bit [48]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of [TRCVICTLR](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCVICTLR at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MRS reads of TRCVICTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCVICTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCSTATR, bit [47]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of [TRCSTATR](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCSTATR at EL1 using AArch64 to EL2.

TRCSTATR	Meaning
0b0	MRS reads of TRCSTATR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSTATR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCSSCSRn, bit [46]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSSCSR<n> are implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of [TRCSSCSR<n>](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCSSCSR<n> at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MRS reads of TRCSSCSR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSSCSR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Single-shot Comparator n is not implemented, a read of [TRCSSCSR<n>](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCSEQSTR, bit [45]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSEQSTR is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of [TRCSEQSTR](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCSEQSTR at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MRS reads of TRCSEQSTR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCPRGCTLR, bit [44]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of [TRCPRGCTLR](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCPRGCTLR at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
0b0	MRS reads of TRCPRGCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCOSLSR, bit [43]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of [TRCOSLSR](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCOSLSR at EL1 using AArch64 to EL2.

TRCOSLSR	Meaning
0b0	MRS reads of TRCOSLSR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCOSLSR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TRCIMSPECn, bit [41]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of [TRCIMSPEC<n>](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCIMSPEC<n> at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MRS reads of TRCIMSPEC<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCIMSPEC<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If [TRCIMSPEC<n>](#) is not implemented, a read of [TRCIMSPEC<n>](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCID, bit [40]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- In an Armv9 implementation:
 - [TRCDEVARCH](#).
 - [TRCDEVID](#).
 - All of the TRCIDR<n> registers.
- In an Armv8 implementation:
 - ETM TRCDEVARCH.
 - ETM TRCDEVID.
 - All of the ETM TRCIDR<n> registers.

TRCID	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

TRCCNTVRn, bit [37]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCCNTVR<n> are implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of [TRCCNTVR<n>](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCCNTVR<n> at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MRS reads of TRCCNTVR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCCNTVR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Counter n is not implemented, a read of [TRCCNTVR<n>](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCCLAIM, bit [36]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of [TRCCLAIMCLR](#) and [TRCCLAIMSET](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCCLAIMCLR and ETM TRCCLAIMSET at EL1 using AArch64 to EL2.

TRCCLAIM	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCAUXCTLR, bit [35]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of [TRCAUXCTLR](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCAUXCTLR at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MRS reads of TRCAUXCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCAUXCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCAUTHSTATUS, bit [34]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of [TRCAUTHSTATUS](#) at EL1 using AArch64 to EL2.

TRCAUTHSTATUS	Meaning
0b0	MRS reads of TRCAUTHSTATUS are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCAUTHSTATUS at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRC, bit [33]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of the following registers at EL1 using AArch64 to EL2:

- [TRCACATR<n>](#).
- [TRCACVR<n>](#).
- [TRCBBCTLR](#).
- [TRCCCCTLR](#).
- [TRCCIDCCTLR0](#).
- [TRCCIDCCTLR1](#).
- [TRCCIDCVR<n>](#).
- [TRCCNTCTLR<n>](#).
- [TRCCNTRLDVR<n>](#).
- [TRCCONFIGR](#).
- [TRCEVENTCTL0R](#).
- [TRCEVENTCTL1R](#).
- [TRCEXTINSELR<n>](#).
- [TRCOCTLR](#).
- [TRCRSCTLR<n>](#).
- [TRCRSR](#).
- [TRCSEQEVR<n>](#).
- [TRCSEQRSTEVR](#).
- [TRCSSCCR<n>](#).
- [TRCSSPCICR<n>](#).
- [TRCSTALLCTLR](#).
- [TRCSYNCPR](#).
- [TRCTRACEIDR](#).
- [TRCTSCTLR](#).
- [TRCVIIECTLR](#).
- [TRCVIPCSSCTLR](#).
- [TRCVISSCTLR](#).
- [TRCVMIDCCTLR0](#).
- [TRCVMIDCCTLR1](#).
- [TRCVMIDCVR<n>](#).

In an Armv8 implementation, trap MRS reads of the following registers at EL1 using AArch64 to EL2:

- ETM [TRCACATR<n>](#).

- ETM TRCACVR<n>.
- ETM TRCBBCTLR.
- ETM TRCCCCTLR.
- ETM TRCCIDCCTLR0.
- ETM TRCCIDCCTLR1.
- ETM TRCCIDCVR<n>.
- ETM TRCCNTCTLR<n>.
- ETM TRCCNTRLDVR<n>.
- ETM TRCCONFIGR.
- ETM TRCEVENTCTL0R.
- ETM TRCEVENTCTL1R.
- ETM TRCEXTINSELR.
- ETM TRCQCTLR.
- ETM TRCRSCTLR<n>.
- ETM TRCSEQEVR<n>.
- ETM TRCSEQRSTEVR.
- ETM TRCSSCCR<n>.
- ETM TRCSSPCICR<n>.
- ETM TRCSTALLCTLR.
- ETM TRCSYNCPR.
- ETM TRCTRACEIDR.
- ETM TRCTSCTLR.
- ETM TRCVIIECTLR.
- ETM TRCVIPCSSCTLR.
- ETM TRCVISSCTLR.
- ETM TRCVMIDCCTLR0.
- ETM TRCVMIDCCTLR1.
- ETM TRCVMIDCVR<n>.

TRC	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

A read of an unimplemented register is UNDEFINED.

[TRCEXTINSELR<n>](#) and [TRCRSR](#) are only implemented if FEAT_ETE is implemented.

TRCEXTINSELR is only implemented if FEAT_ETE is not implemented and FEAT_ETMv4 is implemented.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSLATFR_EL1, bit [32]

When FEAT_SPE is implemented:

Trap MRS reads of [PMSLATFR_EL1](#) at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MRS reads of PMSLATFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSLATFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSIRR_EL1, bit [31]

When FEAT_SPE is implemented:

Trap MRS reads of [PMSIRR_EL1](#) at EL1 using AArch64 to EL2.

PMSIRR_EL1	Meaning
0b0	MRS reads of PMSIRR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSIRR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSIDR_EL1, bit [30]

When FEAT_SPE is implemented:

Trap MRS reads of [PMSIDR_EL1](#) at EL1 using AArch64 to EL2.

PMSIDR_EL1	Meaning
0b0	MRS reads of PMSIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSICR_EL1, bit [29]**When FEAT_SPE is implemented:**

Trap MRS reads of [PMSICR_EL1](#) at EL1 using AArch64 to EL2.

PMSICR_EL1	Meaning
0b0	MRS reads of PMSICR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSICR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSFCR_EL1, bit [28]**When FEAT_SPE is implemented:**

Trap MRS reads of [PMSFCR_EL1](#) at EL1 using AArch64 to EL2.

PMSFCR_EL1	Meaning
0b0	MRS reads of PMSFCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSEVFR_EL1, bit [27]**When FEAT_SPE is implemented:**

Trap MRS reads of [PMSEVFR_EL1](#) at EL1 using AArch64 to EL2.

PMSEVFR_EL1	Meaning
0b0	MRS reads of PMSEVFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSCR_EL1, bit [26]

When FEAT_SPE is implemented:

Trap MRS reads of [PMSCR_EL1](#) at EL1 using AArch64 to EL2.

PMSCR_EL1	Meaning
0b0	MRS reads of PMSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBSR_EL1, bit [25]

When FEAT_SPE is implemented:

Trap MRS reads of [PMBSR_EL1](#) at EL1 using AArch64 to EL2.

PMBSR_EL1	Meaning
0b0	MRS reads of PMBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBPTR_EL1, bit [24]**When FEAT_SPE is implemented:**

Trap MRS reads of [PMBPTR_EL1](#) at EL1 using AArch64 to EL2.

PMBPTR_EL1	Meaning
0b0	MRS reads of PMBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBLIMITR_EL1, bit [23]**When FEAT_SPE is implemented:**

Trap MRS reads of [PMBLIMITR_EL1](#) at EL1 using AArch64 to EL2.

PMBLIMITR_EL1	Meaning
0b0	MRS reads of PMBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMMIR_EL1, bit [22]**When FEAT_PMUv3 is implemented:**

Trap MRS reads of [PMMIR_EL1](#) at EL1 using AArch64 to EL2.

PMMIR_EL1	Meaning
0b0	MRS reads of PMMIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTE _n == 1, then MRS reads of PMMIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [21:20]

Reserved, RES0.

PMSELR_ELO, bit [19]

When FEAT_PMUv3 is implemented:

Trap MRS reads of [PMSELR_ELO](#) at EL1 and EL0 using AArch64 and MRC reads of [PMSELR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSELR_ELO	Meaning
0b0	MRS reads of PMSELR_ELO at EL1 and EL0 using AArch64 and MRC reads of PMSELR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTE _n == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> MRS reads of PMSELR_ELO at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MRC reads of PMSELR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMOVS, bit [18]

When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [PMOVSCLR_ELO](#) and [PMOVSSET_ELO](#).
- At EL0 using AArch32 when EL1 is using AArch64: MRC reads of [PMOVSR](#) and [PMOVSSET](#).

PMOVS	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	<p>If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> MRS reads at EL1 and EL0 using AArch64 of PMOVSCLR_ELO and PMOVSSSET_ELO are trapped to EL2 and reported with EC syndrome value 0x18. MRC reads at EL0 using AArch32 of PMOVSR and PMOVSSSET are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMINTEN, bit [17]

When FEAT_PMUv3 is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [PMINTENCLR_EL1](#).
- [PMINTENSET_EL1](#).

PMINTEN	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	<p>If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.</p>

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCNTEN, bit [16]

When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [PMCNTENCLR_ELO](#) and [PMCNTENSET_ELO](#).
- At EL0 using AArch32 when EL1 is using AArch64: MRC reads of [PMCNTENCLR](#) and [PMCNTENSET](#).

PMCNTEN	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	<p>If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> MRS reads at EL1 and EL0 using AArch64 of PMCNTENCLR_EL0 and PMCNTENSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. MRC reads at EL0 using AArch32 of PMCNTENCLR and PMCNTENSET are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCNTR_EL0, bit [15]

When FEAT_PMUv3 is implemented:

Trap MRS reads of [PMCCNTR_EL0](#) at EL1 and EL0 using AArch64 and MRC and MRRC reads of [PMCCNTR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MRC and MRRC reads of PMCCNTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	<p>If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MRC and MRRC reads of PMCCNTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03 (for MRC) or 0x04 (for MRRC).

[PMCCNTR_EL0](#) is indirectly accessed when [PMCR_EL0](#).C is set to 0b1.

Setting this field to 1 has no effect on accesses to [PMCCNTR_EL0](#) using [PMCR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCFILTR_EL0, bit [14]**When FEAT_PMuV3 is implemented:**

Trap MRS reads of [PMCCFILTR_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [PMCCFILTR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCFILTR_EL0	Meaning
0b0	MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCCFILTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> • MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMCCFILTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

[PMCCFILTR_EL0](#) can also be accessed in AArch64 state using [PMXEVTYPER_EL0](#) when [PMSELR_EL0](#).SEL == 31, and [PMCCFILTR](#) can also be accessed in AArch32 state using [PMXEVTYPER](#) when [PMSELR](#).SEL == 31.

Setting this field to 1 has no effect on accesses to [PMXEVTYPER_EL0](#) and [PMXEVTYPER](#), regardless of the value of [PMSELR_EL0](#).SEL or [PMSELR](#).SEL.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMEVTYPERn_EL0, bit [13]**When FEAT_PMuV3 is implemented:**

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [PMEVTYPER<n>_EL0](#) and [PMXEVTYPER_EL0](#).
- At EL0 using AArch32 when EL1 is using AArch64: MRC reads of [PMEVTYPER<n>](#) and [PMXEVTYPER](#).

PMEVTYPERn_EL0	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> • MRS reads at EL1 and EL0 using AArch64 of PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 of PMEVTYPER<n> and PMXEVTYPER are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
 - In AArch64 state, a read of [PMEVTYPER<n>_EL0](#), or, if n is not 31, a read of [PMXEVTYPER_EL0](#) when [PMSELR_EL0](#).SEL == n.
 - In AArch32 state, a read of [PMEVTYPER<n>](#), or, if n is not 31, a read of [PMXEVTYPER](#) when [PMSELR](#).SEL == n.
- If event counter n is implemented, n is greater-than-or-equal-to [MDCR_EL2](#).HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
 - In AArch64 state, a read of [PMEVTYPER<n>_EL0](#), or a read of [PMXEVTYPER_EL0](#) when [PMSELR_EL0](#).SEL == n, reported with EC syndrome value 0x18.
 - In AArch32 state, a read of [PMEVTYPER<n>](#), or a read of [PMXEVTYPER](#) when [PMSELR](#).SEL == n, reported with EC syndrome value 0x03.

See also [HDFGRTR_EL2.PMCCFILTR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMEVCNTRn_EL0, bit [12]

When FEAT_PMuV3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [PMEVCNTR<n>_EL0](#) and [PMXEVCNTR_EL0](#).
- At EL0 using AArch32 when EL1 is using AArch64: MRC reads of [PMEVCNTR<n>](#) and [PMXEVCNTR](#).

PMEVCNTRn_EL0	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	<p>If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTE == 1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> • MRS reads at EL1 and EL0 using AArch64 of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 of PMEVCNTR<n> and PMXEVCNTR are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
 - In AArch64 state, a read of [PMEVCNTR<n>_EL0](#), or a read of [PMXEVCNTR_EL0](#) when [PMSELR_EL0](#).SEL == n.
 - In AArch32 state, a read of [PMEVCNTR<n>](#), or a read of [PMXEVCNTR](#) when [PMSELR](#).SEL == n.
- If event counter n is implemented, n is greater-than-or-equal-to [MDCR_EL2](#).HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
 - In AArch64 state, a read of [PMEVCNTR<n>_EL0](#), or a read of [PMXEVCNTR_EL0](#) when [PMSELR_EL0](#).SEL == n, reported with EC syndrome value 0x18.
 - In AArch32 state, a read of [PMEVCNTR<n>](#), or a read of [PMXEVCNTR](#) when [PMSELR](#).SEL == n, reported with EC syndrome value 0x03.

PMEVCNTR<n>_EL0 is indirectly accessed when **PMCR_EL0.P** is set to 0b1.

Setting this field to 1 has no effect on accesses to **PMEVCNTR<n>_EL0** using **PMCR_EL0**.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

OSDLR_EL1, bit [11]

When FEAT_DoubleLock is implemented:

Trap MRS reads of [OSDLR_EL1](#) at EL1 using AArch64 to EL2.

OSDLR_EL1	Meaning
0b0	MRS reads of OSDLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSDLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

OSECCR_EL1, bit [10]

Trap MRS reads of [OSECCR_EL1](#) at EL1 using AArch64 to EL2.

OSECCR_EL1	Meaning
0b0	MRS reads of OSECCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSECCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

OSLSR_EL1, bit [9]

Trap MRS reads of [OSLSR_EL1](#) at EL1 using AArch64 to EL2.

OSLSR_EL1	Meaning
0b0	MRS reads of OSLSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSLSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [8]

Reserved, RES0.

DBGPRCR_EL1, bit [7]

Trap MRS reads of [DBGPRCR_EL1](#) at EL1 using AArch64 to EL2.

DBGPRCR_EL1	Meaning
0b0	MRS reads of DBGPRCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGPRCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGAUTHSTATUS_EL1, bit [6]

Trap MRS reads of [DBGAUTHSTATUS_EL1](#) at EL1 using AArch64 to EL2.

DBGAUTHSTATUS_EL1	Meaning
0b0	MRS reads of DBGAUTHSTATUS_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGAUTHSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGCLAIM, bit [5]

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [DBGCLAIMCLR_EL1](#).
- [DBGCLAIMSET_EL1](#).

DBGCLAIM	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MDSCR_EL1, bit [4]

Trap MRS reads of [MDSCR_EL1](#) at EL1 using AArch64 to EL2.

MDSCR_EL1	Meaning
0b0	MRS reads of MDSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MDSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGWVRn_EL1, bit [3]

Trap MRS reads of [DBGWVR<n>_EL1](#) at EL1 using AArch64 to EL2.

DBGWVRn_EL1	Meaning
0b0	MRS reads of DBGWVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGWVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of [DBGWVR<n>_EL1](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGWCRn_EL1, bit [2]

Trap MRS reads of [DBGWCR<n>_EL1](#) at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MRS reads of DBGWCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGWCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of [DBGWCR<n>_EL1](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGBVRn_EL1, bit [1]

Trap MRS reads of [DBGBVR<n>_EL1](#) at EL1 using AArch64 to EL2.

DBGBVRn_EL1	Meaning
0b0	MRS reads of DBGBVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGBVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of [DBGBVR<n>_EL1](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGBCRn_EL1, bit [0]

Trap MRS reads of [DBGBCR<n>_EL1](#) at EL1 using AArch64 to EL2.

DBGBCRn_EL1	Meaning
0b0	MRS reads of DBGBCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGBCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of [DBGBCR<n>_EL1](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HDFGRTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDFGRTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;

HDFGWTR2_EL2, Hypervisor Debug Fine-Grained Write Trap Register 2

The HDFGWTR2_EL2 characteristics are:

Purpose

Provides controls for traps of MSR and MCR writes of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

This register is present only when FEAT_FGT2 is implemented. Otherwise, direct accesses to HDFGWTR2_EL2 are UNDEFINED.

Attributes

HDFGWTR2_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46						
RES0				nPMZR_ELO				nTRCITECR_EL1				nPMSDSFR_EL1				RES0		nSPMSCR_EL1		nSPMACCESSR_EL1		nSPMCR_EL1	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14						

Bits [63:22]

Reserved, RES0.

nPMZR_ELO, bit [21]

When FEAT_PMUv3p9 is implemented:

Trap MSR writes of [PMZR_ELO](#) at EL1 and EL0 using AArch64 to EL2.

nPMZR_ELO	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn2 == 1, then MSR writes of PMZR_ELO at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMZR_ELO are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTRCITECR_EL1, bit [20]**When FEAT_ITE is implemented:**

Trap MSR writes of [TRCITECR_EL1](#) at EL1 using AArch64 to EL2.

nTRCITECR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MSR writes of TRCITECR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TRCITECR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMDSFR_EL1, bit [19]**When FEAT_SPE_FDS is implemented:**

Trap MSR writes of [PMDSFR_EL1](#) at EL1 using AArch64 to EL2.

nPMDSFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MSR writes of PMDSFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMDSFR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [18:17]

Reserved, RES0.

nSPMSCR_EL1, bit [16]**When FEAT_SPMU is implemented:**

Trap MSR writes of [SPMSCR_EL1](#) at EL1 using AArch64 to EL2.

nSPMSCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MSR writes of SPMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SPMSCR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMACCESSR_EL1, bit [15]**When FEAT_SPMU is implemented:**

Trap MSR writes of [SPMACCESSR_EL1](#) at EL1 using AArch64 to EL2.

nSPMACCESSR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MSR writes of SPMACCESSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SPMACCESSR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMCR_EL0, bit [14]**When FEAT_SPMU is implemented:**

Trap MSR writes of [SPMCR_EL0](#) at EL1 and EL0 using AArch64 to EL2.

nSPMCR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn2 == 1, then MSR writes of SPMCR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SPMCR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMOVS, bit [13]

When FEAT_SPMU is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- [SPMOVSLR_EL0](#).
- [SPMOVSSET_EL0](#).

nSPMOVS	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn2 == 1, then MSR writes at EL1 and EL0 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMINTEN, bit [12]

When FEAT_SPMU is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [SPMINTENCLR_EL1](#).
- [SPMINTENSET_EL1](#).

nSPMINTEN	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMCNTEN, bit [11]

When FEAT_SPMU is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- [SPMCNTENCLR_EL0](#).
- [SPMCNTENSET_EL0](#).

nSPMCNTEN	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MSR writes at EL1 and EL0 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMSELR_EL0, bit [10]

When FEAT_SPMU is implemented:

Trap MSR writes of [SPMSELR_EL0](#) at EL1 and EL0 using AArch64 to EL2.

nSPMSELR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTE _{n2} == 1, then MSR writes of SPMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SPMSELR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMEVTYPEPn_EL0, bit [9]

When FEAT_SPMU is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- [SPMEVTYPEP<n>_EL0](#).
- [SPMEVFILTR<n>_EL0](#).
- [SPMEVFILT2R<n>_EL0](#).

nSPMEVTYPEPn_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTE _{n2} == 1, then MSR writes at EL1 and EL0 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the System registers listed above are not trapped by this mechanism.

Regardless of the value of this bit, if event counter n is not implemented, a write of [SPMEVTYPEP<n>_EL0](#), [SPMEVFILTR<n>_EL0](#), or [SPMEVFILT2R<n>_EL0](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMEVCNTRn_EL0, bit [8]**When FEAT_SPMU is implemented:**

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2: [SPMEVCNTR<n>_EL0](#).

nSPMEVCNTRn_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn2 == 1, then MSR writes at EL1 and EL0 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the System registers listed above are not trapped by this mechanism.

Regardless of the value of this bit, if event counter n is not implemented, a write of [SPMEVCNTR<n>_EL0](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSSCR_EL1, bit [7]**When FEAT_PMUv3_SS is implemented:**

Trap MSR writes of [PMSSCR_EL1](#) at EL1 using AArch64 to EL2.

nPMSSCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn2 == 1, then MSR writes of PMSSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMSSCR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [6]

Reserved, RES0.

nMDSELR_EL1, bit [5]**When FEAT_Debugv8p9 is implemented:**

Trap MSR writes of [MDSELR_EL1](#) at EL1 using AArch64 to EL2.

nMDSELR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MSR writes of MDSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of MDSELR_EL1 are not trapped by this mechanism.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and [MDSELR_EL1](#) is implemented as RAZ/WI.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMUACR_EL1, bit [4]**When FEAT_PMUv3p9 is implemented:**

Trap MSR writes of [PMUACR_EL1](#) at EL1 using AArch64 to EL2.

nPMUACR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MSR writes of PMUACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMUACR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMICFILTR_EL0, bit [3]**When FEAT_PMUv3_ICNTR is implemented:**

Trap MSR writes of [PMICFILTR_EL0](#) at EL1 and EL0 using AArch64 to EL2.

nPMICFILTR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn2 == 1, then MSR writes of PMICFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMICFILTR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMICNTR_EL0, bit [2]

When FEAT_PMuV3_ICNTR is implemented:

Trap MSR writes of [PMICNTR_EL0](#) at EL1 and EL0 using AArch64 to EL2.

nPMICNTR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn2 == 1, then MSR writes of PMICNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMICNTR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMIAR_EL1, bit [1]

When FEAT_SEBEP is implemented:

Trap MSR writes of [PMIAR_EL1](#) at EL1 using AArch64 to EL2.

nPMIAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MSR writes of PMIAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMIAR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMECR_EL1, bit [0]

When FEAT_EBEP is implemented:

Trap MSR writes of [PMECR_EL1](#) at EL1 using AArch64 to EL2.

nPMECR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MSR writes of PMECR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMECR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HDFGWTR2_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDFGWTR2_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        X[t, 64] = NVMem[0x1B0];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    X[t, 64] = HDFGWTR2_EL2;
elsif PSTATE.EL == EL3 then
    X[t, 64] = HDFGWTR2_EL2;

```

MSR HDFGWTR2_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x1B0] = X[t, 64];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HDFGWTR2_EL2 = X[t, 64];
elsif PSTATE.EL == EL3 then
    HDFGWTR2_EL2 = X[t, 64];

```

HDFGWTR_EL2, Hypervisor Debug Fine-Grained Write Trap Register

The HDFGWTR_EL2 characteristics are:

Purpose

Provides controls for traps of MSR and MCR writes of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HDFGWTR_EL2 are UNDEFINED.

Attributes

HDFGWTR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	
RES0	nPMSNEVFR_EL1	nBRBDATA	nBRBCTL	RES0		PMUSERENR_ELO	TRBTRG_EL1	TF
PMSIRR_EL1	RES0	PMSICR_EL1	PMSFCR_EL1	PMSEVFR_EL1	PMSCR_EL1	PMBSR_EL1	PMBPTR_EL1	PMB
31	30	29	28	27	26	25	24	

Bit [63]

Reserved, RES0.

nPMSNEVFR_EL1, bit [62] When FEAT_SPEv1p2 is implemented:

Trap MSR writes of [PMSNEVFR_EL1](#) at EL1 using AArch64 to EL2.

nPMSNEVFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTE _n == 1, then MSR writes of PMSNEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMSNEVFR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nBRBDATA, bit [61]**When FEAT_BRBE is implemented:**

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [BRBINFINJ_EL1](#).
- [BRBSRCINJ_EL1](#).
- [BRBTGTINJ_EL1](#).
- [BRBTS_EL1](#).

nBRBDATA	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTE _n == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nBRBCTL, bit [60]**When FEAT_BRBE is implemented:**

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [BRBCR_EL1](#).
- [BRBFCR_EL1](#).

nBRBCTL	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTE _n == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the System registers listed above are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [59:58]

Reserved, RES0.

PMUSERENR_EL0, bit [57]**When FEAT_PMUv3 is implemented:**

Trap MSR writes of [PMUSERENR_EL0](#) at EL1 using AArch64 to EL2.

PMUSERENR_EL0	Meaning
0b0	MSR writes of PMUSERENR_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMUSERENR_EL0 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBTRG_EL1, bit [56]**When FEAT_TRBE is implemented:**

Trap MSR writes of [TRBTRG_EL1](#) at EL1 using AArch64 to EL2.

TRBTRG_EL1	Meaning
0b0	MSR writes of TRBTRG_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBTRG_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBSR_EL1, bit [55]**When FEAT_TRBE is implemented:**

Trap MSR writes of [TRBSR_EL1](#) at EL1 using AArch64 to EL2.

TRBSR_EL1	Meaning
0b0	MSR writes of TRBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBPTR_EL1, bit [54]

When FEAT_TRBE is implemented:

Trap MSR writes of [TRBPTR_EL1](#) at EL1 using AArch64 to EL2.

TRBPTR_EL1	Meaning
0b0	MSR writes of TRBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBMAR_EL1, bit [53]

When FEAT_TRBE is implemented:

Trap MSR writes of [TRBMAR_EL1](#) at EL1 using AArch64 to EL2.

TRBMAR_EL1	Meaning
0b0	MSR writes of TRBMAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBMAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRBLIMITR_EL1, bit [52]**When FEAT_TRBE is implemented:**

Trap MSR writes of [TRBLIMITR_EL1](#) at EL1 using AArch64 to EL2.

TRBLIMITR_EL1	Meaning
0b0	MSR writes of TRBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [51]

Reserved, RES0.

TRBBASER_EL1, bit [50]**When FEAT_TRBE is implemented:**

Trap MSR writes of [TRBBASER_EL1](#) at EL1 using AArch64 to EL2.

TRBBASER_EL1	Meaning
0b0	MSR writes of TRBBASER_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBBASER_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRFCR_EL1, bit [49]**When FEAT_TRF is implemented:**

Trap MSR writes of [TRFCR_EL1](#) at EL1 using AArch64 to EL2.

TRFCR_EL1	Meaning
0b0	MSR writes of TRFCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCVICTLR, bit [48]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of [TRCVICTLR](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCVICTLR at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MSR writes of TRCVICTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCVICTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [47]

Reserved, RES0.

TRCSSCSRn, bit [46]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSSCSR<n> are implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of [TRCSSCSR<n>](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCSSCSR<n> at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MSR writes of TRCSSCSR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCSSCSR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Single-shot Comparator n is not implemented, a write of [TRCSSCSR<n>](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCSEQSTR, bit [45]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSEQSTR is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of [TRCSEQSTR](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCSEQSTR at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MSR writes of TRCSEQSTR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCPRGCTLR, bit [44]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of [TRCPRGCTLR](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCPRGCTLR at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
0b0	MSR writes of TRCPRGCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [43]

Reserved, RES0.

TRCOSLAR, bit [42]

When System register access to the trace unit registers is implemented and FEAT_ETMv4 is implemented:

In an Armv8 implementation, trap MSR writes of ETM TRCOSLAR at EL1 using AArch64 to EL2.

TRCOSLAR	Meaning
0b0	MSR writes of TRCOSLAR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCOSLAR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCIMSPECn, bit [41]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of [TRCIMSPEC<n>](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCIMSPEC<n> at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MSR writes of TRCIMSPEC<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCIMSPEC<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If [TRCIMSPEC<n>](#) is not implemented, a write of [TRCIMSPEC<n>](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [40:38]

Reserved, RES0.

TRCCNTVRn, bit [37]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCCNTVR<n> are implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of [TRCCNTVR<n>](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCCNTVR<n> at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MSR writes of TRCCNTVR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCCNTVR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Counter n is not implemented, a write of [TRCCNTVR<n>](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCCLAIM, bit [36]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of [TRCCLAIMCLR](#) and [TRCCLAIMSET](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCCLAIMCLR and ETM TRCCLAIMSET at EL1 using AArch64 to EL2.

TRCCLAIM	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCAUXCTLR, bit [35]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of [TRCAUXCTLR](#) at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCAUXCTLR at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MSR writes of TRCAUXCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCAUXCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [34]

Reserved, RES0.

TRC, bit [33]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of the following registers at EL1 using AArch64 to EL2:

- [TRCACATR<n>](#).
- [TRCACVR<n>](#).
- [TRCBBCTLR](#).
- [TRCCCCTLR](#).
- [TRCCIDCTLRO](#).
- [TRCCIDCTLRI](#).

- [TRCCIDCVR<n>](#).
- [TRCCNTCTLR<n>](#).
- [TRCCNTRLDVR<n>](#).
- [TRCCONFIGR](#).
- [TRCEVENTCTL0R](#).
- [TRCEVENTCTL1R](#).
- [TRCEXTINSELR<n>](#).
- [TRCQCTLR](#).
- [TRCRSCTLR<n>](#).
- [TRCRSR](#).
- [TRCSEQEVR<n>](#).
- [TRCSEQRSTEVR](#).
- [TRCSSCCR<n>](#).
- [TRCSSPCICR<n>](#).
- [TRCSTALLCTLR](#).
- [TRCSYNCPR](#).
- [TRCTRACEIDR](#).
- [TRCTSCTLR](#).
- [TRCVIIECTLR](#).
- [TRCVIPCSSCTLR](#).
- [TRCVISSCTLR](#).
- [TRCVMIDCCTL0R](#).
- [TRCVMIDCCTL1R](#).
- [TRCVMIDCVR<n>](#).

In an Armv8 implementation, trap MSR writes of the following registers at EL1 using AArch64 to EL2:

- ETM TRCACATR<n>.
- ETM TRCACVR<n>.
- ETM TRCBBCTLR.
- ETM TRCCCCTLR.
- ETM TRCCIDCCTL0R.
- ETM TRCCIDCCTL1R.
- ETM TRCCIDCVR<n>.
- ETM TRCCNTCTLR<n>.
- ETM TRCCNTRLDVR<n>.
- ETM TRCCONFIGR.
- ETM TRCEVENTCTL0R.
- ETM TRCEVENTCTL1R.
- ETM TRCEXTINSELR.
- ETM TRCQCTLR.
- ETM TRCRSCTLR<n>.
- ETM TRCSEQEVR<n>.
- ETM TRCSEQRSTEVR.
- ETM TRCSSCCR<n>.
- ETM TRCSSPCICR<n>.
- ETM TRCSTALLCTLR.
- ETM TRCSYNCPR.
- ETM TRCTRACEIDR.
- ETM TRCTSCTLR.
- ETM TRCVIIECTLR.
- ETM TRCVIPCSSCTLR.
- ETM TRCVISSCTLR.
- ETM TRCVMIDCCTL0R.
- ETM TRCVMIDCCTL1R.
- ETM TRCVMIDCVR<n>.

TRC	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

A write of an unimplemented register is UNDEFINED.

[TRCEXTINSELR<n>](#) and [TRCRSR](#) are only implemented if FEAT_ETE is implemented.

TRCEXTINSEL is only implemented if FEAT_ETE is not implemented and FEAT_ETMv4 is implemented.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSLATFR_EL1, bit [32]

When FEAT_SPE is implemented:

Trap MSR writes of [PMSLATFR_EL1](#) at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MSR writes of PMSLATFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSLATFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSIRR_EL1, bit [31]

When FEAT_SPE is implemented:

Trap MSR writes of [PMSIRR_EL1](#) at EL1 using AArch64 to EL2.

PMSIRR_EL1	Meaning
0b0	MSR writes of PMSIRR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSIRR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [30]

Reserved, RES0.

PMSICR_EL1, bit [29]**When FEAT_SPE is implemented:**

Trap MSR writes of [PMSICR_EL1](#) at EL1 using AArch64 to EL2.

PMSICR_EL1	Meaning
0b0	MSR writes of PMSICR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSICR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSEVFR_EL1, bit [28]**When FEAT_SPE is implemented:**

Trap MSR writes of [PMSEVFR_EL1](#) at EL1 using AArch64 to EL2.

PMSEVFR_EL1	Meaning
0b0	MSR writes of PMSEVFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSEVFR_EL1, bit [27]**When FEAT_SPE is implemented:**

Trap MSR writes of [PMSEVFR_EL1](#) at EL1 using AArch64 to EL2.

PMSEVFR_EL1	Meaning
0b0	MSR writes of PMSEVFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSCR_EL1, bit [26]

When FEAT_SPE is implemented:

Trap MSR writes of [PMSCR_EL1](#) at EL1 using AArch64 to EL2.

PMSCR_EL1	Meaning
0b0	MSR writes of PMSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBSR_EL1, bit [25]

When FEAT_SPE is implemented:

Trap MSR writes of [PMBSR_EL1](#) at EL1 using AArch64 to EL2.

PMBSR_EL1	Meaning
0b0	MSR writes of PMBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBPTR_EL1, bit [24]**When FEAT_SPE is implemented:**

Trap MSR writes of [PMBPTR_EL1](#) at EL1 using AArch64 to EL2.

PMBPTR_EL1	Meaning
0b0	MSR writes of PMBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBLIMITR_EL1, bit [23]**When FEAT_SPE is implemented:**

Trap MSR writes of [PMBLIMITR_EL1](#) at EL1 using AArch64 to EL2.

PMBLIMITR_EL1	Meaning
0b0	MSR writes of PMBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

PMCR_ELO, bit [21]**When FEAT_PMUv3 is implemented:**

Trap MSR writes of [PMCR_ELO](#) at EL1 and EL0 using AArch64 and MCR writes of [PMCR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCR_ELO	Meaning
0b0	MSR writes of PMCR_ELO at EL1 and EL0 using AArch64 and MCR writes of PMCR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> MSR writes of PMCR_ELO at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MCR writes of PMCR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSWINC_ELO, bit [20]**When FEAT_PMUv3 is implemented:**

Trap MSR writes of [PMSWINC_ELO](#) at EL1 and EL0 using AArch64 and MCR writes of [PMSWINC](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSWINC_ELO	Meaning
0b0	MSR writes of PMSWINC_ELO at EL1 and EL0 using AArch64 and MCR writes of PMSWINC at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> MSR writes of PMSWINC_ELO at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MCR writes of PMSWINC at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSELR_EL0, bit [19]**When FEAT_PMUv3 is implemented:**

Trap MSR writes of [PMSELR_EL0](#) at EL1 and EL0 using AArch64 and MCR writes of [PMSELR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSELR_EL0	Meaning
0b0	MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSELR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MCR writes of PMSELR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMOVS, bit [18]**When FEAT_PMUv3 is implemented:**

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of [PMOVSLR_EL0](#) and [PMOVSSET_EL0](#).
- At EL0 using AArch32 when EL1 is using AArch64: MCR writes of [PMOVS](#) and [PMOVSSET](#).

PMOVS	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> MSR writes at EL1 and EL0 using AArch64 of PMOVSLR_EL0 and PMOVSSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. MCR writes at EL0 using AArch32 of PMOVS and PMOVSSET are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMINTEN, bit [17]**When FEAT_PMUv3 is implemented:**

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [PMINTENCLR_EL1](#).
- [PMINTENSET_EL1](#).

PMINTEN	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCNTEN, bit [16]**When FEAT_PMUv3 is implemented:**

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of [PMCNTENCLR_EL0](#) and [PMCNTENSET_EL0](#).
- At EL0 using AArch32 when EL1 is using AArch64: MCR writes of [PMCNTENCLR](#) and [PMCNTENSET](#).

PMCNTEN	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> • MSR writes at EL1 and EL0 using AArch64 of PMCNTENCLR_EL0 and PMCNTENSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 of PMCNTENCLR and PMCNTENSET are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCNTR_EL0, bit [15]**When FEAT_PMUv3 is implemented:**

Trap MSR writes of [PMCCNTR_EL0](#) at EL1 and EL0 using AArch64 and MCR and MCRR writes of [PMCCNTR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MCR and MCRR writes of PMCCNTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MCR and MCRR writes of PMCCNTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03 (for MCR) or 0x04 (for MCRR).

[PMCCNTR_EL0](#) is indirectly accessed when [PMCR_EL0.C](#) is set to 0b1.

Setting this field to 1 has no effect on accesses to [PMCCNTR_EL0](#) using [PMCR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCFILTR_EL0, bit [14]**When FEAT_PMUv3 is implemented:**

Trap MSR writes of [PMCCFILTR_EL0](#) at EL1 and EL0 using AArch64 and MCR writes of [PMCCFILTR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCFILTR_EL0	Meaning
0b0	MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCCFILTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MCR writes of PMCCFILTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

[PMCCFILTR_EL0](#) can also be accessed in AArch64 state using [PMXEVTYPER_EL0](#) when [PMSELR_EL0](#).SEL == 31, and [PMCCFILTR](#) can also be accessed in AArch32 state using [PMXEVTYPER](#) when [PMSELR](#).SEL == 31.

Setting this field to 1 has no effect on accesses to [PMXEVTYPER_EL0](#) and [PMXEVTYPER](#), regardless of the value of [PMSELR_EL0](#).SEL or [PMSELR](#).SEL.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMEVTYPEPn_EL0, bit [13]

When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of [PMEVTYPEP<n>_EL0](#) and [PMXEVTYPEn_EL0](#).
- At EL0 using AArch32 when EL1 is using AArch64: MCR writes of [PMEVTYPEP<n>](#) and [PMXEVTYPEn](#).

PMEVTYPEPn_EL0	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTEN == 1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> MSR writes at EL1 and EL0 using AArch64 of PMEVTYPEP<n>_EL0 and PMXEVTYPEn_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. MCR writes at EL0 using AArch32 of PMEVTYPEP<n> and PMXEVTYPEn are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
 - In AArch64 state, a write of [PMEVTYPEP<n>_EL0](#), or, if n is not 31, a write of [PMXEVTYPEn_EL0](#) when [PMSELR_EL0](#).SEL == n.
 - In AArch32 state, a write of [PMEVTYPEP<n>](#), or, if n is not 31, a write of [PMXEVTYPEn](#) when [PMSELR](#).SEL == n.
- If event counter n is implemented, n is greater-than-or-equal-to [MDCR_EL2](#).HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
 - In AArch64 state, a write of [PMEVTYPEP<n>_EL0](#), or a write of [PMXEVTYPEn_EL0](#) when [PMSELR_EL0](#).SEL == n, reported with EC syndrome value 0x18.
 - In AArch32 state, a write of [PMEVTYPEP<n>](#), or a write of [PMXEVTYPEn](#) when [PMSELR](#).SEL == n, reported with EC syndrome value 0x03.

See also HDFGWTR_EL2.PMCCFILTR_EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMEVCNTRn_EL0, bit [12]**When FEAT_PMUv3 is implemented:**

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of [PMEVCNTR<n>_EL0](#) and [PMXEVCNTR_EL0](#).
- At EL0 using AArch32 when EL1 is using AArch64: MCR writes of [PMEVCNTR<n>](#) and [PMXEVCNTR](#).

PMEVCNTRn_EL0	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	<p>If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception:</p> <ul style="list-style-type: none"> • MSR writes at EL1 and EL0 using AArch64 of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 of PMEVCNTR<n> and PMXEVCNTR are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
 - In AArch64 state, a write of [PMEVCNTR<n>_EL0](#), or a write of [PMXEVCNTR_EL0](#) when [PMSELR_EL0](#).SEL == n.
 - In AArch32 state, a write of [PMEVCNTR<n>](#), or a write of [PMXEVCNTR](#) when [PMSELR](#).SEL == n.
- If event counter n is implemented, n is greater-than-or-equal-to [MDCR_EL2](#).HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
 - In AArch64 state, a write of [PMEVCNTR<n>_EL0](#), or a write of [PMXEVCNTR_EL0](#) when [PMSELR_EL0](#).SEL == n, reported with EC syndrome value 0x18.
 - In AArch32 state, a write of [PMEVCNTR<n>](#), or a write of [PMXEVCNTR](#) when [PMSELR](#).SEL == n, reported with EC syndrome value 0x03.

[PMEVCNTR<n>_EL0](#) is indirectly accessed when [PMCR_EL0](#).P is set to 0b1.

Setting this field to 1 has no effect on accesses to [PMEVCNTR<n>_EL0](#) using [PMCR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

OSDLR_EL1, bit [11]**When FEAT_DoubleLock is implemented:**

Trap MSR writes of [OSDLR_EL1](#) at EL1 using AArch64 to EL2.

OSDLR_EL1	Meaning
0b0	MSR writes of OSDLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of OSDLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

OSECCR_EL1, bit [10]

Trap MSR writes of [OSECCR_EL1](#) at EL1 using AArch64 to EL2.

OSECCR_EL1	Meaning
0b0	MSR writes of OSECCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of OSECCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [9]

Reserved, RES0.

OSLAR_EL1, bit [8]

Trap MSR writes of [OSLAR_EL1](#) at EL1 using AArch64 to EL2.

OSLAR_EL1	Meaning
0b0	MSR writes of OSLAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of OSLAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGPRCR_EL1, bit [7]

Trap MSR writes of [DBGPRCR_EL1](#) at EL1 using AArch64 to EL2.

DBGPRCR_EL1	Meaning
0b0	MSR writes of DBGPRCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGPRCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [6]

Reserved, RES0.

DBGCLAIM, bit [5]

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [DBGCLAIMCLR_EL1](#).
- [DBGCLAIMSET_EL1](#).

DBGCLAIM	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MDSCR_EL1, bit [4]

Trap MSR writes of [MDSCR_EL1](#) at EL1 using AArch64 to EL2.

MDSCR_EL1	Meaning
0b0	MSR writes of MDSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MDSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGWVRn_EL1, bit [3]

Trap MSR writes of [DBGWVR<n>_EL1](#) at EL1 using AArch64 to EL2.

DBGWVRn_EL1	Meaning
0b0	MSR writes of DBGWVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGWVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of [DBGWVR<n>_EL1](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGWCRn_EL1, bit [2]

Trap MSR writes of [DBGWCR<n>_EL1](#) at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MSR writes of DBGWCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGWCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of [DBGWCR<n>_EL1](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGBVRn_EL1, bit [1]

Trap MSR writes of [DBGBVR<n>_EL1](#) at EL1 using AArch64 to EL2.

DBGBVRn_EL1	Meaning
0b0	MSR writes of DBGBVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGBVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of [DBGBVR<n>_EL1](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGBCRn_EL1, bit [0]

Trap MSR writes of [DBGBCR<n>_EL1](#) at EL1 using AArch64 to EL2.

DBGBCRn_EL1	Meaning
0b0	MSR writes of DBGBCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGBCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of [DBGBCR<n>_EL1](#) is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HDFGWTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDFGWTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b101

HFGITR_EL2, Hypervisor Fine-Grained Instruction Trap Register

The HFGITR_EL2 characteristics are:

Purpose

Provides instruction trap controls.

Configuration

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGITR_EL2 are UNDEFINED.

Attributes

HFGITR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56
	RES0		COSPRCTXnBRBIAL		RES0nBRBIN		nBRBIAL
TLBIVAAE1IS	TLBIASIDE1IS	TLBIVAE1IS	TLBIVMALE1IS	TLBIRVALE1OS	TLBIRVAE1OS	TLBIRVAE1OS	TLBIRVA
31	30	29	28	27	26	25	24

Bits [63:6157]

Reserved, RES0.

COSPRCTX, bit [60]

When FEAT_SPECRES2 is implemented:

Trap execution of [COSP_RCTX](#) at EL1 and EL0 using AArch64 and execution of [COSPRCTX](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

COSPRCTX	Meaning
0b0	Execution of COSP_RCTX at EL1 and EL0 using AArch64 and execution of COSPRCTX at EL0 using AArch32 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTE == 1, then, unless the instruction generates a higher priority exception: <ul style="list-style-type: none"> Execution of COSP_RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. Execution of COSPRCTX at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [59:57]

Reserved, RES0.

nBRBIALL, bit [56]**When FEAT_BRBE is implemented:**Trap execution of [BRB IALL](#) at EL1 using AArch64 to EL2.

nBRBIALL	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of BRB IALL at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of BRB IALL is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nBRBINJ, bit [55]**When FEAT_BRBE is implemented:**Trap execution of [BRB INJ](#) at EL1 using AArch64 to EL2.

nBRBINJ	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of BRB INJ at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of BRB INJ is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

DCCVAC, bit [54]

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC CVAC](#).

- [DC_CGVAC](#), if FEAT_MTE is implemented.
- [DC_CGDVAC](#), if FEAT_MTE is implemented.

If the Point of Coherence is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

DCCVAC	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

SVC_EL1, bit [53]

Trap execution of SVC at EL1 using AArch64 to EL2.

SVC_EL1	Meaning
0b0	Execution of SVC is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution of SVC at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

SVC_EL0, bit [52]

Trap execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 when EL1 is using AArch64 to EL2.

SVC_EL0	Meaning
0b0	Execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then, unless the instruction generates a higher priority exception: <ul style="list-style-type: none"> • Execution of SVC at EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15. • Execution of SVC at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ERET, bit [51]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- ERET.

- ERETAA, if FEAT_PAuth is implemented.
- ERETAB, if FEAT_PAuth is implemented.

ERET	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x1A, unless the instruction generates a higher priority exception.

If EL2 is implemented and enabled in the current Security state, [HCR_EL2.API](#) == 0, and this field enables a fine-grained trap on the instruction, then execution at EL1 using AArch64 of ERETAA or ERETAB instructions is trapped to EL2 and reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the trap enabled by [HCR_EL2.API](#) == 0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CPPRCTX, bit [50]

When FEAT_SPECRES is implemented:

Trap execution of [CPP RCTX](#) at EL1 and EL0 using AArch64 and execution of [CPPRCTX](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

CPPRCTX	Meaning
0b0	Execution of CPP RCTX at EL1 and EL0 using AArch64 and execution of CPPRCTX at EL0 using AArch32 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the instruction generates a higher priority exception: <ul style="list-style-type: none"> • Execution of CPP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. • Execution of CPPRCTX at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

DVPRCTX, bit [49]

When FEAT_SPECRES is implemented:

Trap execution of [DVP RCTX](#) at EL1 and EL0 using AArch64 and execution of [DVPRCTX](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

DVPRCTX	Meaning
0b0	Execution of DVP RCTX at EL1 and EL0 using AArch64 and execution of DVPRCTX at EL0 using AArch32 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTE == 1, then, unless the instruction generates a higher priority exception: <ul style="list-style-type: none"> Execution of DVP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. Execution of DVPRCTX at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

CFPRCTX, bit [48]

When FEAT_SPECRES is implemented:

Trap execution of [CFP RCTX](#) at EL1 and EL0 using AArch64 and execution of [CFPRCTX](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

CFPRCTX	Meaning
0b0	Execution of CFP RCTX at EL1 and EL0 using AArch64 and execution of CFPRCTX at EL0 using AArch32 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3 .FGTE == 1, then, unless the instruction generates a higher priority exception: <ul style="list-style-type: none"> Execution of CFP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. Execution of CFPRCTX at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIVAALE1, bit [47]

Trap execution of [TLBI VAALE1](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2](#).FGTnXS == 0, this field also traps execution of TLBI VAALE1NXS.

TLBIVAAE1	Meaning
0b0	Execution of TLBI VAAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVALE1, bit [46]

Trap execution of [TLBI VALE1](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI VALE1NXS.

TLBIVALE1	Meaning
0b0	Execution of TLBI VALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVAAE1, bit [45]

Trap execution of [TLBI VAAE1](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI VAAE1NXS.

TLBIVAAE1	Meaning
0b0	Execution of TLBI VAAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIASIDE1, bit [44]

Trap execution of [TLBI ASIDE1](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI ASIDE1NXS.

TLBIASIDE1	Meaning
0b0	Execution of TLBI ASIDE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVAE1, bit [43]

Trap execution of [TLBI VAE1](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI VAE1NXS.

TLBIVAE1	Meaning
0b0	Execution of TLBI VAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVMALE1, bit [42]

Trap execution of [TLBI VMALLE1](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI VMALLE1NXS.

TLBIVMALE1	Meaning
0b0	Execution of TLBI VMALLE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VMALLE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIRVALE1, bit [41]

When FEAT_TLBIRANGE is implemented:

Trap execution of [TLBI RVAALE1](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI RVAALE1NXS.

TLBIRVALE1	Meaning
0b0	Execution of TLBI RVALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVALE1, bit [40]

When FEAT_TLBIRANGE is implemented:

Trap execution of [TLBI RVALE1](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI RVALE1NXS.

TLBIRVALE1	Meaning
0b0	Execution of TLBI RVALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAE1, bit [39]

When FEAT_TLBIRANGE is implemented:

Trap execution of [TLBI RVAE1](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI RVAE1NXS.

TLBIRVAE1	Meaning
0b0	Execution of TLBI RVAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAE1, bit [38]**When FEAT_TLBIRANGE is implemented:**

Trap execution of [TLBI RVAE1](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI RVAE1NXS.

TLBIRVAE1	Meaning
0b0	Execution of TLBI RVAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAALE1IS, bit [37]**When FEAT_TLBIRANGE is implemented:**

Trap execution of [TLBI RVAALE1IS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI RVAALE1ISNXS.

TLBIRVAALE1IS	Meaning
0b0	Execution of TLBI RVAALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVALE1IS, bit [36]**When FEAT_TLBIRANGE is implemented:**

Trap execution of [TLBI RVALE1IS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2](#).FGTnXS == 0, this field also traps execution of TLBI RVALE1ISNXS.

TLBIRVALE1IS	Meaning
0b0	Execution of TLBI RVALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution of TLBI RVALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAAE1IS, bit [35]**When FEAT_TLBIRANGE is implemented:**

Trap execution of [TLBI RVAAE1IS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2](#).FGTnXS == 0, this field also traps execution of TLBI RVAAE1ISNXS.

TLBIRVAAE1IS	Meaning
0b0	Execution of TLBI RVAAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution of TLBI RVAAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAE1IS, bit [34]**When FEAT_TLBIRANGE is implemented:**

Trap execution of [TLBI RVAE1IS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2](#).FGTnXS == 0, this field also traps execution of TLBI RVAE1ISNXS.

TLBIRVAE1IS	Meaning
0b0	Execution of TLBI RVAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIVAALE1IS, bit [33]

Trap execution of [TLBI VAALE1IS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI VAALE1ISNXS.

TLBIVAALE1IS	Meaning
0b0	Execution of TLBI VAALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVALE1IS, bit [32]

Trap execution of [TLBI VALE1IS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI VALE1ISNXS.

TLBIVALE1IS	Meaning
0b0	Execution of TLBI VALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVAAE1IS, bit [31]

Trap execution of [TLBI VAAE1IS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI VAAE1ISNXS.

TLBIVAAE1IS	Meaning
0b0	Execution of TLBI VAAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIASIDE1IS, bit [30]

Trap execution of [TLBI ASIDE1IS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI ASIDE1ISNXS.

TLBIASIDE1IS	Meaning
0b0	Execution of TLBI ASIDE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVAE1IS, bit [29]

Trap execution of [TLBI VAE1IS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI VAE1ISNXS.

TLBIVAE1IS	Meaning
0b0	Execution of TLBI VAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVMALE1IS, bit [28]

Trap execution of [TLBI VMALLE1IS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI VMALLE1ISNXS.

TLBIVMALE1IS	Meaning
0b0	Execution of TLBI VMALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VMALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIRVALE1OS, bit [27]

When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of [TLBI RVALE1OS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI RVALE1OSNXS.

TLBIRVALE1OS	Meaning
0b0	Execution of TLBI RVALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVALE1OS, bit [26]

When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of [TLBI RVALE1OS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI RVALE1OSNXS.

TLBIRVALE1OS	Meaning
0b0	Execution of TLBI RVALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAAE1OS, bit [25]**When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:**

Trap execution of [TLBI RAAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI RAAE1OSNXS.

TLBIRVAAE1OS	Meaning
0b0	Execution of TLBI RAAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RAAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAE1OS, bit [24]**When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:**

Trap execution of [TLBI RAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI RAE1OSNXS.

TLBIRVAE1OS	Meaning
0b0	Execution of TLBI RAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIVAAE1OS, bit [23]**When FEAT_TLBIOS is implemented:**

Trap execution of [TLBI VAAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI VAALE1OSNXS.

TLBIVAALE1OS	Meaning
0b0	Execution of TLBI VAALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIVALE1OS, bit [22]

When FEAT_TLBIOS is implemented:

Trap execution of [TLBI VALE1OS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI VALE1OSNXS.

TLBIVALE1OS	Meaning
0b0	Execution of TLBI VALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIVAAE1OS, bit [21]

When FEAT_TLBIOS is implemented:

Trap execution of [TLBI VAAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI VAAE1OSNXS.

TLBIVAAE1OS	Meaning
0b0	Execution of TLBI VAAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIASIDE1OS, bit [20]

When FEAT_TLBIOS is implemented:

Trap execution of [TLBI ASIDE1OS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI ASIDE1OSNXS.

TLBIASIDE1OS	Meaning
0b0	Execution of TLBI ASIDE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIVAE1OS, bit [19]

When FEAT_TLBIOS is implemented:

Trap execution of [TLBI VAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2.FGTnXS](#) == 0, this field also traps execution of TLBI VAE1OSNXS.

TLBIVAE1OS	Meaning
0b0	Execution of TLBI VAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBVMALLE1OS, bit [18]**When FEAT_TLBIOS is implemented:**

Trap execution of [TLBI VMALLE1OS](#) at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and [HCRX_EL2](#).FGTnXS == 0, this field also traps execution of TLBI VMALLE1OSNXS.

TLBVMALLE1OS	Meaning
0b0	Execution of TLBI VMALLE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution of TLBI VMALLE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ATS1E1WP, bit [17]**When FEAT_PAN2 is implemented:**

Trap execution of [AT S1E1WP](#) at EL1 using AArch64 to EL2.

ATS1E1WP	Meaning
0b0	Execution of AT S1E1WP is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution of AT S1E1WP at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ATS1E1RP, bit [16]**When FEAT_PAN2 is implemented:**

Trap execution of [AT S1E1RP](#) at EL1 using AArch64 to EL2.

ATS1E1RP	Meaning
0b0	Execution of AT S1E1RP is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1RP at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ATS1E0W, bit [15]

Trap execution of [AT S1E0W](#) at EL1 using AArch64 to EL2.

ATS1E0W	Meaning
0b0	Execution of AT S1E0W is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E0W at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ATS1E0R, bit [14]

Trap execution of [AT S1E0R](#) at EL1 using AArch64 to EL2.

ATS1E0R	Meaning
0b0	Execution of AT S1E0R is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E0R at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ATS1E1W, bit [13]

Trap execution of [AT S1E1W](#) at EL1 using AArch64 to EL2.

ATS1E1W	Meaning
0b0	Execution of AT S1E1W is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1W at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ATS1E1R, bit [12]

Trap execution of [AT S1E1R](#) at EL1 using AArch64 to EL2.

ATS1E1R	Meaning
0b0	Execution of AT S1E1R is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1R at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCZVA, bit [11]

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC ZVA](#).
- [DC GVA](#), if FEAT_MTE is implemented.
- [DC GZVA](#), if FEAT_MTE is implemented.

Note

Unlike [HCR_EL2.TDZ](#), this field has no effect on [DCZID_EL0.DZP](#).

DCZVA	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCCIVAC, bit [10]

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC CIVAC](#).
- [DC CIGVAC](#), if FEAT_MTE is implemented.
- [DC CIGDVAC](#), if FEAT_MTE is implemented.

If the Point of Coherence is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

DCCIVAC	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCCVADP, bit [9]

When FEAT_DPB2 is implemented:

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC CVADP](#).
- [DC CGVADP](#), if FEAT_MTE is implemented.
- [DC CGDVADP](#), if FEAT_MTE is implemented.

If the Point of Deep Persistence is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

DCCVADP	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

DCCVAP, bit [8]

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC CVAP](#).
- [DC CGVAP](#), if FEAT_MTE is implemented.
- [DC CGDVAP](#), if FEAT_MTE is implemented.

If the Point of Persistence is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

DCCVAP	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCCVAU, bit [7]

Trap execution of [DC CVAU](#) at EL1 and EL0 using AArch64 to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

DCCVAU	Meaning
0b0	Execution of DC CVAU is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution of DC CVAU at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCCISW, bit [6]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC CISW](#).
- [DC CIGSW](#), if FEAT_MTE2 is implemented.
- [DC CIGDSW](#), if FEAT_MTE2 is implemented.

DCCISW	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCCSW, bit [5]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC CSW](#).
- [DC CGSW](#), if FEAT_MTE2 is implemented.
- [DC CGDSW](#), if FEAT_MTE2 is implemented.

DCCSW	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCISW, bit [4]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC ISW](#).
- [DC IGSW](#), if FEAT_MTE2 is implemented.
- [DC IGDSW](#), if FEAT_MTE2 is implemented.

DCISW	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCIVAC, bit [3]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC IVAC](#).
- [DC IGVAC](#), if FEAT_MTE2 is implemented.
- [DC IGDVAC](#), if FEAT_MTE2 is implemented.

If the Point of Coherence is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

DCIVAC	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ICIVAU, bit [2]

Trap execution of [IC IVAU](#) at EL1 and EL0 using AArch64 to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

ICIVAU	Meaning
0b0	Execution of IC IVAU is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution of IC IVAU at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ICIALLU, bit [1]

Trap execution of [IC IALLU](#) at EL1 using AArch64 to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

ICIALLU	Meaning
0b0	Execution of IC IALLU is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution of IC IALLU at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ICIALUIS, bit [0]

Trap execution of [IC IALLUIS](#) at EL1 using AArch64 to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

ICIALUIS	Meaning
0b0	Execution of IC IALLUIS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then execution of IC IALLUIS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HFGITR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HFGITR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b110

```

HFGRTR2_EL2, Hypervisor Fine-Grained Read Trap Register 2

The HFGRTR2_EL2 characteristics are:

Purpose

Provides controls for traps of MRS and MRC reads of System registers.

Configuration

This register is present only when FEAT_FGT2 is implemented. Otherwise, direct accesses to HFGRTR2_EL2 are UNDEFINED.

Attributes

HFGRTR2_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:3]

Reserved, RES0.

nRCWSMASK_EL1, bit [2]

When FEAT_TME is implemented:

Trap MRS or MRRS reads of RCWSMASK_EL1 at EL1 using AArch64 to EL2.

nRCWSMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn2 == 1, then MRS or MRRS reads of RCWSMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18 for 64-bit access and 0x14 for 128-bit access, unless the read generates a higher priority exception.
0b1	MRS or MRRS reads of RCWSMASK_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nERXGSR_EL1, bit [1]**When FEAT_RASv2 is implemented:**

Trap MRS reads of [ERXGSR_EL1](#) at EL1 using AArch64 to EL2.

nERXGSR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn2 == 1, then MRS reads of ERXGSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of ERXGSR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPFAR_EL1, bit [0]**When FEAT_PFAR is implemented:**

Trap MRS reads of [PFAR_EL1](#) at EL1 using AArch64 to EL2.

nPFAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn2 == 1, then MRS reads of PFAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PFAR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HFGRTR2_EL2

Accesses to this register use the following encodings in the System register encoding space:

HFGRTR_EL2, Hypervisor Fine-Grained Read Trap Register

The HFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRS and MRC reads of System registers.

Configuration

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGRTR_EL2 are UNDEFINED.

Attributes

HFGRTR_EL2 is a 64-bit register.

Field descriptions

nMAIR2_EL1, Bits bit [63:56]
When FEAT_AIE is implemented:

Trap MRS reads of MAIR2_EL1 at EL1 using AArch64 to EL2.

nMAIR2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MAIR2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of MAIR2_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nMAIR2_EL1, bit [62]
When FEAT_AIE is implemented:

Trap MRS reads of MAIR2_EL1 at EL1 using AArch64 to EL2.

nMAIR2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MAIR2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of MAIR2_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nS2POR_EL1, bit [61]

When FEAT_S2POE is implemented:

Trap MRS reads of S2POR_EL1 at EL1 using AArch64 to EL2.

nS2POR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of S2POR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of S2POR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nPOR_EL1, bit [60]

When FEAT_S1POE is implemented:

Trap MRS reads of POR_EL1 at EL1 using AArch64 to EL2.

nPOR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of POR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of POR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nPOR_EL0, bit [59]**When FEAT_S1POE is implemented:**Trap MRS reads of [POR_EL0](#) at EL1 using AArch64 to EL2.

nPOR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of POR_EL0 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of POR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nPIR_EL1, bit [58]**When FEAT_S1PIE is implemented:**Trap MRS reads of [PIR_EL1](#) at EL1 using AArch64 to EL2.

nPIR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PIR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nPIRE0_EL1, bit [57]**When FEAT_S1PIE is implemented:**Trap MRS reads of [PIRE0_EL1](#) at EL1 using AArch64 to EL2.

nPIRE0_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PIRE0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PIRE0_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nRCWMASK_EL1, bit [56]

When FEAT_THE is implemented:

Trap MRS or MRRS reads of RCWMASK_EL1 at EL1 using AArch64 to EL2.

nRCWMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS or MRRS reads of RCWMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS or MRRS reads of RCWMASK_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nTPIDR2_EL0, bit [55]

When FEAT_SME is implemented:

Trap MRS reads of [TPIDR2_EL0](#) at EL1 and EL0 using AArch64 to EL2.

nTPIDR2_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TPIDR2_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TPIDR2_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nSMPRI_EL1, bit [54]**When FEAT_SME is implemented:**

Trap MRS reads of [SMPRI_EL1](#) at EL1 using AArch64 to EL2.

nSMPRI_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SMPRI_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SMPRI_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [53:51]

Reserved, RES0.

nACCDATA_EL1, bit [50]**When FEAT_LS64_ACCDATA is implemented:**

Trap MRS reads of [ACCDATA_EL1](#) at EL1 using AArch64 to EL2.

nACCDATA_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of ACCDATA_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXADDR_EL1, bit [49]**When FEAT_RAS is implemented:**

Trap MRS reads of [ERXADDR_EL1](#) at EL1 using AArch64 to EL2.

ERXADDR_EL1	Meaning
0b0	MRS reads of ERXADDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFPCDN_EL1, bit [48]

When FEAT_RASv1p1 is implemented:

Trap MRS reads of [ERXPFPCDN_EL1](#) at EL1 using AArch64 to EL2.

ERXPFPCDN_EL1	Meaning
0b0	MRS reads of ERXPFPCDN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFPCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFCTL_EL1, bit [47]

When FEAT_RASv1p1 is implemented:

Trap MRS reads of [ERXPFCTL_EL1](#) at EL1 using AArch64 to EL2.

ERXPFCTL_EL1	Meaning
0b0	MRS reads of ERXPFCTL_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFGF_EL1, bit [46]**When FEAT_RAS is implemented:**

Trap MRS reads of [ERXPFGF_EL1](#) at EL1 using AArch64 to EL2.

ERXPFGF_EL1	Meaning
0b0	MRS reads of ERXPFGF_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGF_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXMISCN_EL1, bit [45]**When FEAT_RAS is implemented:**

Trap MRS reads of [ERXMISCN_EL1](#) at EL1 using AArch64 to EL2.

ERXMISCN_EL1	Meaning
0b0	MRS reads of ERXMISCN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXMISCN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXSTATUS_EL1, bit [44]**When FEAT_RAS is implemented:**

Trap MRS reads of [ERXSTATUS_EL1](#) at EL1 using AArch64 to EL2.

ERXSTATUS_EL1	Meaning
0b0	MRS reads of ERXSTATUS_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXCTLR_EL1, bit [43]

When FEAT_RAS is implemented:

Trap MRS reads of [ERXCTLR_EL1](#) at EL1 using AArch64 to EL2.

ERXCTLR_EL1	Meaning
0b0	MRS reads of ERXCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXFR_EL1, bit [42]

When FEAT_RAS is implemented:

Trap MRS reads of [ERXFR_EL1](#) at EL1 using AArch64 to EL2.

ERXFR_EL1	Meaning
0b0	MRS reads of ERXFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERRSEL_EL1, bit [41]**When FEAT_RAS is implemented:**

Trap MRS reads of [ERRSEL_EL1](#) at EL1 using AArch64 to EL2.

ERRSEL_EL1	Meaning
0b0	MRS reads of ERRSEL_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERRSEL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERRIDR_EL1, bit [40]**When FEAT_RAS is implemented:**

Trap MRS reads of [ERRIDR_EL1](#) at EL1 using AArch64 to EL2.

ERRIDR_EL1	Meaning
0b0	MRS reads of ERRIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERRIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ICC_IGRPENn_EL1, bit [39]**When FEAT_GICv3 is implemented:**

Trap MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 to EL2.

ICC_IGRPEN _n _EL1	Meaning
0b0	MRS reads of ICC_IGRPEN<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

VBAR_EL1, bit [38]

Trap MRS reads of [VBAR_EL1](#) at EL1 using AArch64 to EL2.

VBAR_EL1	Meaning
0b0	MRS reads of VBAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of VBAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR1_EL1, bit [37]

Trap MRS ~~reads of~~ [MRRS reads of](#) [TTBR1_EL1](#) at EL1 using AArch64 to EL2.

TTBR1_EL1	Meaning
0b0	MRS reads of MRRS reads of TTBR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MRRS reads of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR0_EL1, bit [36]

Trap MRS ~~reads of~~ [MRRS reads of](#) [TTBR0_EL1](#) at EL1 using AArch64 to EL2.

TTBR0_EL1	Meaning
0b0	MRS or reads of MRRS reads of TTBR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS or reads of MRRS reads of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_EL0, bit [35]

Trap MRS reads of [TPIDR_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [TPIDRURW](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDR_EL0	Meaning
0b0	MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURW at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MRC reads of TPIDRURW at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDRRO_EL0, bit [34]

Trap MRS reads of [TPIDRRO_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [TPIDRURO](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDRRO_EL0	Meaning
0b0	MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURO at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MRC reads of TPIDRURO at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_EL1, bit [33]

Trap MRS reads of [TPIDR_EL1](#) at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MRS reads of TPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TCR_EL1, bit [32]

Trap MRS reads of [any of the following registers at EL1 using AArch64 to EL2](#). [TCR_EL1](#) at EL1 using AArch64 to [EL2](#).

- [TCR_EL1](#).
- [TCR2_EL1](#), if FEAT_TCR2 is implemented.

TCR_EL1	Meaning
0b0	MRS reads of the specified registers are not trapped by this mechanism . TCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value TCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

SCXTNUM_ELO, bit [31]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MRS reads of [SCXTNUM_ELO](#) at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_ELO	Meaning
0b0	MRS reads of SCXTNUM_ELO are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCXTNUM_ELO at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCXTNUM_EL1, bit [30]**When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:**

Trap MRS reads of [SCXTNUM_EL1](#) at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MRS reads of SCXTNUM_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCXTNUM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCTLR_EL1, bit [29]

Trap MRS reads of any of the following registers at EL1 using AArch64 to EL2. [SCTLR_EL1](#) at EL1 using AArch64 to EL2.

- [SCTLR_EL1](#).
- [SCTLR2_EL1](#), if FEAT_SCTLR2 is implemented.

SCTLR_EL1	Meaning
0b0	MRS reads of the specified registers are not trapped by this mechanism. SCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value SCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

REVIDR_EL1, bit [28]

Trap MRS reads of [REVIDR_EL1](#) at EL1 using AArch64 to EL2.

REVIDR_EL1	Meaning
0b0	MRS reads of REVIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of REVIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

PAR_EL1, bit [27]

Trap MRS ~~or reads of~~ MRRS reads of [PAR_EL1](#) at EL1 using AArch64 to EL2.

PAR_EL1	Meaning
0b0	MRS or reads of MRRS reads of PAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS or reads of MRRS reads of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MPIDR_EL1, bit [26]

Trap MRS reads of [MPIDR_EL1](#) at EL1 using AArch64 to EL2.

MPIDR_EL1	Meaning
0b0	MRS reads of MPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MIDR_EL1, bit [25]

Trap MRS reads of [MIDR_EL1](#) at EL1 using AArch64 to EL2.

MIDR_EL1	Meaning
0b0	MRS reads of MIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MAIR_EL1, bit [24]

Trap MRS reads of [MAIR_EL1](#) at EL1 using AArch64 to EL2.

MAIR_EL1	Meaning
0b0	MRS reads of MAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

LORSA_EL1, bit [23]

When FEAT_LOR is implemented:

Trap MRS reads of [LORSA_EL1](#) at EL1 using AArch64 to EL2.

LORSA_EL1	Meaning
0b0	MRS reads of LORSA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORSA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORN_EL1, bit [22]

When FEAT_LOR is implemented:

Trap MRS reads of [LORN_EL1](#) at EL1 using AArch64 to EL2.

LORN_EL1	Meaning
0b0	MRS reads of LORN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORID_EL1, bit [21]

When FEAT_LOR is implemented:

Trap MRS reads of [LORID_EL1](#) at EL1 using AArch64 to EL2.

LORID_EL1	Meaning
0b0	MRS reads of LORID_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORID_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LOREA_EL1, bit [20]

When FEAT_LOR is implemented:

Trap MRS reads of [LOREA_EL1](#) at EL1 using AArch64 to EL2.

LOREA_EL1	Meaning
0b0	MRS reads of LOREA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LOREA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORC_EL1, bit [19]

When FEAT_LOR is implemented:

Trap MRS reads of [LORC_EL1](#) at EL1 using AArch64 to EL2.

LORC_EL1	Meaning
0b0	MRS reads of LORC_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORC_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ISR_EL1, bit [18]

Trap MRS reads of [ISR_EL1](#) at EL1 using AArch64 to EL2.

ISR_EL1	Meaning
0b0	MRS reads of ISR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ISR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

FAR_EL1, bit [17]

Trap MRS reads of [FAR_EL1](#) at EL1 using AArch64 to EL2.

FAR_EL1	Meaning
0b0	MRS reads of FAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of FAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ESR_EL1, bit [16]

Trap MRS reads of [ESR_EL1](#) at EL1 using AArch64 to EL2.

ESR_EL1	Meaning
0b0	MRS reads of ESR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ESR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCZID_EL0, bit [15]

Trap MRS reads of [DCZID_EL0](#) at EL1 and EL0 using AArch64 to EL2.

DCZID_EL0	Meaning
0b0	MRS reads of DCZID_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then MRS reads of DCZID_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CTR_EL0, bit [14]

Trap MRS reads of [CTR_EL0](#) at EL1 and EL0 using AArch64 to EL2.

CTR_EL0	Meaning
0b0	MRS reads of CTR_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then MRS reads of CTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CSSELR_EL1, bit [13]

Trap MRS reads of [CSSELR_EL1](#) at EL1 using AArch64 to EL2.

CSSELR_EL1	Meaning
0b0	MRS reads of CSSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then MRS reads of CSSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CPACR_EL1, bit [12]

Trap MRS reads of [CPACR_EL1](#) at EL1 using AArch64 to EL2.

CPACR_EL1	Meaning
0b0	MRS reads of CPACR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then MRS reads of CPACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CONTEXTIDR_EL1, bit [11]

Trap MRS reads of [CONTEXTIDR_EL1](#) at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MRS reads of CONTEXTIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CONTEXTIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CLIDR_EL1, bit [10]

Trap MRS reads of [CLIDR_EL1](#) at EL1 using AArch64 to EL2.

CLIDR_EL1	Meaning
0b0	MRS reads of CLIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CLIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CCSIDR_EL1, bit [9]

Trap MRS reads of [CCSIDR_EL1](#) at EL1 using AArch64 to EL2.

CCSIDR_EL1	Meaning
0b0	MRS reads of CCSIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CCSIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

APIBKey, bit [8]**When FEAT_PAAuth is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIBKeyHi_EL1](#).
- [APIBKeyLo_EL1](#).

APIBKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APIAKey, bit [7]

When FEAT_PAAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIAKeyHi_EL1](#).
- [APIAKeyLo_EL1](#).

APIAKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APGAKey, bit [6]

When FEAT_PAAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APGAKeyHi_EL1](#).
- [APGAKeyLo_EL1](#).

APGAKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APDBKey, bit [5]

When FEAT_PAAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDBKeyHi_EL1](#).
- [APDBKeyLo_EL1](#).

APDBKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APDAKey, bit [4]

When FEAT_PAAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDAKeyHi_EL1](#).
- [APDAKeyLo_EL1](#).

APDAKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

AMAIR_EL1, bit [3]

Trap MRS reads of [AMAIR_EL1](#) at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MRS reads of AMAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AMAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

AIDR_EL1, bit [2]

Trap MRS reads of [AIDR_EL1](#) at EL1 using AArch64 to EL2.

AIDR_EL1	Meaning
0b0	MRS reads of AIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

AFSR1_EL1, bit [1]

Trap MRS reads of [AFSR1_EL1](#) at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MRS reads of AFSR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AFSR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

AFSR0_EL1, bit [0]

Trap MRS reads of [AFSR0_EL1](#) at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MRS reads of AFSR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AFSR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HFGTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HFGTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        X[t, 64] = NVMem[0x1B8];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then

HFGWTR_EL2, Hypervisor Fine-Grained Write Trap Register

The HFGWTR_EL2 characteristics are:

Purpose

Provides controls for traps of MSR and MCR writes of System registers.

Configuration

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGWTR_EL2 are UNDEFINED.

Attributes

HFGWTR_EL2 is a 64-bit register.

Field descriptions

nMAIR2_EL1, Bits bit [63:56]
When FEAT_AIE is implemented:

Trap MSR writes of MAIR2_EL1 at EL1 using AArch64 to EL2.

nMAIR2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MAIR2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of MAIR2_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nMAIR2_EL1, bit [62]
When FEAT_AIE is implemented:

Trap MSR writes of MAIR2_EL1 at EL1 using AArch64 to EL2.

nMAIR2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MAIR2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of MAIR2_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nS2POR_EL1, bit [61]

When FEAT_S2POE is implemented:

Trap MSR writes of S2POR_EL1 at EL1 using AArch64 to EL2.

nS2POR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of S2POR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of S2POR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nPOR_EL1, bit [60]

When FEAT_S1POE is implemented:

Trap MSR writes of POR_EL1 at EL1 using AArch64 to EL2.

nPOR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of POR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of POR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nPOR_EL0, bit [59]**When FEAT_S1POE is implemented:**Trap MSR writes of [POR_EL0](#) at EL1 using AArch64 to EL2.

nPOR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of POR_EL0 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of POR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nPIR_EL1, bit [58]**When FEAT_S1PIE is implemented:**Trap MSR writes of [PIR_EL1](#) at EL1 using AArch64 to EL2.

nPIR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PIR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nPIRE0_EL1, bit [57]**When FEAT_S1PIE is implemented:**Trap MSR writes of [PIRE0_EL1](#) at EL1 using AArch64 to EL2.

nPIRE0_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PIRE0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PIRE0_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nRCWMASK_EL1, bit [56]

When FEAT_THE is implemented:

Trap MSR or MSRR writes of RCWMASK_EL1 at EL1 using AArch64 to EL2.

nRCWMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of RCWMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of RCWMASK_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nTPIDR2_EL0, bit [55]

When FEAT_SME is implemented:

Trap MSR writes of [TPIDR2_EL0](#) at EL1 and EL0 using AArch64 to EL2.

nTPIDR2_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDR2_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TPIDR2_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nSMPRI_EL1, bit [54]**When FEAT_SME is implemented:**

Trap MSR writes of [SMPRI_EL1](#) at EL1 using AArch64 to EL2.

nSMPRI_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SMPRI_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SMPRI_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [53:51]

Reserved, RES0.

nACCDATA_EL1, bit [50]**When FEAT_LS64_ACCDATA is implemented:**

Trap MSR writes of [ACCDATA_EL1](#) at EL1 using AArch64 to EL2.

nACCDATA_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of ACCDATA_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXADDR_EL1, bit [49]**When FEAT_RAS is implemented:**

Trap MSR writes of [ERXADDR_EL1](#) at EL1 using AArch64 to EL2.

ERXADDR_EL1	Meaning
0b0	MSR writes of ERXADDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFPGCDN_EL1, bit [48]

When FEAT_RASv1p1 is implemented:

Trap MSR writes of [ERXPFPGCDN_EL1](#) at EL1 using AArch64 to EL2.

ERXPFPGCDN_EL1	Meaning
0b0	MSR writes of ERXPFPGCDN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXPFPGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFPGCTL_EL1, bit [47]

When FEAT_RASv1p1 is implemented:

Trap MSR writes of [ERXPFPGCTL_EL1](#) at EL1 using AArch64 to EL2.

ERXPFPGCTL_EL1	Meaning
0b0	MSR writes of ERXPFPGCTL_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXPFPGCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [46]

Reserved, RES0.

ERXMISCn_EL1, bit [45]**When FEAT_RAS is implemented:**

Trap MSR writes of ERXMISC<n>_EL1 at EL1 using AArch64 to EL2.

ERXMISCn_EL1	Meaning
0b0	MSR writes of ERXMISC<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXMISC<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXSTATUS_EL1, bit [44]**When FEAT_RAS is implemented:**

Trap MSR writes of [ERXSTATUS_EL1](#) at EL1 using AArch64 to EL2.

ERXSTATUS_EL1	Meaning
0b0	MSR writes of ERXSTATUS_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXCTLR_EL1, bit [43]**When FEAT_RAS is implemented:**

Trap MSR writes of [ERXCTLR_EL1](#) at EL1 using AArch64 to EL2.

ERXCTLR_EL1	Meaning
0b0	MSR writes of ERXCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTE _n == 1, then MSR writes of ERXCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

ERRSELR_EL1, bit [41]**When FEAT_RAS is implemented:**

Trap MSR writes of [ERRSELR_EL1](#) at EL1 using AArch64 to EL2.

ERRSELR_EL1	Meaning
0b0	MSR writes of ERRSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTE _n == 1, then MSR writes of ERRSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [40]

Reserved, RES0.

ICC_IGRPEN_n_EL1, bit [39]**When FEAT_GICv3 is implemented:**

Trap MSR writes of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 to EL2.

ICC_IGRPEN _n _EL1	Meaning
0b0	MSR writes of ICC_IGRPEN<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

VBAR_EL1, bit [38]

Trap MSR ~~or writes of~~ MSRR writes of [VBAR_EL1](#) at EL1 using AArch64 to EL2.

VBAR_EL1	Meaning
0b0	MSR or writes of MSRR writes of VBAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR or writes of MSRR writes of VBAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR1_EL1, bit [37]

Trap MSR ~~or writes of~~ MSRR writes of [TTBR1_EL1](#) at EL1 using AArch64 to EL2.

TTBR1_EL1	Meaning
0b0	MSR or writes of MSRR writes of TTBR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR or writes of MSRR writes of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR0_EL1, bit [36]

Trap MSR ~~or writes of~~ MSRR writes of [TTBR0_EL1](#) at EL1 using AArch64 to EL2.

TTBR0_EL1	Meaning
0b0	MSR or writes of MSRR writes of TTBR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR or writes of MSRR writes of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_ELO, bit [35]

Trap MSR writes of [TPIDR_ELO](#) at EL1 and EL0 using AArch64 and MCR writes of [TPIDRURW](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDR_ELO	Meaning
0b0	MSR writes of TPIDR_ELO at EL1 and EL0 using AArch64 and MCR writes of TPIDRURW at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> MSR writes of TPIDR_ELO at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MCR writes of TPIDRURW at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDRRO_ELO, bit [34]

Trap MSR writes of [TPIDRRO_ELO](#) at EL1 using AArch64 to EL2.

TPIDRRO_ELO	Meaning
0b0	MSR writes of TPIDRRO_ELO are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDRRO_ELO at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_EL1, bit [33]

Trap MSR writes of [TPIDR_EL1](#) at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MSR writes of TPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TCR_EL1, bit [32]

Trap MSR writes of any of the following registers at EL1 using AArch64 to EL2. [TCR_EL1](#) at EL1 using AArch64 to EL2.

- [TCR_EL1](#).
- [TCR2_EL1](#), if FEAT_TCR2 is implemented.

TCR_EL1	Meaning
0b0	MSR writes of the specified registers are not trapped by this mechanism. TCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value TCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

SCXTNUM_ELO, bit [31]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MSR writes of [SCXTNUM_ELO](#) at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_ELO	Meaning
0b0	MSR writes of SCXTNUM_ELO are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCXTNUM_ELO at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCXTNUM_EL1, bit [30]**When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:**

Trap MSR writes of [SCXTNUM_EL1](#) at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MSR writes of SCXTNUM_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCXTNUM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCTLR_EL1, bit [29]

Trap MSR writes of any of the following registers at EL1 using AArch64 to EL2. [SCTLR_EL1](#) at EL1 using AArch64 to EL2.

- [SCTLR_EL1](#).
- [SCTLR2_EL1](#), if FEAT_SCTLR2 is implemented.

SCTLR_EL1	Meaning
0b0	MSR writes of the specified registers are not trapped by this mechanism. SCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value SCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [28]

Reserved, RES0.

PAR_EL1, bit [27]

Trap MSR or writes of MSRR writes of [PAR_EL1](#) at EL1 using AArch64 to EL2.

PAR_EL1	Meaning
0b0	MSR or writes of MSRR writes of PAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR or writes of MSRR writes of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bits [26:25]

Reserved, RES0.

MAIR_EL1, bit [24]

Trap MSR writes of [MAIR_EL1](#) at EL1 using AArch64 to EL2.

MAIR_EL1	Meaning
0b0	MSR writes of MAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

LORSA_EL1, bit [23]

When FEAT_LOR is implemented:

Trap MSR writes of [LORSA_EL1](#) at EL1 using AArch64 to EL2.

LORSA_EL1	Meaning
0b0	MSR writes of LORSA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORSA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORN_EL1, bit [22]

When FEAT_LOR is implemented:

Trap MSR writes of [LORN_EL1](#) at EL1 using AArch64 to EL2.

LORN_EL1	Meaning
0b0	MSR writes of LORN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

LOREA_EL1, bit [20]

When FEAT_LOR is implemented:

Trap MSR writes of [LOREA_EL1](#) at EL1 using AArch64 to EL2.

LOREA_EL1	Meaning
0b0	MSR writes of LOREA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LOREA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORC_EL1, bit [19]

When FEAT_LOR is implemented:

Trap MSR writes of [LORC_EL1](#) at EL1 using AArch64 to EL2.

LORC_EL1	Meaning
0b0	MSR writes of LORC_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORC_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

FAR_EL1, bit [17]

Trap MSR writes of [FAR_EL1](#) at EL1 using AArch64 to EL2.

FAR_EL1	Meaning
0b0	MSR writes of FAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of FAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ESR_EL1, bit [16]

Trap MSR writes of [ESR_EL1](#) at EL1 using AArch64 to EL2.

ESR_EL1	Meaning
0b0	MSR writes of ESR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ESR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bits [15:14]

Reserved, RES0.

CSSELR_EL1, bit [13]

Trap MSR writes of [CSSELR_EL1](#) at EL1 using AArch64 to EL2.

CSSELR_EL1	Meaning
0b0	MSR writes of CSSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CSSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CPACR_EL1, bit [12]

Trap MSR writes of [CPACR_EL1](#) at EL1 using AArch64 to EL2.

CPACR_EL1	Meaning
0b0	MSR writes of CPACR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CPACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CONTEXTIDR_EL1, bit [11]

Trap MSR writes of [CONTEXTIDR_EL1](#) at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MSR writes of CONTEXTIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CONTEXTIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bits [10:9]

Reserved, RES0.

APIBKey, bit [8]

When FEAT_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIBKeyHi_EL1](#).
- [APIBKeyLo_EL1](#).

APIBKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APIAKey, bit [7]

When FEAT_PAAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIAKeyHi_EL1](#).
- [APIAKeyLo_EL1](#).

APIAKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APGAKey, bit [6]

When FEAT_PAAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APGAKeyHi_EL1](#).
- [APGAKeyLo_EL1](#).

APGAKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APDBKey, bit [5]

When FEAT_PAAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDBKeyHi_EL1](#).
- [APDBKeyLo_EL1](#).

APDBKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APDAKey, bit [4]

When FEAT_PAAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDAKeyHi_EL1](#).
- [APDAKeyLo_EL1](#).

APDAKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

AMAIR_EL1, bit [3]

Trap MSR writes of [AMAIR_EL1](#) at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MSR writes of AMAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AMAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [2]

Reserved, RES0.

AFSR1_EL1, bit [1]

Trap MSR writes of [AFSR1_EL1](#) at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MSR writes of AFSR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AFSR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

AFSR0_EL1, bit [0]

Trap MSR writes of [AFSR0_EL1](#) at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MSR writes of AFSR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AFSR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HFGWTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HFGWTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b101

HPFAR_EL2, Hypervisor IPA Fault Address Register

The HPFAR_EL2 characteristics are:

Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to EL2.

Configuration

AArch64 System register HPFAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HPFAR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

The HPFAR_EL2 is written for:

- Translation or Access faults in the second stage of translation.
- An abort in the second stage of translation performed during the translation table walk of a first stage translation, caused by a Translation fault, an Access flag fault, or a Permission fault.
- A stage 2 Address size fault.
- If FEAT_RME is implemented, a Granule Protection Check fault in the second stage of translation.

For all other exceptions taken to EL2, this register is UNKNOWN.

Note

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the Instruction Abort exception or Data Abort exception. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

Attributes

HPFAR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NS		RES0														FIPA															
FIPA																								RES0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Execution at EL1 or EL0 makes HPFAR_EL2 become UNKNOWN.

NS, bit [63]

When FEAT_SEL2 is implemented:

Faulting IPA address space.

NS	Meaning
0b0	Faulting IPA is from the Secure IPA space.
0b1	Faulting IPA is from the Non-secure IPA space.

For Data Abort exceptions or Instruction Abort exceptions taken to Non-secure EL2:

- This field is RES0.
- The address is from the Non-secure IPA space.

If FEAT_RME is implemented, for Data Abort exceptions or Instruction Abort exceptions taken to Realm EL2:

- This field is RES0.
- The address is from the Realm IPA space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [62:48:44]

Reserved, RES0.

FIPA, bits [47:43:4]

FIPA encoding when FEAT_D128FEAT_LPA is implemented

FIPA, bits [43:39:0]

Bits [55:4:12] of the Faulting Intermediate Physical Address.

For implementations with fewer than 55:52 physical address bits, the corresponding upper bits in this field are RES0.

When FEAT_MOPS is implemented, the value presented in FIPA on a synchronous exception that set the HPFAR_EL2 from any of the Memory Copy and Memory Set instructions is within the address range of the current stage 2 translation granule, aligned to the size of the current stage 2 translation granule, of the address that generated the Data abort.

Bits[(n-1):0] of the value are UNKNOWN, where 2^n is the current stage 2 translation granule size in bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIPA encoding when FEAT_LPA is implemented and FEAT_D128 is not implemented

Bits [43:39]:40:36]

Reserved, RES0.

FIPA, bits [39:35]:0]

Bits [51:47]:12] of the Faulting Intermediate Physical Address.

For implementations with fewer than 52:48 physical address bits, the corresponding upper bits in this field are RES0.

When FEAT_MOPS is implemented, the value presented in FIPA on a synchronous exception that set the HPFAR_EL2 from any of the Memory Copy and Memory Set instructions is within the address range of the current stage 2 translation granule, aligned to the size of the current stage 2 translation granule, of the address that generated the Data abort.

Bits[(n-1):0] of the value are UNKNOWN, where 2^n is the current stage 2 translation granule size in bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIPA encoding when FEAT_LPA is not implemented

Bits [43:36]

Reserved, RES0.

FIPA, bits [35:0]

Bits[47:12] Faulting Intermediate Physical Address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

When FEAT_MOPS is implemented, the value presented in FIPA on a synchronous exception that set the HPFAR_EL2 from any of the Memory Copy and Memory Set instructions is within the address range of the current stage 2 translation granule, aligned to the size of the current stage 2 translation granule, of the address that generated the Data abort.

Bits[(n-1):0] of the value are UNKNOWN, where 2^n is the current stage 2 translation granule size in bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IC IALLU, Instruction Cache Invalidate All to PoU

The IC IALLU characteristics are:

Purpose

Invalidate all instruction caches of the PE executing the instruction to the Point of Unification.

Configuration

AArch64 System instruction IC IALLU performs the same function as AArch32 System instruction [ICIALLU](#).

Attributes

IC IALLU is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the IC IALLU instruction

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

IC IALLU{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0101	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TPU == '1' then

IC IVAU, Instruction Cache line Invalidate by VA to PoU

The IC IVAU characteristics are:

Purpose

Invalidate instruction cache by address to Point of Unification.

Configuration

AArch64 System instruction IC IVAU performs the same function as AArch32 System instruction [ICIMVAU](#).

Attributes

IC IVAU is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual address to use																															
Virtual address to use																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the IC IVAU instruction

If EL0 access is enabled, when executed at EL0, the instruction may generate a Permission fault, subject to the constraints described in 'MMU faults generated by cache maintenance operations'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The [data instruction](#) cache maintenance instruction (DCIC)'.
~~If EL0 access is enabled, when executed at EL0, if this instruction does not have read access permission to the VA, it is IMPLEMENTATION DEFINED whether it generates a Permission fault.~~

~~If EL0 access is enabled, when executed at EL0, if this instruction does not have read access permission to the VA, it is IMPLEMENTATION DEFINED whether it generates a Permission fault.~~

For more information, see 'Permission fault'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

IC IVAU{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0101	0b001

```

ICC_AP1R<n>_EL1, Interrupt Controller Active Priorities Group 1 Registers, n = 0 - 3

The ICC_AP1R<n>_EL1 characteristics are:

Purpose

Provides information about Group 1 active priorities.

Configuration

AArch64 System register ICC_AP1R<n>_EL1 bits [31:0] (ICC_AP1R<n>_EL1_S) are architecturally mapped to AArch32 System register [ICC_AP1R<n>\[31:0\]](#) (ICC_AP1R<n>_S).

AArch64 System register ICC_AP1R<n>_EL1 bits [31:0] (ICC_AP1R<n>_EL1_NS) are architecturally mapped to AArch32 System register [ICC_AP1R<n>\[31:0\]](#) (ICC_AP1R<n>_NS).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_AP1R<n>_EL1 are UNDEFINED.

Attributes

ICC_AP1R<n>_EL1 is a 64-bit register.

This register has the following instances:

- ICC_AP1R<n>_EL1, when when EL3 is not implemented
- ICC_AP1R<n>_EL1_S, when when EL3 is implemented
- ICC_AP1R<n>_EL1_NS, when when EL3 is implemented

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NMI		RES0																													
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NMI, bit [63]

When FEAT_GICv3_NMI is implemented and n == 0:

Indicates whether there is an active NMI priority.

NMI	Meaning
0b0	There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority drop.
0b1	There is an active Group 1 NMI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [62:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICC_AP1R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP1R1_EL1 is only implemented in implementations that support 6 or more bits of priority. ICC_AP1R2_EL1 and ICC_AP1R3_EL1 are only implemented in implementations that support 7 or more bits of priority. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by [ICH_VTR_EL2](#).PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- [ICC_AP0R<n>_EL1](#).
- Secure ICC_AP1R<n>_EL1.
- Non-secure ICC_AP1R<n>_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_AP1R<m>_EL1 ; Where m = 0-3

op0	op1	CRn	CRm	op2

ICC_BPR1_EL1, Interrupt Controller Binary Point Register 1

The ICC_BPR1_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

Configuration

AArch64 System register ICC_BPR1_EL1 bits [31:0] (ICC_BPR1_EL1_S) are architecturally mapped to AArch32 System register [ICC_BPR1\[31:0\]](#) (ICC_BPR1_S).

AArch64 System register ICC_BPR1_EL1 bits [31:0] (ICC_BPR1_EL1_NS) are architecturally mapped to AArch32 System register [ICC_BPR1\[31:0\]](#) (ICC_BPR1_NS).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_BPR1_EL1 are UNDEFINED.

Virtual accesses to this register update [ICH_VMCR_EL2.VBPR1](#).

Attributes

ICC_BPR1_EL1 is a 64-bit register.

This register has the following instances:

- [ICC_BPR1_EL1](#), when when EL3 is not implemented
- [ICC_BPR1_EL1_S](#), when when EL3 is implemented
- [ICC_BPR1_EL1_NS](#), when when EL3 is implemented

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

BinaryPoint																															

Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The minimum value of the Non-secure copy of this register is the minimum value of [ICC_BPR0_EL1](#) + 1. The minimum value of the Secure copy of this register is the minimum value of [ICC_BPR0_EL1](#).

If EL3 is implemented and [ICC_CTLR_EL3.CBPR_EL1S](#) is 1:

- Accesses to this register from Secure EL2 access the state of [ICC_BPR0_EL1](#).
- Accesses to this register from Secure EL1:
 - When SCR_EL3.EEL2 is 1 and HCR_EL2.IMO is 1, access the state of [ICV_BPR1_EL1](#).
 - Otherwise, access the state of [ICC_BPR0_EL1](#).

If EL3 is implemented and [ICC_CTLR_EL3](#).CBPR_EL1NS is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR_EL2.IMO and SCR_EL3.IRQ:

HCR_EL2.IMO	SCR_EL3.IRQ	Behavior
0b0	0b0	Non-secure EL1 and EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b0	0b1	Non-secure EL1 and EL2 accesses trap to EL3.
0b1	0b0	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.
0b1	0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3.

If EL3 is not implemented and [ICC_CTLR_EL1](#).CBPR is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR_EL2.IMO:

HCR_EL2.IMO	Behavior
0b0	Non-secure EL1 and EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_BPR1_EL1

On a reset, the binary point field is UNKNOWN.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_BPR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b011

ICC_CTLR_EL1, Interrupt Controller Control Register (EL1)

The ICC_CTLR_EL1 characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

AArch64 System register ICC_CTLR_EL1 bits [31:0] (ICC_CTLR_EL1_S) are architecturally mapped to AArch32 System register [ICC_CTLR\[31:0\]](#) (ICC_CTLR_S).

AArch64 System register ICC_CTLR_EL1 bits [31:0] (ICC_CTLR_EL1_NS) are architecturally mapped to AArch32 System register [ICC_CTLR\[31:0\]](#) (ICC_CTLR_NS).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_CTLR_EL1 are UNDEFINED.

Attributes

ICC_CTLR_EL1 is a 64-bit register.

This register has the following instances:

- ICC_CTLR_EL1, when when EL3 is not implemented
- ICC_CTLR_EL1_S, when when EL3 is implemented
- ICC_CTLR_EL1_NS, when when EL3 is implemented

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0												ExtRange		RSS	RES0	A3V	SEIS	IDbits	PRIbits	RES0	PMHE	RES0		EOImode	CBPR						
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	<p>CPU interface does not support INTIDs in the range 1024..8191.</p> <ul style="list-style-type: none"> Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. <p>Note Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.</p>
0b1	<p>CPU interface supports INTIDs in the range 1024..8191</p> <ul style="list-style-type: none"> All INTIDs in the range 1024..8191 are treated as requiring deactivation.

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of [ICC_CTLR_EL3.ExtRange](#).

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

A3V	Meaning
0b0	The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

If EL3 is implemented, this bit is an alias of [ICC_CTLR_EL3.A3V](#).

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

SEIS	Meaning
0b0	The CPU interface logic does not support local generation of SEIs.
0b1	The CPU interface logic supports local generation of SEIs.

If EL3 is implemented, this bit is an alias of [ICC_CTLR_EL3.SEIS](#).

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is implemented, this field is an alias of [ICC_CTLR_EL3.IDbits](#).

PRIBits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of [GICD_CTLR.DS](#).

For physical accesses, this field determines the minimum value of [ICC_BPR0_EL1](#).

If EL3 is implemented, physical accesses return the value from [ICC_CTLR_EL3.PRIBits](#).

If EL3 is not implemented, physical accesses return the value from this field.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

PMHE	Meaning
0b0	Disables use of ICC_PMR_EL1 as a hint for interrupt distribution.
0b1	Enables use of ICC_PMR_EL1 as a hint for interrupt distribution.

If EL3 is implemented, this bit is an alias of [ICC_CTLR_EL3.PMHE](#). Whether this bit can be written as part of an access to this register depends on the value of [GICD_CTLR.DS](#):

- If [GICD_CTLR.DS](#) == 0, this bit is read-only.
- If [GICD_CTLR.DS](#) == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read/write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

Bits [5:2]

Reserved, RES0.

EOImode, bit [1]

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

EOImode	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

The Secure [ICC_CTLR_EL1](#).EOImode is an alias of [ICC_CTLR_EL3](#).EOImode_EL1S.

The Non-secure [ICC_CTLR_EL1](#).EOImode is an alias of [ICC_CTLR_EL3](#).EOImode_EL1NS

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for both Group 0 and Group 1 interrupts.

If EL3 is implemented:

- This bit is an alias of [ICC_CTLR_EL3](#).CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If [GICD_CTLR](#).DS == 0, this bit is read-only.
- If [GICD_CTLR](#).DS == 1, this bit is read/write.

If EL3 is not implemented, this bit is read/write.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_CTLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_CTLR_EL1

op0	op1	CRn	CRm	op2

The ICC_CTLR_EL3 characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

This register is present only when FEAT_GICv3 is implemented and EL3 is implemented. Otherwise, direct accesses to ICC_CTLR_EL3 are UNDEFINED.

Attributes

ICC_CTLR_EL3 is a 64-bit register.

Field descriptions

636261605958575655545352	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35
RES0																	
RES0	ExtRange	RSSn	DS	RES0	A3V	SEIS	IDbits	PRIBits	RES0	PMHE	RM	EOImode	EL1NS	EOImode	EL1		
313029282726252423222120	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3

Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	<p>CPU interface does not support INTIDs in the range 1024..8191.</p> <ul style="list-style-type: none"> Behavior Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. <hr/> <p>Note</p> <p>Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.</p> <hr/>
0b1	<p>CPU interface supports INTIDs in the range 1024..8191</p> <ul style="list-style-type: none"> All INTIDs in the range 1024..8191 are treated as requiring deactivation.

RSS, bit [18]

Range Selector Support.

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0-15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0-255 are supported.

This bit is read-only.

nDS, bit [17]

Disable Security not supported. Read-only and writes are ignored.

nDS	Meaning
0b0	The CPU interface logic supports disabling of security.
0b1	The CPU interface logic does not support disabling of security, and requires that security is not disabled.

When a PE implements [FEAT_RME](#) the [and Realm](#) [FEAT_SEL2](#) [Management Extension](#), this field is RAO/WI.

Bit [16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored.

A3V	Meaning
0b0	The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.

If EL3 is present, [ICC_CTLR_EL1](#).A3V is an alias of ICC_CTLR_EL3.A3V

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The CPU interface logic does not support generation of SEIs.
0b1	The CPU interface logic supports generation of SEIs.

If EL3 is present, [ICC_CTLR_EL1](#).SEIS is an alias of ICC_CTLR_EL3.SEIS

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported.

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is present, [ICC_CTLR_EL1](#).IDbits is an alias of ICC_CTLR_EL3.IDbits

PRibits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the value of SCR_EL3.NS or the value of [GICD_CTLR.DS](#).

The division between group priority and subpriority is defined in the binary point registers [ICC_BPR0_EL1](#) and [ICC_BPR1_EL1](#).

This field determines the minimum value of ICC_BPR0_EL1.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable.

PMHE	Meaning
0b0	Disables use of the priority mask register as a hint for interrupt distribution.
0b1	Enables use of the priority mask register as a hint for interrupt distribution.

Software must write [ICC_PMR_EL1](#) to 0xFF before clearing this field to 0.

- An implementation might choose to make this field RAO/WI if priority-based routing is always used
- An implementation might choose to make this field RAZ/WI if priority-based routing is never used

If EL3 is present, [ICC_CTLR_EL1](#).PMHE is an alias of ICC_CTLR_EL3.PMHE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

RM, bit [5]

Routing Modifier. This bit controls whether EL3 can acknowledge, or observe as the Highest Priority Pending Interrupt, Secure Group 0 and Non-secure Group 1 interrupts.

RM	Meaning
0b0	Secure Group 0 and Non-secure Group 1 interrupts can be acknowledged and observed as the highest priority interrupt at EL3.
0b1	Secure Group 0 and Non-secure Group 1 interrupts cannot be acknowledged and observed as the highest priority interrupt at EL3. Secure Group 0 interrupts return a special INTID value of 1020. This affects accesses to ICC_IAR0_EL1 and ICC_HPPIR0_EL1 . Non-secure Group 1 interrupts return a special INTID value of 1021. This affects accesses to ICC_IAR1_EL1 and ICC_HPPIR1_EL1 .

Note

The Routing Modifier bit is supported in AArch64 only. In systems without EL3 the behavior is as if the value is 0. Software must ensure this bit is 0 when the Secure copy of [ICC_SRE_EL1](#).SRE is 1, otherwise system behavior is UNPREDICTABLE. In systems without EL3 or where the Secure copy of [ICC_SRE_EL1](#).SRE is RAO/WI, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1NS, bit [4]

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1NS	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

If EL3 is present, [ICC_CTLR_EL1](#)(NS).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1S, bit [3]

EOI mode for interrupts handled at Secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1S	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

If EL3 is present, [ICC_CTLR_EL1](#)(S).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL3	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

CBPR_EL1NS	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Non-secure Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1_EL1 access the state of ICC_BPR0_EL1 .

If EL3 is present, [ICC_CTLR_EL1\(NS\)](#).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts at EL1 and EL2.

CBPR_EL1S	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Secure Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 accesses to ICC_BPR1_EL1 access the state of ICC_BPR0_EL1 .

If EL3 is present, [ICC_CTLR_EL1\(S\)](#).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_CTLR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_CTLR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b100

ICC_IGRPEN0_EL1, Interrupt Controller Interrupt Group 0 Enable register

The ICC_IGRPEN0_EL1 characteristics are:

Purpose

Controls whether Group 0 interrupts are enabled or not.

Configuration

AArch64 System register ICC_IGRPEN0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICC_IGRPEN0\[31:0\]](#).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_IGRPEN0_EL1 are UNDEFINED.

Attributes

ICC_IGRPEN0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															Enable
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 0 interrupts.

Enable	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

Virtual accesses to this register update [ICH_VMCR_EL2.VENG0](#).

If the highest priority pending interrupt for that PE is a Group 0 interrupt using 1 of N model, then the interrupt will be targeted to another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_IGRPEN0_EL1

Accesses to this register use the following encodings in the System register encoding space:

- The Non-secure [ICC_IGRPEN1_EL1](#).Enable bit is a read/write alias of the [ICC_IGRPEN1_EL3](#).EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_IGRPEN1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_IGRPEN1_EL1

ICC_SRE_EL1, Interrupt Controller System Register Enable register (EL1)

The ICC_SRE_EL1 characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL1.

Configuration

AArch64 System register ICC_SRE_EL1 bits [31:0] (ICC_SRE_EL1_S) are architecturally mapped to AArch32 System register [ICC_SRE\[31:0\]](#) (ICC_SRE_S).

AArch64 System register ICC_SRE_EL1 bits [31:0] (ICC_SRE_EL1_NS) are architecturally mapped to AArch32 System register [ICC_SRE\[31:0\]](#) (ICC_SRE_NS).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SRE_EL1 are UNDEFINED.

Attributes

ICC_SRE_EL1 is a 64-bit register.

This register has the following instances:

- ICC_SRE_EL1, when when EL3 is not implemented
- ICC_SRE_EL1_S, when when EL3 is implemented
- ICC_SRE_EL1_NS, when when EL3 is implemented

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
RES0																															
DIBDFBSRE																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

If [GICD_CTLR.DS](#) == 1 and EL2 is implemented, this field is a read-only alias of [ICC_SRE_EL2.DIB](#).

In systems that do not support IRQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and [GICD_CTLR.DS](#) == 0, this field is a read-only alias of [ICC_SRE_EL3.DFB](#).

If EL3 is implemented and [GICD_CTLR.DS](#) == 1, and EL2 is not implemented, this field is a read/write alias of [ICC_SRE_EL3.DFB](#).

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of [ICC_SRE_EL2.DFB](#).

If [GICD_CTLR.DS](#) == 1 and EL2 is implemented, this field is a read-only alias of [ICC_SRE_EL2.DFB](#).

In systems that do not support FIQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL1 to any ICC_* System register other than ICC_SRE_EL1 is trapped to EL1.
0b1	The System register interface for the current Security state is enabled.

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and [ICC_SRE_EL3.SRE](#)==0 the Secure copy of this bit is RAZ/WI. If [ICC_SRE_EL3.SRE](#) is changed from zero to one, the Secure copy of this bit becomes UNKNOWN.

If EL2 is implemented and [ICC_SRE_EL2.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI. If [ICC_SRE_EL2.SRE](#) is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

If EL3 is implemented and [ICC_SRE_EL3.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI. If [ICC_SRE_EL3.SRE](#) is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

If Realm Management Extension is implemented, this field is RAO/WI.

GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI. The following options are supported:

- The Non-secure copy of [ICC_SRE_EL1.SRE](#) can be RAO/WI if [ICC_SRE_EL2.SRE](#) is also RAO/WI. This means all Non-secure software, including VMs using only virtual interrupts, must access the GIC using System registers.
- The Secure copy of [ICC_SRE_EL1.SRE](#) can be RAO/WI if [ICC_SRE_EL3.SRE](#) and [ICC_SRE_EL2.SRE](#) are also RAO/WI. This means that all Secure software must access the GIC using System registers and all Non-secure accesses to registers for physical interrupts must use System registers.

Note

A VM using only virtual interrupts might still use memory-mapped access if the Non-secure copy of [ICC_SRE_EL1](#).SRE is not RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_SRE_EL1

Execution with [ICC_SRE_EL1](#).SRE set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_SRE_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b101

ICV_CTLR_EL1, Interrupt Controller Virtual Control Register

The ICV_CTLR_EL1 characteristics are:

Purpose

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

Configuration

AArch64 System register ICV_CTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV_CTLR\[31:0\]](#).

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_CTLR_EL1 are UNDEFINED.

Attributes

ICV_CTLR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0												ExtRange	RSS	RES0	A3V	SEIS	IDbits	PRIbits	RES0						EOImode	CBPR					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. <ul style="list-style-type: none">BehaviorBehaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. <div>Note<p>Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.</p></div>
0b1	CPU interface supports INTIDs in the range 1024..8191 <ul style="list-style-type: none">All INTIDs in the range 1024..8191 are treated as requiring deactivation.

ICV_CTLR_EL1.ExtRange is an alias of [ICC_CTLR_EL1](#).ExtRange.

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support local generation of SEIs.
0b1	The virtual CPU interface logic supports local generation of SEIs.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation must implement at least 32 levels of physical priority (5 priority bits).

Note

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers [ICV_BPR0_EL1](#) and [ICV_BPR1_EL1](#).

Bits [7:2]

Reserved, RES0.

EOImode, bit [1]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

EOImode	Meaning
0b0	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR_EL1 are UNPREDICTABLE.
0b1	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide priority drop functionality only. ICV_DIR_EL1 provides interrupt deactivation functionality.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

CBPR	Meaning
0b0	ICV_BPR1_EL1 determines the preemption group for virtual Group 1 interrupts.
0b1	Non-secure reads of ICV_BPR1_EL1 return ICV_BPR0_EL1 plus one, saturated to 0b111. Non-secure writes to ICV_BPR1_EL1 are ignored. Secure reads of ICV_BPR1_EL1 return ICV_BPR0_EL1 . Secure writes of ICV_BPR1_EL1 modify ICV_BPR0_EL1 .

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_CTLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_CTLR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b100

```

ICV_IGRPEN0_EL1, Interrupt Controller Virtual Interrupt Group 0 Enable register

The ICV_IGRPEN0_EL1 characteristics are:

Purpose

Controls whether virtual Group 0 interrupts are enabled or not.

Configuration

AArch64 System register ICV_IGRPEN0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV_IGRPEN0\[31:0\]](#).

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_IGRPEN0_EL1 are UNDEFINED.

Attributes

ICV_IGRPEN0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															Enable
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:1]

Reserved, RES0.

Enable, bit [0]

Enables virtual Group 0 interrupts.

Enable	Meaning
0b0	Virtual Group 0 interrupts are disabled.
0b1	Virtual Group 0 interrupts are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_IGRPEN0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_IGRPEN0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b110

ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0

The ID_AA64DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

The external register [EDDFR](#) gives information from this register.

Attributes

ID_AA64DFR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

HPMN0, bits [63:60]

Zero PMU event counters for a Guest operating system. Defined values are:

HPMN0	Meaning
0b0000	Setting MDCR_EL2 .HPMN to zero has CONSTRAINED UNPREDICTABLE behavior.
0b0001	Setting MDCR_EL2 .HPMN to zero has defined behavior.

All other values are reserved.

If FEAT_PMUv3 is not implemented, FEAT_FGT is not implemented, or EL2 is not implemented, the only permitted value is 0b0000.

FEAT_HPMN0 implements the functionality identified by the value 0b0001.

From Armv8.8, in an implementation that includes FEAT_PMUv3, FEAT_FGT, and EL2, the value 0b0000 is not permitted.

ExtTrcBuff, bits [59:56]

Trace Buffer External Mode Extension. Defined values are:

Reserved, RES0.

ExtTrcBuff	Meaning
0b0000	Trace Buffer External Mode not implemented.
0b0001	Trace Buffer External Mode implemented.

All other values are reserved.

FEAT_TRBE_EXT implements the functionality identified by the value 0b0001.

BRBE, bits [55:52]

Branch Record Buffer Extension. Defined values are:

BRBE	Meaning
0b0000	Branch Record Buffer Extension not implemented.
0b0001	Branch Record Buffer Extension implemented.
0b0010	As 0b0001, and adds support for branch recording at EL3.

All other values are reserved.

FEAT_BRBE implements the functionality identified by the value 0b0001.

FEAT_BRBEv1p1 implements the functionality identified by the value 0b0010.

From Armv9.3, if FEAT_BRBE is implemented, the value 0b0001 is not permitted.

MTPMU, bits [51:48]

Multi-threaded PMU extension. Defined values are:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are read/write or RES0.
0b0001	FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are RES0.

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

TraceBuffer, bits [47:44]

Trace Buffer Extension. Defined values are:

TraceBuffer	Meaning
0b0000	Trace Buffer Extension not implemented.
0b0001	Trace Buffer Extension implemented.

All other values are reserved.

FEAT_TRBE implements the functionality identified by the value 0b0001.

In any Armv9 implementation, if FEAT_ETE is implemented, the value 0b0000 is not permitted.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if an Embedded Trace Macrocell Architecture trace unit is implemented, the value 0b0000 is not permitted.

DoubleLock, bits [39:36]

OS Double Lock implemented. Defined values are:

DoubleLock	Meaning
0b0000	OS Double Lock implemented. OSDLR_EL1 is RW.
0b1111	OS Double Lock not implemented. OSDLR_EL1 is RAZ/WI.

All other values are reserved.

FEAT_DoubleLock implements the functionality identified by the value 0b0000.

In Armv8.0, the only permitted value is 0b0000.

If FEAT_Debugv8p2 is implemented and FEAT_DoPD is not implemented, the permitted values are 0b0000 and 0b1111.

If FEAT_DoPD is implemented, the only permitted value is 0b1111.

PMSVer, bits [35:32]

Statistical Profiling Extension version. Defined values are:

PMSVer	Meaning
0b0000	Statistical Profiling Extension not implemented.
0b0001	Statistical Profiling Extension implemented.
0b0010	As 0b0001, and adds: <ul style="list-style-type: none"> Support for the Events packet Alignment flag. If FEAT_SVE is implemented, support for the Scalable Vector extensions to Statistical Profiling.
0b0011	As 0b0010, and adds: <ul style="list-style-type: none"> Discard mode. Extended event filtering, including the PMSNEVER_EL1 System register. Support for the OPTIONAL previous branch target Address packet. If FEAT_PMUv3 is implemented, controls to freeze the PMU event counters after an SPE buffer management event occurs. If FEAT_PMUv3 is implemented, the SAMPLE_FEED_BR, SAMPLE_FEED_EVENT, SAMPLE_FEED_LAT, SAMPLE_FEED_LD, SAMPLE_FEED_OP, and SAMPLE_FEED_ST PMU events.
0b0100	As 0b0011, and adds: <ul style="list-style-type: none"> If FEAT_MOPS is implemented, Operation Type packet encodings for Memory Copy and Set operations. If FEAT_MTE is implemented, Operation Type packet encodings for loads and stores of Allocation Tags.
0b0101	As 0b0100, and adds: <ul style="list-style-type: none"> Support for the Events packet Level 2 Data cache access, Level 2 Data cache miss, Cached data modified, Recently fetched cache line, and Cache snoop flags. Support for Data Source filtering.

All other values are reserved.

FEAT_SPE implements the functionality identified by the value 0b0001.

FEAT_SPEv1p1 implements the functionality identified by the value 0b0010.

FEAT_SPEv1p2 implements the functionality identified by the value 0b0011.

FEAT_SPEv1p3 implements the functionality identified by the value 0b0100.

FEAT_SPEv1p4 implements the functionality identified by the value 0b0101.

From Armv8.5, if FEAT_SPE is implemented, the value 0b0001 is not permitted.

From Armv8.7, if FEAT_SPE is implemented, the value 0b0010 is not permitted.

From Armv8.8, if FEAT_SPE is implemented, the value 0b0011 is not permitted.

From Armv8.9, if FEAT_SPE is implemented, the value 0b0100 is not permitted.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

If FEAT_Debugv8p9 is implemented and 16 or more breakpoints that are context-aware are implemented, this field reads as 0b1111.

SEBEP, bits [27:24]

Synchronous-exception-based event profiling. Defined values are:

Reserved, RES0.

SEBEP	Meaning
0b0000	Synchronous-exception-based event profiling not implemented.
0b0001	Synchronous-exception-based event profiling implemented.

All other values are reserved.

FEAT_SEBEP implements the functionality identified by the value 0b0001.

WRPs, bits [23:20]

Number of watchpoints, minus 1.

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

If FEAT_Debugv8p9 is implemented and 16 or more watchpoints are implemented, this field reads as 0b1111.

The value of 0b0000 is reserved.

PMSS, bits [19:16]

PMU Snapshot extension. Defined values are:

Reserved, RES0.

PMSS	Meaning
0b0000	PMU snapshot extension not implemented.
0b0001	PMU snapshot extension implemented.

All other values are reserved.

FEAT_PMUv3_SS implements the functionality identified by the value 0b0001.

BRPs, bits [15:12]

Number of breakpoints, minus 1.

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

If FEAT_Debugv8p9 is implemented and 16 or more breakpoints are implemented, this field reads as 0b1111.

The value of 0b0000 is reserved.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and adds support for: <ul style="list-style-type: none"> Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. If EL2 is implemented, the MDCR_EL2.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR_EL1 register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: <ul style="list-style-type: none"> 64-bit event counters. If EL2 is implemented, the MDCR_EL2.HCCD control. If EL3 is implemented, the MDCR_EL3.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: <ul style="list-style-type: none"> The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO controls. If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: <ul style="list-style-type: none"> Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1001	PMUv3 for Armv8.9. As 0b1000, and: <ul style="list-style-type: none"> Updates the definitions of existing PMU events. Adds support for the PMUSERENR_EL0.UEN control and the PMUACR_EL1 register. Adds support for the EDECR.PME control.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

FEAT_PMUv3p9 implements the functionality identified by the value 0b1001.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

From Armv8.9, if FEAT_PMUv3 is implemented, the value 0b1000 is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a trace unit is implemented. Defined values are:

TraceVer	Meaning
0b0000	Trace unit System registers not implemented.
0b0001	Trace unit System registers implemented.

All other values are reserved.

When trace unit System registers are implemented, see [TRCIDR1](#) for tracing capabilities of the trace unit.

DebugVer, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

DebugVer	Meaning
0b0110	Armv8 debug architecture.
0b0111	Armv8 debug architecture with Virtualization Host Extensions.
0b1000	Armv8.2 debug architecture, FEAT_Debugv8p2.
0b1001	Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010	Armv8.8 debug architecture, FEAT_Debugv8p8.
0b1011	Armv8.9 debug architecture, FEAT_Debugv8p9.

All other values are reserved.

FEAT_VHE adds the functionality identified by the value 0b0111.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

FEAT_Debugv8p8 adds the functionality identified by the value 0b1010.

FEAT_Debugv8p9 adds the functionality identified by the value 0b1011.

From Armv8.1, when FEAT_VHE is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

From Armv8.9, the value 0b1010 is not permitted.

Accessing ID_AA64DFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64DFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0101	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            X[t, 64] = ID_AA64DFR0_EL1;
    elseif PSTATE.EL == EL2 then
        X[t, 64] = ID_AA64DFR0_EL1;
    elseif PSTATE.EL == EL3 then
        X[t, 64] = ID_AA64DFR0_EL1;

```

ID_AA64DFR1_EL1, AArch64 Debug Feature Register 1

The ID_AA64DFR1_EL1 characteristics are:

Purpose

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Provides Reserved for future expansion of top level information about the debug system in AArch64 state.

Configuration

There are no configuration notes.

Attributes

ID_AA64DFR1_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ABL_CMPs, Bits bits [63:560]

When FEAT_ABLE is implemented:

Number of breakpoints that support address linking, minus 1.

The values 0x40 to 0xFF are reserved.

The value of this field is never greater than either ID_AA64DFR1_EL1.WRPs or ID_AA64DFR1_EL1.BRPs.

Otherwise:

Reserved, RES0.

Bits [55:52]

Reserved, RES0.

EBEP, bits [51:48]

Exception-based event profiling. Defined values are:

EBEP	Meaning
0b0000	Exception-based event profiling not implemented.
0b0001	Exception-based event profiling implemented.

All other values are reserved.

FEAT_EBEP implements the functionality identified by the value 0b0001.

ITE, bits [47:44]

Instrumentation Trace Extension. Defined values are:

ITE	Meaning
0b0000	Instrumentation Trace Extension not implemented.
0b0001	Instrumentation Trace Extension implemented.

All other values are reserved.

FEAT_ITE implements the functionality identified by the value 0b0001.

If FEAT_ITE is not implemented, then the only permitted value is 0b0000.

From Armv9.4, when FEAT_ITE is implemented, the value 0b0000 is not permitted.

ABLE, bits [43:40]

Address Breakpoint Linking Extension. Defined values are:

ABLE	Meaning
0b0000	Address Breakpoint Linking Extension not implemented.
0b0001	Address Breakpoint Linking Extension implemented.

All other values are reserved.

FEAT_ABLE implements the functionality identified by the value 0b0001.

If FEAT_ABLE is not implemented, then the only permitted value is 0b0000.

From Armv9.4, when FEAT_ABLE is implemented, the value 0b0000 is not permitted.

PMICNTR, bits [39:36]

PMU fixed-function instruction counter. Defined values are:

PMICNTR	Meaning
0b0000	PMU fixed-function instruction counter not implemented.
0b0001	PMU fixed-function instruction counter implemented.

All other values are reserved.

FEAT_PMUv3_ICNTR implements the functionality identified by the value 0b0001.

If FEAT_PMUv3 is not implemented, then the only permitted value is 0b0000.

SPMU, bits [35:32]

System PMU extension.

SPMU	Meaning
0b0000	System PMU extension not implemented.
0b0001	System PMU extension implemented.

All other values are reserved.

FEAT_SPMU implements the functionality identified by the value 0b0001.

CTX_CMPs, bits [31:24]

When FEAT_Debugv8p9 is implemented and ID_AA64DFR0_EL1.CTX_CMPs == 0b1111:

Number of breakpoints that are context-aware, minus 1.

The value 0x00 means 16 breakpoints that are context-aware are implemented. Otherwise, this field is the number of breakpoints that are context-aware, minus 1.

The values 0x01 to 0x0F and 0x40 to 0xFF are reserved.

The value of this field is never greater than ID_AA64DFR1_EL1.BRPs.

Otherwise:

Reserved, RES0.

WRPs, bits [23:16]

When FEAT_Debugv8p9 is implemented and ID_AA64DFR0_EL1.WRPs == 0b1111:

Number of watchpoints, minus 1.

The value 0x00 means 16 watchpoints are implemented. Otherwise, this field is the number of watchpoints, minus 1.

The values 0x01 to 0x0F and 0x40 to 0xFF are reserved.

Otherwise:

Reserved, RES0.

BRPs, bits [15:8]

When FEAT_Debugv8p9 is implemented and ID_AA64DFR0_EL1.BRPs == 0b1111:

Number of breakpoints, minus 1.

The value 0x00 means 16 breakpoints are implemented. Otherwise, this field is the number of breakpoints, minus 1.

The values 0x01 to 0x0F and 0x40 to 0xFF are reserved.

Otherwise:

Reserved, RES0.

SYSPMUID, bits [7:0]

When FEAT_SPMU is implemented:

System PMU ID. Indicates the largest value of [SPMSELR_ELO](#).SYSPMUSEL.

Since System PMUs might not be contiguously accessible, this field does not necessarily indicate the total number of accessible System PMUs.

The values 0x20 to 0xFF are reserved.

Otherwise:

Reserved, RES0.

Accessing ID_AA64DFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64DFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0101	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            X[t, 64] = ID_AA64DFR1_EL1;
    elsif PSTATE.EL == EL2 then
        X[t, 64] = ID_AA64DFR1_EL1;
    elsif PSTATE.EL == EL3 then
        X[t, 64] = ID_AA64DFR1_EL1;

```

ID_AA64ISAR0_EL1, AArch64 Instruction Set Attribute Register 0

The ID_AA64ISAR0_EL1 characteristics are:

Purpose

Provides information about the instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64ISAR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RNDR					TLB				TS				FHM			DP				SM4			SM3				SHA3				
RDM					TME				Atomic				CRC32			SHA2				SHA1			AES				RES0				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RNDR, bits [63:60]

Indicates support for Random Number instructions in AArch64 state.

When FEAT_RNG_TRAP is implemented, the value returned by a direct read of ID_AA64ISAR0_EL1.RNDR is further controlled by the value of [SCR_EL3.TRNDR](#).

Defined values are:

RNDR	Meaning
0b0000	No Random Number instructions are implemented.
0b0001	RNDR and RNDRRS registers are implemented.

All other values are reserved.

FEAT_RNG implements the functionality identified by the value 0b0001.

From Armv8.5, the permitted values are 0b0000 and 0b0001.

TLB, bits [59:56]

Indicates support for Outer Shareable and TLB range maintenance instructions. Defined values are:

TLB	Meaning
0b0000	Outer Shareable and TLB range maintenance instructions are not implemented.
0b0001	Outer Shareable TLB maintenance instructions are implemented.
0b0010	Outer Shareable and TLB range maintenance instructions are implemented.

All other values are reserved.

FEAT_TLBIOS implements the functionality identified by the values 0b0001 and 0b0010.

FEAT_TLBIRANGE implements the functionality identified by the value 0b0010.

From Armv8.4, the only permitted value is 0b0010.

TS, bits [55:52]

Indicates support for flag manipulation instructions. Defined values are:

TS	Meaning
0b0000	No flag manipulation instructions are implemented.
0b0001	CFINV, RMIF, SETF16, and SETF8 instructions are implemented.
0b0010	CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.

All other values are reserved.

FEAT_FlagM implements the functionality identified by the value 0b0001.

FEAT_FlagM2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

In Armv8.4, the only permitted value is 0b0001.

From Armv8.5, the only permitted value is 0b0010.

FHM, bits [51:48]

Indicates support for FMLAL and FMLSL instructions. Defined values are:

FHM	Meaning
0b0000	FMLAL and FMLSL instructions are not implemented.
0b0001	FMLAL and FMLSL instructions are implemented.

All other values are reserved.

FEAT_FHM implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

DP, bits [47:44]

Indicates support for Dot Product instructions in AArch64 state. Defined values are:

DP	Meaning
0b0000	No Dot Product instructions implemented.
0b0001	UDOT and SDOT instructions implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

SM4, bits [43:40]

Indicates support for SM4 instructions in AArch64 state. Defined values are:

SM4	Meaning
0b0000	No SM4 instructions implemented.
0b0001	SM4E and SM4EKEY instructions implemented.

All other values are reserved.

If FEAT_SM4 is not implemented, the value 0b0001 is reserved.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM3.

SM3, bits [39:36]

Indicates support for SM3 instructions in AArch64 state. Defined values are:

SM3	Meaning
0b0000	No SM3 instructions implemented.
0b0001	SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented.

All other values are reserved.

If FEAT_SM3 is not implemented, the value 0b0001 is reserved.

FEAT_SM3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM4.

SHA3, bits [35:32]

Indicates support for SHA3 instructions in AArch64 state. Defined values are:

SHA3	Meaning
0b0000	No SHA3 instructions implemented.
0b0001	EOR3, RAX1, XAR, and BCAX instructions implemented.

All other values are reserved.

If FEAT_SHA3 is not implemented, the value 0b0001 is reserved.

FEAT_SHA3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0001, ID_AA64ISAR0_EL1.SHA2 must have the value 0b0010.

RDM, bits [31:28]

Indicates support for SQRDMLAH and SQRDMLSH instructions in AArch64 state. Defined values are:

RDM	Meaning
0b0000	No RDMA instructions implemented.
0b0001	SQRDMLAH and SQRDMLSH instructions implemented.

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

TME, bits [27:24]

Indicates support for TME instructions. Defined values are:

TME	Meaning
0b0000	TME instructions are not implemented.
0b0001	TCANCEL, TCOMMIT, TSTART, and TTEST instructions are implemented.

All other values are reserved.

Accessing this field has the following behavior:

- Access is **RAZ/WI** if all of the following are true:
 - PSTATE.EL IN {EL2, EL1}
 - SCR_EL3.TME == 0
- Access is **RAZ/WI** if all of the following are true:
 - PSTATE.EL == EL1
 - EL2Enabled()
 - HCR_EL2.TME == 0
- Otherwise, access to this field is **RO**.

Atomic, bits [23:20]

Indicates support for Atomic instructions in AArch64 state. Defined values are:

Atomic	Meaning	Applies when
0b0000	No Atomic instructions implemented.	
0b0010	LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.	
0b0011	As for 0b0010, plus 128-bit instructions LDCLRP, LDSETP and SWPP.	When FEAT_LSE128 is implemented

All other values are reserved.

FEAT_LSE implements the functionality identified by the value 0b0010.

FEAT_LSE128From implementsArmv8.1, the functionalityonly identifiedpermitted byvalue the valueis 0b00110b0010.

From Armv8.1, the value 0b0000 is not permitted.

CRC32, bits [19:16]

Indicates support for CRC32 instructions in AArch64 state. Defined values are:

CRC32	Meaning
0b0000	No CRC32 instructions implemented.
0b0001	CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates support for SHA2 instructions in AArch64 state. Defined values are:

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	Implements instructions: SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.
0b0010	Implements instructions: <ul style="list-style-type: none"> SHA256H, SHA256H2, SHA256SU0, and SHA256SU1. SHA512H, SHA512H2, SHA512SU0, and SHA512SU1.

All other values are reserved.

FEAT_SHA256 implements the functionality identified by the value 0b0001.

FEAT_SHA512 implements the functionality identified by the value 0b0010.

In Armv8, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0010, ID_AA64ISAR0_EL1.SHA3 must have the value 0b0001.

SHA1, bits [11:8]

Indicates support for SHA1 instructions in AArch64 state. Defined values are:

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.

All other values are reserved.

FEAT_SHA1 implements the functionality identified by the value 0b0001.

From Armv8, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA2 is 0b0000, this field must have the value 0b0000.

AES, bits [7:4]

Indicates support for AES instructions in AArch64 state. Defined values are:

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC instructions implemented.
0b0010	As for 0b0001, plus PMULL and PMULL2 instructions operating on 64-bit source data elements quantities .

FEAT_AES implements the functionality identified by the value 0b0001.

FEAT_PMULL implements the functionality identified by the value 0b0010.

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0010.

Bits [3:0]

Reserved, RES0.

MRS <Xt>, ID_AA64ISAR0_EL1

ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1

The ID_AA64ISAR1_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64ISAR1_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
LS64				XS				I8MM				DGH				BF16				SPECRES				SB				FRINTTS			
GPI				GPA				LRCPC				FCMA				JSCVT				API				APA				DPB			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LS64, bits [63:60]

Indicates support for LD64B and ST64B* instructions, and the [ACCDATA_EL1](#) register. Defined values of this field are:

LS64	Meaning
0b0000	The LD64B, ST64B, ST64BV, and ST64BV0 instructions, the ACCDATA_EL1 register, and associated traps are not supported.
0b0001	The LD64B and ST64B instructions are supported.
0b0010	The LD64B, ST64B, and ST64BV instructions, and their associated traps are supported.
0b0011	The LD64B, ST64B, ST64BV, and ST64BV0 instructions, the ACCDATA_EL1 register, and their associated traps are supported.

All other values are reserved.

FEAT_LS64 implements the functionality identified by 0b0001.

FEAT_LS64_V implements the functionality identified by 0b0010.

FEAT_LS64_ACCDATA implements the functionality identified by 0b0011.

From Armv8.7, the permitted values are 0b0000, 0b0001, 0b0010, and 0b0011.

XS, bits [59:56]

Indicates support for the XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the [HCRX_EL2](#).{FGTnXS, FnXS} fields in AArch64 state. Defined values are:

XS	Meaning
0b0000	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2 .{FGTnXS, FnXS} fields are not supported.
0b0001	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2 .{FGTnXS, FnXS} fields are supported.

All other values are reserved.

FEAT_XS implements the functionality identified by 0b0001.

From Armv8.7, the only permitted value is 0b0001.

I8MM, bits [55:52]

Indicates support for Advanced SIMD and Floating-point Int8 matrix multiplication instructions in AArch64 state. Defined values are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID_AA64ZFR0_EL1](#).I8MM.

From Armv8.6, the only permitted value is 0b0001.

DGH, bits [51:48]

Indicates support for the Data Gathering Hint instruction. Defined values are:

DGH	Meaning
0b0000	Data Gathering Hint is not implemented.
0b0001	Data Gathering Hint is implemented.

All other values are reserved.

FEAT_DGH implements the functionality identified by 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0b0000.

BF16, bits [47:44]

Indicates support for Advanced SIMD and Floating-point BFloat16 instructions in AArch64 state. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	BFCVT, BFCVTN, BFCVTN2, BFDOT, BFMLALB, BFMLALT, and BFMMMLA instructions are implemented.
0b0010	As 0b0001, but the FPCR .EBF field is also supported.

All other values are reserved.

Otherwise, from Armv8.6, the only permitted value is 0b0001.

FEAT_BF16 **adds** the functionality identified by 0b0001.

FEAT_EBF16 **adds** the functionality identified by 0b0010.

When ~~FEAT_SVE or FEAT_SME are implemented, this field must return the same value as~~ **FEAT_SVE or FEAT_SME is implemented, this field must return the same value as** ID_AA64ZFR0_EL1.BF16.

From Armv8.6 and Armv9.1, the value 0b0000 is not permitted.

~~If FEAT_SME is implemented, the permitted values are 0b0001 and 0b0010.~~

SPECRES, bits [43:40]

Indicates support for prediction invalidation instructions in AArch64 state. Defined values are:

SPECRES	Meaning
0b0000	Prediction CFP invalidation RCTX, DVP RCTX, and CPP RCTX instructions are not implemented.
0b0001	CFP RCTX, DVP RCTX and CPP RCTX CFP RCTX, DVP RCTX, and CPP RCTX instructions are implemented.
0b0010	As 0b0001, and COSP RCTX instruction is implemented.

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

FEAT_SPECRES2 implements the functionality identified by 0b0010.

~~In Armv8.0, the permitted values are 0b0000 and 0b0001.~~

From Armv8.5, the ~~only permitted value is~~ **0b0000** ~~0b0001 is not permitted.~~

From Armv8.9, the value 0b0001 is not permitted.

SB, bits [39:36]

Indicates support for SB instruction in AArch64 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

FRINTTS, bits [35:32]

Indicates support for the FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. Defined values are:

FRINTTS	Meaning
0b0000	FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are not implemented.
0b0001	FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented.

All other values are reserved.

FEAT_FRINTTS implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

GPI, bits [31:28]

Indicates support for an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

GPI	Meaning
0b0000	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

FEAT_PACIMP implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPA is non-zero, or the value of [ID_AA64ISAR2_EL1.GPA3](#) is non-zero, this field must have the value 0b0000.

GPA, bits [27:24]

Indicates whether the QARMA5 algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

GPA	Meaning
0b0000	Generic Authentication using the QARMA5 algorithm is not implemented.
0b0001	Generic Authentication using the QARMA5 algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

FEAT_PACQARMA5 implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPI is non-zero, or the value of [ID_AA64ISAR2_EL1.GPA3](#) is non-zero, this field must have the value 0b0000.

LRCPC, bits [23:20]

Indicates support for weaker release consistency, RCpc, based model. Defined values are:

LRCPC	Meaning
0b0000	RCpc The LDAPR*, LDAPUR*, and STLUR* instructions are not implemented.
0b0001	The LDAPUR*, and STLUR* instructions are not implemented. The no offset LDAPR, LDAPRB, and LDAPRH* instructions are implemented.
0b0010	As The LDAPR*, LDAPUR*, and STLUR* instructions are implemented. 0b0001, and the LDAPR (unscaled immediate) and STLR (unscaled immediate) instructions are implemented.
0b0011	As 0b0010, and the post-index LDAPR, LDIAPP, STILP, and pre-index STLR instructions are implemented. If Advanced SIMD and floating-point is implemented, then the LDAPUR (SIMD&FP), LDAP1 (SIMD&FP), STLUR (SIMD&FP), and STL1 (SIMD&FP) instructions are implemented in Advanced SIMD and floating-point.

All other values are reserved.

FEAT_LRCPC implements the functionality identified by the value 0b0001.

FEAT_LRCPC2 implements the functionality identified by the value 0b0010.

FEAT_LRCPC3 implements the functionality identified by the value 0b0011.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.3, the value 0b0000 is not permitted.

In Armv8.3, the permitted values are 0b0001 and 0b0010.

From Armv8.4, the only permitted value is 0b0001. 0b0010 is not permitted.

FCMA, bits [19:16]

Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are:

FCMA	Meaning
0b0000	The FCMLA and FCADD instructions are not implemented.
0b0001	The FCMLA and FCADD instructions are implemented.

All other values are reserved.

FEAT_FCMA implements the functionality identified by the value 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

JSCVT, bits [15:12]

Indicates support for JavaScript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

JSCVT	Meaning
0b0000	The FJCVTZS instruction is not implemented.
0b0001	The FJCVTZS instruction is implemented.

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

API, bits [11:8]

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

API	Meaning
0b0000	Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE, and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.

FEAT_EPAC implements the functionality identified by 0b0010.

FEAT_PAuth2 implements the functionality identified by 0b0011.

FEAT_FPAC implements the functionality identified by 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

When this field is non-zero, FEAT_PACIMP is implemented.

In Armv8.3, the permitted values are 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.APA is non-zero, or the value of [ID_AA64ISAR2_EL1.APA3](#) is non-zero, this field must have the value 0b0000.

APA, bits [7:4]

Indicates whether the QARMA5 algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

APA	Meaning
0b0000	Address Authentication using the QARMA5 algorithm is not implemented.
0b0001	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.

FEAT_EPAC implements the functionality identified by 0b0010.

FEAT_PAuth2 implements the functionality identified by 0b0011.

FEAT_FPAC implements the functionality identified by 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

When this field is non-zero, FEAT_PACQARMA5 is implemented.

In Armv8.3, the permitted values are 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.API is non-zero, or the value of [ID_AA64ISAR2_EL1.APA3](#) is non-zero, this field must have the value 0b0000.

DPB, bits [3:0]

Data Persistence writeback. Indicates support for the [DC CVAP](#) and [DC CVADP](#) instructions in AArch64 state. Defined values are:

DPB	Meaning
0b0000	DC CVAP not supported.
0b0001	DC CVAP supported.
0b0010	DC CVAP and DC CVADP supported.

All other values are reserved.

FEAT_DPB implements the functionality identified by the value 0b0001.

FEAT_DPB2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0001 and 0b0010.

From Armv8.5, the only permitted value is 0b0010.

ID_AA64ISAR2_EL1, AArch64 Instruction Set Attribute Register 2

The ID_AA64ISAR2_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64ISAR2_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:56:28]

Reserved, RES0.

CSSC, bits [55:52]

Indicates support for common short sequence compression instructions. Defined values are:

CSSC	Meaning
0b0000	Common short sequence compression instructions are not implemented.
0b0001	Common short sequence compression instructions are implemented.

All other values are reserved.

FEAT_CSSC adds the functionality identified by the value 0b0001.

From Armv9.4, the value 0b0000 is not permitted.

RPRFM, bits [51:48]

RPRFM hint instruction. Defined values are:

RPRFM	Meaning
0b0000	RPRFM hint instruction is not implemented and is treated as a NOP.
0b0001	RPRFM hint instruction is implemented.

All other values are reserved.

FEAT_RPRFM adds the functionality identified by the value 0b0001.

Bits [47:44]

Reserved, RES0.

PRFMSLC, bits [43:40]

Indicates whether the PFRM instructions support a system level cache option. Defined values are:

PRFMSLC	Meaning
0b0000	The PRFM instructions do not support the SLC target.
0b0001	The PRFM instructions support the SLC target.

All other values are reserved.

FEAT_PRFMSLC implements the functionality identified by 0b0001.

SYSINSTR_128, bits [39:36]

SYSINSTR_128. Defined values are:

SYSINSTR_128	Meaning
0b0000	System instructions that take 128-bit inputs are not supported.
0b0001	System instructions that take 128-bit inputs are supported.

All other values are reserved.

FEAT_SYSINSTR128 implements the functionality identified by 0b0001.

SYSREG_128, bits [35:32]

SYSREG_128. Defined values are:

SYSREG_128	Meaning
0b0000	Instructions to access 128-bit System Registers are not supported.
0b0001	Instructions to access 128-bit System Registers are supported.

All other values are reserved.

FEAT_SYSREG128 implements the functionality identified by 0b0001.

CLRBHB, bits [31:28]

Indicates support for the CLRBHB instruction in AArch64 state. Defined values are:

CLRBHB	Meaning
0b0000	CLRBHB instruction is not implemented.
0b0001	CLRBHB instruction is implemented.

All other values are reserved.

FEAT_CLRBHB implements the functionality identified by 0b0001.

From Armv8.9, the value 0b0000 is not permitted.

PAC_frac, bits [27:24]

Indicates whether the ConstPACField() function used as part of the PAC addition returns FALSE or TRUE.

PAC_frac	Meaning
0b0000	ConstPACField() returns FALSE.
0b0001	ConstPACField() returns TRUE.

All other values are reserved.

FEAT_CONSTPACFIELD implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

BC, bits [23:20]

Indicates support for the BC instruction in AArch64 state. Defined values are:

BC	Meaning
0b0000	BC instruction is not implemented.
0b0001	BC instruction is implemented.

All other values are reserved.

FEAT_HBC implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

MOPS, bits [19:16]

Indicates support for the Memory Copy and Memory Set instructions in AArch64 state.

MOPS	Meaning
0b0000	The Memory Copy and Memory Set instructions are not implemented in AArch64 state.
0b0001	The Memory Copy and Memory Set instructions are implemented in AArch64 state with the following exception. If FEAT_MTE is implemented, then SETGP*, SETGM* and SETGE* instructions are also supported.

All other values are reserved.

FEAT_MOPS implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

APA3, bits [15:12]

Indicates whether the QARMA3 algorithm is implemented in the PE for address authentication in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

APA3	Meaning
0b0000	Address Authentication using the QARMA3 algorithm is not implemented.
0b0001	Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.

FEAT_EPAC implements the functionality identified by 0b0010.

FEAT_PAuth2 implements the functionality identified by 0b0011.

FEAT_FPAC implements the functionality identified by 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

When this field is non-zero, FEAT_PACQARMA3 is implemented.

In Armv8.3, the permitted values are 0b0000, 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of [ID_AA64ISAR1_EL1.API](#) is non-zero, or the value of [ID_AA64ISAR1_EL1.APA](#) is non-zero, this field must have the value 0b0000.

GPA3, bits [11:8]

Indicates whether the QARMA3 algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

GPA3	Meaning
0b0000	Generic Authentication using the QARMA3 algorithm is not implemented.
0b0001	Generic Authentication using the QARMA3 algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

FEAT_PACQARMA3 implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of [ID_AA64ISAR1_EL1.GPI](#) is non-zero, or the value of [ID_AA64ISAR1_EL1.GPA](#) is non-zero, this field must have the value 0b0000.

RPRES, bits [7:4]

Indicates support for 12 bits of mantissa in reciprocal and reciprocal square root instructions in AArch64 state, when [FPCR.AH](#) is 1. Defined values are:

RPRES	Meaning	Applies when
0b0000	Reciprocal and reciprocal square root estimates give 8 bits of mantissa, when FPCR.AH is 1.	When FPCR.AH == 1
0b0001	Reciprocal and reciprocal square root estimates give 12 bits of mantissa, when FPCR.AH is 1.	When FPCR.AH == 1

All other values are reserved.

FEAT_RPRES implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

WFxT, bits [3:0]

Indicates support for the WFET and WFIT instructions in AArch64 state. Defined values are:

WFxT	Meaning
0b0000	WFET and WFIT are not supported.
0b0010	WFET and WFIT are supported, and the register number is reported in the ESR ELx on exceptions.

All other values are reserved.

FEAT_WFxT implements the functionality identified by the value 0b0010.

From Armv8.7, the only permitted value is 0b0010.

Accessing ID_AA64ISAR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ISAR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (IsFeatureImplemented(FEAT_FGT) || !IsZero(ID_AA64ISAR2_EL1) || boolean
IMPLEMENTATION_DEFINED "ID_AA64ISAR2_EL1 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = ID_AA64ISAR2_EL1;
elseif PSTATE.EL == EL2 then
    X[t, 64] = ID_AA64ISAR2_EL1;
elseif PSTATE.EL == EL3 then
    X[t, 64] = ID_AA64ISAR2_EL1;

```

ID_AA64MMFR0_EL1, AArch64 Memory Model Feature Register 0

The ID_AA64MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64MMFR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ECV				FGT				RES0								ExS				TGran4_2				TGran64_2				TGran16_2			
TGran4				TGran64				TGran16				BigEndEL0				SNSMem				BigEnd				ASIDBits				PARange			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECV, bits [63:60]

Indicates presence of Enhanced Counter Virtualization. Defined values are:

ECV	Meaning
0b0000	Enhanced Counter Virtualization is not implemented.
0b0001	Enhanced Counter Virtualization is implemented. Supports CNTHCTL_EL2 .{EL1TVT, EL1TVCT, EL1NVPCT, EL1NVVCT, EVNTIS}, CNTKCTL_EL1 .EVNTIS, CNTPTSS_EL0 counter views, and CNTVCTSS_EL0 counter views. Extends the PMSCR_EL1 .PCT, PMSCR_EL2 .PCT, TRFCR_EL1 .TS, and TRFCR_EL2 .TS fields.
0b0010	As 0b0001, and also includes support for CNTHCTL_EL2 .ECV and CNTPOFF_EL2 .

All other values are reserved.

FEAT_ECV implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.6, the only permitted values are 0b0001 and 0b0010.

FGT, bits [59:56]

Indicates presence of the Fine-Grained Trap controls. Defined values are:

FGT	Meaning
0b0000	Fine-grained trap controls are not implemented.
0b0001	Fine-grained trap controls are implemented. Supports: <ul style="list-style-type: none"> If EL2 is implemented, the HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGTRTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers, and their associated traps. If EL2 is implemented, MDCR_EL2.TDCC. If EL3 is implemented, MDCR_EL3.TDCC. If both EL2 and EL3 are implemented, SCR_EL3.FGTEn.
0b0010	As 0b0001, and also includes support for: <ul style="list-style-type: none"> If EL2 is implemented, the HDFGRTR2_EL2, HDFGWTR2_EL2, HFGITR2_EL2, HFGTRTR2_EL2, and HFGWTR2_EL2 registers, and their associated traps. If both EL2 and EL3 are implemented, SCR_EL3.FGTEn2.

All other values are reserved.

FEAT_FGT implements the functionality identified by the value 0b0001.

FEAT_FGT2 implements the functionality identified by the value 0b0010.

From Armv8.6, the value 0b0000 is not permitted.

From Armv8.9, the value 0b0001 is not permitted.

Bits [55:48]

Reserved, RES0.

ExS, bits [47:44]

Indicates support for disabling context synchronizing exception entry and exit. Defined values are:

ExS	Meaning
0b0000	All exception entries and exits are context synchronization events.
0b0001	Non-context synchronizing exception entry and exit are supported.

All other values are reserved.

FEAT_ExS implements the functionality identified by the value 0b0001.

TGran4_2, bits [43:40]

Indicates support for 4KB memory granule size at stage 2. Defined values are:

TGran4_2	Meaning	Applies when
0b0000	Support for 4KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran4 field.	
0b0001	4KB granule not supported at stage 2.	
0b0010	4KB granule supported at stage 2.	
0b0011	4KB granule at stage 2 supports 52-bit input addresses and can describe 52-bit output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

TGran64_2, bits [39:36]

Indicates support for 64KB memory granule size at stage 2. Defined values are:

TGran64_2	Meaning
0b0000	Support for 64KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran64 field.
0b0001	64KB granule not supported at stage 2.
0b0010	64KB granule supported at stage 2.

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

TGran16_2, bits [35:32]

Indicates support for 16KB memory granule size at stage 2. Defined values are:

TGran16_2	Meaning	Applies when
0b0000	Support for 16KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran16 field.	
0b0001	16KB granule not supported at stage 2.	
0b0010	16KB granule supported at stage 2.	
0b0011	16KB granule at stage 2 supports 52-bit input addresses and can describe 52-bit output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

TGran4, bits [31:28]

Indicates support for 4KB memory translation granule size. Defined values are:

TGran4	Meaning	Applies when
0b0000	4KB granule supported.	
0b0001	4KB granule supports 52-bit input addresses and can describe 52-bit output addresses.	When FEAT_LPA2 is implemented
0b1111	4KB granule not supported.	

All other values are reserved.

TGran64, bits [27:24]

Indicates support for 64KB memory translation granule size. Defined values are:

TGran64	Meaning
0b0000	64KB granule supported.
0b1111	64KB granule not supported.

All other values are reserved.

TGran16, bits [23:20]

Indicates support for 16KB memory translation granule size. Defined values are:

TGran16	Meaning	Applies when
0b0000	16KB granule not supported.	
0b0001	16KB granule supported.	
0b0010	16KB granule supports 52-bit input addresses and can describe 52-bit output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

BigEndEL0, bits [19:16]

Indicates support for mixed-endian at EL0 only. Defined values are:

BigEndEL0	Meaning
0b0000	No mixed-endian support at EL0. The SCTLR_EL1.E0E bit has a fixed value.
0b0001	Mixed-endian support at EL0. The SCTLR_EL1.E0E bit can be configured.

All other values are reserved.

This field is invalid and is RES0 if ID_AA64MMFR0_EL1.BigEnd is not 0b0000.

SNSMem, bits [15:12]

Indicates support for a distinction between Secure and Non-secure Memory. Defined values are:

SNSMem	Meaning
0b0000	Does not support a distinction between Secure and Non-secure Memory.
0b0001	Does support a distinction between Secure and Non-secure Memory.

Note

If EL3 is implemented, the value 0b0000 is not permitted.

All other values are reserved.

BigEnd, bits [11:8]

Indicates support for mixed-endian configuration. Defined values are:

BigEnd	Meaning
0b0000	No mixed-endian support. The SCTL _R _EL _x .EE bits have a fixed value. See the BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian.
0b0001	Mixed-endian support. The SCTL _R _EL _x .EE and SCTL_R_EL1.E0E bits can be configured.

All other values are reserved.

ASIDBits, bits [7:4]

Number of ASID bits. Defined values are:

ASIDBits	Meaning
0b0000	8 bits.
0b0010	16 bits.

All other values are reserved.

PARange, bits [3:0]

Physical Address range supported. Defined values are:

PARange	Meaning	Applies when
0b0000	32 bits, 4GB.	
0b0001	36 bits, 64GB.	
0b0010	40 bits, 1TB.	
0b0011	42 bits, 4TB.	
0b0100	44 bits, 16TB.	
0b0101	48 bits, 256TB.	
0b0110	52 bits, 4PB.	When FEAT_LPA is implemented or FEAT_LPA2 is implemented
0b0111	56 bits, 64PB.	When FEAT_D128 is implemented

All other values are reserved.

The value 0b0110 is permitted only if the implementation includes FEAT_LPA, otherwise it is reserved.

Accessing ID_AA64MMFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            X[t, 64] = ID_AA64MMFR0_EL1;
    elseif PSTATE.EL == EL2 then
        X[t, 64] = ID_AA64MMFR0_EL1;
    elseif PSTATE.EL == EL3 then
        X[t, 64] = ID_AA64MMFR0_EL1;

```

ECBHB, bitsBits [63:60]

Indicates support for cache maintenance instruction permission. Defined values are:

Reserved, RES0.

ECBHB	Meaning
0b0000	The implementation does not disclose whether the branch history information created in a context before an exception to a higher exception level using AArch64 can be used by code before that exception to exploitatively control the execution of any indirect branches in code in a different context after the exception.
0b0001	The branch history information created in a context before an exception to a higher exception level using AArch64 cannot be used by code before that exception to exploitatively control the execution of any indirect branches in code in a different context after the exception.

All other values are reserved.

FEAT_ECBHB implements the functionality identified by the value 0b0001.

From Armv8.9, the value 0b0000 is not permitted.

CMOW, bits [59:56]

Indicates support for cache maintenance instruction permission. Defined values are:

CMOW	Meaning
0b0000	SCTLR_EL1 .CMOW, SCTLR_EL2 .CMOW, and HCRX_EL2 .CMOW bits are not implemented.
0b0001	SCTLR_EL1 .CMOW is implemented. If EL2 is implemented, SCTLR_EL2 .CMOW and HCRX_EL2 .CMOW bits are implemented.

All other values are reserved.

FEAT_CMOW implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

TIDCP1, bits [55:52]

Indicates whether [SCTLR_EL1](#).TIDCP and [SCTLR_EL2](#).TIDCP are implemented in AArch64 state. Defined values are:

TIDCP1	Meaning
0b0000	SCTLR_EL1 .TIDCP and SCTLR_EL2 .TIDCP bits are not implemented and are RES0.
0b0001	SCTLR_EL1 .TIDCP bit is implemented. If EL2 is implemented, SCTLR_EL2 .TIDCP bit is implemented.

All other values are reserved.

FEAT_TIDCP1 implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

nTLBPA, bits [51:48]

Indicates support for intermediate caching of translation table walks. Defined values are:

nTLBPA	Meaning
0b0000	The intermediate caching of translation table walks might include non-coherent physical translation caches.
0b0001	The intermediate caching of translation table walks does not include non-coherent physical translation caches.

Non-coherent physical translation caches are non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE, where either:

- The caching is indexed by the physical address of the location holding the translation table entry.
- The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

AFP, bits [47:44]

Indicates support for [FPCR](#).{AH, FIZ, NEP}. Defined values are:

AFP	Meaning
0b0000	The FPCR .{AH, FIZ, NEP} fields are not supported.
0b0001	The FPCR .{AH, FIZ, NEP} fields are supported.

All other values are reserved.

FEAT_AFP implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

HCX, bits [43:40]

Indicates support for [HCRX_EL2](#) and its associated EL3 trap. Defined values are:

HCX	Meaning
0b0000	HCRX_EL2 and its associated EL3 trap are not supported.
0b0001	HCRX_EL2 and its associated EL3 trap are supported.

All other values are reserved.

FEAT_HCX implements the functionality identified by the value 0b0001.

From Armv8.7, if EL2 is implemented, the only permitted value is 0b0001.

ETS, bits [39:36]

Indicates support for Enhanced Translation Synchronization. Defined values are:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is supported.

All other values are reserved.

FEAT_ETS implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

TWED, bits [35:32]

Indicates support for the configurable delayed trapping of WFE. Defined values are:

TWED	Meaning
0b0000	Configurable delayed trapping of WFE is not supported.
0b0001	Configurable delayed trapping of WFE is supported.

All other values are reserved.

FEAT_TWED implements the functionality identified by the value 0b0001.

From Armv8.6, the permitted values are 0b0000 and 0b0001.

XNX, bits [31:28]

Indicates support for execute-never control distinction by Exception level at stage 2. Defined values are:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [27:24]**When FEAT_RAS is implemented:**

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches.

SpecSEI	Meaning
0b0000	The PE never generates an SError interrupt due to an External abort on a speculative read.
0b0001	The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

Otherwise:

Reserved, RES0.

PAN, bits [23:20]

Privileged Access Never. Indicates support for the PAN bit in PSTATE, [SPSR_EL1](#), [SPSR_EL2](#), [SPSR_EL3](#), and [DSPSR_EL0](#). Defined values are:

PAN	Meaning
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and AT S1E1RP and AT S1E1WP instructions supported.
0b0011	PAN supported, AT S1E1RP and AT S1E1WP instructions supported, and SCTLR_EL1 .EPAN and SCTLR_EL2 .EPAN bits supported.

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

FEAT_PAN3 implements the functionality added by the value 0b0011.

In Armv8.1, the permitted values are 0b0001, 0b0010, and 0b0011.

From Armv8.2, the permitted values are 0b0010 and 0b0011.

From Armv8.7, the only permitted value is 0b0011.

LO, bits [19:16]

LORegions. Indicates support for LORegions. Defined values are:

LO	Meaning
0b0000	LORegions not supported.
0b0001	LORegions supported.

All other values are reserved.

FEAT_LOR implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

HPDS, bits [15:12]

Hierarchical Permission Disables. Indicates support for disabling hierarchical controls in translation tables. Defined values are:

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Disabling of hierarchical controls supported with the TCR_EL1 .{HPD1, HPD0}, TCR_EL2 .HPD or TCR_EL2 .{HPD1, HPD0}, and TCR_EL3 .HPD bits.
0b0010	As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the Translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT_HPDS implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality identified by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

VH, bits [11:8]

Virtualization Host Extensions. Defined values are:

VH	Meaning
0b0000	Virtualization Host Extensions not supported.
0b0001	Virtualization Host Extensions supported.

All other values are reserved.

FEAT_VHE implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

VMIDBits, bits [7:4]

Number of VMID bits. Defined values are:

VMIDBits	Meaning
0b0000	8 bits
0b0010	16 bits

All other values are reserved.

FEAT_VMID16 implements the functionality identified by the value 0b0010.

From Armv8.1, the permitted values are 0b0000 and 0b0010.

HAFDBS, bits [3:0]

Hardware updates to Access flag and Dirty state in translation tables. Defined values are:

HAFDBS	Meaning
0b0000	Hardware update of the Access flag and dirty state are not supported.
0b0001	Hardware update of the Access flag is supported.
0b0010	Hardware update of both the Access flag and dirty state is supported.

All other values are reserved.

FEAT_HAFDBS implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.

Accessing ID_AA64MMFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = ID_AA64MMFR1_EL1;
elseif PSTATE.EL == EL2 then
    X[t, 64] = ID_AA64MMFR1_EL1;
elseif PSTATE.EL == EL3 then
    X[t, 64] = ID_AA64MMFR1_EL1;

```

ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2

The ID_AA64MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64MMFR2_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
EOPD				EVT				BBM				TTL				RES0				FWB				IDS				AT			
ST				NV				CCIDX				VARange				IESB				LSM				UAO				CnP			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EOPD, bits [63:60]

Indicates support for the EOPD mechanism. Defined values are:

EOPD	Meaning
0b0000	EOPDx mechanism is not implemented.
0b0001	EOPDx mechanism is implemented.

All other values are reserved.

FEAT_EOPD implements the functionality identified by the value 0b0001.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_EOPD is implemented, FEAT_CSV3 must be implemented.

EVT, bits [59:56]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the [HCR_EL2](#).{TTLBOS, TLBIS, TOCU, TICAB, TID4} traps. Defined values are:

EVT	Meaning
0b0000	HCR_EL2 .{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	HCR_EL2 .{TOCU, TICAB, TID4} traps are supported. HCR_EL2 .{TTLBOS, TTLBIS} traps are not supported.
0b0010	HCR_EL2 .{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

BBM, bits [55:52]

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation.

BBM	Meaning
0b0000	Level 0 support for changing block size is supported.
0b0001	Level 1 support for changing block size is supported.
0b0010	Level 2 support for changing block size is supported.

All other values are reserved.

FEAT_BBM implements the functionality identified by the values 0b0000, 0b0001, and 0b0010.

From Armv8.4, the permitted values are 0b0000, 0b0001, and 0b0010.

TTL, bits [51:48]

Indicates support for TTL field in address operations. Defined values are:

TTL	Meaning
0b0000	TLB maintenance instructions by address have bits[47:44] as RES0.
0b0001	TLB maintenance instructions by address have bits[47:44] holding the TTL field.

All other values are reserved.

FEAT_TTL implements the functionality identified by the value 0b0001.

This field affects [TLBI IPAS2E1](#), [TLBI IPAS2E1IS](#), [TLBI IPAS2E1OS](#), [TLBI IPAS2LE1](#), [TLBI IPAS2LE1IS](#), [TLBI IPAS2LE1OS](#), [TLBI VAAE1](#), [TLBI VAAE1IS](#), [TLBI VAAE1OS](#), [TLBI VAALE1](#), [TLBI VAALE1IS](#), [TLBI VAALE1OS](#), [TLBI VAE1](#), [TLBI VAE1IS](#), [TLBI VAE1OS](#), [TLBI VAE2](#), [TLBI VAE2IS](#), [TLBI VAE2OS](#), [TLBI VAE3](#), [TLBI VAE3IS](#), [TLBI VAE3OS](#), [TLBI VALE1](#), [TLBI VALE1IS](#), [TLBI VALE1OS](#), [TLBI VALE2](#), [TLBI VALE2IS](#), [TLBI VALE2OS](#), [TLBI VALE3](#), [TLBI VALE3IS](#), [TLBI VALE3OS](#).

From Armv8.4, the only permitted value is 0b0001.

Bits [47:44]

Reserved, RES0.

FWB, bits [43:40]

Indicates support for [HCR_EL2](#).FWB. Defined values are:

FWB	Meaning
0b0000	HCR_EL2 .FWB bit is not supported.
0b0001	HCR_EL2 .FWB is supported.

All other values reserved.

FEAT_S2FWB implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

IDS, bits [39:36]

Indicates the value of ESR_ELx.EC that reports an exception generated by a read access to the feature ID space. Defined values are:

IDS	Meaning
0b0000	An exception which is generated by a read access to the feature ID space, other than a trap caused by HCR_EL2 .TIDx, SCTLR_EL1 .UCT, or SCTLR_EL2 .UCT, is reported by ESR_ELx.EC == 0x0.
0b0001	All exceptions generated by an AArch64 read access to the feature ID space are reported by ESR_ELx.EC == 0x18.

All other values are reserved.

The Feature ID space is defined as the System register space in AArch64 with op0==3, op1=={0, 1, 3}, CRn==0, CRm=={0-7}, op2=={0-7}.

FEAT_IDST implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AT, bits [35:32]

Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are:

AT	Meaning
0b0000	Unaligned single-copy atomicity and atomic functions are not supported.
0b0001	Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.

All other values are reserved.

FEAT_LSE2 implements the functionality identified by the value 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

ST, bits [31:28]

Identifies support for small translation tables. Defined values are:

ST	Meaning
0b0000	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 39.
0b0001	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.

All other values are reserved.

FEAT_TTST implements the functionality identified by the value 0b0001.

If FEAT_SEL2 is implemented, the only permitted value is 0b0001.

In an implementation which does not support FEAT_SEL2, the permitted values are 0b0000 and 0b0001.

NV, bits [27:24]

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:

NV	Meaning
0b0000	Nested virtualization is not supported.
0b0001	The HCR_EL2 .{AT, NV1, NV} bits are implemented.
0b0010	The VNCR_EL2 register and the HCR_EL2 .{NV2, AT, NV1, NV} bits are implemented.

All other values are reserved.

If EL2 is not implemented, the only permitted value is 0b0000.

FEAT_NV implements the functionality identified by the value 0b0001.

FEAT_NV2 implements the functionality identified by the value 0b0010.

In Armv8.3, if EL2 is implemented, the permitted values are 0b0000 and 0b0001.

From Armv8.4, if EL2 is implemented, the permitted values are 0b0000, 0b0001, and 0b0010.

CCIDX, bits [23:20]

Support for the use of revised [CCSIDR_EL1](#) register format. Defined values are:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR_EL1.
0b0001	64-bit format implemented for all levels of the CCSIDR_EL1.

All other values are reserved.

FEAT_CCIDX implements the functionality identified by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

VARange, bits [19:16]

Indicates support for a larger virtual address. Defined values are:

VARange	Meaning	Applies when
0b0000	VMSAv8-64 supports 48-bit VAs.	
0b0001	VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The size for other translation granules is not defined by this field.	
0b0010	VMSAv9-128 supports 56-bit VAs.	When FEAT_D128 is implemented

All other values are reserved.

FEAT_LVA implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

IESB, bits [15:12]

Indicates support for the IESB bit in the SCTLR_ELx registers. Defined values are:

IESB	Meaning
0b0000	IESB bit in the SCTLR_ELx registers is not supported.
0b0001	IESB bit in the SCTLR_ELx registers is supported.

All other values are reserved.

FEAT_IESB implements the functionality identified by the value 0b0001.

LSM, bits [11:8]

Indicates support for LSMAOE and nTLSMD bits in [SCTLR_EL1](#) and [SCTLR_EL2](#). Defined values are:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

UAO, bits [7:4]

User Access Override. Defined values are:

UAO	Meaning
0b0000	UAO not supported.
0b0001	UAO supported.

All other values are reserved.

FEAT_UAO implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

CnP, bits [3:0]

Indicates support for Common not Private translations. Defined values are:

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Accessing ID_AA64MMFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && (IsFeatureImplemented(FEAT_FGT) || !IsZero(ID_AA64MMFR2_EL1) || boolean
IMPLEMENTATION_DEFINED "ID_AA64MMFR2_EL1 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            X[t, 64] = ID_AA64MMFR2_EL1;
    elsif PSTATE.EL == EL2 then
        X[t, 64] = ID_AA64MMFR2_EL1;
    elsif PSTATE.EL == EL3 then
        X[t, 64] = ID_AA64MMFR2_EL1;

```

ID_AA64MMFR3_EL1, AArch64 Memory Model Feature Register 3

The ID_AA64MMFR3_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64MMFR3_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Spec_FPACC				ADERR				SDERR				RES0				ANERR				SNERR				D128_2				D128			
MEC				AIE				S2POE				S1POE				S2PIE				S1PIE				SCTLRX				TCRX			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Spec_FPACC, bits [63:60] When FEAT_FPACCOMBINE is implemented:

Speculative behavior in the event of a PAC authentication failure in an implementation that includes FEAT_FPACCOMBINE. Defined values are:

Spec_FPACC	Meaning
0b0000	The implementation does not disclose whether the speculative use of pointers processed by a PAC Authentication is materially different in terms of the impact on cached microarchitectural state between passing and failing of the PAC Authentication.
0b0001	The speculative use of pointers processed by a PAC Authentication is not materially different in terms of the impact on cached microarchitectural state between passing and failing of the PAC Authentication.

All other values are reserved.

For the purpose of this definition, cached microarchitecture state is the state of caching agents such as instruction caches, data caches and TLBs which can be altered as a result of speculation caused by a mispredicted execution, but is not restored to the state prior to the speculation when the misprediction is corrected.

Otherwise:

Reserved, RES0.

ADERR, bits [59:56]

Asynchronous Device error exceptions. With ID_AA64MMFR3_EL1.SDERR, describes the PE behavior for error exceptions on Device memory loads.

ADERR	Meaning
0b0000	If FEAT_RASv2 is not implemented and ID_AA64MMFR3_EL1.SDERR is 0b0000, then the behavior is not described. Otherwise, the behavior is described by ID_AA64MMFR3_EL1.SDERR.
0b0001	Some error exceptions for Device memory loads are taken asynchronously.
0b0010	FEAT_ADERR is implemented. SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR are implemented.

All other values are reserved.

When FEAT_RASv2 is implemented and ID_AA64MMFR3_EL1.SDERR is 0b0000, the value of this field is 0b0001.

When ID_AA64MMFR3_EL1.SDERR is 0b0001, the value of this field is 0b0000.

When ID_AA64MMFR3_EL1.SDERR is 0b0010, the value of this field is 0b0010.

FEAT_ADERR implements the functionality described by the value 0b0010.

SDERR, bits [55:52]

Synchronous Device error exceptions. With ID_AA64MMFR3_EL1.ADERR, describes the PE behavior for error exceptions on Device memory loads.

SDERR	Meaning
0b0000	If FEAT_RASv2 is not implemented and ID_AA64MMFR3_EL1.ADERR is 0b0000, then the behavior is not described. Otherwise, the behavior is described by ID_AA64MMFR3_EL1.ADERR.
0b0001	All error exceptions for Device memory loads are taken synchronously.
0b0010	FEAT_ADERR is implemented. SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR are implemented.

All other values are reserved.

When FEAT_RASv2 is implemented and ID_AA64MMFR3_EL1.ADERR is 0b0000, the value of this field is 0b0001.

When ID_AA64MMFR3_EL1.ADERR is 0b0001, the value of this field is 0b0000.

When ID_AA64MMFR3_EL1.ADERR is 0b0010, the value of this field is 0b0010.

FEAT_ADERR implements the functionality described by the value 0b0010.

Bits [51:48]

Reserved, RES0.

ANERR, bits [47:44]

Asynchronous Normal error exceptions. With ID_AA64MMFR3_EL1.SNERR, describes the PE behavior for error exceptions on Normal memory loads.

ANERR	Meaning
0b0000	If FEAT_RASv2 is not implemented and ID_AA64MMFR3_EL1.SNERR is 0b0000, then the behavior is not described. Otherwise, the behavior is described by ID_AA64MMFR3_EL1.SNERR.
0b0001	Some error exceptions for Normal memory loads are taken asynchronously.
0b0010	FEAT_ANERR is implemented. SCTL2_ELx.EnANERR and HCRX_EL2.EnSNERR are implemented.

All other values are reserved.

When FEAT_RASv2 is implemented and ID_AA64MMFR3_EL1.SNERR is 0b0000, the value of this field is 0b0001.

When ID_AA64MMFR3_EL1.SNERR is 0b0001, the value of this field is 0b0000.

When ID_AA64MMFR3_EL1.SNERR is 0b0010, the value of this field is 0b0010.

FEAT_ANERR implements the functionality described by the value 0b0010.

SNERR, bits [43:40]

Synchronous Normal error exceptions. With ID_AA64MMFR3_EL1.ANERR, describes the PE behavior for error exceptions on Normal memory loads.

SNERR	Meaning
0b0000	If FEAT_RASv2 is not implemented and ID_AA64MMFR3_EL1.ANERR is 0b0000, then the behavior is not described. Otherwise, the behavior is described by ID_AA64MMFR3_EL1.ANERR.
0b0001	All error exceptions for Normal memory loads are taken synchronously.
0b0010	FEAT_ANERR is implemented. SCTL2_ELx.EnANERR and HCRX_EL2.EnSNERR are implemented.

All other values are reserved.

When FEAT_RASv2 is implemented and ID_AA64MMFR3_EL1.ANERR is 0b0000, the value of this field is 0b0001.

When ID_AA64MMFR3_EL1.ANERR is 0b0001, the value of this field is 0b0000.

When ID_AA64MMFR3_EL1.ANERR is 0b0010, the value of this field is 0b0010.

FEAT_ANERR implements the functionality described by the value 0b0010.

D128_2, bits [39:36]

128-bit Page Table Descriptor at stage 2. Indicates support for 128-bit Page Table Descriptor at stage 2. Defined values are:

D128_2	Meaning
0b0000	128-bit Page Table Descriptor Extension at stage 2 is not supported.
0b0001	128-bit Page Table Descriptor Extension at stage 2 is supported.

All other values are reserved.

D128, bits [35:32]

128-bit Page Table Descriptor. Indicates support for 128-bit Page Table Descriptor. Defined values are:

D128	Meaning
0b0000	128-bit Page Table Descriptor Extension is not supported.
0b0001	128-bit Page Table Descriptor Extension is supported.

All other values are reserved.

MEC, bits [31:28]

Indicates support for Memory Encryption Contexts. Defined values are:

MEC	Meaning
0b0000	Memory Encryption Contexts is not supported.
0b0001	Memory Encryption Contexts is supported for Realm physical address space.

All other values are reserved.

FEAT_MEC implements the functionality identified by the value 0b0001.

AIE, bits [27:24]

Attribute Indexing. Indicates support for the Attribute Index Extension. Defined values are:

AIE	Meaning
0b0000	The Attribute Index Extension is not supported.
0b0001	The Attribute Index Extension at Stage 1 is supported.

All other values are reserved.

S2POE, bits [23:20]

Stage 2 Permission Overlay. Indicates support for Permission Overlay at Stage 2. Defined values are:

S2POE	Meaning
0b0000	The Permission Overlay at Stage 2 is not supported.
0b0001	The Permission Overlay at Stage 2 is supported.

All other values are reserved.

S1POE, bits [19:16]

Stage 1 Permission Overlay. Indicates support for Permission Overlay at Stage 1. Defined values are:

S1POE	Meaning
0b0000	The Permission Overlay at Stage 1 is not supported.
0b0001	The Permission Overlay at Stage 1 is supported.

All other values are reserved.

S2PIE, bits [15:12]

Stage 2 Permission Indirection. Indicates support for Permission Indirection at Stage 2. Defined values are:

S2PIE	Meaning
0b0000	The Permission Indirection at Stage 2 is not supported.
0b0001	The Permission Indirection at Stage 2 is supported.

All other values are reserved.

S1PIE, bits [11:8]

Stage 1 Permission Indirection. Indicates support for Permission Indirection at Stage 1. Defined values are:

S1PIE	Meaning
0b0000	The Permission Indirection at Stage 1 is not supported.
0b0001	The Permission Indirection at Stage 1 is supported.

All other values are reserved.

SCTLRX, bits [7:4]

SCTLRX Extension. Indicates support for Extension of [SCTLR_EL1](#). Defined values are:

SCTLRX	Meaning
0b0000	SCTLR2_EL1 , SCTLR2_EL2 and their associated trap controls are not implemented.
0b0001	SCTLR2_EL1 , SCTLR2_EL2 and their associated trap controls are implemented.

All other values are reserved.

TCRX, bits [3:0]

TCR Extension. Indicates support for Extension of [TCR_EL1](#). Defined values are:

TCRX	Meaning
0b0000	TCR2_EL1 , TCR2_EL2 and their associated trap controls are not implemented.
0b0001	TCR2_EL1 , TCR2_EL2 and their associated trap controls are implemented.

All other values are reserved.

Accessing ID_AA64MMFR3_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR3_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b011

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (IsFeatureImplemented(FEAT_FGT) || !IsZero(ID_AA64MMFR3_EL1) || boolean
IMPLEMENTATION_DEFINED "ID_AA64MMFR3_EL1 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = ID_AA64MMFR3_EL1;
elseif PSTATE.EL == EL2 then
    X[t, 64] = ID_AA64MMFR3_EL1;
elseif PSTATE.EL == EL3 then
    X[t, 64] = ID_AA64MMFR3_EL1;

```

ID_AA64MMFR4_EL1, AArch64 Memory Model Feature Register 4

The ID_AA64MMFR4_EL1 characteristics are:

Purpose

Provides additional information about implemented memory model and memory management support in AArch64.

Configuration

There are no configuration notes.

Attributes

ID_AA64MMFR4_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
																RES0																			
																				RES0								EIESB				RES0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:8]

Reserved, RES0.

EIESB, bits [7:4] When FEAT_IESB is implemented:

Indicates whether the implicit Error synchronization event inserted on taking an exception is inserted before or after the exception is taken.

EIESB	Meaning
0b0000	The behavior is not described.
0b0001	Implicit Error synchronization event is inserted before an exception is taken.
0b1111	Implicit Error synchronization event is inserted after an exception is taken.

All other values are reserved.

Implicit Error synchronization events are inserted on taking an exception to ELx when SCTLR_ELx.EISB is 0b1.

Inserting the event before the exception is taken means that if the Error synchronization event causes an SError exception to become pending, and SError exceptions are not masked and not disabled, then the SError exception is taken in place of the original exception.

Otherwise:

Reserved, RES0.

Bits [3:0]

Reserved, RES0.

ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0

The ID_AA64PFR0_EL1 characteristics are:

Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

The external register [EDPFR](#) gives information from this register.

Attributes

ID_AA64PFR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CSV3				CSV2				RME				DIT				AMU				MPAM			SEL2				SVE				
RAS				GIC				AdvSIMD				FP				EL3				EL2			EL1				ELO				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CSV3, bits [63:60]

Speculative use of faulting data. Defined values are:

CSV3	Meaning
0b0000	This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence.
0b0001	Data loaded under speculation with a permission or domain fault cannot be used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence. The execution timing of any other instructions in the speculative sequence is not a function of the data loaded under speculation.

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

CSV2, bits [59:56]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	The implementation does not disclose whether FEAT_CSV2 is implemented.
0b0001	FEAT_CSV2 is implemented, but FEAT_CSV2_2 and FEAT_CSV2_3 are not implemented. ID_AA64PFR1_EL1 .CSV2_frac determines whether either or both of FEAT_CSV2_1p1 or FEAT_CSV2_1p2 are implemented.
0b0010	FEAT_CSV2_2 is implemented, but FEAT_CSV2_3 is not implemented.
0b0011	FEAT_CSV2_3 is implemented.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the value 0b0001.

FEAT_CSV2_2 implements the functionality identified by the value 0b0010.

FEAT_CSV2_3 implements the functionality identified by the feature 0b0011.

In Armv8.0, the permitted values are 0b0000, 0b0001, 0b0010, and 0b0011.

From Armv8.5, the permitted values are 0b0001, 0b0010, and 0b0011.

RME, bits [55:52]

Realm Management Extension (RME). Defined values are:

RME	Meaning
0b0000	Realm Management Extension not implemented.
0b0001	RMEv1 is implemented.

All other values are reserved.

FEAT_RME implements the functionality identified by the value 0b0001.

DIT, bits [51:48]

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch64 does not guarantee constant execution time of any instructions.
0b0001	AArch64 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

MPAM, bits [43:40]

Indicates the major version number of support for the MPAM Extension.

Defined values are:

MPAM	Meaning
0b0000	The major version number of the MPAM extension is 0.
0b0001	The major version number of the MPAM extension is 1.

All other values are reserved.

When combined with the minor version number from [ID_AA64PFR1_EL1](#).MPAM_frac, the "major.minor" version is:

MPAM Extension version	MPAM	MPAM_frac
Not implemented.	0b0000	0b0000
v0.1 is implemented.	0b0000	0b0001
v1.0 is implemented.	0b0001	0b0000
v1.1 is implemented.	0b0001	0b0001

For more information, see 'The Memory Partitioning and Monitoring (MPAM) Extension'.

SEL2, bits [39:36]

Secure EL2. Defined values are:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

All other values are reserved.

FEAT_SEL2 implements the functionality identified by the value 0b0001.

SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

SVE	Meaning
0b0000	SVE architectural state and programmers' model are not implemented.
0b0001	SVE architectural state and programmers' model are implemented.

All other values are reserved.

FEAT_SVE implements the functionality identified by the value 0b0001.

If implemented, refer to [ID_AA64ZFR0_EL1](#) for information about which SVE instructions are available.

RAS, bits [31:28]

RAS Extension version. **Defined values are:**

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension implemented.
0b0010	FEAT_RASv1p1 implemented and, if EL3 is implemented, FEAT_DoubleFault implemented. As 0b0001, and adds support for: <ul style="list-style-type: none"> If EL3 is implemented, FEAT_DoubleFault. Additional ERXMISC<m>_EL1 System registers. Additional System registers ERXPFPCDN_EL1, ERXPFPCCTL_EL1, and ERXPFPGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.
0b0011	FEAT_RASv2 implemented. As 0b0010 and adds support for: <ul style="list-style-type: none"> ERXGSR_EL1, to support System RAS agents. Additional fine-grained EL2 traps for additional error record System registers. The SCR_EL3.ERR2En trap control for additional error record System registers. The SCR_EL3.TWERR write control for error record System registers. Error records accessed through System registers conform to RAS System Architecture v2.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 and FEAT_DoubleFault implement the functionality identified by the value 0b0010.

FEAT_RASv2 implements the functionality identified by the value 0b0011.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

From Armv8.4, when FEAT_DoubleFault is not implemented, and [ERRIDR_EL1](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

From In Armv8.2, the only permitted value is 0b0000 0b0001 is not permitted.

From Armv8.4, if FEAT_DoubleFault is implemented or [ERRIDR_EL1.NUM](#) is nonzero, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

Note

When the value of this field is 0b0001, [ID_AA64PFR1_EL1.RAS_frac](#) indicates whether FEAT_RASv1p1 is implemented.

GIC, bits [27:24]

System register GIC CPU interface. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following Sisd and SIMD operations: <ul style="list-style-type: none"> Integer byte, halfword, word and doubleword element operations. Single-precision and double-precision floating-point arithmetic. Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

FP, bits [19:16]

Floating-point. Defined values are:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: <ul style="list-style-type: none"> Single-precision and double-precision floating-point types. Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with floating-point support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without floating-point support.

EL3, bits [15:12]

EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL2, bits [11:8]

EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL1, bits [7:4]

EL1 Exception level handling. Defined values are:

EL1	Meaning
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL0, bits [3:0]

EL0 Exception level handling. Defined values are:

EL0	Meaning
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

Accessing ID_AA64PFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64PFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b000

ID_AA64PFR1_EL1, AArch64 Processor Feature Register 1

The ID_AA64PFR1_EL1 characteristics are:

Purpose

Reserved for future expansion of information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64PFR1_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

PFAR, Bits bits [63:6040]

Support for physical fault address registers, FEAT_PFAR.

PFAR	Meaning
0b0000	FEAT_PFAR is not implemented.
0b0001	FEAT_PFAR is implemented. Includes support for the PFAR ELx and, if EL3 is implemented, MFAR_EL3 registers.

All other values are reserved.

FEAT_PFAR implements the functionality identified by the value 0b0001.

Bits [59:56]

Reserved, RES0.

MTEX, bits [55:52]

Additional tag checking modes for MTE. Defined values are:

MTEX	Meaning
0b0000	Support for Memory Tagging when Address tagging is enabled.
0b0001	As 0b0000, and the following additional modes are supported: <ul style="list-style-type: none"> Canonical Tag checking, identified as FEAT_MTE_CANONICAL_TAGS. Memory tagging with Address tagging disabled, identified as FEAT_MTE_NO_ADDRESS_TAGS.

Note

ID_AA64PFR1_EL1.MTE identifies Memory Tagging when Address tagging is enabled.

ID_AA64PFR1_EL1.MTE_frac identifies whether or not Asynchronous Faulting and asymmetric Tag Check Fault handling are supported, in conjunction with the value of ID_AA64PFR1_EL1.MTE. Support for Asynchronous Faulting and asymmetric Tag Check Fault handling applies to all tag checking modes, including those introduced by ID_AA64PFR1_EL1.MTEX.

All other values are reserved.

This field is valid only if ID_AA64PFR1_EL1.MTE ≥ 0b0010.

FEAT_MTE4 implements the functionality identified by the value 0b0001.

From Armv8.9, the only permitted value is 0b0001.

THE, bits [51:48]

Support for Translation Hardening Extension. Defined values are:

THE	Meaning
0b0000	Translation Hardening Extension is not implemented.
0b0001	The RCW and RCWS instructions, their associated registers and traps are supported. If EL2 is implemented, the AssuredOnly check, TopLevel check, and their associated controls are also implemented.

All other values are reserved.

FEAT_THE implements the functionality identified by the value 0b0001.

Bits [47:44]

Reserved, RES0.

MTE_frac, bits [43:40]

Support for Asynchronous Faulting and asymmetric Tag Check Fault handling. Defined values are:

MTE_frac	Meaning
0b0000	Asynchronous Faulting is supported. If ID_AA64PFR1_EL1.MTE ≥ 0b0011, asymmetric Tag Check Fault handling is supported.
0b1111	Asynchronous Faulting is not supported. If ID_AA64PFR1_EL1.MTE ≥ 0b0011, asymmetric Tag Check Fault handling is not supported.

All other values are reserved.

This field is valid only if ID_AA64PFR1_EL1.MTE ≥ 0b0010.

NMI, bits [39:36]

Non-maskable Interrupt. Indicates support for Non-maskable interrupts. Defined values are:

NMI	Meaning
0b0000	SCTLR_ELx.{SPINTMASK, NMI} and PSTATE.ALLINT with its associated instructions are not supported.
0b0001	SCTLR_ELx.{SPINTMASK, NMI} and PSTATE.ALLINT with its associated instructions are supported.

All other values are reserved.

FEAT_NMI implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

CSV2_frac, bits [35:32]

CSV2 fractional field. Defined values are:

CSV2_frac	Meaning
0b0000	Either ID_AA64PFR0_EL1 .CSV2 is not 0b0001, or the implementation does not disclose whether FEAT_CSV2_1p1 is implemented. FEAT_CSV2_1p2 is not implemented.
0b0001	FEAT_CSV2_1p1 is implemented, but FEAT_CSV2_1p2 is not implemented.
0b0010	FEAT_CSV2_1p2 is implemented.

All other values are reserved.

FEAT_CSV2_1p1 implements the functionality identified by the value 0b0001.

FEAT_CSV2_1p2 implements the functionality identified by the value 0b0010.

From Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

The values 0b0001 and 0b0010 are permitted only when [ID_AA64PFR0_EL1](#).CSV2 is 0b0001.

RNDR_trap, bits [31:28]

Random Number trap to EL3 field. Defined values are:

RNDR_trap	Meaning
0b0000	Trapping of RNDR and RNDRRS to EL3 is not supported.
0b0001	Trapping of RNDR and RNDRRS to EL3 is supported. SCR_EL3 .TRNDR is present.

All other values are reserved.

FEAT_RNG_TRAP implements the functionality identified by the value 0b0001.

SME, bits [27:24]

Scalable Matrix Extension. Defined values are:

SME	Meaning
0b0000	SME architectural state and programmers' model are not implemented.
0b0001	SME architectural state and programmers' model are implemented.
0b0010	As 0b0001, plus the SME2 ZT0 register.

All other values are reserved.

FEAT_SME implements the functionality identified by the value 0b0001.

FEAT_SME2 implements the functionality identified by the value 0b0010.

From Armv9.2, the permitted values are 0b0000 and 0b0001.

From Armv9.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If implemented, refer to [ID_AA64SMFR0_EL1](#) and [ID_AA64ZFR0_EL1](#) for information about which SME and SVE instructions are available.

Bits [23:20]

Reserved, RES0.

MPAM_frac, bits [19:16]

Indicates the minor version number of support for the MPAM Extension.

Defined values are:

MPAM_frac	Meaning
0b0000	The minor version number of the MPAM extension is 0.
0b0001	The minor version number of the MPAM extension is 1.

All other values are reserved.

When combined with the major version number from [ID_AA64PFR0_EL1](#).MPAM, The combined "major.minor" version is:

MPAM Extension version	MPAM	MPAM_frac
Not implemented.	0b0000	0b0000
v0.1 is implemented.	0b0000	0b0001
v1.0 is implemented.	0b0001	0b0000
v1.1 is implemented.	0b0001	0b0001

For more information, see 'The Memory Partitioning and Monitoring (MPAM) Extension'.

RAS_frac, bits [15:12]

RAS Extension fractional field. Defined values are:

RAS_frac	Meaning
0b0000	If ID_AA64PFR0_EL1 .RAS == 0b0001, RAS Extension implemented.
0b0001	If ID_AA64PFR0_EL1 .RAS == 0b0001, as 0b0000 and adds support for: <ul style="list-style-type: none"> Additional ERXMISC<m>_EL1 System registers. Additional System registers ERXPGCDN_EL1, ERXPGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS , and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

FEAT_RASv1p1 implements the functionality identified by the value 0b0001.

This field is valid only if [ID_AA64PFR0_EL1](#).RAS == 0b0001.

MTE, bits [11:8]

Support for the Memory Tagging Extension. Defined values are:

MTE	Meaning
0b0000	Memory Tagging Extension is not implemented.
0b0001	Instruction-only Memory Tagging Extension is implemented.
0b0010	Full Memory Tagging Extension is implemented. Support for Asynchronous Faulting is defined by ID_AA64PFR1_EL1.MTE_frac
0b0011	Memory Tagging Extension is implemented with support for asymmetric Tag Check Fault handling. Support for Asynchronous Faulting and asymmetric Tag Check Fault handling is defined by ID_AA64PFR1_EL1.MTE_frac.

All other values are reserved.

FEAT_MTE implements the functionality identified by the value 0b0001.

FEAT_MTE2 implements the functionality identified by the value 0b0010.

FEAT_MTE3 implements the functionality identified by the value 0b0011.

In Armv8.5, the permitted values are 0b0000, 0b0001, 0b0010, and 0b0011.

From Armv8.7, the value 0b0010 is not permitted.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

SSBS	Meaning
0b0000	AArch64 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.
0b0010	As 0b0001, and adds the MSR and MRS instructions to directly read and write the PSTATE.SSBS field.

All other values are reserved.

FEAT_SSBS implements the functionality identified by the value 0b0001.

FEAT_SSBS2 implements the functionality identified by the value 0b0010.

BT, bits [3:0]

Branch Target Identification mechanism support in AArch64 state. Defined values are:

BT	Meaning
0b0000	The Branch Target Identification mechanism is not implemented.
0b0001	The Branch Target Identification mechanism is implemented.

All other values are reserved.

FEAT_BTI implements the functionality identified by the value 0b0001.

From Armv8.5, the only permitted value is 0b0001.

Accessing ID_AA64PFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64PFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            X[t, 64] = ID_AA64PFR1_EL1;
    elseif PSTATE.EL == EL2 then
        X[t, 64] = ID_AA64PFR1_EL1;
    elseif PSTATE.EL == EL3 then
        X[t, 64] = ID_AA64PFR1_EL1;

```

ID_AA64PFR2_EL1, AArch64 Processor Feature Register 2

The ID_AA64PFR2_EL1 characteristics are:

Purpose

Reserved for future expansion of information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64PFR2_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0															
RES0																MTEFAR				MTESTOREONLY				MTEPERM							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:12]

Reserved, RES0.

MTEFAR, bits [11:8]

Information reported in FAR_ELx on a synchronous exception due to a Tag Check Fault. Defined values are:

MTEFAR	Meaning
0b0000	On a synchronous exception due to a Tag Check Fault, FAR_ELx [63:60] is UNKNOWN. Support for Memory Tagging when Address tagging is enabled.
0b0001	On a synchronous exception due to a Tag Check Fault, FAR_ELx [63:60] is not UNKNOWN. This feature is identified as FEAT_MTE_TAGGED_FAR.

All other values are reserved.

This field is valid when [ID_AA64PFR1_EL1](#).MTE >= 0b0010 and [ID_AA64PFR1_EL1](#).MTEx >= 0b0001.

FEAT_MTE4 implements the functionality identified by the value 0b0001.

From Armv8.9, the only permitted value is 0b0001.

MTESTOREONLY, bits [7:4]

Store-only Tag checking, identified as FEAT_MTE_STORE_ONLY. Defined values are:

MTESTOREONLY	Meaning
0b0000	FEAT_MTE_STORE_ONLY is not supported.
0b0001	FEAT_MTE_STORE_ONLY is supported.

All other values are reserved.

This field is valid when [ID_AA64PFR1_EL1.MTE](#) \geq 0b0010 and [ID_AA64PFR1_EL1.MTEX](#) \geq 0b0001.

FEAT_MTE4 implements the functionality identified by the value 0b0001.

From Armv8.9, the only permitted value is 0b0001.

MTEPERM, bits [3:0]

Tag access permissions. Defined values are:

MTEPERM	Meaning
0b0000	FEAT_MTE_PERM is not supported.
0b0001	FEAT_MTE_PERM is supported.

All other values are reserved.

This field is valid when [ID_AA64PFR1_EL1.MTE](#) \geq 0b0010.

Accessing ID_AA64PFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64PFR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (IsFeatureImplemented(FEAT_FGT) || !IsZero(ID_AA64PFR2_EL1) || boolean
IMPLEMENTATION_DEFINED "ID_AA64PFR2_EL1 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = ID_AA64PFR2_EL1;
elseif PSTATE.EL == EL2 then
    X[t, 64] = ID_AA64PFR2_EL1;
elseif PSTATE.EL == EL3 then
    X[t, 64] = ID_AA64PFR2_EL1;

SMEver	Meaning
0b0000	The mandatory SME instructions are implemented.
0b0001	As 0b0000, and adds the mandatory SME2 instructions.
0b0010	As 0b0001, and adds the mandatory SME2.1 instructions.

All other values are reserved.

If FEAT_SME is implemented and FEAT_SME2 is not implemented, the only permitted value is 0b0000.

If FEAT_SME2 is implemented and FEAT_SME2p1 is not implemented, the only permitted value is 0b0001.

FEAT_SME2p1 implements the functionality identified by 0b0010.

Otherwise:

Reserved, RES0.

I16I64, bits [55:52]

Indicates SME support for instructions that accumulate into 64-bit integer elements in the ZA array. Defined values are:

I16I64	Meaning
0b0000	Instructions that accumulate into 64-bit integer elements in the ZA array are not implemented.
0b1111	The variants of the ADDHA, ADDVA, SMOPA, SMOPS, SUMOPA, SUMOPS, UMOA, UMOPS, USMOPA, and USMOPS instructions that accumulate into 64-bit integer tiles are implemented. When FEAT_SME2 is implemented, the variants of the ADD, ADDA, SDOT, SMLALL, SMLSLL, SUB, SUBA, SVDOT, UDOT, UMLALL, UMLSLL, and UVDOT instructions that accumulate into 64-bit integer elements in ZA array vectors are implemented.

All other values are reserved.

FEAT_SME_I16I64 implements the functionality identified by the value 0b1111.

The only permitted values are 0b0000 and 0b1111.

Bits [51:49]

Reserved, RES0.

F64F64, bit [48]

Indicates SME support for instructions that accumulate into FP64 double-precision floating-point elements in the ZA array. Defined values are:

F64F64	Meaning
0b0	Instructions that accumulate into double-precision floating-point elements in the ZA array are not implemented.
0b1	The variants of the FMOPA and FMOPS instructions that accumulate into double-precision tiles are implemented. When FEAT_SME2 is implemented, the variants of the FADD, FMLA, FMLS, and FSUB instructions that accumulate into double-precision elements in ZA array vectors are implemented.

FEAT_SME_F64F64 implements the functionality identified by the value 0b1.

I16I32, Bits bits [47:4440]

Indicates SME2 support for instructions that accumulate 16-bit outer products into 32-bit integer tiles. Defined values are:

I16I32	Meaning
0b0000	Instructions that accumulate 16-bit outer products into 32-bit integer tiles are not implemented.
0b0101	The SMOPA (2-way), SMOPS (2-way), UMOPA (2-way), and UMOPS (2-way) instructions that accumulate 16-bit outer products into 32-bit integer tiles are implemented.

All other values are reserved.

If FEAT_SME2 is implemented, the only permitted value is 0b0101. Otherwise, the only permitted value is 0b0000.

B16B16, bit [43]

Indicates support for SME2.1 non-widening BFloat16 instructions. Defined values are:

B16B16	Meaning
0b0	SME2.1 non-widening BFloat16 instructions are not implemented.
0b1	SME2.1 non-widening BFloat16 instructions are implemented.

FEAT_B16B16 implements the functionality identified by 0b1.

This field must indicate the same level of support as [ID_AA64ZFR0_EL1.B16B16](#).

If one or more of FEAT_SVE2p1 and FEAT_SME2p1 is implemented, the values 0b0 and 0b1 are permitted.

Otherwise, the only permitted value is 0b0.

F16F16, bit [42]

Indicates support for SME2.1 non-widening half-precision floating-point instructions. Defined values are:

F16F16	Meaning
0b0	SME2.1 non-widening half-precision floating-point instructions are not implemented.
0b1	SME2.1 non-widening half-precision floating-point instructions are implemented.

FEAT_SME_F16F16 implements the functionality identified by 0b1.

If FEAT_SME2p1 is implemented, the values 0b0 and 0b1 are permitted.

Otherwise, the only permitted value is 0b0.

Bits [41:40]

Reserved, RES0.

I8I32, bits [39:36]

Indicates SME support for instructions that accumulate 8-bit integer outer products into 32-bit integer tiles. Defined values are:

I8I32	Meaning
0b0000	Instructions that accumulate 8-bit outer products into 32-bit tiles are not implemented.
0b1111	The SMOPA, SMOPS, SUMOPA, SUMOPS, UMOPA, UMOPS, USMOPA, and USMOPS instructions that accumulate 8-bit outer products into 32-bit tiles are implemented.

All other values are reserved.

If FEAT_SME is implemented, the only permitted value is 0b1111.

F16F32, bit [35]

Indicates SME support for instructions that accumulate FP16 half-precision floating-point outer products into FP32 single-precision floating-point tiles. Defined values are:

F16F32	Meaning
0b0	Instructions that accumulate half-precision outer products into single-precision tiles are not implemented.
0b1	The FMOPA and FMOPS instructions that accumulate half-precision outer products into single-precision tiles are implemented.

If FEAT_SME is implemented, the only permitted value is 0b1.

B16F32, bit [34]

Indicates SME support for instructions that accumulate BFloat16 outer products into FP32 single-precision floating-point tiles. Defined values are:

B16F32	Meaning
0b0	Instructions that accumulate BFloat16 outer products into single-precision tiles are not implemented.
0b1	The BFMOPA and BFMOPS instructions that accumulate BFloat16 outer products into single-precision tiles are implemented.

If FEAT_SME is implemented, the only permitted value is 0b1.

BI32I32, bit [33]

Indicates SME support for instructions that accumulate thirty-two 1-bit binary outer products into 32-bit integer tiles. Defined values are:

Reserved, RES0.

BI32I32	Meaning
0b0	Instructions that accumulate 1-bit binary outer products into 32-bit integer tiles are not implemented.
0b1	The BMOPA and BMOPS instructions that accumulate 1-bit binary outer products into 32-bit integer tiles are implemented.

If FEAT_SME2 is implemented, the only permitted value is 0b1. Otherwise, the only permitted value is 0b0.

F32F32, bit [32]

Indicates SME support for instructions that accumulate FP32 single-precision floating-point outer products into single-precision floating-point tiles. Defined values are:

F32F32	Meaning
0b0	Instructions that accumulate single-precision outer products into single-precision tiles are not implemented.
0b1	The FMOPA and FMOPS instructions that accumulate single-precision outer products into single-precision tiles are implemented.

If FEAT_SME is implemented, the only permitted value is 0b1.

Bits [31:0]

Reserved, RES0.

ID_AA64ZFR0_EL1, SVE Feature ID register 0

The ID_AA64ZFR0_EL1 characteristics are:

Purpose

Provides additional information about the implemented features of the AArch64 Scalable Vector Extension instruction set, when one or more of FEAT_SVE and FEAT_SME is implemented.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

If FEAT_SME is implemented and FEAT_SVE is not implemented, then SVE instructions can only be executed when the PE is in Streaming SVE mode and the instructions are legal to execute in Streaming SVE mode.

Attributes

ID_AA64ZFR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:60]

Reserved, RES0.

F64MM, bits [59:56]

Indicates support for SVE FP64 double-precision floating-point matrix multiplication instructions. Defined values are:

F64MM	Meaning
0b0000	Double-precision matrix multiplication and related SVE instructions are not implemented.
0b0001	Double-precision variant of the FMMLA instruction, and the LD1RO* instructions are implemented. The 128-bit element variantsvariations of the SVE TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2 instructions are also implemented.

All other values are reserved.

FEAT_F64MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

When the PE is in Streaming SVE mode and it is not known whether FEAT_SME_FA64 is implemented and enabled at the current Exception level, software should not attempt to execute the instructions described by non-zero values of this field, irrespective of the value of this field.

F32MM, bits [55:52]

Indicates support for the SVE FP32 single-precision floating-point matrix multiplication instruction. Defined values are:

F32MM	Meaning
0b0000	Single-precision matrix multiplication instruction is not implemented.
0b0001	Single-precision variant of the FMMLA instruction is implemented.

All other values are reserved.

FEAT_F32MM implements the functionality identified by 0b0001.

From Arm v8.2, the permitted values are 0b0000 and 0b0001.

When the PE is in Streaming SVE mode and it is not known whether FEAT_SME_FA64 is implemented and enabled at the current Exception level, software should not attempt to execute the instructions described by non-zero values of this field, irrespective of the value of this field.

Bits [51:48]

Reserved, RES0.

I8MM, bits [47:44]

Indicates support for SVE Int8 matrix multiplication instructions. Defined values are:

I8MM	Meaning
0b0000	SVE Int8 matrix multiplication instructions are not implemented.
0b0001	SVE SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID_AA64ISAR1_EL1](#).I8MM.

From Armv8.6, the only permitted value is 0b0001.

When the PE is in Streaming SVE mode and it is not known whether FEAT_SME_FA64 is implemented and enabled at the current Exception level, software should not attempt to execute the SVE instructions SMMLA, UMMLA, and USMMLA, irrespective of the value of this field.

SM4, bits [43:40]

Indicates support for SVE SM4 instructions. Defined values are:

SM4	Meaning
0b0000	SVE SM4 instructions are not implemented.
0b0001	SVE SM4E and SM4EKEY instructions are implemented.

All other values are reserved.

FEAT_SVE_SM4 implements the functionality identified by 0b0001.

When the PE is in Streaming SVE mode and it is not known whether FEAT_SME_FA64 is implemented and enabled at the current Exception level, software should not attempt to execute the instructions described by non-zero values of this field, irrespective of the value of this field.

Bits [39:36]

Reserved, RES0.

SHA3, bits [35:32]

Indicates support for the SVE SHA3 instructions. Defined values are:

SHA3	Meaning
0b0000	SVE SHA3 instructions are not implemented.
0b0001	SVE RAX1 instruction is implemented.

All other values are reserved.

FEAT_SVE_SHA3 implements the functionality identified by 0b0001.

When the PE is in Streaming SVE mode and it is not known whether FEAT_SME_FA64 is implemented and enabled at the current Exception level, software should not attempt to execute the instructions described by non-zero values of this field, irrespective of the value of this field.

However, if both FEAT_SME2p1 and FEAT_SVE_SHA3 are implemented, then the SVE RAX1 instruction can be executed when the PE is in Streaming SVE mode regardless of whether FEAT_SME_FA64 is implemented and enabled at the current Exception level.

Bits [31:28:24]

Reserved, RES0.

B16B16, bits [27:24]

Indicates support for SVE2.1 non-widening BFloat16 instructions. Defined values are:

B16B16	Meaning
0b0000	SVE2.1 non-widening BFloat16 instructions are not implemented.
0b0001	SVE2.1 non-widening BFloat16 instructions are implemented.

FEAT_B16B16 implements the functionality identified by 0b0001.

This field must indicate the same level of support as [ID_AA64SMFR0_EL1.B16B16](#).

If one or more of FEAT_SVE2p1 and FEAT_SME2p1 is implemented, the values 0b0000 and 0b0001 are permitted.

Otherwise, the only permitted value is 0b0000.

BF16, bits [23:20]

Indicates support for SVE BFloat16 instructions. Defined values are:

BF16	Meaning
0b0000	SVE BFloat16 instructions are not implemented.
0b0001	SVE BFCVT, BFCVTNT, BFDOT, BFMLALB, BFMLALT, and BFMMLA instructions are implemented.
0b0010	As 0b0001, but the EPCR.EBF field is also supported.

All other values are reserved.

FEAT_BF16 **addsimplements** the functionality identified by 0b0001.

FEAT_EBF16 **addsimplements** the functionality identified by 0b0010.

This field must return the same value as [ID_AA64ISAR1_EL1](#).BF16.

When the PE is in Streaming SVE mode and it is not known whether FEAT_SME_FA64 is implemented and enabled at the current Exception level, software should not attempt to execute the SVE instruction BFMMLA, irrespective of the value of this field.

If FEAT_SME is implemented, the permitted values are 0b0001 and 0b0010.

From ~~Otherwise, from~~ Armv8.6 and Armv9.1, the ~~only permitted~~ value ~~is~~ 0b0000 ~~0b0001~~ is not permitted..

BitPerm, bits [19:16]

Indicates support for SVE bit permute instructions. Defined values are:

BitPerm	Meaning
0b0000	SVE bit permute instructions are not implemented.
0b0001	SVE BDEP, BEXT, and BGRP instructions are implemented.

All other values are reserved.

FEAT_SVE_BitPerm implements the functionality identified by 0b0001.

When the PE is in Streaming SVE mode and it is not known whether FEAT_SME_FA64 is implemented and enabled at the current Exception level, software should not attempt to execute the instructions described by non-zero values of this field, irrespective of the value of this field.

Bits [15:8]

Reserved, RES0.

AES, bits [7:4]

Indicates support for SVE AES instructions. Defined values are:

AES	Meaning
0b0000	SVE AES* instructions are not implemented.
0b0001	SVE AESE, AESD, AESMC, and AESIMC instructions are implemented.
0b0010	As 0b0001, plus 64-bit source element variants of SVE PMULLB and PMULLT instructions are with implemented. 64-bit source.

All other values are reserved.

FEAT_SVE_AES implements the functionality identified by the value 0b0001.

FEAT_SVE_PMULL128 implements the functionality identified by the value 0b0010.

The permitted values are 0b0000 and 0b0010.

When the PE is in Streaming SVE mode and it is not known whether FEAT_SME_FA64 is implemented and enabled at the current Exception level, software should not attempt to execute the instructions described by non-zero values of this field, irrespective of the value of this field.

SVEver, bits [3:0]

Indicates support for SVE instructions when one or more of FEAT_SME and FEAT_SVE is implemented. Defined values are:

SVEver	Meaning
0b0000	The SVE instructions are implemented.
0b0001	As 0b0000, and adds the mandatory SVE2 instructions.
0b0010	As 0b0001, and adds the mandatory SVE2.1 instructions.

All other values are reserved.

From Armv9, if this register is present, the value 0b0000 is not permitted.

FEAT_SVE2 implements the functionality identified by 0b0001 when the PE is not in Streaming SVE mode.

FEAT_SME implements the functionality identified by 0b0001 when the PE is in Streaming SVE mode.

FEAT_SME2p1 implements the functionality identified by 0b0010 when the PE is in Streaming SVE mode.

FEAT_SVE2p1 implements the functionality identified by 0b0010 when the PE is not in Streaming SVE mode.

From Armv9.4, the value 0b0001 is not permitted.

Accessing ID_AA64ZFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ZFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b100

```
if PSTATE.EL == EL0 then
  if IsFeatureImplemented(FEAT_IDST) then
    if EL2Enabled() && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);

ID_DFR0_EL1, AArch32 Debug Feature Register 0

The ID_DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_DFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_DFR0\[31:0\]](#).

Attributes

ID_DFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TraceFilt				PerfMon				MProfDbg				MMapTrc				CopTrc				MMapDbg				CopSDBG				CopDbg			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PerfMon	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv1 implemented.
0b0010	Performance Monitors Extension, PMUv2 implemented.
0b0011	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0011, and adds support for: <ul style="list-style-type: none"> Extended 16-bit PMEVTYPER<n>.evtCount field. If EL2 is implemented, the HDCR.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: <ul style="list-style-type: none"> 64-bit event counters. If EL2 is implemented, the HDCR.HCCD control. If EL3 is implemented, the MDCR_EL3.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: <ul style="list-style-type: none"> The PMCR.FZO and, if EL2 is implemented, HDCR.HPMFZO controls. If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: <ul style="list-style-type: none"> Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1001	PMUv3 for Armv8.9. As 0b1000, and: <ul style="list-style-type: none"> Updates the definitions of existing PMU events. Adds support for the EDECR.PME control.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

FEAT_PMUv3p9 implements the functionality identified by the value 0b1001.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

Note

PMUv1 and PMUv2 are not permitted in an Armv8 implementation.

From Armv8.9, if FEAT_PMUv3 is implemented, the value 0b1000 is not permitted.

MProfDbg, bits [23:20]

M-profile Debug. Support for memory-mapped debug model for M-profile processors. Defined values are:

MProfDbg	Meaning
0b0000	Not supported.
0b0001	Support for M-profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

MMapTrc, bits [19:16]

Memory-mapped Trace. Support for memory-mapped trace model. Defined values are:

MMapTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

CopTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

MMapDbg, bits [11:8]

Memory-mapped Debug. Support for Armv7 memory-mapped debug model for A and R-profile processors. Defined values are:

MMapDbg	Meaning
0b0000	Not supported.
0b0100	Support for Armv7, v7 Debug architecture, with memory-mapped access.
0b0101	Support for Armv7, v7.1 Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

The optional memory map defined by Armv8 is not compatible with Armv7.

CopSDBG, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A-profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDBG, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

CopDBG	Meaning
0b0000	Not supported.
0b0010	Armv6, v6 Debug architecture, with System registers access.
0b0011	Armv6, v6.1 Debug architecture, with System registers access.
0b0100	Armv7, v7 Debug architecture, with System registers access.
0b0101	Armv7, v7.1 Debug architecture, with System registers access.
0b0110	Armv8 debug architecture.
0b0111	Armv8 debug architecture with Virtualization Host Extensions.
0b1000	Armv8.2 debug architecture, FEAT_Debugv8p2.
0b1001	Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010	Armv8.8 debug architecture, FEAT_Debugv8p8.
0b1011	Armv8.9 debug architecture, FEAT_Debugv8p9.

All other values are reserved.

The values 0b0000, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted in Armv8.

FEAT_VHE adds the functionality identified by the value 0b0111.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

FEAT_Debugv8p8 adds the functionality identified by the value 0b1010.

FEAT_Debugv8p9 adds the functionality identified by the value 0b1011.

From Armv8.1, when FEAT_VHE is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

From Armv8.9, the value 0b1010 is not permitted.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN

ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6

The ID_ISAR6_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#) and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR6_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR6\[31:0\]](#).

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_ISAR6_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
CLRBHBRES0				I8MM				BF16				SPECRES				SB				FHM				DP				JSCVT			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32:28]

Reserved, RES0.

CLRBHB, bits [31:28]

Indicates support for the CLRBHB instruction in AArch32 state. Defined values are:

CLRBHB	Meaning
0b0000	CLRBHB instruction is not implemented.
0b0001	CLRBHB instruction is implemented.

All other values are reserved.

FEAT_CLRBHB implements the functionality identified by 0b0001.

From Armv8.9, the value 0b0000 is not permitted.

I8MM, bits [27:24]

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values of this field are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.

All other values are reserved.

FEAT_AA32I8MM implements the functionality identified by 0b0001.

BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	VCVT, VCVTB, VCVTT, VDOT, VFMA, VFMA, and VMMLA instructions with BF16 operand or result types are implemented.

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

SPECRES, bits [19:16]

Indicates support for ~~prediction~~~~Speculation~~ invalidation instructions in AArch32 state. Defined values are:

SPECRES	Meaning
0b0000	Prediction invalidation instructions are not implemented.
0b0001	CFPRCTX , DVPRCTX , and CPRCTX instructions are implemented.
0b0010	As 0b0001, and COSPRCTX instruction is implemented.

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

FEAT_SPECRES2 ~~From~~ implements Armv8.5, the ~~functionality only~~ ~~identified~~ ~~permitted~~ ~~by~~ ~~value is~~ 0b0010 ~~0b0001~~.

From Armv8.5, the value 0b0000 is not permitted.

From Armv8.9, the value 0b0001 is not permitted.

SB, bits [15:12]

Indicates support for the SB instruction in AArch32 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point VFMA and VFMSL instructions in AArch32 state. Defined values are:

FHM	Meaning
0b0000	VFMA and VFMSL instructions are not implemented.
0b0001	VFMA and VFMSL instructions are implemented.

All other values are reserved.

FEAT_FHM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

DP, bits [7:4]

Indicates support for dot product instructions in AArch32 state. Defined values are:

DP	Meaning
0b0000	Dot product instructions are not implemented.
0b0001	VUDOT and VSDOT instructions are implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

JSCVT, bits [3:0]

Indicates support for the VJCVT instruction in AArch32 state. Defined values are:

JSCVT	Meaning
0b0000	The VJCVT instruction is not implemented.
0b0001	The VJCVT instruction is implemented.

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR6_EL1

Accesses to this register use the following encodings in the System register encoding space:

Bits [63:32]

Reserved, RES0.

RAS, bits [31:28]RAS Extension version. ~~Defined values are:~~

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension implemented.
0b0010	FEAT_RASv1p1 implemented. As 0b0001, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.
0b0011	FEAT_RASv2 implemented. As 0b0010, and requires that error records accessed through System registers conform to RAS System Architecture v2.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 implements the functionality identified by the value 0b0010.

FEAT_RASv2 implements the functionality identified by the value 0b0011.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

From Armv8.4, when FEAT_DoubleFault is not implemented, and ERRIDR_EL1.NUM is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

From Armv8.2, the only permitted value is 0b00000b0001 is not permitted.

From Armv8.4, if FEAT_DoubleFault is implemented or ERRIDR_EL1.NUM is nonzero, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

Note

When the value of this field is 0b0001, ID_PFR2_EL1.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

DIT, bits [27:24]

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch32 does not guarantee constant execution time of any instructions.
0b0001	AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [23:20]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

CSV2, bits [19:16]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	The implementation does not disclose whether FEAT_CSV2 is implemented.
0b0001	FEAT_CSV2 is implemented, but FEAT_CSV2_1p1 is not implemented.
0b0010	FEAT_CSV2_1p1 is implemented.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the value 0b0001.

FEAT_CSV2_1p1 implements the functionality identified by the value 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

State3, bits [15:12]

T32EE instruction set support. Defined values are:

State3	Meaning
0b0000	Not implemented.
0b0001	T32EE instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

State2, bits [11:8]

Jazelle extension support. Defined values are:

State2	Meaning
0b0000	Not implemented.
0b0001	Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.
0b0010	Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

State1, bits [7:4]

T32 instruction set support. Defined values are:

State1	Meaning
0b0000	T32 instruction set not implemented.
0b0001	T32 encodings before the introduction of Thumb-2 technology implemented: <ul style="list-style-type: none"> • All instructions are 16-bit. • A BL or BLX is a pair of 16-bit instructions. • 32-bit instructions other than BL and BLX cannot be encoded.
0b0011	T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

State0, bits [3:0]

A32 instruction set support. Defined values are:

State0	Meaning
0b0000	A32 instruction set not implemented.
0b0001	A32 instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Otherwise:

ISR_EL1, Interrupt Status Register

The ISR_EL1 characteristics are:

Purpose

Shows the pending status of the IRQ, FIQ, or SError interrupt.

When executing at EL2, EL3 or Secure EL1 when [SCR_EL3.EEL2](#) == 0b0, this shows the pending status of the physical IRQ, FIQ, or SError interrupts.

When executing at either Non-secure EL1 or at Secure EL1 when [SCR_EL3.EEL2](#) == 0b1:

- If the [HCR_EL2](#).{IMO,FMO,AMO} bit has a value of 1, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the [HCR_EL2](#).{IMO,FMO,AMO} bit has a value of 0, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the physical IRQ, FIQ, or SError.

Configuration

AArch64 System register ISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ISR\[31:0\]](#).

Attributes

ISR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0										IS		FS		A		I		F		RES0											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:11]

Reserved, RES0.

IS, bit [10]

When FEAT_NMI is implemented:

IRQ with Superpriority pending bit. Indicates whether an IRQ interrupt with Superpriority is pending.

IS	Meaning
0b0	No pending IRQ with Superpriority.
0b1	An IRQ interrupt with Superpriority is pending.

Otherwise:

Reserved, RES0.

FS, bit [9]**When FEAT_NMI is implemented:**

FIQ with Superpriority pending bit. Indicates whether an FIQ interrupt with Superpriority is pending.

FS	Meaning
0b0	No pending FIQ with Superpriority.
0b1	An FIQ interrupt with Superpriority is pending.

Otherwise:

Reserved, RES0.

A, bit [8]

SError interrupt pending bit. Indicates whether an SError interrupt is pending.

A	Meaning
0b0	No pending SError.
0b1	An SError interrupt is pending.

If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending.

I	Meaning
0b0	No pending IRQ.
0b1	An IRQ interrupt is pending.

Note

This bit indicates the presence of a pending IRQ interrupt regardless of whether the interrupt has Superpriority.

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

F	Meaning
0b0	No pending FIQ.
0b1	An FIQ interrupt is pending.

Note

This bit indicates the presence of a pending FIQ interrupt regardless of whether the interrupt has Superpriority.

Bits [5:0]

Reserved, RES0.

Accessing ISR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ISR_EL1

LORC_EL1, LORegion Control (EL1)

The LORC_EL1 characteristics are:

Purpose

Enables and disables LORegions, and selects the current LORegion descriptor.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORC_EL1 are UNDEFINED.

If no LORegion descriptors are supported by the PE, then this register is RES0.

Attributes

LORC_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																																
RES0																					DS										RES0	EN
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:10]

Reserved, RES0.

DS, bits [9:2]

Descriptor Select. Selects the current LORegion descriptor accessed by [LORSA_EL1](#), [LOREA_EL1](#), and [LORN_EL1](#).

The number of LORegion descriptors in IMPLEMENTATION DEFINED. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is $\text{Log}_2(\text{Number of LORegion descriptors supported by the implementation})$.

If this field points to an LORegion descriptor that is not supported by an implementation, then the registers [LORN_EL1](#), [LOREA_EL1](#), and [LORSA_EL1](#) are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [1]

Reserved, RES0.

EN, bit [0]

Enable. Indicates whether LORegions are enabled.

EN	Meaning
0b0	Disabled. Memory accesses do not match any LORegions.
0b1	Enabled. Memory accesses may match a LORegion.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing LORC_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORC_EL1

LOREA_EL1, LORegion End Address (EL1)

The LOREA_EL1 characteristics are:

Purpose

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by [LORC_EL1](#).DS.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LOREA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC_EL1](#).DS points to a LORegion that is not supported by the PE.

Attributes

LOREA_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								EA[55:52]EA[51:48]EA[51:48]EA[47:16]								EA[47:16]															
EA[47:16]																RES0															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:5652]

Reserved, RES0.

EA[55:52], bits [55:52] When FEAT_D128 is implemented:

Extension to EA[47:16]. For more information, see EA[47:16].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA[51:48], bits [51:48] When FEAT_LPA is implemented:

Extension to EA[47:16]. For more information, see EA[47:16].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA[47:16], bits [47:16]

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by [LORC_EL1](#).DS. Bits[15:0] of this address are 0xFFFF. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented and 52-bit addresses are in use, EA[51:48] form bits [51:48] of the end physical address of the LORegion. Otherwise, when 52-bit addresses are not in use, EA[51:48] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:0]

Reserved, RES0.

LORID_EL1, LORegionID (EL1)

The LORID_EL1 characteristics are:

Purpose

Indicates the number of LORegions and LORegion descriptors supported by the PE.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORID_EL1 are UNDEFINED.

If no LORegion descriptors are implemented, then the registers [LORC_EL1](#), [LORN_EL1](#), [LOREA_EL1](#), and [LORSA_EL1](#) are RES0.

Attributes

LORID_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0															
RES0								LD								RES0								LR							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:24]

Reserved, RES0.

LD, bits [23:16]

Number of LORegion descriptors supported by the PE. This is an 8-bit binary number.

Bits [15:8]

Reserved, RES0.

LR, bits [7:0]

Number of LORegions supported by the PE. This is an 8-bit binary number.

Note

If LORID_EL1 indicates that no LORegions are implemented, then LoadLOAcquire and StoreLORelease will behave as LoadAcquire and StoreRelease.

Accessing LORID_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORID_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b111

```

LORN_EL1, LORegion Number (EL1)

The LORN_EL1 characteristics are:

Purpose

Holds the number of the LORegion described in the current LORegion descriptor selected by [LORC_EL1](#).DS.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORN_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC_EL1](#).DS points to a LORegion that is not supported by the PE.

Attributes

LORN_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																
RES0																Num																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:8]

Reserved, RES0.

Num, bits [7:0]

Number of the LORegion described in the current LORegion descriptor selected by [LORC_EL1](#).DS.

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is (Log₂(Number of LORegions supported by the PE)).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing LORN_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORN_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b010

LORSA_EL1, LORegion Start Address (EL1)

The LORSA_EL1 characteristics are:

Purpose

Indicates whether the current LORegion descriptor selected by [LORC_EL1](#).DS is enabled, and holds the physical address of the start of the LORegion.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORSA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC_EL1](#).DS points to a LORegion that is not supported by the PE.

Attributes

LORSA_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

																SA																			

SA, bits [**39****35**:0]

Bits [**55****51**:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by [LORC_EL1](#).DS.

Bits[15:0] of this address are 0x0000.

For implementations with fewer than 5652 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SA encoding when FEAT_LPA is implemented and FEAT_D128 is not implemented

Bits [3935:3632]

Reserved, RES0.

SA, bits [3531:0]

Bits [5147:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Bits[15:0] of this address are 0x0000.

For implementations with fewer than 5248 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SA encoding when FEAT_LPA is not implemented

Bits [39:32]

Reserved, RES0.

SA, bits [31:0]

Bits [47:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Bits[15:0] of this address are 0x0000.

For implementations with fewer than 48 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:1]

Reserved, RES0.

Valid, bit [0]

Indicates whether the current LORegion descriptor is enabled.

Valid	Meaning
0b0	LORegion descriptor is disabled.
0b1	LORegion descriptor is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing LORSA_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORSA_EL1

MAIR2_EL1, Extended Memory Attribute Indirection Register (EL1)

The MAIR2_EL1 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a VMSAv8-64 or VMSAv9-128 translation table entry for stage 1 translations at EL1.

Configuration

This register is present only when FEAT_AIE is implemented. Otherwise, direct accesses to MAIR2_EL1 are UNDEFINED.

Attributes

MAIR2_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 1, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 0, see MAIR_ELx.Attr

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0boooooiii, (oooo != 0000 and iii != 0000)	Normal memory. See encoding of 'oooo' and 'iii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iii' is encoded as follows:

'iii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MAIR2_EL1

MAIR2_EL2, Extended Memory Attribute Indirection Register (EL2)

The MAIR2_EL2 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a VMSAv8-64 or VMSAv9-128 translation table entry for stage 1 translations at EL1.

Configuration

This register is present only when FEAT_AIE is implemented. Otherwise, direct accesses to MAIR2_EL2 are UNDEFINED.

Attributes

MAIR2_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Attr7								Attr6								Attr5								Attr4							
Attr3								Attr2								Attr1								Attr0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 1, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 0, see MAIR_ELx.Attr

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0boooooiii, (oooo != 0000 and iii != 0000)	Normal memory. See encoding of 'oooo' and 'iii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iii' is encoded as follows:

'iii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR2_EL2

When FEAT_VHE is implemented, and [HCR_EL2.E2H](#) is 1, without explicit synchronization, accesses from EL2 using the register name MAIR2_EL2 or MAIR2_EL1 are not guaranteed to be ordered with respect to accesses using the other register name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MAIR2_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0001	0b001

Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 1, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 0, see MAIR_ELx.Attr

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0boooooiii, (oooo != 0000 and iii != 0000)	Normal memory. See encoding of 'oooo' and 'iii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR2_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MAIR2_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0001	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = MAIR2_EL3;
```

MSR MAIR2_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0001	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MAIR2_EL3 = X[t, 64];
```

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0boooooiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, where (xxxx != 0000 and, xxxx != 0100 and, xxxx != 1010 and, xxxx != 1111)	UNPREDICTABLE.

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic MAIR_EL1 or MAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MAIR_EL1

MAIR_EL2, Memory Attribute Indirection Register (EL2)

The MAIR_EL2 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

Configuration

AArch64 System register MAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HMAIR0\[31:0\]](#).

AArch64 System register MAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register [HMAIR1\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MAIR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Attr7								Attr6								Attr5								Attr4							
Attr3								Attr2								Attr1								Attr0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MAIR_EL2 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory The Attribute memory encoding, attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where AttrIndx[2:0] gives the value of <n> in Attr<n>.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 0, or when FEAT_AIE is not implemented, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 1, see MAIR2_ELx.Attr

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0boooooiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, where (xxxx != 0000 and, xxxx != 0100 and, xxxx != 1010 and, xxxx != 1111)	UNPREDICTABLE.

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic MAIR_EL2 or MAIR_EL1 is not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MAIR_EL2

op0	op1	CRn	CRm	op2

0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MAIR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = MAIR_EL3;
```

MSR MAIR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MAIR_EL3 = X[t, 64];
```

MDCR_EL2, Monitor Debug Configuration Register (EL2)

The MDCR_EL2 characteristics are:

Purpose

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

Configuration

AArch64 System register MDCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HDCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MDCR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39
RES0																				EBWE	HPMFZS	RES0	PMEE	
RES0	HPMFZ0	MTPME	TDCC	HLPE	E2TB	HCCD	RES0	TTRF	RES0	HPMD	RES0	TPMS	E2PB		TDRA		TDOSA	TDATA	TDE	HPM				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7

Bits [63:44]37

Reserved, RES0.

EBWE, bit [43]
When FEAT_Debugv8p9 is implemented:

Extended Breakpoint and Watchpoint Enable. Enables use of additional breakpoints or watchpoints.

EBWE	Meaning
0b0	The Effective value of MDSCR_EL1.EBWE is 0.
0b1	The Effective value of MDSCR_EL1.EBWE is not affected by this bit.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and [MDSELR_EL1](#) is implemented as RAZ/WI.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 1, other than for a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

PMEE, bits [41:40]**When FEAT_EBEP is implemented:**

Performance Monitors Exception Enable. Controls the generation of **PMUIRQ** signal and PMU exception at EL0, EL1, and EL2.

PMEE	Meaning
0b00	PMUIRQ signal is enabled, and PMU exception is disabled.
0b01	PMUIRQ signal and PMU exception are both controlled by PMECR_EL1.PMEE .
0b10	PMUIRQ signal is disabled, and PMU exception is disabled.
0b11	PMUIRQ signal is disabled, and PMU exception is enabled.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 0b01, other than for a direct read of the register.

This field is ignored by the PE when all of the following are true:

- [EL3](#) is implemented.
- [MDCR_EL3.PMEE](#) != 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:37]

Reserved, RES0.

HPMFZS, bit [36]**When FEAT_SPEv1p2 is implemented:**

Hyp Performance Monitors Freeze-on-SPE event. Stop counters when [PMBLIMITR_EL1](#).{PMFZ, E} == {1, 1} and [PMBSR_EL1](#).S == 1.

HPMFZS	Meaning
0b0	Do not freeze on Statistical Profiling Buffer Management event.
0b1	Event counters do not count following a Statistical Profiling Buffer Management event.

If MDCR_EL2.HPMN is less than [PMCR_ELO](#).N, this field affects the operation of event counters in the range [MDCR_EL2.HPMN .. ([PMCR_ELO](#).N-1)].

This field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:30]

Reserved, RES0.

HPMFZO, bit [29]

When FEAT_PMUv3p7 is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

HPMFZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counters do not count when PMOVSLR_EL0 [(PMCR_EL0 .N-1):MDCR_EL2.HPMN] is nonzero.

If MDCR_EL2.HPMN is less than [PMCR_EL0](#).N, this field affects the operation of event counters in the range [MDCR_EL2.HPMN .. ([PMCR_EL0](#).N-1)].

This field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented and EL3 is not implemented:

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>_EL0](#).MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>_EL0 .MT is zero.
0b1	PMEVTYPER<n>_EL0 .MT bits not affected by this field.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]**When FEAT_FGT is implemented:**

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Trap exception to EL2, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: [OSDTRRX_EL1](#), [OSDTRTX_EL1](#), [MDCCSR_EL0](#), [MDCCINT_EL1](#), and, when the PE is in Non-debug state, [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXext](#), [DBGDTRTXext](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL2.TDCC does not trap any accesses to:

AArch64: [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXint](#) and [DBGDTRTXint](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HLP, bit [26]**When FEAT_PMUv3p5 is implemented:**

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

HLP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [63:0].

If MDCR_EL2.HPMN is less than [PMCR_EL0](#).N, this bit affects the operation of event counters in the range [MDCR_EL2.HPMN..([PMCR_EL0](#).N-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2TB, bits [25:24]**When FEAT_TRBE is implemented:**

EL2 Trace Buffer.

If EL2 is implemented and enabled in the Trace Buffer owning Security state, controls the owning translation regime.

If EL2 is implemented and enabled in the current Security state, controls access to Trace Buffer control registers from EL1.

E2TB	Meaning
0b00	If EL2 is implemented and enabled in the Trace Buffer owning Security state, the Trace Buffer owning Exception level is EL2. Otherwise, the Trace Buffer owning Exception level is EL1 and, if <code>TraceBufferEnabled() == TRUE</code> , tracing is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, accesses to Trace Buffer control registers at EL1 generate a Trap exception to EL2.
0b10	Trace Buffer owning Exception level is EL1. If <code>TraceBufferEnabled() == TRUE</code> , tracing is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, accesses to Trace Buffer control registers at EL1 generate a Trap exception to EL2.
0b11	Trace Buffer owning Exception level is EL1. If <code>TraceBufferEnabled() == TRUE</code> , tracing is prohibited at EL2.

All other values are reserved.

The Trace Buffer control registers trapped by this control are: [TRBBASER_EL1](#), [TRBLIMITR_EL1](#), [TRBMAR_EL1](#), [TRBPTR_EL1](#), [TRBSR_EL1](#), and [TRBTRG_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HCCD, bit [23]**When FEAT_PMUv3p5 is implemented:**

Hypervisor Cycle Counter Disable. Prohibits [PMCCNTR_EL0](#) from counting at EL2.

HCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited at EL2.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]**When FEAT_TRF is implemented:**

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:

- Access to [TRFCR_EL1](#) is trapped to EL2, reported using EC syndrome value 0x18.
- Access to [TRFCR](#) is trapped to EL2, reported using EC syndrome value 0x03.

TTRF	Meaning
0b0	Accesses to the specified registers at EL1 are not affected by this control.
0b1	Accesses to the specified registers at EL1 generate a trap exception to EL2 when EL2 is enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]**When FEAT_PMUv3p1 is implemented and FEAT_Debugv8p2 is implemented:**

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

HPMD	Meaning
0b0	Event counting and PMCCNTR_EL0 are not affected by this mechanism.
0b1	Event counting by some event counters is prohibited at EL2. If PMCR_EL0 .DP is 1, PMCCNTR_EL0 is disabled at EL2. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.

If MDCR_EL2.HPMN is not 0, this field affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].

This field does not affect the operation of other event counters.

If [PMCR_EL0](#).DP is 1, this field affects [PMCCNTR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3p1 is implemented:

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

HPMD	Meaning
0b0	Event counting and PMCCNTR_ELO are not affected by this mechanism.
0b1	If <code>ExternalSecureNoninvasiveDebugEnabled()</code> is FALSE, event counting by some event counters is prohibited at EL2, and if PMCR_ELO .DP is 1, PMCCNTR_ELO is disabled at EL2.

If `ExternalSecureNoninvasiveDebugEnabled()` is TRUE, this field does not affect the event counters and does not affect [PMCCNTR_ELO](#).

Otherwise:

- If MDCR_EL2.HPMN is not 0, this field affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].
- This field does not affect the operation of other event counters.
- If [PMCR_ELO](#).DP is 1, this field affects [PMCCNTR_ELO](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [16:15]

Reserved, RES0.

TPMS, bit [14]**When FEAT_SPE is implemented:**

Trap Performance Monitor Sampling. If EL2 is implemented and enabled in the current Security state, controls access to Statistical Profiling control registers from EL1.

TPMS	Meaning
0b0	Do not trap Statistical Profiling controls to EL2.
0b1	If EL2 is implemented and enabled in the current Security state, accesses to Statistical Profiling control registers at EL1 generate a Trap exception to EL2.

The Statistical Profiling control registers trapped by this control are:

- [PMSCR_EL1](#), [PMSEVFR_EL1](#), [PMSFCR_EL1](#), [PMSICR_EL1](#), [PMSIDR_EL1](#), [PMSIRR_EL1](#), and [PMSLATER_EL1](#).
- If FEAT_SPEv1p2 is implemented, [PMSNEVFR_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2PB, bits [13:12]**When FEAT_SPE is implemented:**

EL2 Profiling Buffer. If EL2 is implemented and enabled in the Profiling Buffer owning Security state, this field controls the owning translation regime. If EL2 is implemented and enabled in the current Security state, this field controls access to Profiling Buffer control registers from EL1.

E2PB	Meaning
0b00	If EL2 is implemented and enabled in the Profiling Buffer owning Security state, the Profiling Buffer uses the EL2 or EL2&0 stage 1 translation regime. Otherwise the Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.
0b10	Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.
0b11	Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer control registers at EL1 are not trapped to EL2.

All other values are reserved.

The Profiling Buffer control registers trapped by this control are: [PMBLIMITR_EL1](#), [PMBPTR_EL1](#), and [PMBSR_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to [MDRAR_EL1](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05 and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value 0x0C:
 - [DBGDRAR](#), [DBGDSAR](#).

TDRA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by the following: <ul style="list-style-type: none"> DBGDSCRext.UDCCdis. MDSCR_EL1.TDCC.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2](#).TDE == 1.
- [HCR_EL2](#).TGE == 1.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDOSA, bit [10]

When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
 - [OSLAR_EL1](#), [OSLSR_EL1](#), [OSDLR_EL1](#), and [DBGPRCR_EL1](#).
 - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
 - [DBGOSLSR](#), [DBGOSLAR](#), [DBGOSDLR](#), and [DBGPRCR](#).
 - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2](#).TDE == 1.
- [HCR_EL2](#).TGE == 1.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
 - [OSLAR_EL1](#), [OSLSR_EL1](#), and [DBGPRCR_EL1](#).
 - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
 - [DBGOSLSR](#), [DBGOSLAR](#), and [DBGPRCR](#).
 - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to [OSDLR_EL1](#) are trapped.

It is IMPLEMENTATION DEFINED whether accesses to [DBGOSDLR](#) are trapped.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2.TDE](#) == 1.
- [HCR_EL2.TGE](#) == 1.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL0 and EL1 System register accesses to debug System registers that are not trapped by MDCR_EL2.TDRA or MDCR_EL2.TDOSA, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x18:
 - [MDCCSR_EL0](#), [MDCCINT_EL1](#), [OSDTRRX_EL1](#), [MDSCR_EL1](#), [OSDTRTX_EL1](#), [OSECCR_EL1](#), [DBGBVR<n>_EL1](#), [DBGBCR<n>_EL1](#), [DBGWVR<n>_EL1](#), [DBGWCR<n>_EL1](#), [DBGCLAIMSET_EL1](#), [DBGCLAIMCLR_EL1](#), [DBGAUTHSTATUS_EL1](#).
 - When not in Debug state, [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), [DBGDTRTX_EL0](#).
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05.
 - [DBGDIDR](#), [DBGDSCRint](#), [DBGDCCINT](#), [DBGWFAR](#), [DBGVCR](#), [DBGDSCRext](#), [DBGDTRTXext](#), [DBGDTRRXext](#), [DBGBVR<n>](#), [DBGBCR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#), [DBGCLAIMSET](#), [DBGCLAIMCLR](#), [DBGAUTHSTATUS](#), [DBGDEVID](#), [DBGDEVID1](#), [DBGDEVID2](#), [DBGOSECCR](#).
 - When not in Debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).
- In AArch32 state, STC accesses to [DBGDTRRXint](#) and LDC accesses to [DBGDTRTXint](#) are trapped to EL2, reported using EC syndrome value 0x06.

TDA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 or EL1 System register accesses to the debug registers are trapped from both Execution states to EL2 when EL2 is enabled in the current Security state, unless the access generates a higher priority exception.

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

Traps of AArch64 accesses to [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#) are ignored in Debug state.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2.TDE](#) == 1
- [HCR_EL2.TGE](#) == 1

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDE, bit [8]

Trap Debug Exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D.

TDE	Meaning
0b0	The debug target Exception level is EL1.
0b1	If EL2 is enabled for the current Effective value of SCR_EL3.NS , the debug target Exception level is EL2, otherwise the debug target Exception level is EL1. The MDCR_EL2.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see 'Routing debug exceptions'.

This field is treated as being 1 for all purposes other than a direct read when [HCR_EL2.TGE](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPME, bit [7]

When FEAT_PMuV3 is implemented:

[MDCR_EL2.HPMN..(N-1)] event counters enable.

HPME	Meaning
0b0	Event counters in the range [MDCR_EL2.HPMN.. PMCR_EL0.N-1] are disabled.
0b1	Event counters in the range [MDCR_EL2.HPMN.. PMCR_EL0.N-1] are enabled by PMCNTENSET_EL0 .

If MDCR_EL2.HPMN is less than [PMCR_EL0.N](#), this field affects the operation of event counters in the range [MDCR_EL2.HPMN..[PMCR_EL0.N-1](#)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]

When FEAT_PMuV3 is implemented:

Trap Performance Monitors accesses. Traps EL0 and EL1 accesses to all Performance Monitor registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
 - [PMCR_EL0](#), [PMCNTENSET_EL0](#), [PMCNTENCLR_EL0](#), [PMOVSCLR_EL0](#), [PMSWINC_EL0](#), [PMSELR_EL0](#), [PMCEID0_EL0](#), [PMCEID1_EL0](#), [PMCCNTR_EL0](#), [PMXEVTYPER_EL0](#), [PMXVCNTR_EL0](#), [PMUSERENR_EL0](#), [PMINTENSET_EL1](#), [PMINTENCLR_EL1](#), [PMOVSSET_EL0](#), [PMEVCNTR<n>_EL0](#), [PMEVTYPER<n>_EL0](#), [PMCCFILTR_EL0](#).

- If FEAT_PMUv3p4 is implemented, [PMMIR_EL1](#)
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value 0x04:
 - [PMCR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVSr](#), [PMSWINC](#), [PMSELR](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXVCNTR](#), [PMUSERENR](#), [PMINTENSET](#), [PMINTENCLR](#), [PMOVSSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#).
 - If FEAT_PMUv3p1 is implemented, [PMCEID2](#), and [PMCEID3](#).
 - If FEAT_PMUv3p4 is implemented, [PMMIR](#).

TPM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 accesses to all Performance Monitor registers are trapped to EL2 when EL2 is enabled in the current Security state.

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]**When FEAT_PMUv3 is implemented:**

Trap [PMCR_EL0](#) or [PMCR](#) accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [PMCR_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, accesses to [PMCR](#) are trapped to EL2, reported using EC syndrome value 0x03.

TPMCR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 accesses to the specified registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by the following: <ul style="list-style-type: none"> • PMUSERENR.EN. • PMUSERENR_EL0.EN.

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]**When FEAT_PMUv3 is implemented:**

Defines the number of event counters [PMEVCNTR<n>_EL0](#) and, if FEAT_PMUv3_SS is implemented, snapshot registers [PMEVCNTSVR<n>_EL1](#) that are accessible from EL3, EL2, EL1, and from EL0 if permitted.

Defines the number of event counters ~~that are accessible from EL3, EL2, EL1, and from EL0 if permitted.~~ [PMEVCNTR<n>_EL0](#) that are accessible from EL3, EL2, EL1, and from EL0 if permitted.

If HPMN is not 0 and is less than [PMCR_EL0.N](#), HPMN divides the event counters into a first range [0..(HPMN-1)], and a second range [HPMN..([PMCR_EL0.N](#)-1)].

If FEAT_HPMN0 is implemented and this field is 0, all event counters are in the second range and none are in the first range.

If HPMN is equal to [PMCR_EL0.N](#), all event counters are in the first range and none are in the second range.

For an event counter <n> in the first range:

- The counter is accessible from EL1, EL2, and EL3.
- The counter is accessible from EL0 if permitted by [PMUSERENR_EL0](#) or [PMUSERENR](#).
- If FEAT_PMUv3p5 is implemented, [PMCR_EL0.LP](#) or [PMCR.LP](#) determines whether the counter overflow flag is set on unsigned overflow of [PMEVCNTR<n>_EL0\[31:0\]](#) or [PMEVCNTR<n>_EL0\[63:0\]](#).
- [PMCR_EL0.E](#) and [PMCNTENSET_EL0\[n\]](#) enable the operation of event counter n.

For an event counter <n> in the second range:

- The counter is accessible from EL2 and EL3.
- If EL2 is disabled in the current Security state, the event counter is also accessible from EL1, and from EL0 if permitted by [PMUSERENR_EL0](#).
- If FEAT_PMUv3p5 is implemented, [MDCR_EL2.HLP](#) determines whether the counter overflow flag is set on unsigned overflow of [PMEVCNTR<n>_EL0\[31:0\]](#) or [PMEVCNTR<n>_EL0\[63:0\]](#).
- [MDCR_EL2.HPME](#) and [PMCNTENSET_EL0\[n\]](#) enable the operation of event counter n.

If HPMN is larger than [PMCR_EL0.N](#), or if FEAT_HPMN0 is not implemented and HPMN is 0, the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of [MDCR_EL2.HPMN](#) is UNKNOWN.
- One of the following behaviors:
 - An UNKNOWN number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if [MDCR_EL2.HPMN](#) is set to an UNKNOWN non-zero value less than or equal to [PMCR_EL0.N](#).
 - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

When FEAT_PMUv3_SS is implemented:

- For a snapshot register in the first range, the register is accessible from EL1, EL2, and EL3.
- ~~The value returned by a direct read of [MDCR_EL2.HPMN](#) is UNKNOWN.~~
- For a snapshot register in the second range, the register is accessible from EL2, and EL3. ~~Either:~~
 - ~~An UNKNOWN number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if [MDCR_EL2.HPMN](#) is set to an UNKNOWN non-zero value less than or equal to [PMCR_EL0.N](#).~~
 - ~~All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.~~
- If HPMN is larger than [PMCR_EL0.N](#), or if FEAT_HPMN0 is not implemented and HPMN is 0, then the above CONSTRAINED UNPREDICTABLE behaviors apply.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [PMCR_EL0.N](#).

Otherwise:

Reserved, RES0.

Accessing MDCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;

MDCR_EL3, Monitor Debug Configuration Register (EL3)

The MDCR_EL3 characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to MDCR_EL3 are UNDEFINED.

Attributes

MDCR_EL3 is a 64-bit register.

Field descriptions

Bits [63:5039]

Reserved, RES0.

ETBAD, bits [49:48]
When FEAT_TRBE_EXT is implemented:

External Trace Buffer Access Disable. Controls access to the Trace Buffer registers from an external debugger.

ETBAD	Meaning	Applies when
0b00	Non-secure accesses from an external debugger to Trace Buffer registers are prohibited. If FEAT_RME is implemented, Secure and Realm accesses from an external debugger to Trace Buffer registers are prohibited and Root accesses to Trace Buffer registers are allowed. If FEAT_RME is not implemented, Secure accesses to Trace Buffer registers are allowed.	
0b01	Secure and Non-secure accesses from an external debugger to Trace Buffer registers are prohibited. Root and Realm accesses to Trace Buffer registers are allowed.	When FEAT_RME is implemented
0b10	Realm and Non-secure accesses from an external debugger to Trace Buffer registers are prohibited. Root and Secure accesses to Trace Buffer registers are allowed.	When FEAT_RME is implemented
0b11	All accesses from an external debugger to Trace Buffer registers are allowed.	

If EL3 is not implemented, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EnITE, bit [47]

When FEAT_ITE is implemented:

Enable access to Instrumentation trace registers. When disabled, accesses to Instrumentation trace registers generate a trap to EL3.

EnITE	Meaning
0b0	The following instructions at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception: AArch64: MRS and MSR accesses to TRCITECR_EL1 , TRCITECR_EL2 , and TRCITECR_EL12 , reported with EC syndrome value 0x18.
0b1	Accesses of Instrumentation trace registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EPMSSAD, bits [46:45]**When FEAT_PMuV3_SS is implemented:**

External PMU Snapshot Access Disable. Controls access to the PMU Snapshot registers from an external debugger.

EPMSSAD	Meaning	Applies when
0b00	Non-secure accesses from an external debugger to PMU Snapshot registers are prohibited. If FEAT_RME is implemented, Secure and Realm accesses from an external debugger to PMU Snapshot registers are prohibited and Root accesses to PMU Snapshot registers are allowed. If FEAT_RME is not implemented, Secure accesses to PMU Snapshot registers are allowed.	
0b01	Secure and Non-secure accesses from an external debugger to PMU Snapshot registers are prohibited. Root and Realm accesses to PMU Snapshot registers are allowed.	When FEAT_RME is implemented
0b10	Realm and Non-secure accesses from an external debugger to PMU Snapshot registers are prohibited. Root and Secure accesses to PMU Snapshot registers are allowed.	When FEAT_RME is implemented
0b11	All accesses from an external debugger to PMU Snapshot registers are allowed.	

If EL3 is not implemented, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EnPMSS, bit [44]**When FEAT_PMuV3_SS is implemented:**

Enable access to PMU Snapshot registers. When disabled, accesses to PMU Snapshot registers generate a trap to EL3.

EnPMSS	Meaning
0b0	Accesses of the specified PMU Snapshot registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified PMU Snapshot registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to [PMCCNTSVR_EL1](#), [PMEVCNTSVR<n>_EL1](#), and [PMSSCR_EL1](#).
- If FEAT_PMuV3_ICNTR is implemented, MRS and MSR accesses to [PMICNTSVR_EL1](#).

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3.

Trapped instructions are reported using EC value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EBWE, bit [43]**When FEAT_Debugv8p9 is implemented:**

Extended Breakpoint and Watchpoint Enable. Enables use of additional breakpoints or watchpoints, and enables a trap to EL3 on accesses to debug registers.

EBWE	Meaning
0b0	The Effective value of MDSCR_EL1.EBWE is 0. MRS and MSR accesses to MDSELR_EL1 at EL2 and EL1 are trapped to EL3, reported with EC syndrome value 0x18.
0b1	The Effective value of MDSCR_EL1.EBWE is not affected by this bit. Accesses to MDSELR_EL1 are not trapped by this mechanism.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and [MDSELR_EL1](#) is implemented as RAZ/WI.

If EL3 is not implemented, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnPMS3, bit [42]**When FEAT_SPEv1p4 is implemented or FEAT_SPE_FDS is implemented:**

Enable access to additional SPE registers. When disabled, accesses to additional SPE registers generate a trap to EL3.

EnPMS3	Meaning
0b0	The following instructions at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception: AArch64: MRS and MSR accesses to PMSDSFR_EL1 , reported with EC syndrome value 0x18.
0b1	Accesses of additional SPE registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEE, bits [41:40]**When FEAT_EBEP is implemented:**

Performance Monitors Exception Enable. Controls the generation of **PMUIRQ** signal and PMU exception at all Exception levels.

PMEE	Meaning
0b00	PMUIRQ signal is enabled, and PMU exception is disabled.
0b01	PMUIRQ signal and PMU exception are both controlled by MDCR_EL2.PMEE .
0b10	PMUIRQ signal is disabled, and PMU exception is disabled.
0b11	PMUIRQ signal is disabled, and PMU exception is enabled.

If EL3 is not implemented, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [39]

Reserved, RES0.

E3BREC, bit [38]**When FEAT_BRBEv1p1 is implemented:**

Branch Record Buffer EL3 Cold Reset Enable. With MDCR_EL3.E3BREW, controls branch recording at EL3.

E3BREC	Meaning
0b0	When MDCR_EL3.E3BREW == 0: Branch recording at EL3 is disabled. When MDCR_EL3.E3BREW == 1: Branch recording at EL3 is enabled.
0b1	When MDCR_EL3.E3BREW == 0: Branch recording at EL3 is enabled. When MDCR_EL3.E3BREW == 1: Branch recording at EL3 is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

E3BREW, bit [37]**When FEAT_BRBEv1p1 is implemented:**

Branch Record Buffer EL3 Warm Reset Enable. With MDCR_EL3.E3BREC, controls branch recording at EL3.

For a description of the values derived by evaluating MDCR_EL3.E3BREC and MDCR_EL3.E3BREW together, see MDCR_EL3.E3BREC.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EnPMSN, bit [36]**When FEAT_SPEv1p2 is implemented:**

Trap accesses to [PMSNEVFR_EL1](#). Controls access to Statistical Profiling [PMSNEVFR_EL1](#) System register from EL2 and EL1.

EnPMSN	Meaning
0b0	Accesses to PMSNEVFR_EL1 at EL2 and EL1 generate a Trap exception to EL3.
0b1	Do not trap PMSNEVFR_EL1 to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MPMX, bit [35]**When FEAT_PMUv3p7 is implemented:**

Monitor Performance Monitors Extended control. **WithIn conjunction with** MDCR_EL3.SPME, controls **PMUwhen operation event counters are enabled at EL3. EL3 and in other Secure Exception levels.**

MPMX	Meaning
0b0	CountersEvent are counting not affected by this mechanism and PMCCNTR_EL0 are not affected by this mechanism.
0b1	SomeEvent counting by some or all event counters areis prohibited from counting at EL3. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled at EL3. Otherwise, PMCCNTR_EL0 is not affected by this mechanism. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled at EL3. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.

TheIf countersEL2 affectedis byimplemented, thisMDCR_EL3.SPME field== are:1, and[MDCR_EL2](#).HPMN is less than [PMCR_EL0](#).N then all the following are true:

- If EL2 is implemented, MDCR_EL3.SPME is 1, and [MDCR_EL2](#).HPMN is not 0, this field affects the operation of event counters in the range [0 .. ([MDCR_EL2](#).HPMN-1)).] at EL3.**
- IfThis EL2field isdoes not implementedaffect orthe [MDCR_EL3.SPME](#)operation isof 0, allother event counters.**
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter, [PMICNTR_EL0](#).**
- If [PMCR_EL0](#).DP is 1, this field affects the operation of [PMCCNTR_EL0](#) at EL3.**
- If [PMCR_EL0](#).DP is 1, the cycle counter, [PMCCNTR_EL0](#).**

If EL2 is not implemented, MDCR_EL3.SPME == 0, or [MDCR_EL2](#).HPMN is equal to [PMCR_EL0](#).N then this field affects the operation of all event counters at EL3, and if [PMCR_EL0](#).DP is 1, the operation of [PMCCNTR_EL0](#) at EL3.

OtherThe eventoperation countersof arethis notfield affectedapplies byeven thiswhen field.EL2 Whenis disabled in the current Security state. [PMCR_EL0](#).DP is 0, [PMCCNTR_EL0](#) is not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

MCCD, bit [34]**When FEAT_PMUv3p7 is implemented:**

Monitor Cycle Counter Disable. Prohibits the Cycle Counter, [PMCCNTR_EL0](#), from counting at EL3.

MCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited at EL3.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SBRBE, bits [33:32]**When FEAT_BRBE is implemented:**

Secure Branch Record Buffer Enable. Controls branch recording by the BRBE, and access to BRBE registers and instructions at EL2 and EL1.

SBRBE	Meaning
0b00	Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. EL0, EL1, and EL2 are prohibited regions.
0b01	Direct accesses to BRBE registers and instructions in Secure state, except when in EL3, generate a Trap exception to EL3. EL0, EL1, and EL2 in Secure state are prohibited regions. This control does not cause any direct accesses to BRBE registers when not in Secure state to be trapped, and does not cause any Exception levels when not in Secure state to be a prohibited region.
0b10	Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. This control does not cause any Exception levels to be prohibited regions.
0b11	This control does not cause any direct accesses to BRBE registers or instruction to be trapped, and does not cause any Exception levels to be a prohibited region.

The Branch Record Buffer registers trapped by this control are: [BRBCR_EL1](#), [BRBCR_EL2](#), [BRBCR_EL12](#), [BRBFCR_EL1](#), [BRBIDR0_EL1](#), [BRBINF<n>_EL1](#), [BRBINFINJ_EL1](#), [BRBSRC<n>_EL1](#), [BRBSRCINJ_EL1](#), [BRBTGT<n>_EL1](#), [BRBTGTINJ_EL1](#), and [BRBTS_EL1](#).

The Branch Record Buffer instructions trapped by this control are:

- [BRB IALL](#).
- [BRB INJ](#).

Note

If FEAT_BRBEv1p1 is not implemented, EL3 is a prohibited region.

If EL3 is not implemented then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BitBits [31:29]

Reserved, RES0.

PMSSE, bits [30:29]

When FEAT_PMUv3_SS is implemented:

Performance Monitors Snapshot Enable. Controls the generation of Capture events.

PMSSE	Meaning
0b00	Capture events are disabled.
0b01	Capture events are enabled and prohibited.
0b11	Capture events are enabled and allowed.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>_ELO](#).MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>_ELO .MT is zero.
0b1	PMEVTYPER<n>_ELO .MT bits not affected by this field.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: [OSDTRRX_EL1](#), [OSDTRTX_EL1](#), [MDCCSR_EL0](#), [MDCCINT_EL1](#), and, when the PE is in Non-debug state, [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXint](#), [DBGDTRTXint](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL3.TDCC does not trap any accesses to:

AArch64: [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXint](#) and [DBGDTRTXint](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSTBE, bit [26]

When FEAT_TRBE is implemented and FEAT_RME is implemented:

Non-secure Trace Buffer Extended. Together with MDCR_EL3.NSTB, controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.

For a description of the values derived by evaluating NSTB and NSTBE together, see MDCR_EL3.NSTB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSTB, bits [25:24]

When FEAT_TRBE is implemented and FEAT_RME is implemented:

Non-secure Trace Buffer. Together with MDCR_EL3.NSTBE, controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.

NSTBE	NSTB	Meaning
0b0	0b00	Secure state owns the Trace Buffer. When TraceBufferEnabled()==TRUE, tracing is prohibited in Realm and Non-secure states. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3. When Secure state is not implemented, this encoding is reserved.
0b0	0b01	Secure state owns the Trace Buffer. When TraceBufferEnabled()==TRUE, tracing is prohibited in Realm and Non-secure states. Accesses to Trace Buffer control registers at Realm and Non-secure EL2, and Realm and Non-secure EL1, generate Trap exceptions to EL3. When Secure state is not implemented, this encoding is reserved.
0b0	0b10	Non-secure state owns the Trace Buffer. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure and Realm states. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.
0b0	0b11	Non-secure state owns the Trace Buffer. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure and Realm states. Accesses to Trace Buffer control registers at Secure and Realm EL2, and Secure and Realm EL1, generate Trap exceptions to EL3.
0b1	0b0x	Reserved
0b1	0b10	Realm state owns the Trace Buffer. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure and Non-secure states. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.
0b1	0b11	Realm state owns the Trace Buffer. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure and Non-secure states. Accesses to Trace Buffer control registers at Secure and Non-secure EL2, and Secure and Non-secure EL1, generate Trap exceptions to EL3.

NSTB	Meaning
0b00	When MDCR_EL3.NSTBE == 0b0: Trace Buffer owning Security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3. When MDCR_EL3.NSTBE == 0b1: Reserved.
0b01	When MDCR_EL3.NSTBE == 0b0: Trace Buffer owning Security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure and Realm state generate Trap exceptions to EL3. When MDCR_EL3.NSTBE == 0b1: Reserved.
0b10	When MDCR_EL3.NSTBE == 0b0: Trace Buffer owning Security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3. When MDCR_EL3.NSTBE == 0b1: Trace Buffer owning Security state is Realm state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure and Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.
0b11	When MDCR_EL3.NSTBE == 0b0: Trace Buffer owning Security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 in Secure and Realm state generate Trap exceptions to EL3. When MDCR_EL3.NSTBE == 0b1: Trace Buffer owning Security state is Realm state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure and Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure and Secure state generate Trap exceptions to EL3.

The Trace Buffer control registers trapped by this control are: [TRBBASER_EL1](#), [TRBLIMITR_EL1](#), [TRBMAR_EL1](#), [TRBPTR_EL1](#), [TRBSR_EL1](#), and [TRBTRG_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_TRBE is implemented and FEAT_RME is not implemented:

Non-secure Trace Buffer. Controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.

NSTB	Meaning
0b00	Trace Buffer owning Security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.
0b01	Trace Buffer owning Security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.
0b10	Trace Buffer owning Security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.
0b11	Trace Buffer owning Security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.

The Trace Buffer control registers trapped by this control are: [TRBBASER_EL1](#), [TRBLIMITR_EL1](#), [TRBMAR_EL1](#), [TRBPTR_EL1](#), [TRBSR_EL1](#), and [TRBTRG_EL1](#).

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCCD, bit [23]

When FEAT_PMuV3p5 is implemented:

Secure Cycle Counter Disable. Prohibits [PMCCNTR_EL0](#) from counting in Secure state.

SCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited in Secure state.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

ETAD, bit [22]

When FEAT_RME is implemented, external debugger access to the trace unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable. Together with MDCR_EL3.ETADE, controls access to trace unit registers by an external debugger.

ETADE	ETAD	Meaning
0b0	0b0	Access to trace unit registers by an external debugger is permitted.
0b0	0b1	Root and Secure access to trace unit registers by an external debugger is permitted. Realm and Non-secure access to trace unit registers by an external debugger is not permitted.
0b1	0b0	Root and Realm access to trace unit registers by an external debugger is permitted. Secure and Non-secure access to trace unit registers by an external debugger is not permitted.
0b1	0b1	Root access to trace unit registers by an external debugger is permitted. Secure, Non-secure, and Realm access to trace unit registers by an external debugger is not permitted.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When external debugger access to the trace unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable. Controls Non-secure access to trace unit registers by an external debugger.

ETAD	Meaning
0b0	Non-secure accesses from an external debugger to trace unit are allowed.
0b1	Non-secure accesses from an external debugger to some trace unit registers are prohibited. See individual registers for the effect of this field.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EPMAD, bit [21]

When FEAT_RME is implemented, FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Access Disable. Together with MDCR_EL3.EPMADE, controls access to Performance Monitor registers by an external debugger.

EPMADE	EPMAD	Meaning
0b0	0b0	Access to Performance Monitor registers by an external debugger is permitted.
0b0	0b1	Root and Secure access to Performance Monitor registers by an external debugger is permitted. Realm and Non-secure access to Performance Monitor registers by an external debugger is not permitted.
0b1	0b0	Root and Realm access to Performance Monitor registers by an external debugger is permitted. Secure and Non-secure access to Performance Monitor registers by an external debugger is not permitted.
0b1	0b1	Root access to Performance Monitor registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Performance Monitor registers by an external debugger is not permitted.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_Debugv8p4 is implemented, FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Non-secure Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

EPMAD	Meaning
0b0	Non-secure access to Performance Monitor registers from external debugger is permitted.
0b1	Non-secure access to Performance Monitor registers from external debugger is not permitted.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

EPMAD	Meaning
0b0	Access to Performance Monitor registers from external debugger is permitted.
0b1	Access to Performance Monitor registers from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EDAD, bit [20]**When FEAT_RME is implemented:**

External Debug Access Disable. Together with MDCR_EL3.EDADE, controls access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) by an external debugger.

EDADE	EDAD	Meaning
0b0	0b0	Access to Debug registers by an external debugger is permitted.
0b0	0b1	Root and Secure access to Debug registers by an external debugger is permitted. Realm and Non-secure access to Debug registers by an external debugger is not permitted.
0b1	0b0	Root and Realm access to Debug registers by an external debugger is permitted. Secure and Non-secure access to Debug registers by an external debugger is not permitted.
0b1	0b1	Root access to Debug registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Debug registers by an external debugger is not permitted.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_Debugv8p4 is implemented:

External Debug Non-secure Access Disable. Controls Non-secure access to breakpoint, watchpoint, and [OSLAR_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Non-secure access to debug registers from external debugger is permitted.
0b1	Non-secure access to breakpoint and watchpoint registers, and OSLAR_EL1 from external debugger is not permitted.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable. Controls access to breakpoint, watchpoint, and [OSLAR_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers, and to OSLAR_EL1 from external debugger is permitted.
0b1	Access to breakpoint and watchpoint registers, and to OSLAR_EL1 from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

External Debug Access disable. Controls access to breakpoint, watchpoint, and optionally [OSLAR_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers from external debugger is permitted.
0b1	Access to breakpoint and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TTRF, bit [19]**When FEAT_TRF is implemented:**

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- [TRFCR_EL2](#), [TRFCR_EL12](#), [TRFCR_EL1](#), reported using EC syndrome value 0x18.
- [HTRFCR](#) and [TRFCR](#), reported using EC syndrome value 0x03.

TTRF	Meaning
0b0	Accesses to Trace Filter registers at EL2 and EL1 are not affected by this bit.
0b1	Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

STE, bit [18]**When FEAT_TRF is implemented and Secure state is implemented:**

Secure Trace enable. Enables tracing in Secure state.

STE	Meaning
0b0	Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SPME, bit [17]

When FEAT_PMUv3 is implemented and FEAT_PMUv3p7 is implemented:

Secure Performance Monitors Enable. Controls PMU event operation counting in Secure state and at EL3 when MDCR_EL3.MPMX is 0.EL3.

SPME	Meaning
0b0	When MDCR_EL3.MPMX == 0: Counters Event are counting is prohibited from counting in Secure state and at EL3.state. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state and at EL3.state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
0b1	When MDCR_EL3.MPMX == 0: Counters Event are counting not affected by this mechanism.and PMCCNTR_EL0 are not affected by this mechanism.

When MDCR_EL3.MPMX is 0, this field affects the operation of all event counters affected in by Secure this state, field and are: if PMCR_EL0.DP is 1, the operation of PMCCNTR_EL0 in Secure state.

When MDCR_EL3.MPMX is 1, this field affects the operation of event counters at EL3 only, and if PMCR_EL0.DP is 1, the operation of PMCCNTR_EL0 at EL3 only. See MDCR_EL3.MPMX for more information.

- All event counters.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter, PMICNTR_EL0.
- If PMCR_EL0.DP is 1, the cycle counter, PMCCNTR_EL0.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

When MDCR_EL3.MPMX is 1, this field controls which event counters are affected by MDCR_EL3.MPMX at EL3. See MDCR_EL3.MPMX for more information.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

Secure Performance Monitors Enable. Controls PMU event operation counting in Secure state.

SPME	Meaning
0b0	When Event MDCR_EL3.MPMX counting == is 0: Counters are prohibited from counting in Secure state and at EL3.state. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state and at EL3.state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
0b1	When Event MDCR_EL3.MPMX counting == 0: Counters are not affected by this mechanism.and PMCCNTR_EL0 are not affected by this mechanism.

This field affects the operation of all event counters in Secure state, and if PMCR_EL0.DP is 1, the operation of PMCCNTR_EL0 in Secure state. When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented:

Secure Performance Monitors Enable. Controls **PMUevent operationcounting** in Secure state.

SPME	Meaning
0b0	If ExternalSecureNoninvasiveDebugEnabled() is FALSE, event counting is prohibited in Secure state, and if PMCR_EL0 .DP is 1, PMCCNTR_EL0 is disabled in Secure state.
0b1	Event counting and PMCCNTR_EL0 are not affected by this mechanism.

If ExternalSecureNoninvasiveDebugEnabled() is TRUE, the event counters and [PMCCNTR_EL0](#) are not affected by this field.

Otherwise, this field affects the operation of all event counters in Secure state, and if [PMCR_EL0](#).DP is 1, the operation of [PMCCNTR_EL0](#) in Secure state. When [PMCR_EL0](#).DP is 0, [PMCCNTR_EL0](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR_EL3](#).NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SDD, bit [16]**When Secure state is implemented:**

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

SDD	Meaning
0b0	Debug exceptions in Secure state are not affected by this bit.
0b1	Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of [SCR_EL3](#).RW is 0b1.

If Secure EL2 is implemented and enabled, and Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of [SDER32_EL3](#).SUIDEN is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPD32, bits [15:14]**When EL1 is capable of using AArch32:**

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

SPD32	Meaning
0b00	Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.
0b10	Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
0b11	Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of [SCR_EL3](#).RW is 0b0.

If Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of [SDER32_EL3](#).SUIDEN is 0b1.

If EL3 is not implemented and the Effective value of [SCR_EL3](#).NS is 0b0, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPB, bits [13:12]**When FEAT_SPE is implemented and FEAT_RME is implemented:**

Non-secure Profiling Buffer. Together with MDCR_EL3.NSPBE, controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control [registers from EL2 and EL1 registers.](#)

NSPBE	NSPB	Meaning
0b0	0b00	The Profiling Buffer uses Secure virtual addresses. Statistical Profiling is disabled in Realm and Non-secure states. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3. When Secure state is not implemented, this encoding is reserved.
0b0	0b01	The Profiling Buffer uses Secure virtual addresses. Statistical Profiling is disabled in Realm and Non-secure states. Accesses to Statistical Profiling and Profiling Buffer control registers at Realm and Non-secure EL2, and Realm and Non-secure EL1, generate Trap exceptions to EL3. When Secure state is not implemented, this encoding is reserved.
0b0	0b10	The Profiling Buffer uses Non-secure virtual addresses. Statistical Profiling is disabled in Secure and Realm states. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.
0b0	0b11	The Profiling Buffer uses Non-secure virtual addresses. Statistical Profiling is disabled in Secure and Realm states. Accesses to Statistical Profiling and Profiling Buffer control registers at Secure and Realm EL2, and Secure and Realm EL1, generate Trap exceptions to EL3.
0b1	0b0x	Reserved
0b1	0b10	The Profiling Buffer uses Realm virtual addresses. Statistical Profiling is disabled in Secure and Non-secure states. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.
0b1	0b11	The Profiling Buffer uses Realm virtual addresses. Statistical Profiling is disabled in Secure and Non-secure states. Accesses to Statistical Profiling and Profiling Buffer control registers at Secure and Non-secure EL2, and Secure and Non-secure EL1, generate Trap exceptions to EL3.

NSPB	Meaning
0b00	When MDCR_EL3.NSPBE == 0b0: Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in all Security states generate Trap exceptions to EL3. When MDCR_EL3.NSPBE == 0b1: Reserved.
0b01	When MDCR_EL3.NSPBE == 0b0: Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Realm states generate Trap exceptions to EL3. When MDCR_EL3.NSPBE == 0b1: Reserved.
0b10	When MDCR_EL3.NSPBE == 0b0: Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in all Security states generate Trap exceptions to EL3. When MDCR_EL3.NSPBE == 0b1: Profiling Buffer uses Realm Virtual Addresses. Statistical Profiling enabled in Realm state and disabled in Non-secure and Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in all Security states generate Trap exceptions to EL3.
0b11	When MDCR_EL3.NSPBE == 0b0: Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure and Realm states generate Trap exceptions to EL3. When MDCR_EL3.NSPBE == 0b1: Profiling Buffer uses Realm Virtual Addresses. Statistical Profiling enabled in Realm state and disabled in Non-secure and Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3.

The Statistical Profiling and Profiling Buffer control registers trapped by this control are:

- [PMBLIMITR_EL1](#), [PMBPTR_EL1](#), [PMBSR_EL1](#), [PMSCR_EL1](#), [PMSCR_EL2](#), [PMSCR_EL12](#), [PMSEVFR_EL1](#), [PMSEFCR_EL1](#), [PMSICR_EL1](#), [PMSIDR_EL1](#), [PMSIRR_EL1](#), and [PMSLATFR_EL1](#).
- If FEAT_SPEv1p2 is implemented, [PMSNEVFR_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPE is implemented and FEAT_RME is not implemented:

Non-secure Profiling Buffer. Controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

NSPB	Meaning
0b00	Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3.
0b01	Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.
0b10	Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3.
0b11	Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.

The Statistical Profiling and Profiling Buffer control registers trapped by this control are:

- [PMBLIMITR_EL1](#), [PMBPTR_EL1](#), [PMBSR_EL1](#), [PMSCR_EL1](#), [PMSCR_EL2](#), [PMSCR_EL12](#), [PMSEVFR_EL1](#), [PMSFCR_EL1](#), [PMSICR_EL1](#), [PMSIDR_EL1](#), [PMSIRR_EL1](#), and [PMSLATFR_EL1](#).
- If FEAT_SPEv1p2 is implemented, [PMSNEVFR_EL1](#).

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPBE, bit [11]

When FEAT_SPE is implemented and FEAT_RME is implemented:

Non-secure Profiling Buffer Extended. Together with MDCR_EL3.NSPB, controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control [registers from EL2 and EL1](#). ~~registers.~~

For a description of the values derived by evaluating NSPB and NSPBE together, see MDCR_EL3.NSPB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDOSA, bit [10]

When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, [OSLAR_EL1](#), [OSLSR_EL1](#), [OSDLR_EL1](#), [DBGPRCR_EL1](#), and any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit, are trapped to EL3 and reported using EC syndrome value 0x18.
- Accesses using MCR or MRC to [DBGOSLAR](#), [DBGOSLSR](#), [DBGOSDLR](#), and [DBGPRCR](#), are trapped to EL3 and reported using EC syndrome value 0x05.
- Accesses to any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA .

Note

The powerdown debug registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- AArch64: [OSLAR_EL1](#), [OSLSR_EL1](#), and [DBGPRCR_EL1](#).
- AArch32: [DBGOSLAR](#), [DBGOSLSR](#), and [DBGPRCR](#).
- AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- It is IMPLEMENTATION DEFINED whether accesses to [OSDLR_EL1](#) and [DBGOSDLR](#) are trapped.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA .

Note

The powerdown debug registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the MDCR_EL3.TDOSA field.

Accesses to the debug registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value 0x18:
 - [DBGBVR<n>_EL1](#), [DBGBCR<n>_EL1](#), [DBGWVR<n>_EL1](#), [DBGWCR<n>_EL1](#), [DBGCLAIMSET_EL1](#), [DBGCLAIMCLR_EL1](#), [DBGAUTHSTATUS_EL1](#), [DBGVCR32_EL2](#).
 - AArch64: [MDCR_EL2](#), [MDRAR_EL1](#), [MDCCSR_EL0](#), [MDCCINT_EL1](#), [MDSCR_EL1](#), [OSDTRRX_EL1](#), [OSDTRTX_EL1](#), [OSECCR_EL1](#).
 - If FEAT_Debugv8p9 is implemented, [MDSELR_EL1](#).
- In AArch32 state, [SDER](#) is trapped to EL3 and reported using EC syndrome value 0x03.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x05, accesses using MCRR or MRRC are reported using EC syndrome value 0x0C:

- [HDCR](#), [DBGDRAR](#), [DBGDSAR](#), [DBGDIDR](#), [DBGDCCINT](#), [DBGWFEAR](#), [DBGVCR](#), [DBGBVR<n>](#), [DBGBCR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).
- [DBGCLAIMSET](#), [DBGCLAIMCLR](#), [DBGAUTHSTATUS](#), [DBGDEVID](#), [DBGDEVID1](#), [DBGDEVID2](#), [DBGOSECRR](#).
- In AArch32 state, STC accesses to [DBGDTRRXint](#) and LDC accesses to [DBGDTRTXint](#) are reported using EC syndrome value 0x06.
- When not in Debug state, the following registers are also trapped to EL3:
 - AArch64 accesses to [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#), reported using EC syndrome value 0x18.
 - AArch32 accesses using MCR or MRC to [DBGDTRRXint](#) and [DBGDTRTXint](#), reported using EC syndrome value 0x05.

TDA	Meaning
0b0	AccessesThis ofcontrol thedoes specifiednot debugcause Systemany registersinstructions areto notbe trapped by this mechanism.trapped.
0b1	AccessesEL0, ofEL1, and EL2 accesses to the specified debug Systemregisters, other than the registers atthat EL2,can EL1,be andtrapped EL0by MDCR_EL3.TDOSA, are trapped to EL3, unlessfrom theany instructionSecurity generatesstate and higherboth priorityExecution exception.states, unless it is trapped byDBGDSCRExt.UDCCdis, MDSCR_EL1.TDCC, HDCR.TDA or MDCR_EL2.TDA.

AArch64 accesses to [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#), and AArch32 accesses using MCR or MRC to [DBGDTRRXint](#) and [DBGDTRTXint](#) are not trapped when the PE is in Debug state.

If 16 or fewer breakpoints and 16 or fewer watchpoints are implemented, and [MDSELR_EL1](#) is implemented as RAZ/WI, then it is IMPLEMENTATION DEFINED whether AArch64 accesses to [MDSELR_EL1](#) are trapped to EL3 when [MDCR_EL3.TDA](#) is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BitBits [8:7]

Reserved, RES0.

EnPM2, bit [7]

When FEAT_PMUv3p9 is implemented, or FEAT_SPMU is implemented or FEAT_SEBEP is implemented:

Enable access to additional PMU registers. When disabled, accesses to additional PMU registers generate a trap to EL3.

EnPM2	Meaning
0b0	Accesses of the specified additional PMU registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified additional PMU registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are:

- If FEAT_EBEP is implemented, MRS and MSR accesses to [PMECR_EL1](#).
- If FEAT_SEBEP is implemented, MRS and MSR accesses to [PMIAR_EL1](#).
- If FEAT_PMUv3p9 is implemented, MRS and MSR accesses to [PMUACR_EL1](#).
- If FEAT_SPMU is implemented, MRS and MSR accesses to [SPMACCESSR_EL1](#), [SPMACCESSR_EL2](#), [SPMCFGFR_EL1](#), [SPMCGCR<n>_EL1](#), [SPMCNTENCLR_EL0](#), [SPMCNTENSET_EL0](#), [SPMCR_EL0](#), [SPMDEVAFF_EL1](#), [SPMDEVARCH_EL1](#), [SPMEVCNTR<n>_EL0](#), [SPMEVFILT2R<n>_EL0](#), [SPMEVFILTR<n>_EL0](#), [SPMEVTPER<n>_EL0](#), [SPMIIDR_EL1](#), [SPMINTENCLR_EL1](#), [SPMINTENSET_EL1](#), [SPMOVSLR_EL0](#), [SPMOVSSSET_EL0](#), [SPMSCR_EL1](#), and [SPMSELR_EL0](#).

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3.

Trapped instructions are reported using EC value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

Trap Performance Monitor register accesses. Accesses to all Performance Monitor registers from EL0, EL1, and EL2 to EL3, from any Security state and both Execution states are trapped as follows:

- In AArch64 state, accesses to the following registers are trapped to EL3 and are reported using EC syndrome value 0x18:
 - [PMCR_EL0](#), [PMCNTENSET_EL0](#), [PMCNTENCLR_EL0](#), [PMOVSCLR_EL0](#), [PMSWINC_EL0](#), [PMSELR_EL0](#), [PMCEID0_EL0](#), [PMCEID1_EL0](#), [PMCCNTR_EL0](#), [PMXEVTYPER_EL0](#), [PMXVCNTR_EL0](#), [PMUSERENR_EL0](#), [PMINTENSET_EL1](#), [PMINTENCLR_EL1](#), [PMOVSSET_EL0](#), [PMEVCNTR<n>_EL0](#), [PMEVTYPER<n>_EL0](#), [PMCCFILTR_EL0](#).
 - If FEAT_PMUv3p4 is implemented, [PMMIR_EL1](#).
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses using MCRR or MRRC are reported using EC syndrome value 0x04:
 - [PMCR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVS](#), [PMSWINC](#), [PMSELR](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXVCNTR](#), [PMUSERENR](#), [PMINTENSET](#), [PMINTENCLR](#), [PMOVSSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#).
 - If FEAT_PMUv3p1 is implemented, [PMCEID2](#), and [PMCEID3](#).
 - If FEAT_PMUv3p4 is implemented, [PMMIR](#).

TPM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2, EL1, and EL0 System register accesses to all Performance Monitor registers are trapped to EL3, unless it is trapped by HDCR.TPM or MDCR_EL2.TPM .

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

EDADE, bit [4]

When FEAT_RME is implemented:

External Debug Access Disable Extended. Together with MDCR_EL3.EDAD, controls access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) by an external debugger.

For a description of the values derived by evaluating EDAD and EDADE together, see MDCR_EL3.EDAD.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

ETADE, bit [3]

When FEAT_RME is implemented, external debugger access to the trace unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable Extended. Together with MDCR_EL3.ETAD, controls access to trace unit registers by an external debugger.

For a description of the values derived by evaluating ETAD and ETADE together, see MDCR_EL3.ETAD.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EPMAD, bit [2]

When FEAT_RME is implemented, FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Access Disable Extended. Together with MDCR_EL3.EPMAD, controls access to Performance Monitor registers by an external debugger.

For a description of the values derived by evaluating EPMAD and EPMAD together, see MDCR_EL3.EPMAD.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [1]

Reserved, RES0.

RLTE, bit [0]

When FEAT_RME is implemented and FEAT_TRF is implemented:

Realm Trace enable. Enables tracing in Realm state.

RLTE	Meaning
0b0	Trace prohibited in Realm state, unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Realm state is not affected by this bit.

This bit also controls the level of authentication that is required by an external debugger to enable external tracing.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Accessing MDCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0011	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = MDCR_EL3;
```

MSR MDCR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0011	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MDCR_EL3 = X[t, 64];
```

MDRAR_EL1, Monitor Debug ROM Address Register

The MDRAR_EL1 characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

Configuration

AArch64 System register MDRAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register [DBGDRAR\[63:0\]](#).

Attributes

MDRAR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0								ROMADDR																								
ROMADDR												RES0																Valid				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:**56****52**]

Reserved, RES0.

ROMADDR, bits [**55****51**:12]

ROMADDR encoding when FEAT_D128FEAT_LPA is implemented and MDRAR_EL1.Valid != 0b00

43	42	41	40	39	38	37	36	35	34	33	32																																				
ROMADDR																																															
ROMADDR																																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
39	38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0								
ROMADDR																																															

ROMADDR, bits [**43****39**:0]

Bits [**55****51**:12] of the ROM table physical address.

Bits [11:0] of the ROM table physical address are zero.

For implementations with fewer than **56****52** physical address bits, the corresponding upper bits of this field are RES0

In an implementation that includes EL3, ROMADDR is an address in Non-secure PA space. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure PA space. If FEAT_RME

is implemented, it is IMPLEMENTATION DEFINED whether the ROM table is also accessible in the Root or Realm PA spaces.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system where the implementation only supports execution in AArch32 state.

ROMADDR encoding when FEAT_D128 is not implemented, FEAT_LPA is implemented and MDRAR_EL1.Valid != 0b00

Bits [43:39:40:36]

Reserved, RES0.

ROMADDR, bits [39:35:0]

Bits [51:39:12] of the ROM table physical address.

Bits [11:0] of the ROM table physical address are zero.

For implementations with fewer than 5248 physical address bits, the corresponding upper bits of this field are RES0

In an implementation that includes EL3, ROMADDR is an address in Non-secure PA space. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure PA space. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether the ROM table is also accessible in the Root or Realm PA spaces.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system where the implementation only supports execution in AArch32 state.

ROMADDR encoding when FEAT_D128 is not implemented, FEAT_LPA is not implemented and MDRAR_EL1.Valid == 0b00

Bits [43:39:36:0]

Reserved, RES0UNKNOWN.

ROMADDR, bits [35:0]

Bits [39:12] of the ROM table physical address.

Bits [11:0] of the ROM table physical address are zero.

For implementations with fewer than 48 physical address bits, the corresponding upper bits of this field are RES0

In an implementation that includes EL3, ROMADDR is an address in Non-secure PA space. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure PA space. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Root or Realm PA spaces.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system where the implementation only supports execution in AArch32 state.

ROMADDR encoding when MDRAR_EL1.Valid == 0b00

Bits [43:0]

Reserved, UNKNOWN.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

Valid	Meaning
0b00	ROM Table address is not valid. Software must ignore ROMADDR.
0b11	ROM Table address is valid.

Other values are reserved.

Arm recommends implementations set this field to zero.

Accessing MDRAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDRAR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elsif EL2Enabled() && MDCR_EL2.<TDE,TDRA> != '00' then
        AArch64.SystemAccessTrap(EL2, 0x18);

MDSCR_EL1, Monitor Debug System Control Register

The MDSCR_EL1 characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

AArch64 System register MDSCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGDSCRext\[31:0\]](#).

AArch64 System register MDSCR_EL1 bit [15] is architecturally mapped to AArch32 System register [DBGDSCRint\[15\]](#).

AArch64 System register MDSCR_EL1 bit [12] is architecturally mapped to AArch32 System register [DBGDSCRint\[12\]](#).

AArch64 System register MDSCR_EL1 bits [5:2] are architecturally mapped to AArch32 System register [DBGDSCRint\[5:2\]](#).

AArch64 System register MDSCR_EL1 bit [40] is architecturally mapped to External register [EDSCR2\[8\]](#) when FEAT_Debugv8p9 is implemented.

Attributes

MDSCR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																																TTAEBWE	
TFORXfull		TXfull		RES0		RXOTXU		RES0		INTdis		TDARES0		SC2		RAZ/WI		MDEHDE		KDE		TDCC		RES0			ERR		RES0			SS	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:34]32]

Reserved, RES0.

TTA, bit [33]

When FEAT_TRBE_EXT is implemented or FEAT_ETEv1p3 is implemented:

Used for save/restore of [EDSCR2.TTA](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR2.TTA](#). Reads and writes of this bit are indirect accesses to [EDSCR2.TTA](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

EBWE, bit [32]**When FEAT_Debugv8p9 is implemented:**

Extended Breakpoint and Watchpoint Enable. Enables use of additional breakpoints or watchpoints.

EBWE	Meaning
0b0	Breakpoints and watchpoints above 15 are disabled, and the Effective value of MDSELR_EL1.BANK is zero.
0b1	Breakpoints and watchpoints above 15 are not affected by this field.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

This field is ignored by the PE and treated as zero when all of the following are true:

- Any of the following are true:
 - EL3 is implemented and MDCR_EL3.EBWE is 0.
 - EL2 is implemented and enabled in the current Security state, and MDCR_EL2.EBWE is 0.
- HaltOnBreakpointOrWatchpoint() is FALSE.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

TFO, bit [31]**When FEAT_TRF is implemented:**

Trace Filter override. Used for save/restore of EDSCR.TFO.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

Used for save/restore of EDSCR.RXfull.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).RXfull. Reads and writes of this bit are indirect accesses to [EDSCR](#).RXfull.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

TXfull, bit [29]

Used for save/restore of [EDSCR](#).TXfull.

When [OSLSR_EL1](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).TXfull. Reads and writes of this bit are indirect accesses to [EDSCR](#).TXfull.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of [EDSCR](#).RXO.

When [OSLSR_EL1](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).RXO. Reads and writes of this bit are indirect accesses to [EDSCR](#).RXO.

When [OSLSR_EL1](#).OSLK == 1, if bits [27,6] of the value written to MDSCR_EL1 are {1,0}, that is, the RXO bit is 1 and the ERR bit is 0, the PE sets [EDSCR](#).{RXO,ERR} to UNKNOWN values.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

TXU, bit [26]

Used for save/restore of [EDSCR](#).TXU.

When [OSLSR_EL1](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).TXU. Reads and writes of this bit are indirect accesses to [EDSCR](#).TXU.

When [OSLSR_EL1](#).OSLK == 1, if bits [26,6] of the value written to MDSCR_EL1 are {1,0}, that is, the TXU bit is 1 and the ERR bit is 0, the PE sets [EDSCR](#).{TXU,ERR} to UNKNOWN values.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bits [25:24]

Reserved, RES0.

INTdis, bits [23:22]

Used for save/restore of [EDSCR](#).INTdis.

When [OSLSR_EL1](#).OSLK == 0, and software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this field holds the value of [EDSCR](#).INTdis. Reads and writes of this field are indirect accesses to [EDSCR](#).INTdis.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1](#).OSLK == 1, access to this field is **RW**.
- When [OSLSR_EL1](#).OSLK == 0, access to this field is **RO**.

TDA, bit [21]

Used for save/restore of [EDSCR](#).TDA.

When [OSLSR_EL1](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).TDA. Reads and writes of this bit are indirect accesses to [EDSCR](#).TDA.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1](#).OSLK == 1, access to this field is **RW**.
- When [OSLSR_EL1](#).OSLK == 0, access to this field is **RO**.

Bit [20]

Reserved, RES0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented and FEAT_PCSRv8p2 is not implemented:

Used for save/restore of [EDSCR](#).SC2.

When [OSLSR_EL1](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).SC2. Reads and writes of this bit are indirect accesses to [EDSCR](#).SC2.

Accessing this field has the following behavior:

- When [OSLSR_EL1](#).OSLK == 1, access to this field is **RW**.
- When [OSLSR_EL1](#).OSLK == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [18:16]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

MDE, bit [15]

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

MDE	Meaning
0b0	Breakpoint, Watchpoint, and Vector Catch exceptions disabled.
0b1	Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HDE, bit [14]

Used for save/restore of [EDSCR.HDE](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.HDE](#). Reads and writes of this bit are indirect accesses to [EDSCR.HDE](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is **RO**.

KDE, bit [13]

Local (kernel) debug enable. If [EL_D](#) is using AArch64, enable debug exceptions within [EL_D](#). Permitted values are:

KDE	Meaning
0b0	Debug exceptions, other than Breakpoint Instruction exceptions, disabled within EL_D .
0b1	All debug exceptions enabled within EL_D .

RES0 if [EL_D](#) is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDCC, bit [12]

Traps EL0 accesses to the Debug Communication Channel (DCC) registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from both Execution states, as follows:

- In AArch64 state, MRS or MSR accesses to the following DCC registers are trapped, reported using EC syndrome value 0x18:
 - [MDCCSR_EL0](#).
 - If not in Debug state, [DBGDTR_EL0](#), [DBGDTRTX_EL0](#), and [DBGDTRRX_EL0](#).
- In AArch32 state, MRC or MCR accesses to the following registers are trapped, reported using EC syndrome value 0x05.
 - [DBGDSCRint](#), [DBGDIDR](#), [DBGDSAR](#), [DBGDRAR](#).
 - If not in Debug state, [DBGDTRRXint](#), and [DBGDTRTXint](#).
- In AArch32 state, LDC access to [DBGDTRRXint](#) and STC access to [DBGDTRTXint](#) are trapped, reported using EC syndrome value 0x06.
- In AArch32 state, MRRC accesses to [DBGDSAR](#) and [DBGDRAR](#) are trapped, reported using EC syndrome value 0x0C.

TDCC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 using AArch64: EL0 accesses to the AArch64 DCC registers are trapped. EL0 using AArch32: EL0 accesses to the AArch32 DCC registers are trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of [EDSCR.ERR](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.ERR](#). Reads and writes of this bit are indirect accesses to [EDSCR.ERR](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is **RO**.

Bits [5:1]

Reserved, RES0.

SS, bit [0]

Software step control bit. If EL_D is using AArch64, enable Software step. Permitted values are:

SS	Meaning
0b0	Software step disabled
0b1	Software step enabled.

RES0 if EL_D is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MDSCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDSCR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0010	0b010

```

MDSELR_EL1, Breakpoint and Watchpoint Selection Register

The MDSELR_EL1 characteristics are:

Purpose

Selects the current breakpoints or watchpoints accessed by System register instructions.

Configuration

This register is present only when FEAT_Debugv8p9 is implemented. Otherwise, direct accesses to MDSELR_EL1 are UNDEFINED.

Attributes

MDSELR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																BANK				RES0											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:6]

Reserved, RES0.

BANK, bits [5:4]

When more than 16 breakpoints are implemented or more than 16 watchpoints are implemented:

Breakpoint and watchpoint bank select.

BANK	Meaning	Applies when
0b00	Select 0 to 15.	
0b01	Select 16 to 31.	
0b10	Select 32 to 47.	When at least 32 breakpoints or at least 32 watchpoints are implemented
0b11	Select 48 to 63.	When at least 48 breakpoints or at least 48 watchpoints are implemented

Each of the following register names accesses a register for breakpoint or watchpoint <n>, where n = UInt(MDSELR_EL1.BANK:m[3:0]):

- [DBGBCR<m>_EL1](#).
- [DBGBVR<m>_EL1](#).
- [DBGWCR<m>_EL1](#).
- [DBGWVR<m>_EL1](#).

This field is ignored by the PE and treated as zeros when the Effective value of [MDSCR_EL1.EBWE](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [3:0]

Reserved, RES0.

Accessing MDSELR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDSELR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0100	0b010

MECIDR_EL2, MEC Identification Register

The MECIDR_EL2 characteristics are:

Purpose

MEC identification register. Describes the supported MECID width by this PE.

Configuration

This register is present only when FEAT_MEC is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to MECIDR_EL2 are UNDEFINED.

Attributes

MECIDR_EL2 is a 64-bit register.

Field descriptions

Bits [63:4]

Reserved, RES0.

MECIDWidthm1, bits [3:0]

The number of bits of MECID supported by the PE, minus 1.

The maximum permitted value is 0xF which indicates a MECID width of 16 bits and 2^16 MECIDs.

MECIDWidth is defined as MECIDWidthm1 + 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MECIDR_EL2

For accesses from EL2 and EL3, this register is RO.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MECIDR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b1000	0b111

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    X[t, 64] = MECIDR_EL2;
elsif PSTATE.EL == EL3 then
    X[t, 64] = MECIDR_EL2;
```

MFAR_EL3, PhysicalPA Fault Address Register (EL3)

The MFAR_EL3 characteristics are:

Purpose

RecordsHolds the faulting physical address for a Granule Protection Check, synchronous External Abort, or SError exceptionexceptions taken to EL3.

Configuration

This register is present only when FEAT_PFAR is implemented or FEAT_RME is implemented. Otherwise, direct accesses to MFAR_EL3 are UNDEFINED.

Attributes

MFAR_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
NS	NSE	RES0						FPA[55:52]				FPA[51:48]				FPA[51:48]				FPA[47:12]				FPA[47:12]											
FPA[47:12]												RES0																							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

An exception return at EL3 makes MFAR_EL3 UNKNOWN.

NS, bit [63]

Together with the NSE field, reports the physical address space of the access that triggered the Granule Protection Check exception.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [62]

Together with the NS field, reports the physical address space of the access that triggered the Granule Protection Check exception.

For a description of the values derived by evaluating NS and NSE together, see MFAR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [61:56:52]

Reserved, RES0.

FPA[55:52], bits [55:52]**When FEAT_D128 is implemented:**

When FEAT_D128 is implemented, extension to FPA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FPA[51:48], bits [51:48]**When FEAT_LPA is implemented:**

When FEAT_LPA is implemented, extension to FPA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FPA[47:12], bits [47:12]

Bits [47:12] of the faulting physical address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

When recording an address for a synchronous External Abort or SError exception, the recorded address can be any address within the same naturally-aligned fault granule as the faulting physical address, where the size of the fault granule is IMPLEMENTATION DEFINED, but must be no larger than:

- The size of the range of values permitted to be recorded in FAR_EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing MFAR_EL3

MFAR_EL3 is not valid and reads UNKNOWN if ESR_EL3.PFV is recorded as 0 and ESR_EL3.EC is recorded indicating an Abort or SError exception.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MFAR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0110	0b0000	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = MFAR_EL3;

```

MSR MFAR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0110	0b0000	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MFAR_EL3 = X[t, 64];

```

MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MIDR\[31:0\]](#).

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to External register [MIDR_EL1\[31:0\]](#).

Attributes

MIDR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Implementer								Variant				Architecture				PartNum												Revision			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture, bits [19:16]

Architecture version. Defined values are:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing MIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b000

MPIDR_EL1, Multiprocessor Affinity Register

The MPIDR_EL1 characteristics are:

Purpose

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

Configuration

AArch64 System register MPIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MPIDR\[31:0\]](#).

In a uniprocessor system, Arm recommends that each Aff<n> field of this register returns a value of 0.

Attributes

MPIDR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																								Aff3								
RES1	U	RES0						MT	Aff2								Aff1								Aff0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of Aff0 for more information.

Aff3 is not supported in AArch32 state.

Bit [31]

Reserved, RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels.

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

Accessing MPIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b101

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then

OSDLR_EL1, OS Double Lock Register

The OSDLR_EL1 characteristics are:

Purpose

Used to control the OS Double Lock.

Configuration

AArch64 System register OSDLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGOSDLR\[31:0\]](#).

Attributes

OSDLR_EL1 is a 64-bit register.

Field descriptions

Bits [63:1]

Reserved, RES0.

DLK, bit [0] When FEAT_DoubleLock is implemented:

OS Double Lock control bit.

DLK	Meaning
0b0	OS Double Lock unlocked.
0b1	OS Double Lock locked, if DBGPRCR_EL1 .CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

Accessing OSDLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of [EDECCR](#) that are otherwise invisible to software, so it can save/restore the contents of [EDECCR](#) over powerdown on behalf of the external debugger.

Configuration

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGOSECCR\[31:0\]](#).

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to External register [EDECCR\[31:0\]](#).

If [OSLSR_EL1.OSLK](#) == 0, then OSECCR_EL1 returns an UNKNOWN value on reads and ignores writes.

Attributes

OSECCR_EL1 is a 64-bit register.

Field descriptions

When OSLSR_EL1.OSLK == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																EDECCR															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

EDECCR, bits [31:0]

Used for save/restore to [EDECCR](#) over powerdown.

Reads or writes to this field are indirect accesses to [EDECCR](#).

Accessing OSECCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSECCR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0110	0b010

```

OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configuration

AArch64 System register OSLAR_EL1 bits [31:0] are architecturally mapped to External register [OSLAR_EL1\[31:0\]](#).

The OS Lock can also be locked or unlocked using [DBGOSLAR](#).

Attributes

OSLAR_EL1 is a 64-bit register.

Field descriptions

Bits [63:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use [OSLSR_EL1](#).OSLK to check the current status of the lock.

Accessing OSLAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MSR OSLAR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0000	0b100

```

OSLSR_EL1, OS Lock Status Register

The OSLSR_EL1 characteristics are:

Purpose

Provides the status of the OS Lock.

Configuration

AArch64 System register OSLSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGOSLSR\[31:0\]](#).

Attributes

OSLSR_EL1 is a 64-bit register.

Field descriptions

Bits [63:4]

Reserved, RES0.

OSLM, bits [3, 0]

OS Lock model implemented. Identifies the form of OS save and restore mechanism implemented.

OSLM	Meaning
0b00	OS Lock not implemented.
0b10	OS Lock implemented.

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is OSLSR_EL1[3].
- OSLM[0] is OSLSR_EL1[0].

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

OSLK, bit [1]

OS Lock Status.

OSLK	Meaning
0b0	OS Lock unlocked.
0b1	OS Lock locked.

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Accessing OSLSR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSLSR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0001	0b100

```

PAR_EL1, Physical Address Register

The PAR_EL1 characteristics are:

Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

Configuration

AArch64 System register PAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register [PAR\[63:0\]](#).

AArch64 System register PAR_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

Single stage AT Instructions (ATS1*) report their result using the 128-bit format of PAR_EL1 if the translation system that they target uses VMSAv9-128.

ATS12* Instructions report their result using the 128-bit format PAR_EL1 if either of the following is true:

- if stage 2 translations are enabled and the stage 2 translation system uses VMSAv9-128.
- if stage 2 translations are disabled and the stage 1 translation system uses VMSAv9-128.

Otherwise, 64-bit format of PAR_EL1 is used.

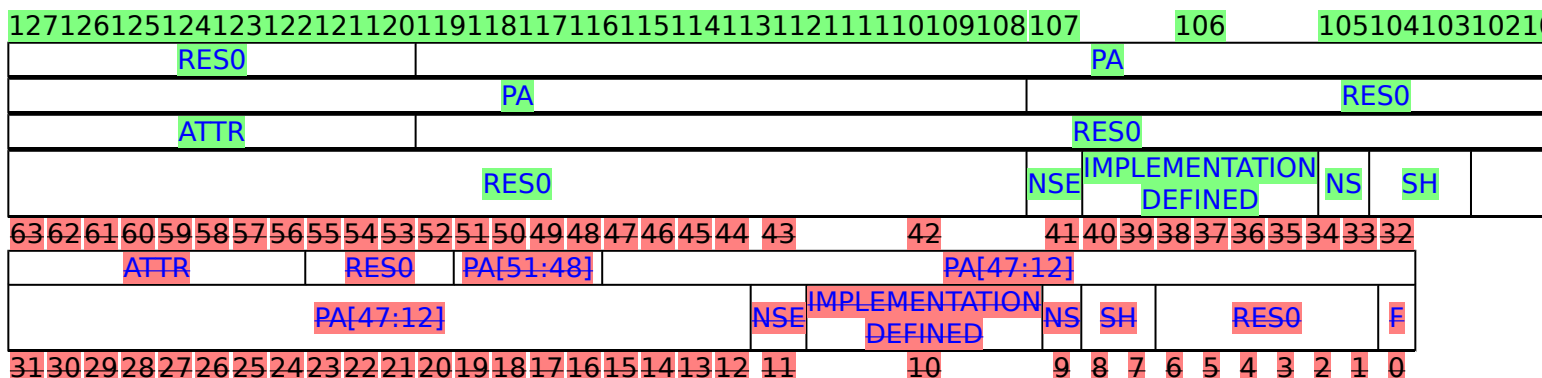

Attributes

PAR_EL1 is a: **64-bit register**.

- 128-bit register when FEAT_D128 is implemented, GetPAR_EL1_D128() == 1 and GetPAR_EL1_F() == 0
- 128-bit register when FEAT_D128 is implemented, GetPAR_EL1_D128() == 1 and GetPAR_EL1_F() == 1
- 128-bit register when FEAT_D128 is implemented, GetPAR_EL1_D128() == 0 and GetPAR_EL1_F() == 0
- 128-bit register when FEAT_D128 is implemented, GetPAR_EL1_D128() == 0 and GetPAR_EL1_F() == 1
- 64-bit register when FEAT_D128 is not implemented and GetPAR_EL1_F() == 0
- 64-bit register when FEAT_D128 is not implemented and GetPAR_EL1_F() == 1

Field descriptions

When **FEAT_D128 is implemented, GetPAR_EL1_D128() == 1 and GetPAR_EL1_F() == 0:**

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

Bits [127:120]

Reserved, RES0.

PA, bits [119:76]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[55:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [75:65]

Reserved, RES0.

D128, bit [64]

Indicates if the PAR_EL1 uses the 128-bit format.

D128	Meaning
0b1	PAR_EL1 uses the 128-bit format. PAR_EL1[127:0] holds valid data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in [MAIR_EL1](#), [MAIR_EL2](#), and [MAIR_EL3](#).

The value returned in this field can be the resulting attribute that is actually implemented by the implementation, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

Note

The attributes presented are consistent with the stages of translation applied in the address translation instruction. If the instruction performed a stage 1 translation only, the attributes are from the stage 1 translation. If the instruction performed a stage 1 and stage 2 translation, the attributes are from the combined stage 1 and stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [55:12]

Reserved, RES0.

NSE, bit [11]

When FEAT_RME is implemented:

Reports the NSE attribute for a translation table descriptor from the EL3 translation regime.

For a description of the values derived by evaluating NS and NSE together, see PAR_EL1.NS.

For a result from a Secure, Non-secure, or Realm translation regime, this bit is unknown.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

NS, bit [9]

When FEAT_RME is implemented:

Non-secure. The NS attribute for a translation table descriptor from a Secure translation regime, a Realm translation regime, and the EL3 translation regime.

NS	Meaning
0b0	When NSE == 0: Secure. When NSE == 1: Root.
0b1	When NSE == 0: Non-secure. When NSE == 1: Realm.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#), [AT S1E0R](#), and [AT S1E0W](#).
- In AArch32 state: [ATS1CPR](#), [ATS1CPW](#), [ATS1CPRP](#), [ATS1CPWP](#), [ATS1CUR](#), and [ATS1CUW](#).

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is unknown.

For a result from an S1E1 or S1E0 operation on the Realm EL1&0 translation regime, this bit is unknown.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RME is not implemented:

Non-secure.

The NS attribute for a translation table descriptor from a Secure translation regime.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#), [AT S1E0R](#), and [AT S1E0W](#).
- In AArch32 state: [ATS1CPR](#), [ATS1CPW](#), [ATS1CPRP](#), [ATS1CPWP](#), [ATS1CUR](#), and [ATS1CUW](#).

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is unknown.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bits [8:7]

Shareability attribute, for the returned output address.

SH	Meaning
0b00	Non-shareable.
0b01	Outer Shareable.
0b10	Inner Shareable.
0b11	Reserved.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is implemented, GetPAR_EL1_D128() == 1 and GetPAR_EL1_F() == 1:

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96	95	94	93	92	91	90	89	88	87	86	85	84	83	82	81	80	79	78	77	76	75	74	73	72	71	70	69	68	67	66	65	64	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																RES0																																																																																																															
																RES0																																																																																																															
IMPLEMENTATION DEFINED								IMPLEMENTATION DEFINED								IMPLEMENTATION DEFINED								RES0																																																																																																							
RES0																DirtyBitOverlay								TopLevel								AssuredOnly								RES1								RES0																																																																															

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

Bits [127:65]

Reserved, RES0.

D128, bit [64]

Indicates if the PAR_EL1 uses the 128-bit format.

D128	Meaning
0b1	PAR_EL1 uses the 128-bit format. PAR_EL1[127:0] holds valid data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:16]

Reserved, RES0.

DirtyBit, bit [15]

When FEAT_S1PIE is implemented or FEAT_S2PIE is implemented:

DirtyBit flag.

If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, this field holds information about the fault.

DirtyBit	Meaning
0b0	The Permission Fault is not due to nDirty State or Dirty State.
0b1	The Permission Fault is due to nDirty State or Dirty State.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [14]

When FEAT_S1POE is implemented or FEAT_S2POE is implemented:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, this field holds information about the fault.

Overlay	Meaning
0b0	The Data Abort is due to Base Permissions.
0b1	The Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TopLevel, bit [13]

When FEAT_THE is implemented:

Fault due to TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [12]

When FEAT_THE is implemented:

AssuredOnly flag.

If a memory access generates a Stage 2 Data Abort, this field holds information about the fault.

AssuredOnly	Meaning
0b0	The Data Abort is not due to AssuredOnly.
0b1	The Data Abort is due to AssuredOnly.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

S	Meaning
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort ESR encoding.

FST	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.

0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b111101	Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When EL1 is capable of using AArch32
0b111110	Page Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When EL1 is capable of using AArch32

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is implemented, GetPAR_EL1_D128() == 0 and GetPAR_EL1_F() == 0:

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107		106		105	104	103	102	101	
RES0																													
RES0																													
ATTR						RES0						PA[51:48]						PA[47:12]											
PA[47:12]																		NSE		IMPLEMENTATION DEFINED				NS		SH			

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the Translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the Translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

Bits [127:65]

Reserved, RES0.

D128, bit [64]

Indicates if the PAR_EL1 uses the 128-bit format.

D128	Meaning
0b1	PAR_EL1 uses the 128-bit format. PAR_EL1[127:0] holds valid data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in [MAIR_EL1](#), [MAIR_EL2](#), and [MAIR_EL3](#).

The value returned in this field can be the resulting attribute that is actually implemented by the implementation, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

Note

The attributes presented are consistent with the stages of translation applied in the address translation instruction. If the instruction performed a stage 1 translation only, the attributes are from the stage 1 translation. If the instruction performed a stage 1 and stage 2 translation, the attributes are from the combined stage 1 and stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

PA[51:48], bits [51:48]**When FEAT_LPA is implemented:**

Extension to PA[47:12]. For more information, see PA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[47:12], bits [47:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When FEAT_LPA is implemented and 52-bit addresses are in use, PA[51:48] forms the upper part of the address value. Otherwise, when 52-bit addresses are not in use, PA[51:48] is RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [11]**When FEAT_RME is implemented:**

Reports the NSE attribute for a translation table entry from the EL3 translation regime.

For a description of the values derived by evaluating NS and NSE together, see PAR_EL1.NS.

For a result from a Secure, Non-secure, or Realm translation regime, this bit is UNKNOWN.

Otherwise:

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]**When FEAT_RME is implemented:**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime, a Realm translation regime, and the EL3 translation regime.

For a result from an EL3 translation regime, NS and NSE are evaluated together to report the physical address space:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit distinguishes between the Secure state and state Non-secure of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#), [AT S1E0R](#), and [AT S1E0W](#).
- In AArch32 state: [ATS1CPR](#), [ATS1CPW](#), [ATS1CPRP](#), [ATS1CPWP](#), [ATS1CUR](#), and [ATS1CUW](#).

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

For a result from an S1E1 or S1E0 operation on the Realm EL1&0 translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when [SCR_EL3.EEL2](#) is 1, this bit distinguishes between the Secure Security and state Non-secure of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#), [AT S1E0R](#), and [AT S1E0W](#).
- In AArch32 state: [ATS1CPR](#), [ATS1CPW](#), [ATS1CPRP](#), [ATS1CPWP](#), [ATS1CUR](#), and [ATS1CUW](#).

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is implemented, GetPAR_EL1_D128() == 0 and GetPAR_EL1_F()PAR_EL1.F == 1:

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96	95	94	93	92	91	90	89	88	87	86	85	84	83	82	81	80	79	78	77	76	75	74	73	72	71	70	69	68	67	66	65	64	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

Bits [127:65]

Reserved, RES0.

D128, bit [64]

Indicates if the PAR_EL1 uses the 128-bit format.

D128	Meaning
0b1	PAR_EL1 uses the 128-bit format. PAR_EL1[127:0] holds valid data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:16:12]

Reserved, RES0.

DirtyBit, bit [15]**When FEAT_S1PIE is implemented or FEAT_S2PIE is implemented:**

DirtyBit flag.

If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, this field holds information about the fault.

DirtyBit	Meaning
0b0	The Permission Fault is not due to nDirty State or Dirty State.
0b1	The Permission Fault is due to nDirty State or Dirty State.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [14]**When FEAT_S1POE is implemented or FEAT_S2POE is implemented:**

Overlay flag. If a memory access generates a Data Abort for a Permission fault, this field holds information about the fault.

Overlay	Meaning
0b0	The Data Abort is due to Base Permissions.
0b1	The Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TopLevel, bit [13]**When FEAT_THE is implemented:**

Fault due to TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b1	Fault is due to TopLevel.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [12]**When FEAT_TTE is implemented:**

AssuredOnly flag.

If a memory access generates a Stage 2 Data Abort, this field holds information about the fault.

AssuredOnly	Meaning
0b0	The Data Abort is not due to AssuredOnly.
0b1	The Data Abort is due to AssuredOnly.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

S	Meaning
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort exception ESR encoding.

FST	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented

0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b111101	Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When EL1 is capable of using AArch32
0b111110	Page Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When EL1 is capable of using AArch32

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PAR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0111	0b0100	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.PAR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = PAR_EL1;
elseif PSTATE.EL == EL2 then
    X[t, 64] = PAR_EL1;
elseif PSTATE.EL == EL3 then
    X[t, 64] = PAR_EL1;

```

MSR PAR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b0111	0b0100	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGWTR_EL2.PAR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        PAR_EL1 = X[t, 64];
elseif PSTATE.EL == EL2 then
    PAR_EL1 = X[t, 64];
elseif PSTATE.EL == EL3 then
    PAR_EL1 = X[t, 64];

```

When FEAT_D128 is not implemented and GetPAR_EL1_F() == 0:

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the Translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the Translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR EL1, MAIR EL2, and MAIR EL3.

If FEAT_MTE_PERM is implemented and the instruction performed a stage 2 translation, the following additional encoding is defined:

ATTR	Meaning
0b11100000	Tagged NoTagAccess Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Note: This encoding in MAIR ELx is Reserved

The value returned in this field can be the resulting attribute that is actually implemented by the implementation, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

Note

The attributes presented are consistent with the stages of translation applied in the address translation instruction. If the instruction performed a stage 1 translation only, the attributes are from the stage 1 translation. If the instruction performed a stage 1 and stage 2 translation, the attributes are from the combined stage 1 and stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

PA[51:48], bits [51:48]

When FEAT_LPA is implemented:

Extension to PA[47:12]. For more information, see PA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[47:12], bits [47:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When FEAT_LPA is implemented and 52-bit addresses are in use, PA[51:48] forms the upper part of the address value. Otherwise, when 52-bit addresses are not in use, PA[51:48] is RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [11]

When FEAT_RME is implemented:

Reports the NSE attribute for a translation table entry from the EL3 translation regime.

For a description of the values derived by evaluating NS and NSE together, see PAR_EL1.NS.

For a result from a Secure, Non-secure, or Realm translation regime, this bit is UNKNOWN.

Otherwise:

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]**When FEAT_RME is implemented:**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime, a Realm translation regime, and the EL3 translation regime.

For a result from an EL3 translation regime, NS and NSE are evaluated together to report the physical address space:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

For a result from a Secure translation regime, when [SCR_EL3.EEL2](#) is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#), [AT S1E0R](#), and [AT S1E0W](#).
- In AArch32 state: [ATS1CPR](#), [ATS1CPW](#), [ATS1CPRP](#), [ATS1CPWP](#), [ATS1CUR](#), and [ATS1CUW](#).

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

For a result from an S1E1 or S1E0 operation on the Realm EL1&0 translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when [SCR_EL3.EEL2](#) is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#), [AT S1E0R](#), and [AT S1E0W](#).
- In AArch32 state: [ATS1CPR](#), [ATS1CPW](#), [ATS1CPRP](#), [ATS1CPWP](#), [ATS1CUR](#), and [ATS1CUW](#).

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is not implemented and GetPAR_EL1_F() == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39								
IMPLEMENTATION DEFINED								IMPLEMENTATION DEFINED								IMPLEMENTATION DEFINED								RES0								
RES0																DirtyBit	Overlay	TopLevel	AssuredOnly	RES1	RES0	S	PTW	RES								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7								

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:16]

Reserved, RES0.

DirtyBit, bit [15]**When FEAT_S1PIE is implemented or FEAT_S2PIE is implemented:**

DirtyBit flag.

If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, this field holds information about the fault.

DirtyBit	Meaning
0b0	The Permission Fault is not due to nDirty State or Dirty State.
0b1	The Permission Fault is due to nDirty State or Dirty State.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [14]**When FEAT_S1POE is implemented or FEAT_S2POE is implemented:**

Overlay flag. If a memory access generates a Data Abort for a Permission fault, this field holds information about the fault.

Overlay	Meaning
0b0	The Data Abort is due to Base Permissions.
0b1	The Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TopLevel, bit [13]**When FEAT_THE is implemented:**

Fault due to TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b1	Fault is due to TopLevel.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [12]

When FEAT_TTE is implemented:

AssuredOnly flag.

If a memory access generates a Stage 2 Data Abort, this field holds information about the fault.

AssuredOnly	Meaning
0b0	The Data Abort is not due to AssuredOnly.
0b1	The Data Abort is due to AssuredOnly.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

S	Meaning
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort exception ESR encoding.

FST	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented

0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b111101	Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When EL1 is capable of using AArch32
0b111110	Page Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When EL1 is capable of using AArch32

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PAR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0111	0b0100	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGTR_EL2.PAR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = PAR_EL1<63:0>;
elsif PSTATE.EL == EL2 then
    X[t, 64] = PAR_EL1<63:0>;
