0bxxxx1010	Normal memory, Inner Write-Through Non-transient, Read-allocate.
0bxxxx1011	Normal memory, Inner Write-Through Non-transient, Read-allocate Write-allocate.
0bxxxx1100	Normal memory, Inner Write-Back Non-transient, No allocate.
0bxxxx1101	Normal memory, Inner Write-Back Non-transient, Write-allocate.
0bxxxx1110	Normal memory, Inner Write-Back Non-transient, Read-allocate.
0bxxxx1111	Normal memory, Inner Write-Back Non-transient, Read-allocate Write-allocate.

The reset behavior of this field is:

- On a Cold reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Attr[7:4]	Meaning
0b0000	Device memory. The Device memory type is defined by TRBMAR_EL1.Attr[3:0].
0b0001	Normal memory, Outer Write-Through Transient, Write-allocate.
0b0010	Normal memory, Outer Write-Through Transient, Read-allocate.
0b0011	Normal memory, Outer Write-Through Transient, Read-allocate Write-allocate.
0b0100	Normal memory, Outer Non-cacheable.
0b0101	Normal memory, Outer Write-Back Transient, Write-allocate.
0b0110	Normal memory, Outer Write-Back Transient, Read-allocate.
0b0111	Normal memory, Outer Write-Back Transient, Read-allocate Write-allocate.
0b1000	Normal memory, Outer Write-Through Non-transient, No allocate.
0b1001	Normal memory, Outer Write-Through Non-transient, Write-allocate.
0b1010	Normal memory, Outer Write-Through Non-transient, Read-allocate.
0b1011	Normal memory, Outer Write-Through Non-transient, Read-allocate Write-allocate.
0b1100	Normal memory, Outer Write-Back Non-transient, No allocate.
0b1101	Normal memory, Outer Write-Back Non-transient, Write-allocate.
0b1110	Normal memory, Outer Write-Back Non-transient, Read-allocate.
0b1111	Normal memory, Outer Write-Back Non-transient, Read-allocate Write-allocate.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Reserved Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the Outer cacheability attributes, for memory addressed by the trace buffer. RES0.

Attr[3:0], bits [3:0]

When TRBMAR_EL1.Attr[7:4] == 0b0000:

Trace buffer memory attributes. Defines the Device memory attributes for memory addressed by the trace buffer.

Attr[3:0]	Meaning	Applies when
0b0000	Device-nGnRnE memory.	
0b0100	Device-nGnRE memory.	
0b1000	Device-nGRE memory.	
0b1100	Device-GRE memory.	
0b0001	Device-nGnRnE memory with the XS attribute set to 0.	When FEAT_XS is implemented
0b0101	Device-nGnRE memory with the XS attribute set to 0.	When FEAT_XS is implemented
0b1001	Device-nGRE memory with the XS attribute set to 0.	When FEAT_XS is implemented
0b1101	Device-GRE memory with the XS attribute set to 0.	When FEAT_XS is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trace buffer memory attributes. Defines the Inner cacheability attributes for memory addressed by the trace buffer.

Attr[3:0]	Meaning	Applies when
0b0000	The memory type is defined by TRBMAR_EL1.Attr[7:4].	When FEAT_MTE2 is implemented or FEAT_XS is implemented
0b0001	Normal memory, Inner Write-Through Transient, Write-allocate.	
0b0010	Normal memory, Inner Write-Through Transient, Read-allocate.	
0b0011	Normal memory, Inner Write-Through Transient, Read-allocate Write-allocate.	
0b0100	Normal memory, Inner Non-cacheable.	
0b0101	Normal memory, Inner Write-Back Transient, Write-allocate.	
0b0110	Normal memory, Inner Write-Back Transient, Read-allocate.	
0b0111	Normal memory, Inner Write-Back Transient, Read-allocate Write-allocate.	
0b1000	Normal memory, Inner Write-Through Non-transient, No allocate.	
0b1001	Normal memory, Inner Write-Through Non-transient, Write-allocate.	
0b1010	Normal memory, Inner Write-Through Non-transient, Read-allocate.	
0b1011	Normal memory, Inner Write-Through Non-transient, Read-allocate Write-allocate.	
0b1100	Normal memory, Inner Write-Back Non-transient, No allocate.	
0b1101	Normal memory, Inner Write-Back Non-transient, Write-allocate.	
0b1110	Normal memory, Inner Write-Back Non-transient, Read-allocate.	
0b1111	Normal memory, Inner Write-Back Non-transient, Read-allocate Write-allocate.	

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBMAR_EL1

The PE might ignore a direct write to TRBMAR_EL1 if `TRBLIMITR_EL1.E == 1`.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBMAR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

TRBSR_EL1, Trace Buffer Status/syndrome Register

The TRBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software for a trace buffer management event.

Configuration

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBSR_EL1 are UNDEFINED.

Attributes

TRBSR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33

IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer**Bits [23:8]**

Reserved, RES0.

AssuredOnly, bit [7]

When FEAT_THE is implemented, TRBSR_EL1.EC == 0b100101 and GetTRBSR_EL1_FSC() == 0b0011xx:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]

When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetTRBSR_EL1_FSC() == 0b0011xx:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort due to Base Permissions.
0b1	Data Abort due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]

When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetTRBSR_EL1_FSC() == 0b0011xx:

DirtyBit flag. If a memory access generates a Data Abort (Write Access) for a Permission fault (When using Indirect Permission), then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to state of nDirty / Dirty bit.
0b1	Permission Fault is due to state of nDirty / Dirty bit.

Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

EC, bits [31:26]

Event class. Top-level description of the cause of the trace buffer management event.

EC	Meaning	MSS	Applies when
0b000000	Other trace buffer management event. All trace buffer management events other than those described by the other defined Event class codes.	MSS encoding for Granule Protection Check faultMSS encoding for other trace buffer management events	
0b011110	Granule Protection Check fault on write to trace buffer, other than Granule Protection Fault (GPF). That on is, write any to of trace the following: buffer. <ul style="list-style-type: none"> Granule Protection Table (GPT) address size fault. GPT walk fault. Synchronous External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for other trace buffer management eventsMSS encoding for Granule Protection Check fault	When FEAT_RME is implemented
0b011111	Buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for Buffer management event for IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	
0b100101	Stage 2 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [25:2423]

Reserved, RES0.

DAT, bit [23]**When FEAT_TRBE_EXT is implemented:**

Data. Indicates when the Trace Buffer Unit has trace data that has not yet been written to memory.

DAT	Meaning
0b0	Internal buffers are empty. All Trace operations Accepted by the Trace Buffer Unit will Complete in finite time.
0b1	Internal buffers are not empty.

When [TRBSR_EL1](#).{DAT, S} is {0, 1}, meaning Collection is stopped and the Trace Buffer Unit internal buffers are empty, then all trace data has been written to memory. An additional Data Synchronization Barrier may be required to ensure that the writes are Complete. When [TRBSR_EL1](#).DAT is 0 and Collection is not stopped, there may still be trace data held by the trace unit that the Trace Buffer Unit has not Accepted.

That is, [TRBSR_EL1](#).DAT reads as 1 when the Trace Buffer Unit has Accepted trace data from the trace unit, but has not yet written it to memory.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IRQ, bit [22]

Maintenance interrupt status.

IRQ	Meaning
0b0	Maintenance interrupt is not asserted.
0b1	Maintenance interrupt is asserted.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

TRG, bit [21]

Triggered.

TRG	Meaning
0b0	No Detected Trigger has been observed since this field was last cleared to zero.
0b1	A Detected Trigger has been observed since this field was last cleared to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

WRAP, bit [20]

Wrapped.

WRAP	Meaning
0b0	The current write pointer has not wrapped since this field was last cleared to zero.
0b1	The current write pointer has wrapped since this field was last cleared to zero.

For each byte of trace the Trace Buffer Unit Accepts and writes to the trace buffer at the address in the current write pointer, if the current write pointer is equal to the Limit pointer minus one, the current write pointer is wrapped by setting it to the Base pointer, and this field is set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

EA, bit [18]

When the PE sets this bit as the result of an External Abort:

External Abort.

EA	Meaning
0b0	An External Abort has not been asserted.
0b1	An External Abort has been asserted and detected by the Trace Buffer Unit.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When the PE never sets this field as the result of an External Abort, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

S, bit [17]

Stopped.

S	Meaning
0b0	Collection has not been stopped.
0b1	Collection is stopped.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [16]

Reserved, RES0.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for other trace buffer management events

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Trace buffer status code.

BSC	Meaning	Applies when
0b000000	Collection not stopped, or access not allowed.	
0b000001	Trace buffer filled. Collection stopped because the current write pointer wrapped to the base pointer and the trace buffer mode is Fill mode.	
0b000010	Trigger Event. Collection stopped because of a Trigger Event. See TRBTRG_EL1 for more information.	
0b000011	Manual Stop. Collection stopped because of a Manual Stop event. See TRBCR.ManStop for more information.	When FEAT_TRBE_EXT is implemented

All other values are reserved.

MSS encoding for Buffer management event for IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

MSS encoding for Granule Protection Check fault

Bits [15:0]

Reserved, RES0.

MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code.

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented

0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

Accessing TRBSR_EL1

The PE might ignore a direct write to [TRBSR_EL1](#) if [TRBLIMITR_EL1](#).E == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBSR_EL1

The TRBTRG_EL1 characteristics are:

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBTRG_EL1 are UNDEFINED.

TRBTRG_EL1 is a 64-bit register.

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																
																TRG

Reserved, RES0.

Trigger count.

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

TRBTRG_EL1 decrements by 1 for every byte of trace written to the trace buffer when all of the following are true:

- TRBTRG_EL1 is nonzero.
- TRBSR_EL1.TRG is 1.

The architecture places restrictions on the values that software can write to the counter.

As a result of the restrictions an implementation might treat some of TRG[M:0] as RES0, where M is defined by [TRBIDR_EL1.Align](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

The PE might ignore a direct write to TRBTRG_EL1 if [TRBLIMITR_EL1.E](#) == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBTRG_EL1

op0	op1	CRn	CRm	op2

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [16]**When TRCIDR6.EXLEVEL_RL_EL0 == 1:**

Realm EL0 address comparison control. Controls whether a comparison can occur at EL0 in Realm state.

EXLEVEL_RL_EL0	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator performs comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator does not perform comparisons in Realm EL0.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator does not perform comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator performs comparisons in Realm EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [14]**When Non-secure EL2 is implemented:**

Non-secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Non-secure state.

EXLEVEL_NS_EL2	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL2.
0b1	The Address Comparator does not perform comparisons in Non-secure EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [13]**When Non-secure EL1 is implemented:**

Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.

EXLEVEL_NS_EL1	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL1.
0b1	The Address Comparator does not perform comparisons in Non-secure EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [12]**When Non-secure EL0 is implemented:**

Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.

EXLEVEL_NS_EL0	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL0.
0b1	The Address Comparator does not perform comparisons in Non-secure EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [11]**When EL3 is implemented:**

EL3 address comparison control. Controls whether a comparison can occur at EL3.

EXLEVEL_S_EL3	Meaning
0b0	The Address Comparator performs comparisons in EL3.
0b1	The Address Comparator does not perform comparisons in EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [10]**When EL2 is implemented and FEAT_SEL2 is implemented:**

Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.

EXLEVEL_S_EL2	Meaning
0b0	The Address Comparator performs comparisons in Secure EL2.
0b1	The Address Comparator does not perform comparisons in Secure EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [9]**When Secure EL1 is implemented:**

Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.

EXLEVEL_S_EL1	Meaning
0b0	The Address Comparator performs comparisons in Secure EL1.
0b1	The Address Comparator does not perform comparisons in Secure EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_ELO, bit [8]**When Secure EL0 is implemented:**

Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

EXLEVEL_S_ELO	Meaning
0b0	The Address Comparator performs comparisons in Secure EL0.
0b1	The Address Comparator does not perform comparisons in Secure EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

CONTEXT, bits [6:4]**When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:**

Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:

CONTEXT	Meaning	Applies when
0b000	Comparator 0.	
0b001	Comparator 1.	When UInt(TRCIDR4.NUMCIDC) > 1 or UInt(TRCIDR4.NUMVMIDC) > 1
0b010	Comparator 2.	When UInt(TRCIDR4.NUMCIDC) > 2 or UInt(TRCIDR4.NUMVMIDC) > 2
0b011	Comparator 3.	When UInt(TRCIDR4.NUMCIDC) > 3 or UInt(TRCIDR4.NUMVMIDC) > 3
0b100	Comparator 4.	When UInt(TRCIDR4.NUMCIDC) > 4 or UInt(TRCIDR4.NUMVMIDC) > 4
0b101	Comparator 5.	When UInt(TRCIDR4.NUMCIDC) > 5 or UInt(TRCIDR4.NUMVMIDC) > 5
0b110	Comparator 6.	When UInt(TRCIDR4.NUMCIDC) > 6 or UInt(TRCIDR4.NUMVMIDC) > 6
0b111	Comparator 7.	When UInt(TRCIDR4.NUMCIDC) > 7 or UInt(TRCIDR4.NUMVMIDC) > 7

The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CONTEXTTYPE, bits [3:2]**When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:**

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons.

CONTEXTTYPE	Meaning	Applies when
0b00	The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators.	
0b01	The Address Comparator is dependent on the Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Context Identifier Comparator and the address comparison match.	When TRCIDR4.NUMCIDC != 0b0000
0b10	The Address Comparator is dependent on the Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Virtual Context Identifier Comparator and the address comparison match.	When TRCIDR4.NUMVMIDC != 0b0000
0b11	The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if the Context Identifier Comparator, the Virtual Context Identifier Comparator, and address comparison all match.	When TRCIDR4.NUMCIDC != 0b0000 and TRCIDR4.NUMVMIDC != 0b0000

If [TRCIDR4.NUMCIDC](#) == 0b0000, then bit [2] is RES0.

If [TRCIDR4.NUMVMIDC](#) == 0b0000, then bit [3] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [1:0]

Reserved, RES0.

Accessing TRCACATR<n>

Must be programmed if any of the following are true:

- [TRCBBCTL](#)R.RANGE[n/2] == 1.
- [TRCRSCTL](#)R<a>.GROUP == 0b0100 and [TRCRSCTL](#)R<a>.SAC[n] == 1.
- [TRCRSCTL](#)R<a>.GROUP == 0b0101 and [TRCRSCTL](#)R<a>.ARC[n/2] == 1.
- [TRCVIIECTL](#)R.EXCLUDE[n/2] == 1.
- [TRCVIIECTL](#)R.INCLUDE[n/2] == 1.
- [TRCVISSCTL](#)R.START[n] == 1.
- [TRCVISSCTL](#)R.STOP[n] == 1.
- TRCSSCCR<>.ARC[n/2] == 1.

TRCACVR<n>, Address Comparator Value Register <n>, n = 0 - 15

The TRCACVR<n> characteristics are:

Purpose

Contains the address value.

Configuration

AArch64 System register TRCACVR<n> bits [63:0] are architecturally mapped to External register [TRCACVR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented** and $\text{UInt}(\text{TRCIDR4.NUMACPAIRS}) * 2 > n$. Otherwise, direct accesses to TRCACVR<n> are UNDEFINED.

Attributes

TRCACVR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																ADDRESS															
																ADDRESS															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ADDRESS, bits [63:0]

Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in the TRCACVR<n>. This requires that the trace analyzer always programs all implemented bits of the TRCACVR<n>.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an UNKNOWN value, where P is defined as the maximum virtual address size supported by the PE.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value, and a read of the register returns the written value.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCACVR<n>

Must be programmed if any of the following are true:

- [TRCBBCTLR](#).RANGE[n/2] == 1.
- [TRCRSCTLR<a>](#).GROUP == 0b0100 and [TRCRSCTLR<a>](#).SAC[n] == 1.
- [TRCRSCTLR<a>](#).GROUP == 0b0101 and [TRCRSCTLR<a>](#).ARC[n/2] == 1.

- [TRCVIIECTLR.EXCLUDE\[n/2\]](#) == 1.
- [TRCVIIECTLR.INCLUDE\[n/2\]](#) == 1.
- [TRCVISSCTLR.START\[n\]](#) == 1.
- [TRCVISSCTLR.STOP\[n\]](#) == 1.
- TRCSSCCR<>.ARC[n/2] == 1.
- TRCSSCCR<>.SAC[n] == 1.
- [TRCQCTL.RANGE\[n/2\]](#) == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCACVR<m> ; Where m = 0-15

TRCAUTHSTATUS, Authentication Status Register

The TRCAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information, see the CoreSight Architecture Specification.

Configuration

AArch64 System register TRCAUTHSTATUS bits [31:0] are architecturally mapped to External register [TRCAUTHSTATUS\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and FEAT_TRC_SR is implemented. Otherwise, direct accesses to TRCAUTHSTATUS are UNDEFINED.

Attributes

TRCAUTHSTATUS is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTNID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLNID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.

HNID, bits [11:10]

Hyp Non-invasive Debug. Indicates whether a separate enable control for EL2 non-invasive debug features is implemented and enabled.

HNID	Meaning
0b00	Separate Hyp non-invasive debug enable not implemented, or EL2 non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

HID, bits [9:8]

Hyp Invasive Debug. Indicates whether a separate enable control for EL2 invasive debug features is implemented and enabled.

HID	Meaning
0b00	Separate Hyp invasive debug enable not implemented, or EL2 invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

SNID, bits [7:6]

Secure Non-invasive Debug. Indicates whether Secure non-invasive debug features are implemented and enabled.

SNID	Meaning
0b00	Secure non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

When EL3 is implemented, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b00.

When EL3 is not implemented and the PE is Secure, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

SID, bits [5:4]

Secure Invasive Debug. Indicates whether Secure invasive debug features are implemented and enabled.

SID	Meaning
0b00	Secure invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

NSNID, bits [3:2]

Non-secure Non-invasive Debug. Indicates whether Non-secure non-invasive debug features are implemented and enabled.

NSNID	Meaning
0b00	Non-secure non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

When EL3 is implemented, this field reads as 0b11.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b11.

When EL3 is not implemented and the PE is Secure, this field reads as 0b00.

NSID, bits [1:0]

Non-secure Invasive Debug. Indicates whether Non-secure invasive debug features are implemented and enabled.

NSID	Meaning
0b00	Non-secure invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

Accessing TRCAUTHSTATUS

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCAUTHSTATUS

op0	op1	CRn	CRm	op2
0b10	0b001	0b0111	0b1110	0b110

```

if PSTATE.EL == EL0 then

TRCAUXCTLR, Auxiliary Control Register

The TRCAUXCTLR characteristics are:

Purpose

The function of this register is IMPLEMENTATION DEFINED.

Configuration

AArch64 System register TRCAUXCTLR bits [31:0] are architecturally mapped to External register [TRCAUXCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_SR is **implemented**. Otherwise, direct accesses to TRCAUXCTLR are UNDEFINED.

Attributes

TRCAUXCTLR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Accessing TRCAUXCTLR

If this register is nonzero then it might cause the behavior of a trace unit to contradict this architecture specification. See the documentation of the specific implementation for information about the IMPLEMENTATION DEFINED support for this register.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCAUXCTLR

op0	op1	CRn	CRm	op2
-----	-----	-----	-----	-----

0b10	0b001	0b0000	0b0110	0b000

The TRCBBCTLR characteristics are:

Purpose

Controls the regions in the memory map where branch broadcasting is active.

Configuration

AArch64 System register TRCBBCTLR bits [31:0] are architecturally mapped to External register [TRCBBCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented**, TRCIDR0.TRCBB == 1 and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCBBCTLR are UNDEFINED.

Attributes

TRCBBCTLR is a 64-bit register.

Field descriptions

6362616059585756555453525150494847464544434241	40	39	38	37	36	35	34

						4	3
							2

Bits [63:9]

Reserved, RES0.

MODE, bit [8]

Mode.

MODE	Meaning
0b0	Exclude Mode. Branch broadcasting is not active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then branch broadcasting is active for all instructions.
0b1	Include Mode. Branch broadcasting is active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then the behavior of the trace unit is CONSTRAINED UNPREDICTABLE. That is, the trace unit might or might not consider any instructions to be in a branch broadcasting region.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Address range field.

Selects whether Address Range Comparator <m> is used with branch broadcasting.

RANGE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected.
0b1	The address range that Address Range Comparator <m> defines, is selected.

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCBBCTLR

Must be programmed if [TRCCONFIGR](#).BB == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCBBCTLR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1111	0b000

TRCCCCTLR, Cycle Count Control Register

The TRCCCCTLR characteristics are:

Purpose

Set the threshold value for cycle counting.

Configuration

AArch64 System register TRCCCCTLR bits [31:0] are architecturally mapped to External register [TRCCCCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, [FEAT_TRC_SR is implemented](#) and TRCIDR0.TRCCCI == 1. Otherwise, direct accesses to TRCCCCTLR are UNDEFINED.

Attributes

TRCCCCTLR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
												RES0																			
RES0												THRESHOLD																			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:12]

Reserved, RES0.

THRESHOLD, bits [11:0]

Sets the threshold value for instruction trace cycle counting.

The minimum threshold value that can be programmed into THRESHOLD is given in [TRCIDR3.CCITMIN](#). If the THRESHOLD value is smaller than the value in [TRCIDR3.CCITMIN](#) then the behavior is CONSTRAINED UNPREDICTABLE. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

Writing a value of zero when [TRCCONFIGR.CCI](#) enables instruction trace cycle counting results in CONSTRAINED UNPREDICTABLE behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCCCTLR

Must be programmed if [TRCCONFIGR.CCI](#) == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCCCTLR

op0	op1	CRn	CRm	op2

TRCCIDCCTLR0, Context Identifier Comparator Control Register 0

The TRCCIDCCTLR0 characteristics are:

Purpose

Contains Context identifier mask values for the [TRCCIDCVR<n>](#) registers, for n = 0 to 3.

Configuration

AArch64 System register TRCCIDCCTLR0 bits [31:0] are architecturally mapped to External register [TRCCIDCCTLR0\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented**, $\text{UInt}(\text{TRCIDR4.NUMCIDC}) > 0 \times 0$ and $\text{UInt}(\text{TRCIDR2.CIDSIZE}) > 0$. Otherwise, direct accesses to TRCCIDCCTLR0 are UNDEFINED.

Attributes

TRCCIDCCTLR0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

COMP3[<m>], bit [m+24], for m = 7 to 0 When UInt(TRCIDR4.NUMCIDC) > 3:

TRCCIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR3. Each bit in this field corresponds to a byte in TRCCIDCVR3.

COMP3[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 2:

TRCCIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR2. Each bit in this field corresponds to a byte in TRCCIDCVR2.

COMP2[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 1:

TRCCIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR1. Each bit in this field corresponds to a byte in TRCCIDCVR1.

COMP1[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 0:

TRCCIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0.

COMP0[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2](#).CIDSIZE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTLR0

If software uses the [TRCCIDCVR<n>](#) registers, for n = 0 to 3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCCIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCCIDCVR<n>](#) is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCIDCCTLR0

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	0b0000	0b010

TRCCIDCCTLR1, Context Identifier Comparator Control Register 1

The TRCCIDCCTLR1 characteristics are:

Purpose

Contains Context identifier mask values for the [TRCCIDCVR<n>](#) registers, for n = 4 to 7.

Configuration

AArch64 System register TRCCIDCCTLR1 bits [31:0] are architecturally mapped to External register [TRCCIDCCTLR1\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented**, $\text{UInt}(\text{TRCIDR4.NUMCIDC}) > 0x4$ and $\text{UInt}(\text{TRCIDR2.CIDSIZE}) > 0$. Otherwise, direct accesses to TRCCIDCCTLR1 are UNDEFINED.

Attributes

TRCCIDCCTLR1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53
COMP7[7] COMP7[6] COMP7[5] COMP7[4] COMP7[3] COMP7[2] COMP7[1] COMP7[0] COMP6[7] COMP6[6] COMP6[5] COMP6[4]										
31	30	29	28	27	26	25	24	23	22	21

Bits [63:32]

Reserved, RES0.

COMP7[<m>], bit [m+24], for m = 7 to 0 When UInt(TRCIDR4.NUMCIDC) > 7:

TRCCIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR7. Each bit in this field corresponds to a byte in TRCCIDCVR7.

COMP7[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 6:

TRCCIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR6. Each bit in this field corresponds to a byte in TRCCIDCVR6.

COMP6[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 5:

TRCCIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR5. Each bit in this field corresponds to a byte in TRCCIDCVR5.

COMP5[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 4:

TRCCIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR4. Each bit in this field corresponds to a byte in TRCCIDCVR4.

COMP4[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2](#).CIDSIZE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTLR1

If software uses the [TRCCIDCVR<n>](#) registers, for n = 4 to 7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCCIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCCIDCVR<n>](#) is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCIDCCTLR1

TRCCIDCVR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																VALUE															
																VALUE															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

VALUE, bits [63:0]

Context identifier value. The width of this field is indicated by [TRCIDR2.CIDSIZE](#). Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Context identifier is zero until the PE updates the Context identifier.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCIDCVR<n>

Must be programmed if any of the following are true:

- [TRCRSCTLR<a>](#).GROUP == 0b0110 and [TRCRSCTLR<a>](#).CID[n] == 1.
- [TRCACATR<a>](#).CONTEXTTYPE == 0b01 or 0b11 and [TRCACATR<a>](#).CONTEXT == n.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCIDCVR<m> ; Where m = 0-7

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	m[2:0]:0b0	0b000

```

TRCCLAIMCLR, Claim Tag Clear Register

The TRCCLAIMCLR characteristics are:

Purpose

In conjunction with [TRCCLAIMSET](#), provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

AArch64 System register TRCCLAIMCLR bits [31:0] are architecturally mapped to External register [TRCCLAIMCLR\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_SR is implemented. Otherwise, direct accesses to TRCCLAIMCLR are UNDEFINED.

Attributes

TRCCLAIMCLR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50
CLR[31]	CLR[30]	CLR[29]	CLR[28]	CLR[27]	CLR[26]	CLR[25]	CLR[24]	CLR[23]	CLR[22]	CLR[21]	CLR[20]	CLR[19]	CLR[18]
31	30	29	28	27	26	25	24	23	22	21	20	19	18

Bits [63:32]

Reserved, RES0.

CLR[<m>], bit [m], for m = 31 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLR[<m>]	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The number of Claim Tag bits implemented is indicated in [TRCCLAIMSET](#).

This bit reads-as-zero and ignores writes if m > the number of Claim Tag bits.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Access to this field is **W1C**.

Accessing TRCCLAIMCLR

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCLAIMCLR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0111	0b1001	0b110

TRCCLAIMSET, Claim Tag Set Register

The TRCCLAIMSET characteristics are:

Purpose

In conjunction with [TRCCLAIMCLR](#), provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

AArch64 System register TRCCLAIMSET bits [31:0] are architecturally mapped to External register [TRCCLAIMSET\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_SR is implemented. Otherwise, direct accesses to TRCCLAIMSET are UNDEFINED.

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as 0b1111.

Attributes

TRCCLAIMSET is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	
SET[31]	SET[30]	SET[29]	SET[28]	SET[27]	SET[26]	SET[25]	SET[24]	SET[23]	SET[22]	SET[21]	SET[20]	SET[19]	SET[18]	SET[17]
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17

Bits [63:32]

Reserved, RES0.

SET[<m>], bit [m], for m = 31 to 0

Claim Tag Set. Indicates whether Claim Tag bit <m> is implemented, and is used to set Claim Tag bit <m> to 1.

SET[<m>]	Meaning
0b0	On a read: Claim Tag bit <m> is not implemented. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is implemented. On a write: Set Claim Tag bit <m> to 1.

This bit reads-as-zero and ignores writes if m > the number of Claim Tag bits.

Access to this field is **RAO/W1S**.

Accessing TRCCLAIMSET

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCLAIMSET

TRCCNTCTLR<n>, Counter Control Register <n>, n = 0 - 3

The TRCCNTCTLR<n> characteristics are:

Purpose

Controls the operation of Counter <n>.

Configuration

AArch64 System register TRCCNTCTLR<n> bits [31:0] are architecturally mapped to External register [TRCCNTCTLR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented** and `UInt(TRCIDR5.NUMCNTR) > n`. Otherwise, direct accesses to TRCCNTCTLR<n> are UNDEFINED.

Attributes

TRCCNTCTLR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35

Bits [63:18]

Reserved, RES0.

CNTCHAIN, bit [17]

For TRCCNTCTLR3 and TRCCNTCTLR1, this field controls whether the Counter decrements when a reload event occurs for Counter <n-1>.

CNTCHAIN	Meaning
0b0	The Counter does not decrement when a reload event for Counter <n-1> occurs.
0b1	Counter <n> decrements when a reload event for Counter <n-1> occurs. This concatenates Counter <n> and Counter <n-1>, to provide a larger count value.

CNTCHAIN is not implemented for TRCCNTCTLR0 and TRCCNTCTLR2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDSELF, bit [16]

Controls whether a reload event occurs for the Counter, when the Counter reaches zero.

RLDSELF	Meaning
0b0	Normal mode. The Counter is in Normal mode.
0b1	Self-reload mode. The Counter is in Self-reload mode.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDEVENT_TYPE, bit [15]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes a reload event for Counter <n>.

RLDEVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCCNTCTLR<n>.RLDEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.RLDEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

RLDEVENT_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.TYPE controls whether TRCCNTCTLR<n>.RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes a reload event for Counter <n>.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

CNTEVENT_TYPE, bit [7]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes Counter <n> to decrement.

CNTEVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCCNTCTLR<n>.CNTEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.CNTEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

CNTEVENT_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.TYPE controls whether TRCCNTCTLR<n>.CNTEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes Counter <n> to decrement.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTCTLR<n>

Must be programmed if [TRCRSCTLR<a>.GROUP == 0b0010](#) and [TRCRSCTLR<a>.COUNTERS\[n\] == 1](#).

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

TRCCNTRLDVR<n>, Counter Reload Value Register <n>, n = 0 - 3

The TRCCNTRLDVR<n> characteristics are:

Purpose

This sets or returns the reload count value for Counter <n>.

Configuration

AArch64 System register TRCCNTRLDVR<n> bits [31:0] are architecturally mapped to External register [TRCCNTRLDVR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented** and $UInt(TRCIDR5.NUMCNTR) > n$. Otherwise, direct accesses to TRCCNTRLDVR<n> are UNDEFINED.

Attributes

TRCCNTRLDVR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
																RES0

Bits [63:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the reload value for Counter <n>. When a reload event occurs for Counter <n> then the trace unit copies the VALUE<n> field into Counter <n>.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTRLDVR<n>

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0010 and [TRCRSCTLR<a>](#).COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

TRCCONFIGR, Trace Configuration Register

The TRCCONFIGR characteristics are:

Purpose

Controls the tracing options.

Configuration

AArch64 System register TRCCONFIGR bits [31:0] are architecturally mapped to External register [TRCCONFIGR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and FEAT_TRC_SR is implemented. Otherwise, direct accesses to TRCCONFIGR are UNDEFINED.

Attributes

TRCCONFIGR is a 64-bit register.

Field descriptions

Bits [63:19]16

Reserved, RES0.

ITO, bit [18]
When TRCIDR0.ITE == 1:

Instrumentation Trace Override.

ITO	Meaning
0b0	Instrumentation Trace Override disabled.
0b1	Instrumentation Trace Override enabled.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [17:16]

Reserved, RES0.

VMIDOPT, bit [15]**When TRCIDR2.VMIDOPT == 0b01:**

Virtual context identifier selection control.

VMIDOPT	Meaning
0b0	VTTBR_EL2 .VMID is used as the Virtual context identifier.
0b1	CONTEXTIDR_EL2 .PROCID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == 0b00:

Reserved, RES0.

Virtual context identifier selection control.

[VTTBR_EL2](#).VMID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == 0b10:

Reserved, RES1.

Virtual context identifier selection control.

[CONTEXTIDR_EL2](#).PROCID is used as the Virtual context identifier.

Otherwise:

Reserved, RES0.

QE, bits [14:13]**When TRCIDR0.QSUPP == 0b01:**

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b01	Q elements with instruction counts are enabled.
	Q elements without instruction counts are disabled.

All other values are reserved.

When TRCIDR0.QSUPP == 0b10:

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b11	Q elements with instruction counts are enabled.
	Q elements without instruction counts are enabled.

All other values are reserved.

When TRCIDR0.QSUPP == 0b11:

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b01	Q elements with instruction counts are enabled.
	Q elements without instruction counts are disabled.
0b11	Q elements with instruction counts are enabled.
	Q elements without instruction counts are enabled.

All other values are reserved.

Otherwise:

Reserved, RES0.

RS, bit [12]**When TRCIDR0.RETSTACK == 1:**

Return stack control.

RS	Meaning
0b0	Return stack is disabled.
0b1	Return stack is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TS, bit [11]**When TRCIDR0.TSSIZE != 0b00000:**

Global timestamp tracing control.

TS	Meaning
0b0	Global timestamp tracing is disabled.
0b1	Global timestamp tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [10:8]

Reserved, RES0.

VMID, bit [7]**When TRCIDR2.VMIDSIZE != 0b000000:**

Virtual context identifier tracing control.

VMID	Meaning
0b0	Virtual context identifier tracing is disabled.
0b1	Virtual context identifier tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CID, bit [6]**When TRCIDR2.CIDSIZE != 0b000000:**

Context identifier tracing control.

CID	Meaning
0b0	Context identifier tracing is disabled.
0b1	Context identifier tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

CCI, bit [4]**When TRCIDR0.TRCCCI == 1:**

Cycle counting instruction tracing control.

CCI	Meaning
0b0	Cycle counting instruction tracing is disabled.
0b1	Cycle counting instruction tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BB, bit [3]
When TRCIDR0.TRCBB == 1:

Branch broadcasting control.

BB	Meaning
0b0	Branch broadcasting is disabled.
0b1	Branch broadcasting is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [2:1]

Reserved, RES0.

Bit [0]

Reserved, RES1.

Accessing TRCCONFIGR

Must always be programmed.

TRCCONFIGR.QE must be set to 0b00 if TRCCONFIGR.BB is not 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCONFIGR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0100	0b000

TRCDEVARCH, Device Architecture Register

The TRCDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

AArch64 System register TRCDEVARCH bits [31:0] are architecturally mapped to External register [TRCDEVARCH\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and FEAT_TRC_SR is implemented. Otherwise, direct accesses to TRCDEVARCH are UNDEFINED.

Attributes

TRCDEVARCH is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
ARCHITECT											PRESENT	REVISION				ARCHVER				ARCHPART											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

ARCHITECT	Meaning
0b01000111011	JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

PRESENT, bit [20]

DEVARCH Present. Defines that the DEVARCH register is present.

PRESENT	Meaning
0b0	Device Architecture information not present.
0b1	Device Architecture information present.

This field reads as 1.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

REVISION	Meaning
0b0000	ETEv1.0, FEAT_ETE.
0b0001	ETEv1.1, FEAT_ETEv1p1.
0b0010	ETEv1.2, FEAT_ETEv1p2.
0b0011	ETEv1.3, FEAT_ETEv1p3.

All other values are reserved.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0101	ETEv1.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0x5.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA13	Arm PE trace architecture.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA13.

Accessing TRCDEVARCH

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCDEVARCH

TRCEVENTCTL0R, Event Control 0 Register

The TRCEVENTCTL0R characteristics are:

Purpose

Controls the generation of ETEEvents.

Configuration

AArch64 System register TRCEVENTCTL0R bits [31:0] are architecturally mapped to External register [TRCEVENTCTL0R\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC SR is implemented** and TRCIDR4.NUMRSPAIR != 0b0000. Otherwise, direct accesses to TRCEVENTCTL0R are UNDEFINED.

Attributes

TRCEVENTCTL0R is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	
RES0																											
EVENT3_TYPE	RES0	EVENT3_SEL	EVENT2_TYPE	RES0	EVENT2_SEL	EVENT1_TYPE	RES0	EVENT1_SEL	EVENT0_TYPE	RES0																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	

Bits [63:32]

Reserved, RES0.

EVENT3_TYPE, bit [31]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 3:

Chooses the type of Resource Selector.

EVENT3_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT3.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT3.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:29]

Reserved, RES0.

EVENT3_SEL, bits [28:24]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 3:

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.TYPE controls whether TRCEVENTCTL0R.EVENT3.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R.INSTEN\[3\]](#) == 1, then Event element 3 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT2_TYPE, bit [23]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 2:

Chooses the type of Resource Selector.

EVENT2_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT2.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT2.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [22:21]

Reserved, RES0.

EVENT2_SEL, bits [20:16]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 2:

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.TYPE controls whether TRCEVENTCTL0R.EVENT2.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R.INSTEN\[2\]](#) == 1, then Event element 2 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT1_TYPE, bit [15]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 1:

Chooses the type of Resource Selector.

EVENT1_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT1.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT1.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [14:13]

Reserved, RES0.

EVENT1_SEL, bits [12:8]**When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 1:**

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.TYPE controls whether TRCEVENTCTL0R.EVENT1.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R.INSTEN\[1\]](#) == 1, then Event element 1 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT0_TYPE, bit [7]**When TRCIDR4.NUMRSPAIR != 0b0000:**

Chooses the type of Resource Selector.

EVENT0_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT0.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT0.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT0_SEL, bits [4:0]**When TRCIDR4.NUMRSPAIR != 0b0000:**

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.TYPE controls whether TRCEVENTCTL0R.EVENT0.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[0] == 1, then Event element 0 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCEVENTCTL0R

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCEVENTCTL0R

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1000	0b000

TRCEVENTCTL1R, Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

Purpose

Controls the behavior of the ETEEvents that [TRCEVENTCTL0R](#) selects.

Configuration

AArch64 System register TRCEVENTCTL1R bits [31:0] are architecturally mapped to External register [TRCEVENTCTL1R\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_SR is **implemented**. Otherwise, direct accesses to TRCEVENTCTL1R are UNDEFINED.

Attributes

TRCEVENTCTL1R is a 64-bit register.

Field descriptions

Bits [63:14]13

Reserved, RES0.

OE, bit [13]
When TRCIDR5.OE == 1:

ETE Trace Output Enable control.

OE	Meaning
0b0	Trace output to any IMPLEMENTATION DEFINED trace output interface is disabled.
0b1	Trace output to any IMPLEMENTATION DEFINED trace output interface is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Otherwise:

Reserved, RES0.

LPOVERRIDE, bit [12]**When TRCIDR5.LPOVERRIDE == 1:**

Low-power Override Mode select.

LPOVERRIDE	Meaning
0b0	Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.
0b1	Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation.

Otherwise:

Reserved, RES0.

ATB, bit [11]**When TRCIDR5.ATBTRIG == 1:**

AMBA Trace Bus (ATB) trigger enable.

If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:

- ATID == 0x7D.
- ATDATA to the value of [TRCTRACEIDR](#).

If the width of ATDATA is greater than the width of [TRCTRACEIDR](#).TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.

If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

ATB	Meaning
0b0	ATB trigger is disabled.
0b1	ATB trigger is enabled.

Otherwise:

Reserved, RES0.

Bits [10:4]

Reserved, RES0.

INSTEN[<m>], bit [m], for m = 3 to 0

Event element control.

INSTEN[<m>]	Meaning
0b0	The trace unit does not generate an Event element <m>.
0b1	The trace unit generates an Event element <m>.

This bit is RES0 if m >= the number indicated by [TRCIDR0](#).NUMEVENT.

Accessing TRCEVENTCTL1R

Must be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCEVENTCTL1R

op0	op1	CRn	CRm	op2

TRCEXTINSEL<n>, External Input Select Register <n>, n = 0 - 3

The TRCEXTINSEL<n> characteristics are:

Purpose

Use this to set, or read, which External Inputs are resources to the trace unit.

The name TRCEXTINSEL is an alias of TRCEXTINSEL0.

Configuration

AArch64 System register TRCEXTINSEL<n> bits [31:0] are architecturally mapped to External register [TRCEXTINSEL<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented** and $UInt(TRCIDR5.NUMEXTINSEL) > n$. Otherwise, direct accesses to TRCEXTINSEL<n> are UNDEFINED.

Attributes

TRCEXTINSEL<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range 0x0000 to 0x003F are common architectural and microarchitectural events.
- PMU event numbers in the range 0x0040 to 0x00BF are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range 0x00C0 to 0x03FF are IMPLEMENTATION DEFINED PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range 0x0000 to 0x003F, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.

- For IMPLEMENTATION DEFINED PMU events, it is UNPREDICTABLE what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

UNPREDICTABLE means the PMU event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common IMPLEMENTATION DEFINED PMU events, then no PMU event is counted and the value read back on evtCount is the value written.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCEXTINSELR<n>

Must be programmed if any of the following is true: [TRCRSCTLR<a>](#).GROUP == 0b0000 and [TRCRSCTLR<a>](#).EXTIN[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCEXTINSELR<m> ; Where m = 0-3

op0	op1	CRn	CRm	op2

TRCIDR0, ID Register 0

The TRCIDR0 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

AArch64 System register TRCIDR0 bits [31:0] are architecturally mapped to External register [TRCIDR0\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_SR is **implemented**. Otherwise, direct accesses to TRCIDR0 are UNDEFINED.

Attributes

TRCIDR0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46
RES0	COMMTRANS	COMMOPT	TSSIZE	TSMARK	ITERES0	RES0	TRCEXDATA	TRCEXDATA	QSUPP	QSUPP	QFILT	QFILT	CONL				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14

Bits [63:31]

Reserved, RES0.

COMMTRANS, bit [30]

Transaction Start element behavior.

COMMTRANS	Meaning
0b0	Transaction Start elements are P0 elements.
0b1	Transaction Start elements are not P0 elements.

COMMOPT, bit [29]

Indicates the contents and encodings of Cycle count packets.

COMMOPT	Meaning
0b0	Commit mode 0.
0b1	Commit mode 1.

The Commit mode defines the contents and encodings of Cycle Count packets, in particular how Commit elements are indicated by these packets. See the descriptions of these packets for more details.

Accessing this field has the following behavior:

- Access is **RAO/WI** if all of the following are true:
 - TRCIDR0.TRCCCI == 1
 - UInt(TRCIDR8.MAXSPEC) == 0x0
- When TRCIDR0.TRCCCI == 0, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

TSSIZE, bits [28:24]

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.

TSSIZE	Meaning
0b00000	Global timestamping not implemented.
0b01000	Global timestamping implemented with a 64-bit timestamp value.

All other values are reserved.

This field reads as 0b01000.

TSMARK, bit [23]**When FEAT_ETEv1p1 is implemented:**

Indicates whether Timestamp Marker elements are generated.

TSMARK	Meaning
0b0	Timestamp Marker elements are not generated.
0b1	Timestamp Marker elements are generated.

Otherwise:

Reserved, RES0.

ITE, Bits bit [22:18]**When FEAT_ETEv1p3 is implemented:**

Indicates whether Instrumentation Trace is implemented.

ITE	Meaning
0b0	Instrumentation Trace not implemented.
0b1	Instrumentation Trace implemented.

This field has the value 1 if FEAT_ITE is implemented.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [21:18]

Reserved, RES0.

TRCEXDATA, bit [17]**When TRCIDR0.TRCDATA != 0b00:**

Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

TRCEXDATA	Meaning
0b0	Tracing of data transfers for exceptions and exception returns not implemented.
0b1	Tracing of data transfers for exceptions and exception returns implemented.

Otherwise:

Reserved, RES0.

QSUPP, bits [16:15]

Indicates that the trace unit implements Q element support.

QSUPP	Meaning
0b00	Q element support is not implemented.
0b01	Q element support is implemented, and only supports Q elements with instruction counts.
0b10	Q element support is implemented, and only supports Q elements without instruction counts.
0b11	Q element support is implemented, and supports: <ul style="list-style-type: none"> • Q elements with instruction counts. • Q elements without instruction counts.

QFILT, bit [14]

Indicates if the trace unit implements Q element filtering.

QFILT	Meaning
0b0	Q element filtering is not implemented.
0b1	Q element filtering is implemented.

If TRCIDR0.QSUPP == 0b00 then this field is 0.

CONDTYPE, bits [13:12]**When TRCIDR0.TRCCOND == 1:**

Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

CONDTYPE	Meaning
0b00	Conditional instructions are traced with an indication of whether they pass or fail their condition code check.
0b01	Conditional instructions are traced with an indication of the APSR condition flags.

All other values are reserved.

Otherwise:

Reserved, RES0.

NUMEVENT, bits [11:10]**When TRCIDR4.NUMRSPAIR == 0b0000:**

Indicates the number of ETEEvents implemented.

NUMEVENT	Meaning
0b00	The trace unit supports 0 ETEEvents.

All other values are reserved.

When TRCIDR4.NUMRSPAIR != 0b0000:

Indicates the number of ETEEvents implemented.

NUMEVENT	Meaning
0b00	The trace unit supports 1 ETEEvent.
0b01	The trace unit supports 2 ETEEvents.
0b10	The trace unit supports 3 ETEEvents.
0b11	The trace unit supports 4 ETEEvents.

Otherwise:

Reserved, RES0.

RETSTACK, bit [9]

Indicates if the trace unit supports the return stack.

RETSTACK	Meaning
0b0	Return stack not implemented.
0b1	Return stack implemented.

Bit [8]

Reserved, RES0.

TRCCCI, bit [7]

Indicates if the trace unit implements cycle counting.

TRCCCI	Meaning
0b0	Cycle counting not implemented.
0b1	Cycle counting implemented.

This field reads as 1.

TRCCOND, bit [6]

Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

TRCCOND	Meaning
0b0	Conditional instruction tracing not implemented.
0b1	Conditional instruction tracing implemented.

This field reads as 0.

TRCBB, bit [5]

Indicates if the trace unit implements branch broadcasting.

TRCBB	Meaning
0b0	Branch broadcasting not implemented.
0b1	Branch broadcasting implemented.

This field reads as 1.

TRCDATA, bits [4:3]

Indicates if the trace unit implements data tracing. Data tracing is not implemented in ETE and this field is reserved for other trace architectures.

TRCDATA	Meaning
0b00	Data tracing not implemented.
0b11	Data tracing implemented.

All other values are reserved.

This field reads as 0b00.

INSTP0, bits [2:1]

Indicates if load and store instructions are P0 instructions. Load and store instructions as P0 instructions is not implemented in ETE and this field is reserved for other trace architectures.

INSTP0	Meaning
0b00	Load and store instructions are not P0 instructions.
0b11	Load and store instructions are P0 instructions.

All other values are reserved.

This field reads as 0b00.

Bit [0]

Reserved, RES1.

Accessing TRCIDR0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIDR0

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1000	0b111

TRCIDR1, ID Register 1

The TRCIDR1 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

AArch64 System register TRCIDR1 bits [31:0] are architecturally mapped to External register [TRCIDR1\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_SR is **implemented**. Otherwise, direct accesses to TRCIDR1 are UNDEFINED.

Attributes

TRCIDR1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
DESIGNER								RES0								RES1				TRCARCHMAJ				TRCARCHMIN				REVISION			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

DESIGNER, bits [31:24]

Indicates which company designed the trace unit. The permitted values of this field are the same as [MIDR_EL1](#).Implementer.

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RES1.

TRCARCHMAJ, bits [11:8]

Major architecture version.

TRCARCHMAJ	Meaning
0b1111	If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH .

All other values are reserved.

This field reads as 0b1111.

TRCARCHMIN, bits [7:4]

Minor architecture version.

TRCARCHMIN	Meaning
0b1111	If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH .

All other values are reserved.

This field reads as 0b1111.

REVISION, bits [3:0]

Implementation revision.

Returns an IMPLEMENTATION DEFINED value that identifies the revision of the trace unit.

Arm deprecates any use of this field and recommends that implementations set this field to zero.

Accessing TRCIDR1

Accesses to this register use the following encodings in the System register encoding space:

TRCIDR2, ID Register 2

The TRCIDR2 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

AArch64 System register TRCIDR2 bits [31:0] are architecturally mapped to External register [TRCIDR2\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_SR is **implemented**. Otherwise, direct accesses to TRCIDR2 are UNDEFINED.

Attributes

TRCIDR2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
WFXMODE	VMIDOPT	CCSIZE	DVSIZE	DASIZE	VMIDSIZE	CIDSIZE	IASIZE																								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

WFXMODE, bit [31]

Indicates whether WFI, WFIT, WFE, and WFET instructions are classified as P0 instructions:

WFXMODE	Meaning
0b0	WFI, WFIT, WFE, and WFET instructions are not classified as P0 instructions.
0b1	WFI, WFIT, WFE, and WFET instructions are classified as P0 instructions.

VMIDOPT, bits [30:29]

Indicates the options for Virtual context identifier selection.

VMIDOPT	Meaning
0b00	Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES0.
0b01	Virtual context identifier selection supported. TRCCONFIGR.VMIDOPT is implemented.
0b10	Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES1.

All other values are reserved.

If TRCIDR2.VMIDSIZE == 0b000000 then this field is 0b00.

If TRCIDR2.VMIDSIZE != 0b000000 then this field is 0b10.

CCSIZE, bits [28:25]

When TRCIDR0.TRCCCI == 1:

Indicates the size of the cycle counter.

CCSIZE	Meaning
0b0000	The cycle counter is 12 bits in length.
0b0001	The cycle counter is 13 bits in length.
0b0010	The cycle counter is 14 bits in length.
0b0011	The cycle counter is 15 bits in length.
0b0100	The cycle counter is 16 bits in length.
0b0101	The cycle counter is 17 bits in length.
0b0110	The cycle counter is 18 bits in length.
0b0111	The cycle counter is 19 bits in length.
0b1000	The cycle counter is 20 bits in length.

All other values are reserved.

Otherwise:

Reserved, RES0.

DVSIZE, bits [24:20]

When TRCIDR0.TRCDATA != 0b00:

Indicates the data value size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

DVSIZE	Meaning
0b00000	Data value tracing not implemented.
0b00100	Data value tracing has a maximum of 32-bit data values.
0b01000	Data value tracing has a maximum of 64-bit data values.

All other values are reserved.

Otherwise:

Reserved, RES0.

DASIZE, bits [19:15]

When TRCIDR0.TRCDATA != 0b00:

Indicates the data address size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

DASIZE	Meaning
0b00000	Data address tracing not implemented.
0b00100	Data address tracing has a maximum of 32-bit data addresses.
0b01000	Data address tracing has a maximum of 64-bit data addresses.

All other values are reserved.

Otherwise:

Reserved, RES0.

VMIDSIZE, bits [14:10]

Indicates the trace unit Virtual context identifier size.

VMIDSIZE	Meaning
0b00000	Virtual context identifier tracing is not supported.
0b00001	8-bit Virtual context identifier size.
0b00010	16-bit Virtual context identifier size.
0b00100	32-bit Virtual context identifier size.

All other values are reserved.

If the PE does not implement EL2 then this field is 0b00000.

If the PE implements EL2 then this field is 0b00100.

CIDSIZE, bits [9:5]

Indicates the Context identifier size.

CIDSIZE	Meaning
0b00000	Context identifier tracing is not supported.
0b00100	32-bit Context identifier size.

All other values are reserved.

This field reads as 0b00100.

IASIZE, bits [4:0]

Virtual instruction address size.

IASIZE	Meaning
0b00100	Maximum of 32-bit instruction address size.
0b01000	Maximum of 64-bit instruction address size.

All other values are reserved.

This field reads as 0b01000.

Accessing TRCIDR2

Accesses to this register use the following encodings in the System register encoding space:

TRCIDR3, ID Register 3

The TRCIDR3 characteristics are:

Purpose

Returns the base architecture of the trace unit.

Configuration

AArch64 System register TRCIDR3 bits [31:0] are architecturally mapped to External register [TRCIDR3\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_SR is **implemented**. Otherwise, direct accesses to TRCIDR3 are UNDEFINED.

Attributes

TRCIDR3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52
NOOVERFLOW	NUMPROC[2:0]	SYSSTALL	STALLCTL	SYNCPR	TRCERR	RES0	EXLEVEL_NS_EL2	EXLEVEL_NS_EL1	EXLEVEL		R
31	30	29	28	27	26	25	24	23	22	21	20

Bits [63:32]

Reserved, RES0.

NOOVERFLOW, bit [31]

Indicates if overflow prevention is implemented.

NOOVERFLOW	Meaning
0b0	Overflow prevention is not implemented.
0b1	Overflow prevention is implemented.

If TRCIDR3.STALLCTL == 0 then this field is 0.

NUMPROC, bits [13:12, 30:28]

Indicates the number of PEs available for tracing.

NUMPROC	Meaning
0b00000	The trace unit can trace one PE.

This field reads as 0b00000.

The NUMPROC field is split as follows:

- NUMPROC[2:0] is TRCIDR3[30:28].
- NUMPROC[4:3] is TRCIDR3[13:12].

SYSSTALL, bit [27]

Indicates if stalling of the PE is permitted.

SYSSTALL	Meaning
0b0	Stalling of the PE is not permitted.
0b1	Stalling of the PE is permitted.

The value of this field might be dynamic and change based on system conditions.

If TRCIDR3.STALLCTL == 0 then this field is 0.

STALLCTL, bit [26]

Indicates if trace unit implements stalling of the PE.

STALLCTL	Meaning
0b0	Stalling of the PE is not implemented.
0b1	Stalling of the PE is implemented.

SYNCPR, bit [25]

Indicates if an implementation has a fixed synchronization period.

SYNCPR	Meaning
0b0	TRCSYNCPR is read/write so software can change the synchronization period.
0b1	TRCSYNCPR is read-only so the synchronization period is fixed.

This field reads as 0.

TRCERR, bit [24]

Indicates forced tracing of System Error exceptions is implemented.

TRCERR	Meaning
0b0	Forced tracing of System Error exceptions is not implemented.
0b1	Forced tracing of System Error exceptions is implemented.

This field reads as 1.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]

Indicates if Non-secure EL2 is implemented.

EXLEVEL_NS_EL2	Meaning
0b0	Non-secure EL2 is not implemented.
0b1	Non-secure EL2 is implemented.

EXLEVEL_NS_EL1, bit [21]

Indicates if Non-secure EL1 is implemented.

EXLEVEL_NS_EL1	Meaning
0b0	Non-secure EL1 is not implemented.
0b1	Non-secure EL1 is implemented.

EXLEVEL_NS_EL0, bit [20]

Indicates if Non-secure EL0 is implemented.

EXLEVEL_NS_EL0	Meaning
0b0	Non-secure EL0 is not implemented.
0b1	Non-secure EL0 is implemented.

EXLEVEL_S_EL3, bit [19]

Indicates if EL3 is implemented.

EXLEVEL_S_EL3	Meaning
0b0	EL3 is not implemented.
0b1	EL3 is implemented.

EXLEVEL_S_EL2, bit [18]

Indicates if Secure EL2 is implemented.

EXLEVEL_S_EL2	Meaning
0b0	Secure EL2 is not implemented.
0b1	Secure EL2 is implemented.

EXLEVEL_S_EL1, bit [17]

Indicates if Secure EL1 is implemented.

EXLEVEL_S_EL1	Meaning
0b0	Secure EL1 is not implemented.
0b1	Secure EL1 is implemented.

EXLEVEL_S_EL0, bit [16]

Indicates if Secure EL0 is implemented.

EXLEVEL_S_EL0	Meaning
0b0	Secure EL0 is not implemented.
0b1	Secure EL0 is implemented.

Bits [15:14]

Reserved, RES0.

CCITMIN, bits [11:0]

Indicates the minimum value that can be programmed in [TRCCCCTLR.THRESHOLD](#).

If [TRCIDR0.TRCCCI](#) == 1 then the minimum value of this field is 0x001.

If [TRCIDR0.TRCCCI](#) == 0 then this field is zero.

Accessing TRCIDR3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIDR3

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1011	0b111

TRCIDR4, ID Register 4

The TRCIDR4 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

AArch64 System register TRCIDR4 bits [31:0] are architecturally mapped to External register [TRCIDR4\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_SR is **implemented**. Otherwise, direct accesses to TRCIDR4 are UNDEFINED.

Attributes

TRCIDR4 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0

Bits [63:32]

Reserved, RES0.

NUMVMIDC, bits [31:28]

Indicates the number of Virtual Context Identifier Comparators that are available for tracing.

NUMVMIDC	Meaning
0b0000	No Virtual Context Identifier Comparators are available.
0b0001	The implementation has one Virtual Context Identifier Comparator.
0b0010	The implementation has two Virtual Context Identifier Comparators.
0b0011	The implementation has three Virtual Context Identifier Comparators.
0b0100	The implementation has four Virtual Context Identifier Comparators.
0b0101	The implementation has five Virtual Context Identifier Comparators.
0b0110	The implementation has six Virtual Context Identifier Comparators.
0b0111	The implementation has seven Virtual Context Identifier Comparators.
0b1000	The implementation has eight Virtual Context Identifier Comparators.

All other values are reserved.

NUMCIDC, bits [27:24]

Indicates the number of Context Identifier Comparators that are available for tracing.

NUMCIDC	Meaning
0b0000	No Context Identifier Comparators are available.
0b0001	The implementation has one Context Identifier Comparator.
0b0010	The implementation has two Context Identifier Comparators.
0b0011	The implementation has three Context Identifier Comparators.
0b0100	The implementation has four Context Identifier Comparators.
0b0101	The implementation has five Context Identifier Comparators.
0b0110	The implementation has six Context Identifier Comparators.
0b0111	The implementation has seven Context Identifier Comparators.
0b1000	The implementation has eight Context Identifier Comparators.

All other values are reserved.

NUMSSCC, bits [23:20]

Indicates the number of Single-shot Comparator Controls that are available for tracing.

NUMSSCC	Meaning
0b0000	No Single-shot Comparator Controls are available.
0b0001	The implementation has one Single-shot Comparator Control.
0b0010	The implementation has two Single-shot Comparator Controls.
0b0011	The implementation has three Single-shot Comparator Controls.
0b0100	The implementation has four Single-shot Comparator Controls.
0b0101	The implementation has five Single-shot Comparator Controls.
0b0110	The implementation has six Single-shot Comparator Controls.
0b0111	The implementation has seven Single-shot Comparator Controls.
0b1000	The implementation has eight Single-shot Comparator Controls.

All other values are reserved.

NUMRSPAIR, bits [19:16]

Indicates the number of resource selector pairs that are available for tracing.

NUMRSPAIR	Meaning
0b0000	The implementation has zero resource selectors.
0b0001	The implementation has two resource selector pairs.
0b0010	The implementation has three resource selector pairs.
0b0011	The implementation has four resource selector pairs.
0b0100	The implementation has five resource selector pairs.
0b0101	The implementation has six resource selector pairs.
0b0110	The implementation has seven resource selector pairs.
0b0111	The implementation has eight resource selector pairs.
0b1000	The implementation has nine resource selector pairs.
0b1001	The implementation has ten resource selector pairs.
0b1010	The implementation has eleven resource selector pairs.
0b1011	The implementation has twelve resource selector pairs.
0b1100	The implementation has thirteen resource selector pairs.
0b1101	The implementation has fourteen resource selector pairs.
0b1110	The implementation has fifteen resource selector pairs.
0b1111	The implementation has sixteen resource selector pairs.

All other values are reserved.

NUMPC, bits [15:12]

Indicates the number of PE Comparator Inputs that are available for tracing.

NUMPC	Meaning
0b0000	No PE Comparator Inputs are available.
0b0001	The implementation has one PE Comparator Input.
0b0010	The implementation has two PE Comparator Inputs.
0b0011	The implementation has three PE Comparator Inputs.
0b0100	The implementation has four PE Comparator Inputs.
0b0101	The implementation has five PE Comparator Inputs.
0b0110	The implementation has six PE Comparator Inputs.
0b0111	The implementation has seven PE Comparator Inputs.
0b1000	The implementation has eight PE Comparator Inputs.

All other values are reserved.

Bits [11:9]

Reserved, RES0.

SUPPDAC, bit [8]

When TRCIDR4.NUMACPAIRS != 0b0000:

Indicates whether data address comparisons are implemented. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

SUPPDAC	Meaning
0b0	Data address comparisons not implemented.
0b1	Data address comparisons implemented.

This field reads as 0.

Otherwise:

Reserved, RES0.

NUMDVC, bits [7:4]

Indicates the number of data value comparators. Data value comparators are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

NUMDVC	Meaning
0b0000	No data value comparators implemented.
0b0001	One data value comparator implemented.
0b0010	Two data value comparators implemented.
0b0011	Three data value comparators implemented.
0b0100	Four data value comparators implemented.
0b0101	Five data value comparators implemented.
0b0110	Six data value comparators implemented.
0b0111	Seven data value comparators implemented.
0b1000	Eight data value comparators implemented.

All other values are reserved.

This field reads as 0b0000.

NUMACPAIRS, bits [3:0]

Indicates the number of Address Comparator pairs that are available for tracing.

NUMACPAIRS	Meaning
0b0000	No Address Comparator pairs are available.
0b0001	The implementation has one Address Comparator pair.
0b0010	The implementation has two Address Comparator pairs.
0b0011	The implementation has three Address Comparator pairs.
0b0100	The implementation has four Address Comparator pairs.
0b0101	The implementation has five Address Comparator pairs.
0b0110	The implementation has six Address Comparator pairs.
0b0111	The implementation has seven Address Comparator pairs.
0b1000	The implementation has eight Address Comparator pairs.

All other values are reserved.

Accessing TRCIDR4

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIDR4

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1100	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;

(old)

htmldiff from-

(new)

All other values are reserved.

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0b000.

NUMSEQSTATE, bits [27:25]

Indicates if the Sequencer is implemented and the number of Sequencer states that are implemented.

NUMSEQSTATE	Meaning
0b000	The Sequencer is not implemented.
0b100	Four Sequencer states are implemented.

All other values are reserved.

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0b000.

Bit [24]

Reserved, RES0.

LPOVERRIDE, bit [23]

Indicates support for Low-power Override Mode.

LPOVERRIDE	Meaning
0b0	The trace unit does not support Low-power Override Mode.
0b1	The trace unit supports Low-power Override Mode.

ATBTRIG, bit [22]

Indicates if the implementation can support ATB triggers.

ATBTRIG	Meaning
0b0	The implementation does not support ATB triggers.
0b1	The implementation supports ATB triggers.

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0.

TRACEIDSIZE, bits [21:16]

Indicates the trace ID width.

TRACEIDSIZE	Meaning
0b000000	The external trace interface is not implemented.
0b000111	The implementation supports a 7-bit trace ID.

All other values are reserved.

Note that AMBA ATB requires a 7-bit trace ID width.

Bits [15:12]

Reserved, RES0.

NUMEXTINSEL, bits [11:9]

Indicates how many External Input Selector resources are implemented.

NUMEXTINSEL	Meaning
0b000	No External Input Selector resources are available.
0b001	1 External Input Selector resource is available.
0b010	2 External Input Selector resources are available.
0b011	3 External Input Selector resources are available.
0b100	4 External Input Selector resources are available.

All other values are reserved.

NUMEXTIN, bits [8:0]

Indicates how many External Inputs are implemented.

NUMEXTIN	Meaning
0b11111111	Unified PMU event selection.

All other values are reserved.

Accessing TRCIDR5

Accesses to this register use the following encodings in the System register encoding space:

TRCIDR8, ID Register 8

The TRCIDR8 characteristics are:

Purpose

Returns the maximum speculation depth of the instruction trace element stream.

Configuration

AArch64 System register TRCIDR8 bits [31:0] are architecturally mapped to External register [TRCIDR8\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and FEAT_TRC_SR is implemented. Otherwise, direct accesses to TRCIDR8 are UNDEFINED.

Attributes

TRCIDR8 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

MAXSPEC, bits [31:0]

Indicates the maximum speculation depth of the instruction trace element stream. This is the maximum number of P0 elements in the trace element stream that can be speculative at any time.

Accessing TRCIDR8

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIDR8

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0000	0b110

```

TRCIDR9, ID Register 9

The TRCIDR9 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

AArch64 System register TRCIDR9 bits [31:0] are architecturally mapped to External register [TRCIDR9\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_SR is **implemented**. Otherwise, direct accesses to TRCIDR9 are UNDEFINED.

Attributes

TRCIDR9 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

TRCIMSPEC0, IMP DEF Register 0

The TRCIMSPEC0 characteristics are:

Purpose

TRCIMSPEC0 shows the presence of any IMPLEMENTATION DEFINED features, and provides an interface to enable the features that are provided.

Configuration

AArch64 System register TRCIMSPEC0 bits [31:0] are architecturally mapped to External register [TRCIMSPEC0\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and FEAT_TRC_SR is implemented. Otherwise, direct accesses to TRCIMSPEC0 are UNDEFINED.

Attributes

TRCIMSPEC0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:8]

Reserved, RES0.

EN, bits [7:4] When TRCIMSPEC0.SUPPORT != 0b0000:

Enable. Controls whether the IMPLEMENTATION DEFINED features are enabled.

EN	Meaning
0b0000	The IMPLEMENTATION DEFINED features are not enabled. The trace unit must behave as if the IMPLEMENTATION DEFINED features are not supported.
0b0001	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0010	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0011	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0100	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0101	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0110	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0111	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1000	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1001	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1010	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1011	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1100	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1101	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1110	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1111	The trace unit behavior is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SUPPORT, bits [3:0]

Indicates whether the implementation supports IMPLEMENTATION DEFINED features.

SUPPORT	Meaning
0b0000	No IMPLEMENTATION DEFINED features are supported.
0b0001	IMPLEMENTATION DEFINED features are supported.
0b0010	IMPLEMENTATION DEFINED features are supported.
0b0011	IMPLEMENTATION DEFINED features are supported.
0b0100	IMPLEMENTATION DEFINED features are supported.
0b0101	IMPLEMENTATION DEFINED features are supported.
0b0110	IMPLEMENTATION DEFINED features are supported.
0b0111	IMPLEMENTATION DEFINED features are supported.
0b1000	IMPLEMENTATION DEFINED features are supported.
0b1001	IMPLEMENTATION DEFINED features are supported.
0b1010	IMPLEMENTATION DEFINED features are supported.
0b1011	IMPLEMENTATION DEFINED features are supported.
0b1100	IMPLEMENTATION DEFINED features are supported.
0b1101	IMPLEMENTATION DEFINED features are supported.
0b1110	IMPLEMENTATION DEFINED features are supported.
0b1111	IMPLEMENTATION DEFINED features are supported.

Use of nonzero values requires written permission from Arm.

Access to this field is **RO**.

Accessing TRCIMSPEC0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIMSPEC0

TRCIMSPEC<n>, IMP DEF Register <n>, n = 1 - 7

The TRCIMSPEC<n> characteristics are:

Purpose

These registers might return information that is specific to an implementation, or enable features specific to an implementation to be programmed. The product Technical Reference Manual describes these registers.

Configuration

AArch64 System register TRCIMSPEC<n> bits [31:0] are architecturally mapped to External register [TRCIMSPEC<n>\[31:0\]](#).

This register is present only when the trace unit implements this OPTIONAL register, **FEAT_ETE is implemented** and **FEAT_TRC_SRRFEAT_ETE** is implemented. Otherwise, direct accesses to TRCIMSPEC<n> are UNDEFINED.

Attributes

TRCIMSPEC<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

TRCIT, Trace Instrumentation

The TRCIT characteristics are:

Purpose

Generates an instrumentation packet in the trace.

Configuration

This instruction is present only when FEAT_ITE is implemented. Otherwise, direct accesses to TRCIT are UNDEFINED.

Attributes

TRCIT is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																VALUE															
																VALUE															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Value to be included in the Instrumentation packet.

Executing TRCIT

Accesses to this instruction use the following encodings in the System instruction encoding space:

TRCIT <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0010	0b111

```

if PSTATE.EL == EL0 then

TRCITECR_EL1, Instrumentation Trace Control Register (EL1)

The TRCITECR_EL1 characteristics are:

Purpose

Provides EL1 controls for Trace Instrumentation.

Configuration

This register is present only when FEAT_ITE is implemented and FEAT_TRC_SR is implemented. Otherwise, direct accesses to TRCITECR_EL1 are UNDEFINED.

Attributes

TRCITECR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:2]

Reserved, RES0.

E1E, bit [1]

EL1 Instrumentation Trace Enable.

E1E	Meaning
0b0	Instrumentation trace prohibited at EL1.
0b1	Instrumentation trace not prohibited at EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

E0E, bit [0]

EL0 Instrumentation Trace Enable.

E0E	Meaning
0b0	Instrumentation trace prohibited at EL0.
0b1	Instrumentation trace not prohibited at EL0.

This field is ignored by the PE when EL2 is implemented and enabled in the current Security state and [HCR_EL2.TGE](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing TRCITECR_EL1

TRCITECR_EL2, Instrumentation Trace Control Register (EL2)

The TRCITECR_EL2 characteristics are:

Purpose

Provides EL2 controls for Trace Instrumentation.

Configuration

This register is present only when FEAT_ITE is implemented and FEAT_TRC_SR is implemented. Otherwise, direct accesses to TRCITECR_EL2 are UNDEFINED.

Attributes

TRCITECR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:2]

Reserved, RES0.

E2E, bit [1]

EL2 Instrumentation Trace Enable.

E2E	Meaning
0b0	Instrumentation trace prohibited at EL2.
0b1	Instrumentation trace not prohibited at EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EOHE, bit [0]

EL0 Instrumentation Trace Enable.

EOHE	Meaning
0b0	Instrumentation trace prohibited at EL0 when HCR_EL2.TGE == 1.
0b1	Instrumentation trace not prohibited at EL0 when HCR_EL2.TGE == 1.

This field is ignored by the PE when any of the following are true:

- [HCR_EL2.TGE](#) == 0.
- EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing TRCITECR_EL2

When FEAT_VHE is implemented, and [HCR_EL2.E2H](#) is 1, without explicit synchronization, accesses from EL2 using the register name TRCITECR_EL2 or TRCITECR_EL1 are not guaranteed to be ordered with respect to accesses using the other register name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCITECR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0010	0b011

TRCITEEDCR, Instrumentation Trace Extension External Debug Control Register

The TRCITEEDCR characteristics are:

Purpose

Controls instrumentation trace filtering.

Configuration

This register is present only when FEAT_ETE is implemented, FEAT_TRC_SR is implemented and TRCIDR0.ITE == 1. Otherwise, direct accesses to TRCITEEDCR are UNDEFINED.

Attributes

TRCITEEDCR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32												
																RES0																											
																							RES0														RL	S	NS	E3	E2	E1	E0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0												

Bits [63:7]

Reserved, RES0.

RL, bit [6] When FEAT_RME is implemented:

Instrumentation Trace in Realm state.

RL	Meaning
0b0	Instrumentation trace prohibited in Realm state.
0b1	Instrumentation trace permitted in Realm state.

Used in conjunction with [TRCCONFIGR.ITO](#) and [TRCITEEDCR.E<m>](#) to control whether Instrumentation trace is permitted or prohibited in Realm state.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [5]**When Secure state is implemented:**

Instrumentation Trace in Secure state.

S	Meaning
0b0	Instrumentation trace prohibited in Secure state.
0b1	Instrumentation trace permitted in Secure state.

Used in conjunction with [TRCCONFIGR.ITO](#) and [TRCITEEDCR.E<m>](#) to control whether Instrumentation trace is permitted or prohibited in Secure state.

This field is ignored when `SelfHostedTraceEnabled()` returns TRUE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NS, bit [4]**When Any of Non-secure EL2, EL1, or EL0 are implemented:**

Instrumentation Trace in Non-secure state.

NS	Meaning
0b0	Instrumentation trace prohibited in Non-secure state.
0b1	Instrumentation trace permitted in Non-secure state.

Used in conjunction with [TRCCONFIGR.ITO](#) and [TRCITEEDCR.E<m>](#) to control whether Instrumentation trace is permitted or prohibited in Non-secure state.

This field is ignored when `SelfHostedTraceEnabled()` returns TRUE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [3]**When EL3 is implemented:**

Instrumentation Trace Enable at EL3.

E3	Meaning
0b0	Instrumentation trace prohibited at EL3.
0b1	Instrumentation trace permitted at EL3.

This field is ignored when `SelfHostedTraceEnabled()` returns TRUE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E<m>, bit [m], for m = 2 to 0

Instrumentation Trace Enable at EL<m>.

E<m>	Meaning
0b0	Instrumentation trace prohibited at EL<m>.
0b1	Instrumentation trace permitted at EL<m>.

Used in conjunction with [TRCCONFIGR.ITO](#), [TRCITEEDCR.NS](#), [TRCITEEDCR.S](#), and [TRCITEEDCR.RL](#) to control whether Instrumentation trace is permitted or prohibited at EL<m> in the specified security states.

This field is ignored when `SelfHostedTraceEnabled()` returns TRUE.

E<2> is RES0 if EL2 is not implemented in any security states.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCITEEDCR

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCITEEDCR

op0	op1	CRn	CRm	op2

TRCOSLSR, Trace OS Lock Status Register

The TRCOSLSR characteristics are:

Purpose

Returns the status of the Trace OS Lock.

Configuration

AArch64 System register TRCOSLSR bits [31:0] are architecturally mapped to External register [TRCOSLSR\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_SR is **implemented**. Otherwise, direct accesses to TRCOSLSR are UNDEFINED.

Attributes

TRCOSLSR is a 64-bit register.

Bits [63:5]

Reserved, RES0.

OSLM, bits [4:3, 0]

OS Lock model.

OSLM	Meaning
0b000	Trace OS Lock is not implemented.
0b010	Trace OS Lock is implemented.
0b100	Trace OS Lock is not implemented, and the trace unit is controlled by the PE OS Lock.

All other values are reserved.

This field reads as 0b100.

The OSLM field is split as follows:

- OSLM[2:1] is TRCOSLSR[4:3].
- OSLM[0] is TRCOSLSR[0].

Bit [2]

Reserved, RES0.

OSLK, bit [1]

OS Lock status.

OSLK	Meaning
0b0	The OS Lock is unlocked.
0b1	The OS Lock is locked.

Note that this field indicates the state of the PE OS Lock.

Accessing TRCOSLSR

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCOSLSR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0001	0b0001	0b100

TRCPRGCTLR, Programming Control Register

The TRCPRGCTLR characteristics are:

Purpose

Enables the trace unit.

Configuration

AArch64 System register TRCPRGCTLR bits [31:0] are architecturally mapped to External register [TRCPRGCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_SR is **implemented**. Otherwise, direct accesses to TRCPRGCTLR are UNDEFINED.

Attributes

TRCPRGCTLR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

TRCQCTLR, Q Element Control Register

The TRCQCTLR characteristics are:

Purpose

Controls when Q elements are enabled.

Configuration

AArch64 System register TRCQCTLR bits [31:0] are architecturally mapped to External register [TRCQCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, FEAT_TRC_SR is implemented and TRCIDR0.QFILT == 1. Otherwise, direct accesses to TRCQCTLR are UNDEFINED.

Attributes

TRCQCTLR is a 64-bit register.

Field descriptions

Bits [63:9]

Reserved, RES0.

MODE, bit [8]

Selects whether the Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:

MODE	Meaning
0b0	Exclude mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map.
0b1	Include Mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0 then Q elements are disabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Specifies whether Address Range Comparator <m> controls Q elements.

RANGE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected.
0b1	The address range that Address Range Comparator <m> defines, is selected.

This bit is RES0 if $m \geq \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCQCTLR

Must be programmed if $\text{TRCCONFIGR.QE} \neq 0b00$.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCQCTLR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0001	0b001

TRCRSCTLR<n>, Resource Selection Control Register <n>, n = 2 - 31

The TRCRSCTLR<n> characteristics are:

Purpose

Controls the selection of the resources in the trace unit.

Configuration

AArch64 System register TRCRSCTLR<n> bits [31:0] are architecturally mapped to External register [TRCRSCTLR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented** and $(\text{UInt}(\text{TRCIDR4.NUMRSPAIR}) + 1) * 2 > n$. Otherwise, direct accesses to TRCRSCTLR<n> are UNDEFINED.

Resource selector 0 always returns FALSE.

Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

Attributes

TRCRSCTLR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0										PAIRINV		INV		GROUP				SELECT													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:22]

Reserved, RES0.

PAIRINV, bit [21]

When n MOD 2 == 0:

Controls whether the combined result from a resource selector pair is inverted.

PAIRINV	Meaning
0b0	Do not invert the combined output of the 2 resource selectors.
0b1	Invert the combined output of the 2 resource selectors.

If:

- A is the register TRCRSCTLR<n>.
- B is the register TRCRSCTLR<n+1>.

Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:

- 0b000 -> A and B.
- 0b001 -> Reserved.
- 0b010 -> not(A) and B.
- 0b011 -> not(A) and not(B).
- 0b100 -> not(A) or not(B).
- 0b101 -> not(A) or B.
- 0b110 -> Reserved.
- 0b111 -> A or B.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

INV, bit [20]

Controls whether the resource, that TRCRSCTLR<n>.GROUP and TRCRSCTLR<n>.SELECT selects, is inverted.

INV	Meaning
0b0	Do not invert the output of this selector.
0b1	Invert the output of this selector.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

GROUP, bits [19:16]

Selects a group of resources.

GROUP	Meaning	SELECT
0b0000	External Input Selectors.	SELECT encoding for External Input Selectors
0b0001	PE Comparator Inputs.	SELECT encoding for PE Comparator Inputs
0b0010	Counters and Sequencer.	SELECT encoding for Counters and Sequencer
0b0011	Single-shot Comparator Controls.	SELECT encoding for Single-shot Comparator Controls
0b0100	Single Address Comparators.	SELECT encoding for Single Address Comparators
0b0101	Address Range Comparators.	SELECT encoding for Address Range Comparators
0b0110	Context Identifier Comparators.	SELECT encoding for Context Identifier Comparators
0b0111	Virtual Context Identifier Comparators.	SELECT encoding for Virtual Context Identifier Comparators

All other values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT, bits [15:0]

Resource Specific Controls. Contains the controls specific to the resource group selected by GROUP, described in the following sections.

SELECT encoding for External Input Selectors

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												EXTIN[3]	EXTIN[2]	EXTIN[1]	EXTIN[0]

Bits [15:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

Selects one or more External Inputs.

EXTIN[<m>]	Meaning
0b0	Ignore EXTIN <m>.
0b1	Select EXTIN <m>.

This bit is RES0 if m >= [TRCIDR5](#).NUMEXTINSEL.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for PE Comparator Inputs

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PECOMP[7]	PECOMP[6]	PECOMP[5]	PECOMP[4]	PECOMP[3]	PECOMP[2]	PECOMP[1]	PECOMP[0]

Bits [15:8]

Reserved, RES0.

PECOMP[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs.

PECOMP[<m>]	Meaning
0b0	Ignore PE Comparator Input <m>.
0b1	Select PE Comparator Input <m>.

This bit is RES0 if m >= [TRCIDR4](#).NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Counters and Sequencer

15	14	13	12	11	10	9	8	7	6	5	4	3	2
RES0								SEQUENCER[3]	SEQUENCER[2]	SEQUENCER[1]	SEQUENCER[0]	COUNTERS[3]	COUNTERS[2]

Bits [15:8]

Reserved, RES0.

SEQUENCER[<m>], bit [m+4], for m = 3 to 0

Sequencer states.

SEQUENCER[<m>]	Meaning
0b0	Ignore Sequencer state <m>.
0b1	Select Sequencer state <m>.

This bit is RES0 if m >= [TRCIDR5](#).NUMSEQSTATE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COUNTERS[<m>], bit [m], for m = 3 to 0

Counters resources at zero.

COUNTERS[<m>]	Meaning
0b0	Ignore Counter <m>.
0b1	Select Counter <m> is zero.

This bit is RES0 if m >= [TRCIDR5](#).NUMCNTR.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single-shot Comparator Controls

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	SINGLE_SHOT[7]	SINGLE_SHOT[6]	SINGLE_SHOT[5]	SINGLE_SHOT[4]	SINGLE_SHOT[3]	SINGLE_SHOT[2]	SINGLE_SHOT[1]	SINGLE_SHOT[0]	SINGLE_SHOT[7]	SINGLE_SHOT[6]	SINGLE_SHOT[5]	SINGLE_SHOT[4]	SINGLE_SHOT[3]	SINGLE_SHOT[2]	SINGLE_SHOT[1]

Bits [15:8]

Reserved, RES0.

SINGLE_SHOT[<m>], bit [m], for m = 7 to 0

Selects one or more Single-shot Comparator Controls.

SINGLE_SHOT[<m>]	Meaning
0b0	Ignore Single-shot Comparator Control <m>.
0b1	Select Single-shot Comparator Control <m>.

This bit is RES0 if m >= [TRCIDR4](#).NUMSSCC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single Address Comparators

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SAC[15]	SAC[14]	SAC[13]	SAC[12]	SAC[11]	SAC[10]	SAC[9]	SAC[8]	SAC[7]	SAC[6]	SAC[5]	SAC[4]	SAC[3]	SAC[2]	SAC[1]	SAC[0]

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators.

SAC[<m>]	Meaning
0b0	Ignore Single Address Comparator <m>.
0b1	Select Single Address Comparator <m>.

This bit is RES0 if m >= 2 × [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Address Range Comparators

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								ARC[7]	ARC[6]	ARC[5]	ARC[4]	ARC[3]	ARC[2]	ARC[1]	ARC[0]

Bits [15:8]

Reserved, RES0.

ARC[<m>], bit [m], for m = 7 to 0

Selects one or more Address Range Comparators.

ARC[<m>]	Meaning
0b0	Ignore Address Range Comparator <m>.
0b1	Select Address Range Comparator <m>.

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Context Identifier Comparators

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								CID[7]	CID[6]	CID[5]	CID[4]	CID[3]	CID[2]	CID[1]	CID[0]

Bits [15:8]

Reserved, RES0.

CID[<m>], bit [m], for m = 7 to 0

Selects one or more Context Identifier Comparators.

CID[<m>]	Meaning
0b0	Ignore Context Identifier Comparator <m>.
0b1	Select Context Identifier Comparator <m>.

This bit is RES0 if m >= [TRCIDR4](#).NUMCIDC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Virtual Context Identifier Comparators

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								VMID[7]	VMID[6]	VMID[5]	VMID[4]	VMID[3]	VMID[2]	VMID[1]	VMID[0]

Bits [15:8]

Reserved, RES0.

VMID[<m>], bit [m], for m = 7 to 0

Selects one or more Virtual Context Identifier Comparators.

VMID[<m>]	Meaning
0b0	Ignore Virtual Context Identifier Comparator <m>.
0b1	Select Virtual Context Identifier Comparator <m>.

This bit is RES0 if m >= [TRCIDR4.NUMVMIDC](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCRSCTLR<n>

Must be programmed if any of the following are true:

- [TRCCNTCTLR<a>.RLDEVENT](#).TYPE == 0 and [TRCCNTCTLR<a>.RLDEVENT](#).SEL == n.
- [TRCCNTCTLR<a>.RLDEVENT](#).TYPE == 1 and [TRCCNTCTLR<a>.RLDEVENT](#).SEL == n/2.
- [TRCCNTCTLR<a>.CNTEVENT](#).TYPE == 0 and [TRCCNTCTLR<a>.CNTEVENT](#).SEL == n.
- [TRCCNTCTLR<a>.CNTEVENT](#).TYPE == 1 and [TRCCNTCTLR<a>.CNTEVENT](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT0](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT0](#).SEL == n.
- [TRCEVENTCTL0R.EVENT0](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT0](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT1](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT1](#).SEL == n.
- [TRCEVENTCTL0R.EVENT1](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT1](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT2](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT2](#).SEL == n.
- [TRCEVENTCTL0R.EVENT2](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT2](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT3](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT3](#).SEL == n.
- [TRCEVENTCTL0R.EVENT3](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT3](#).SEL == n/2.
- [TRCSEQEVR<a>.B](#).TYPE == 0 and [TRCSEQEVR<a>.B](#).SEL == n.
- [TRCSEQEVR<a>.B](#).TYPE == 1 and [TRCSEQEVR<a>.B](#).SEL == n/2.
- [TRCSEQEVR<a>.F](#).TYPE == 0 and [TRCSEQEVR<a>.F](#).SEL == n.
- [TRCSEQEVR<a>.F](#).TYPE == 1 and [TRCSEQEVR<a>.F](#).SEL == n/2.
- [TRCSEQRSTEVR.RST](#).TYPE == 0 and [TRCSEQRSTEVR.RST](#).SEL == n.
- [TRCSEQRSTEVR.RST](#).TYPE == 1 and [TRCSEQRSTEVR.RST](#).SEL == n/2.
- [TRCTSCTLR.EVENT](#).TYPE == 0 and [TRCTSCTLR.EVENT](#).SEL == n.
- [TRCTSCTLR.EVENT](#).TYPE == 1 and [TRCTSCTLR.EVENT](#).SEL == n/2.
- [TRCVICTLR.EVENT](#).TYPE == 0 and [TRCVICTLR.EVENT](#).SEL == n.
- [TRCVICTLR.EVENT](#).TYPE == 1 and [TRCVICTLR.EVENT](#).SEL == n/2.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCRSCTLR<m> ; Where m = 2-31

TRCRSR, Resources Status Register

The TRCRSR characteristics are:

Purpose

Use this to set, or read, the status of the resources.

Configuration

AArch64 System register TRCRSR bits [31:0] are architecturally mapped to External register [TRCRSR\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_SR is **implemented**. Otherwise, direct accesses to TRCRSR are UNDEFINED.

Attributes

TRCRSR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33							
																					RES0																
RES0																					TA	EVENT[3]		EVENT[2]		EVENT[1]		EVENT[0]		RES0		EXTIN[3]		EXTIN[2]		EXTIN[1]	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1							

Bits [63:13]

Reserved, RES0.

TA, bit [12]

Tracing active.

TA	Meaning
0b0	Tracing is not active.
0b1	Tracing is active.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

EVENT[<m>], bit [m+8], for m = 3 to 0

Untraced status of ETEEvents.

EVENT[<m>]	Meaning
0b0	An ETEEvent <m> has not occurred.
0b1	An ETEEvent <m> has occurred while the resources were in the Paused state.

This bit is RES0 if [TRCIDR4](#).NUMRSPAIR == 0 || m > [TRCIDR0](#).NUMEVENT.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

The sticky status of the External Input Selectors.

EXTIN[<m>]	Meaning
0b0	An event selected by External Input Selector <m> has not occurred.
0b1	At least one event selected by External Input Selector <m> has occurred while the resources were in the Paused state.

This bit is RES0 if m >= [TRCIDR5.NUMEXTINSEL](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCRSR

Must always be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCRSR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1010	0b000

TRCSEQEVR<n>, Sequencer State Transition Control Register <n>, n = 0 - 2

The TRCSEQEVR<n> characteristics are:

Purpose

Moves the Sequencer state:

- Backwards, from state n+1 to state n when a programmed resource event occurs.
- Forwards, from state n to state n+1 when a programmed resource event occurs.

Configuration

AArch64 System register TRCSEQEVR<n> bits [31:0] are architecturally mapped to External register [TRCSEQEVR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented** and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQEVR<n> are UNDEFINED.

Attributes

TRCSEQEVR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0															
RES0																B_TYPE	RES0	B_SEL				F_TYPE	RES0	F_SEL							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:16]

Reserved, RES0.

B_TYPE, bit [15]

Chooses the type of Resource Selector.

Backward field. Defines whether the backward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == 0x14 then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

B_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQEVR<n>.B.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.B.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.B.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

B_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.B.TYPE controls whether TRCSEQEVR<n>.B.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Backward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

F_TYPE, bit [7]

Chooses the type of Resource Selector.

Backward field. Defines whether the forward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == 0x12 then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

F_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQEVR<n>.F.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.F.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.F.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

F_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.F.TYPE controls whether TRCSEQEVR<n>.F.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Forward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQEVR<n>

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0010 and [TRCRSCTLR<a>](#).SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSEQEVR<m> ; Where m = 0-2

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b00:m[1:0]	0b100

```

TRCSEQRSTEV, Sequencer Reset Control Register

The TRCSEQRSTEV characteristics are:

Purpose

Moves the Sequencer to state 0 when a programmed resource event occurs.

Configuration

AArch64 System register TRCSEQRSTEV bits [31:0] are architecturally mapped to External register [TRCSEQRSTEV\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented** and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQRSTEV are UNDEFINED.

Attributes

TRCSEQRSTEV is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40		39		38	37	36	35	34	33	32																
RES0

Bits [63:8]

Reserved, RES0.

RST_TYPE, bit [7]

Chooses the type of Resource Selector.

RST_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQRSTEV.RST.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQRSTEV.RST.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQRSTEV.RST.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

RST_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQRSTEV.RST.TYPE controls whether TRCSEQRSTEV.RST.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQRSTEV

Must be programmed if [TRCRSCTLR<a>.GROUP == 0b0010](#) and [TRCRSCTLR<a>.SEQUENCER != 0b0000](#).

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSEQSTR, Sequencer State Register

The TRCSEQSTR characteristics are:

Purpose

Use this to set, or read, the Sequencer state.

Configuration

AArch64 System register TRCSEQSTR bits [31:0] are architecturally mapped to External register [TRCSEQSTR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, FEAT_TRC_SR is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQSTR are UNDEFINED.

Attributes

TRCSEQSTR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															STATE
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:2]

Reserved, RES0.

STATE, bits [1:0]

Set or returns the state of the Sequencer.

STATE	Meaning
0b00	State 0.
0b01	State 1.
0b10	State 2.
0b11	State 3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQSTR

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0010 and [TRCRSCTLR<a>](#).SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

Bits [63:25]

Reserved, RES0.

RST, bit [24]

Selects the Single-shot Comparator Control mode.

RST	Meaning
0b0	The Single-shot Comparator Control is in single-shot mode.
0b1	The Single-shot Comparator Control is in multi-shot mode.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

ARC[<m>], bit [m+16], for m = 7 to 0

Selects one or more Address Range Comparators for Single-shot control.

ARC[<m>]	Meaning
0b0	The Address Range Comparator <m>, is not selected for Single-shot control.
0b1	The Address Range Comparator <m>, is selected for Single-shot control.

This bit is RES0 if m >= [TRCIDR4.NUMACPAIRS](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators for Single-shot control.

SAC[<m>]	Meaning
0b0	The Single Address Comparator <m>, is not selected for Single-shot control.
0b1	The Single Address Comparator <m>, is selected for Single-shot control.

This bit is RES0 if m >= 2 × [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSSCCR<n>

Must be programmed if any [TRCRSCTLR<a>](#).GROUP == 0b0011 and [TRCRSCTLR<a>](#).SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSSCCR<m> ; Where m = 0-7

op0	op1	CRn	CRm	op2
0b10	0b001	0b0001	0b0:m[2:0]	0b010

TRCSSCSR<n>, Single-shot Comparator Control Status Register <n>, n = 0 - 7

The TRCSSCSR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

AArch64 System register TRCSSCSR<n> bits [31:0] are architecturally mapped to External register [TRCSSCSR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented** and $UInt(TRCIDR4.NUMSSCC) > n$. Otherwise, direct accesses to TRCSSCSR<n> are UNDEFINED.

Attributes

TRCSSCSR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
STATUS	PENDING	RES0																											PCDV	DA	INST
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

STATUS, bit [31]

Single-shot Comparator Control status. Indicates if any of the comparators selected by this Single-shot Comparator control have matched. The selected comparators are defined by [TRCSSCCR<n> .ARC](#), [TRCSSCCR<n> .SAC](#), and [TRCSSPCICR<n> .PC](#).

STATUS	Meaning
0b0	No match has occurred. When the first match occurs, this field takes a value of 1. It remains at 1 until explicitly modified by a write to this register.
0b1	One or more matches has occurred. If TRCSSCCR<n> .RST == 0 then: <ul style="list-style-type: none"> There is only one match and no more matches are possible. Software must reset this field to 0 to re-enable the Single-shot Comparator Control.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

PENDING, bit [30]

Single-shot pending status. The Single-shot Comparator Control fired while the resources were in the Paused state.

PENDING	Meaning
0b0	No match has occurred.
0b1	One or more matches has occurred.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [29:4]

Reserved, RES0.

PC, bit [3]

PE Comparator Input support. Indicates if the Single-shot Comparator Control supports PE Comparator Inputs.

PC	Meaning
0b0	This Single-shot Comparator Control does not support PE Comparator Inputs. Selecting any PE Comparator Inputs using the associated TRCSSPCICR<n> results in CONSTRAINED UNPREDICTABLE behavior of the Single-shot Comparator Control resource. The Single-shot Comparator Control might match unexpectedly or might not match.
0b1	This Single-shot Comparator Control supports PE Comparator Inputs.

Access to this field is **RO**.

DV, bit [2]

Data value comparator support. Data value comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

DV	Meaning
0b0	This Single-shot Comparator Control does not support data value comparisons.
0b1	This Single-shot Comparator Control supports data value comparisons.

This field reads as 0.

Access to this field is **RO**.

DA, bit [1]

Data Address Comparator support. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

DA	Meaning
0b0	This Single-shot Comparator Control does not support data address comparisons.
0b1	This Single-shot Comparator Control supports data address comparisons.

This field reads as 0.

Access to this field is **RO**.

INST, bit [0]

Instruction Address Comparator support. Indicates if the Single-shot Comparator Control supports instruction address comparisons.

INST	Meaning
0b0	This Single-shot Comparator Control does not support instruction address comparisons.
0b1	This Single-shot Comparator Control supports instruction address comparisons.

This field reads as 1.

Access to this field is **RO**.

Accessing TRCSSCSR<n>

Must be programmed if [TRCRSCTLR<a>.GROUP](#) == 0b0011 and [TRCRSCTLR<a>.SINGLE_SHOT\[n\]](#) == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSSCSR<m> ; Where m = 0-7

The TRCSSPCICR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

AArch64 System register TRCSSPCICR<n> bits [31:0] are architecturally mapped to External register [TRCSSPCICR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented**, $\text{UInt}(\text{TRCIDR4.NUMSSCC}) > n$, $\text{UInt}(\text{TRCIDR4.NUMPC}) > 0$ and $\text{TRCSSCSR}\langle n \rangle.\text{PC} == 1$. Otherwise, direct accesses to $\text{TRCSSPCICR}\langle n \rangle$ are UNDEFINED.

Attributes

TRCSSPCICR<n> is a 64-bit register.

Field descriptions

Diagram illustrating the structure of a 64-bit register. The register is divided into two 32-bit halves. The upper half is labeled **RES0** and the lower half is labeled **RES0**. The lower half is further divided into eight 4-bit fields labeled **PC[7]**, **PC[6]**, **PC[5]**, **PC[4]**, **PC[3]**, **PC[2]**, **PC[1]**, and **PC[0]**. Bit positions 63 down to 32 are shown above the register, and bit positions 31 down to 0 are shown below the register.

Bits [63:8]

Reserved, RES0.

PC[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs for Single-shot control.

PC[<m>]	Meaning
0b0	The single PE Comparator Input <m>, is not selected as for Single-shot control.
0b1	The single PE Comparator Input <m>, is selected as for Single-shot control.

This bit is RES0 if $m \geq \text{TRCIDR4.NUMPC}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSSPCICR<n>

Must be programmed if implemented and any [TRCRSCTLR<a>](#).GROUP == 0b0011 and [TRCRSCTLR<a>](#).SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSTALLCTLR, Stall Control Register

The TRCSTALLCTLR characteristics are:

Purpose

Enables trace unit functionality that prevents trace unit buffer overflows.

Configuration

AArch64 System register TRCSTALLCTLR bits [31:0] are architecturally mapped to External register [TRCSTALLCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented** and TRCIDR3.STALLCTL == 1. Otherwise, direct accesses to TRCSTALLCTLR are UNDEFINED.

Attributes

TRCSTALLCTLR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
																		RES0																			
RES0																		NOOVERFLOW				RES0				ISTALL		RES0				LEVEL					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

Bits [63:14]

Reserved, RES0.

NOOVERFLOW, bit [13]

When TRCIDR3.NOOVERFLOW == 1:

Trace overflow prevention.

NOOVERFLOW	Meaning
0b0	Trace unit buffer overflow prevention is disabled.
0b1	Trace unit buffer overflow prevention is enabled.

Note that enabling this feature might cause a significant performance impact.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

ISTALL, bit [8]

Instruction stall control. Controls if a trace unit can stall the PE when the trace buffer space is less than LEVEL.

ISTALL	Meaning
0b0	The trace unit must not stall the PE.
0b1	The trace unit can stall the PE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

LEVEL, bits [3:0]

Threshold level field. The field can support 16 monotonic levels from 0b0000 to 0b1111.

The value 0b0000 defines the Minimal invasion level. This setting has a greater risk of a trace unit buffer overflow.

The value 0b1111 defines the Maximum invasion level. This setting has a reduced risk of a trace unit buffer overflow.

Note that for some implementations, invasion might occur at the minimal invasion level.

One or more of the least significant bits of LEVEL are permitted to be RES0. Arm recommends that LEVEL[3:2] are fully implemented. Arm strongly recommends that LEVEL[3] is always implemented. If one or more bits are RES0 and are written with a non-zero value, the effective value of LEVEL is rounded down to the nearest power of 2 value which has the RES0 bits as zero. For example, if LEVEL[1:0] are RES0 and a value of 0b1110 is written to LEVEL, the effective value of LEVEL is 0b1100.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSTALLCTLR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSTALLCTLR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1011	0b000

Bits [63:2]

Reserved, RES0.

PMSTABLE, bit [1]

Programmers' model stable.

PMSTABLE	Meaning
0b0	The programmers' model is not stable.
0b1	The programmers' model is stable.

Accessing this field has the following behavior:

- When the trace unit is enabled, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

IDLE, bit [0]

Idle status.

IDLE	Meaning
0b0	The trace unit is not idle.
0b1	The trace unit is idle.

Accessing TRCSTATR

Accesses to this register use the following encodings in the System register encoding space:

TRCSYNCP, Synchronization Period Register

The TRCSYNCP characteristics are:

Purpose

Controls how often trace protocol synchronization requests occur.

Configuration

AArch64 System register TRCSYNCP bits [31:0] are architecturally mapped to External register [TRCSYNCP\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and FEAT_TRC_SR is implemented. Otherwise, direct accesses to TRCSYNCP are UNDEFINED.

Attributes

TRCSYNCP is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:5]

Reserved, RES0.

PERIOD, bits [4:0]

Defines the number of bytes of trace between each periodic trace protocol synchronization request.

PERIOD	Meaning
0b00000	Trace protocol synchronization is disabled.
0b01000	Trace protocol synchronization request occurs after 2^8 bytes of trace.
0b01001	Trace protocol synchronization request occurs after 2^9 bytes of trace.
0b01010	Trace protocol synchronization request occurs after 2^{10} bytes of trace.
0b01011	Trace protocol synchronization request occurs after 2^{11} bytes of trace.
0b01100	Trace protocol synchronization request occurs after 2^{12} bytes of trace.
0b01101	Trace protocol synchronization request occurs after 2^{13} bytes of trace.
0b01110	Trace protocol synchronization request occurs after 2^{14} bytes of trace.
0b01111	Trace protocol synchronization request occurs after 2^{15} bytes of trace.
0b10000	Trace protocol synchronization request occurs after 2^{16} bytes of trace.
0b10001	Trace protocol synchronization request occurs after 2^{17} bytes of trace.
0b10010	Trace protocol synchronization request occurs after 2^{18} bytes of trace.
0b10011	Trace protocol synchronization request occurs after 2^{19} bytes of trace.
0b10100	Trace protocol synchronization request occurs after 2^{20} bytes of trace.

Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is CONSTRAINED UNPREDICTABLE and one of the following behaviors occurs:

- No trace protocol synchronization requests are generated by this counter.
- Trace protocol synchronization requests occur at the specified period.
- Trace protocol synchronization requests occur at some other UNKNOWN period which can vary.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSYNCP

Must be programmed if [TRCIDR3.SYNCP](#) == 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSYNCP

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1101	0b000

TRCTRACEIDR, Trace ID Register

The TRCTRACEIDR characteristics are:

Purpose

Sets the trace ID for instruction trace.

Configuration

AArch64 System register TRCTRACEIDR bits [31:0] are architecturally mapped to External register [TRCTRACEIDR\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented and FEAT_TRC_SR is implemented**. Otherwise, direct accesses to TRCTRACEIDR are UNDEFINED.

Attributes

TRCTRACEIDR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
																RES0																					
RES0																										TRACEID											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

Bits [63:7]

Reserved, RES0.

TRACEID, bits [6:0]

Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of [TRCIDR5.TRACEIDSIZE](#). Unimplemented bits are RES0.

If an implementation supports AMBA ATB, then:

- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause UNPREDICTABLE behavior of the trace capture infrastructure.

See the AMBA ATB Protocol Specification for information about which ATID values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCTRACEIDR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCTRACEIDR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0000	0b001

```

TRCTSCTLR, Timestamp Control Register

The TRCTSCTLR characteristics are:

Purpose

Controls the insertion of global timestamps in the trace stream.

Configuration

AArch64 System register TRCTSCTLR bits [31:0] are architecturally mapped to External register [TRCTSCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, FEAT_TRC_SR is implemented and TRCIDR0.TSSIZE != 0b00000. Otherwise, direct accesses to TRCTSCTLR are UNDEFINED.

Attributes

TRCTSCTLR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40		39		38	37	36	35	34	33	32
RES0																																	
RES0																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8		7		6	5	4	3	2	1	0
																								EVENT_TYPE				RES0		EVENT_SEL			

Bits [63:8]

Reserved, RES0.

EVENT_TYPE, bit [7] When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

EVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCTSCTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCTSCTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCTSCTLR.EVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT_SEL, bits [4:0]
When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCTSCTLR.EVENT.TYPE controls whether TRCTSCTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCTSCTLR

Must be programmed if [TRCCONFIGR](#).TS == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCTSCTLR

The TRCVICTLR characteristics are:

Purpose

Controls instruction trace filtering.

Configuration

AArch64 System register TRCVICTLR bits [31:0] are architecturally mapped to External register [TRCVICTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and FEAT_TRC_SR is implemented. Otherwise, direct accesses to TRCVICTLR are UNDEFINED.

Attributes

TRCVICTLR is a 64-bit register.

Field descriptions

6362616059										58										57										56										55										54										53										52									
RES0										EXLEVEL_RL_EL2										EXLEVEL_RL_EL1										EXLEVEL_RL_EL0										RES0										EXLEVEL_NS_EL2										EXLEVEL_NS_EL1										EXLEVEL_NS_EL0									
3130292827										26										25										24										23										22										21										20									

Bits [63:27]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [26]

When TRCIDR6.EXLEVEL RL_EL2 == 1:

Filter instruction trace for EL2 in Realm state.

EXLEVEL_RL_EL2	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit generates instruction trace for EL2 in Realm state.
	When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit does not generate instruction trace for EL2 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit does not generate instruction trace for EL2 in Realm state.
	When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit generates instruction trace for EL2 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [25]**When TRCIDR6.EXLEVEL_RL_EL1 == 1:**

Filter instruction trace for EL1 in Realm state.

EXLEVEL_RL_EL1	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit generates instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit does not generate instruction trace for EL1 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit does not generate instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit generates instruction trace for EL1 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [24]**When TRCIDR6.EXLEVEL_RL_EL0 == 1:**

Filter instruction trace for EL0 in Realm state.

EXLEVEL_RL_EL0	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit generates instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit does not generate instruction trace for EL0 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit does not generate instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit generates instruction trace for EL0 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]**When Non-secure EL2 is implemented:**

Filter instruction trace for EL2 in Non-secure state.

EXLEVEL_NS_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [21]**When Non-secure EL1 is implemented:**

Filter instruction trace for EL1 in Non-secure state.

EXLEVEL_NS_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_ELO, bit [20]**When Non-secure ELO is implemented:**

Filter instruction trace for ELO in Non-secure state.

EXLEVEL_NS_ELO	Meaning
0b0	The trace unit generates instruction trace for ELO in Non-secure state.
0b1	The trace unit does not generate instruction trace for ELO in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [19]**When EL3 is implemented:**

Filter instruction trace for EL3.

EXLEVEL_S_EL3	Meaning
0b0	The trace unit generates instruction trace for EL3.
0b1	The trace unit does not generate instruction trace for EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [18]**When EL2 is implemented and FEAT_SEL2 is implemented:**

Filter instruction trace for EL2 in Secure state.

EXLEVEL_S_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [17]**When Secure EL1 is implemented:**

Filter instruction trace for EL1 in Secure state.

EXLEVEL_S_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_ELO, bit [16]**When Secure ELO is implemented:**

Filter instruction trace for ELO in Secure state.

EXLEVEL_S_ELO	Meaning
0b0	The trace unit generates instruction trace for ELO in Secure state.
0b1	The trace unit does not generate instruction trace for ELO in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:12]

Reserved, RES0.

TRCERR, bit [11]**When TRCIDR3.TRCERR == 1:**

Controls the forced tracing of System Error exceptions.

TRCERR	Meaning
0b0	Forced tracing of System Error exceptions is disabled.
0b1	Forced tracing of System Error exceptions is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCRESET, bit [10]

Controls the forced tracing of PE Resets.

TRCRESET	Meaning
0b0	Forced tracing of PE Resets is disabled.
0b1	Forced tracing of PE Resets is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SSSTATUS, bit [9]

ViewInst start/stop function status.

SSSTATUS	Meaning
0b0	Stopped State. The ViewInst start/stop function is in the stopped state.
0b1	Started State. The ViewInst start/stop function is in the started state.

Before software enables the trace unit, it must write to this field to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this field to 1. Arm recommends that the value of this field is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is UNKNOWN and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing [TRCPRGCTLR.EN](#) or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **RES1** if all of the following are true:
 - TRCIDR4.NUMACPAIRS == 0b0000
 - TRCIDR4.NUMPC == 0b0000
- Otherwise, access to this field is **RW**.

Bit [8]

Reserved, RES0.

EVENT_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

EVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCVICTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCVICTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

Bits[4:0]**When TRCIDR4.NUMRSPAIR != 0b0000:****EVENT_SEL, bits [4:0] of bits [4:0]**

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

When TRCIDR4.NUMRSPAIR == 0b0000:**Reserved, bits [4:0] of bits [4:0]**

This field is reserved:

- Bits [4:1] are RES0.
- Bit [0] is RES1.

Otherwise:

Reserved, RES0.

Accessing TRCVICTLR

Must be programmed.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVICTLR

op0	op1	CRn	CRm	op2

INCLUDE[<m>], bit [m], for m = 7 to 0

Include Address Range Comparator <m>.

Selects whether Address Range Comparator <m> is in use with the ViewInst include function.

Selecting no comparators for the ViewInst include function indicates that all instructions are included by default.

The ViewInst exclude function then indicates which ranges are excluded.

INCLUDE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected for the ViewInst include function.
0b1	The address range that Address Range Comparator <m> defines, is selected for the ViewInst include function.

This bit is RES0 if m >= [TRCIDR4.NUMACPAIRS](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVIIECTLR

Must be programmed if [TRCIDR4.NUMACPAIRS](#) > 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVIIECTLR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0001	0b010

TRCVISSCTLR, ViewInst Start/Stop Control Register

The TRCVISSCTLR characteristics are:

Purpose

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

Configuration

AArch64 System register TRCVISSCTLR bits [31:0] are architecturally mapped to External register [TRCVISSCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented** and `UInt(TRCIDR4.NUMACPAIRS) > 0`. Otherwise, direct accesses to TRCVISSCTLR are UNDEFINED.

Attributes

TRCVISSCTLR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51
STOP[15]	STOP[14]	STOP[13]	STOP[12]	STOP[11]	STOP[10]	STOP[9]	STOP[8]	STOP[7]	STOP[6]	STOP[5]	STOP[4]	STOP[3]
31	30	29	28	27	26	25	24	23	22	21	20	19

Bits [63:32]

Reserved, RES0.

STOP[<m>], bit [m+16], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of stopping trace.

STOP[<m>]	Meaning
0b0	The Single Address Comparator <m>, is not selected as a stop resource.
0b1	The Single Address Comparator <m>, is selected as a stop resource.

This bit is RES0 if $m \geq 2 \times \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

START[<m>], bit [m], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of starting trace.

START[<m>]	Meaning
0b0	The Single Address Comparator <m>, is not selected as a start resource.
0b1	The Single Address Comparator <m>, is selected as a start resource.

This bit is RES0 if $m \geq 2 \times \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVISSCTLR

Must be programmed if $\text{TRCIDR4.NUMACPAIRS} > 0b0000$.

For any 2 comparators selected for the ViewInst start/stop function, the comparator containing the lower address must be a lower numbered comparator.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVISSCTLR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0010	0b010

TRCVMIDCCTLR0, Virtual Context Identifier Comparator Control Register 0

The TRCVMIDCCTLR0 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the [TRCVMIDCVR<n>](#) registers, where n=0-3.

Configuration

AArch64 System register TRCVMIDCCTLR0 bits [31:0] are architecturally mapped to External register [TRCVMIDCCTLR0\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented**, $\text{UInt}(\text{TRCIDR4.NUMVMIDC}) > 0 \times 0$ and $\text{UInt}(\text{TRCIDR2.VMIDSIZE}) > 0$. Otherwise, direct accesses to TRCVMIDCCTLR0 are UNDEFINED.

Attributes

TRCVMIDCCTLR0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	
COMP3[7]	COMP3[6]	COMP3[5]	COMP3[4]	COMP3[3]	COMP3[2]	COMP3[1]	COMP3[0]	COMP2[7]	COMP2[6]	COMP2[5]	COMP2[4]
31	30	29	28	27	26	25	24	23	22	21	

Bits [63:32]

Reserved, RES0.

COMP3[<m>], bit [m+24], for m = 7 to 0
When $\text{UInt}(\text{TRCIDR4.NUMVMIDC}) > 3$:

TRCVMIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR3. Each bit in this field corresponds to a byte in TRCVMIDCVR3.

COMP3[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if $m \geq \text{TRCIDR2.VMIDSIZE}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 2:

TRCVMIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR2. Each bit in this field corresponds to a byte in TRCVMIDCVR2.

COMP2[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 1:

TRCVMIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR1. Each bit in this field corresponds to a byte in TRCVMIDCVR1.

COMP1[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 0:

TRCVMIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR0. Each bit in this field corresponds to a byte in TRCVMIDCVR0.

COMP0[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLRO

If software uses the [TRCVMIDCVR<n>](#) registers, where n=0-3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCVMIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCVMIDCVR<n>](#) is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVMIDCCTLRO

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	0b0010	0b010

TRCVMIDCCTLR1, Virtual Context Identifier Comparator Control Register 1

The TRCVMIDCCTLR1 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the [TRCVMIDCVR<n>](#) registers, where n=4-7.

Configuration

AArch64 System register TRCVMIDCCTLR1 bits [31:0] are architecturally mapped to External register [TRCVMIDCCTLR1\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_SR is implemented**, $\text{UInt}(\text{TRCIDR4.NUMVMIDC}) > 0x4$ and $\text{UInt}(\text{TRCIDR2.VMIDSIZE}) > 0$. Otherwise, direct accesses to TRCVMIDCCTLR1 are UNDEFINED.

Attributes

TRCVMIDCCTLR1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53					
COMP7[7]	COMP7[6]	COMP7[5]	COMP7[4]	COMP7[3]	COMP7[2]	COMP7[1]	COMP7[0]	COMP6[7]	COMP6[6]	COMP6[5]	COMP6[4]	COMP6[3]	COMP6[2]	COMP6[1]	COMP6[0]
31	30	29	28	27	26	25	24	23	22	21					

Bits [63:32]

Reserved, RES0.

COMP7[<m>], bit [m+24], for m = 7 to 0 When UInt(TRCIDR4.NUMVMIDC) > 7:

TRCVMIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR7. Each bit in this field corresponds to a byte in TRCVMIDCVR7.

COMP7[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0**When UInt(TRCIDR4.NUMVMIDC) > 6:**

TRCVMIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR6. Each bit in this field corresponds to a byte in TRCVMIDCVR6.

COMP6[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0**When UInt(TRCIDR4.NUMVMIDC) > 5:**

TRCVMIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.

COMP5[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0**When UInt(TRCIDR4.NUMVMIDC) > 4:**

TRCVMIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.

COMP4[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLR1

If software uses the [TRCVMIDCVR<n>](#) registers, where n=4-7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCVMIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCVMIDCVR<n>](#) is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVMIDCCTLR1

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	0b0011	0b010

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

VALUE, bits [63:0]

Virtual context identifier value. The width of this field is indicated by [TRCIDR2.VMIDSIZE](#). Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier .

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVMIDCVR<n>

Must be programmed if any of the following are true:

- [TRCRSCTLR<a>](#).GROUP == 0b0111 and [TRCRSCTLR<a>](#).VMID[n] == 1.
- [TRCACATR<a>](#).CONTEXTTYPE == 0b10 or 0b11 and [TRCACATR<a>](#).CONTEXT == n.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVMIDCVR<m> ; Where m = 0-7

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	m[2:0]:0b0	0b001

```

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

E1TRE	Meaning
0b0	Trace is prohibited at EL1.
0b1	Trace is allowed at EL1.

This field is ignored if SelfHostedTraceEnabled() == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

E0TRE, bit [0]

EL0 Trace Enable.

E0TRE	Meaning
0b0	Trace is prohibited at EL0.
0b1	Trace is allowed at EL0.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current Security state and [HCR_EL2.TGE](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

The TTBR0_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR0_EL1 bits [63:0] are architecturally mapped to AArch32 System register [TTBR0\[63:0\]](#).

TTBR0_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

Attributes

TTBR0_EL1 is a 64-bit register.

- 128-bit register when FEAT_D128 is implemented and TCR2_EL1.D128 == 1
- 64-bit register when FEAT_D128 is not implemented or TCR2_EL1.D128 == 0

Field descriptions

When FEAT_D128 is implemented and TCR2_EL1.D128 == 1:

12712612512412312212112011911811711611511411311211110109108107106105104103102101100999897

Bits [127:88]

Reserved, RES0.

BADDR, bits [87:80, 47:5]

Translation table base address:

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[87:80, 47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR field is split as follows:

- BADDR[50:43] is TTBR0_EL1[87:80].
- BADDR[42:0] is TTBR0_EL1[47:5].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

ASID, bits [63:48]

An ASID for the translation table base address. The [TCR_EL1.A1](#) field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using [TTBR0_EL1](#).

This determines the number of levels to be skipped from the regular start level of the Stage 1 EL1&0 translation table walks using [TTBR0_EL1](#).

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

CnP	Meaning
0b0	<p>The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> The value of TTBR0_EL1.CnP on those other PEs. The value of the current ASID. If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
0b1	<p>The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply:</p> <ul style="list-style-type: none"> The translation table entries are pointed to by TTBR0_EL1. The translation tables relate to the same translation regime. The ASID is the same as the current ASID. If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see 'CONstrained UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or TCR2_EL1.D128 == 0:

ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL1.T0SZ](#), the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of [TCR_EL1.IPS](#) is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of [TCR_EL1.IPS](#) is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x>6, register bits[(x-1):6] are RES0.

Note

[TCR_EL1.IPS](#)==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of [ID_AA64MMFR0_EL1.PARange](#) indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of [TCR_EL1.IPS](#) is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

When the value of [ID_AA64MMFR0_EL1.PARange](#) indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]**When FEAT_TTCNP is implemented:**

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

CnP	Meaning
0b0	<p>The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> • The value of TTBR0_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
0b1	<p>The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply:</p> <ul style="list-style-type: none"> • The translation table entries are pointed to by TTBR0_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNpredictable, see 'CONstrained UNpredictable behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR0_EL1 or TTBR0_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

TTBR0_EL2, Translation Table Base Register 0 (EL2)

The TTBR0_EL2 characteristics are:

Purpose

When [HCR_EL2.E2H](#) is 0, holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

When [HCR_EL2.E2H](#) is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL2&0 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR0_EL2 bits [47:1] are architecturally mapped to AArch32 System register [HTTBR\[47:1\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

TTBR0_EL2 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

Attributes

TTBR0_EL2 is a: ~~64-bit register.~~

- 128-bit register when [FEAT_D128](#) is implemented, [TCR2_EL2.D128](#) == 1 and [HCR_EL2.E2H](#) == 1
- 64-bit register when [FEAT_D128](#) is not implemented or [TCR2_EL2.D128](#) == 0

Field descriptions

When [FEAT_D128](#) is implemented, [TCR2_EL2.D128](#) == 1 and [HCR_EL2.E2H](#) == 1:

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97			
RES0

Bits [127:88]

Reserved, RES0.

BADDR[55:5], bits [87:80, 47:5]

Translation table base address:

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[87:80, 47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on $\text{LOG2}(\text{StartTableSize})$, as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR[55:5] field is split as follows:

- BADDR[55:5][50:43] is TTBR0_EL2[87:80].
- BADDR[55:5][42:0] is TTBR0_EL2[47:5].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

ASID, bits [63:48]

When FEAT_VHE is implemented:

When HCR_EL2.E2H is 1, it holds an ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using TTBR0_EL2.

This determines the number of levels to be skipped from the regular start level of the Stage 1 EL2&0 translation table walks using TTBR0_EL2.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.

CnP	Meaning
0b0	<p>The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> The value of TTBR0_EL2.CnP on those other PEs. When the current translation regime is the EL2&0 regime, the value of the current ASID.
0b1	<p>The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply:</p> <ul style="list-style-type: none"> The translation table entries are pointed to by TTBR0_EL2. The translation tables relate to the same translation regime. If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID.

This bit is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or TCR2_EL2.D128 == 0:

ASID, bits [63:48]

When FEAT_VHE is implemented:

When [HCR_EL2.E2H](#) is 0, this field is RES0.

When [HCR_EL2.E2H](#) is 1, it holds an ASID for the translation table base address. The [TCR_EL2.A1](#) field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL2.T0SZ](#), the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of [TCR_EL2.{I}PS](#) is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of [TCR_EL2.{I}PS](#) is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x>6, register bits[(x-1):6] are RES0.

Note

The OA size specified by [TCR_EL2.{I}PS](#) is determined as follows:

- The value of [TCR_EL2.PS](#) when the value of [HCR_EL2.E2H](#) is 0.
- The value of [TCR_EL2.IPS](#) when the value of [HCR_EL2.E2H](#) is 1.

[TCR_EL2.{I}PS](#)==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of [ID_AA64MMFR0_EL1.PARange](#) indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of [TCR_EL2.{I}PS](#) is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

When the value of [ID_AA64MMFR0_EL1.PARange](#) indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL2, then the translation table base address might be misaligned, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]**When FEAT_TTCNP is implemented:**

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.

CnP	Meaning
0b0	<p>The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> The value of TTBR0_EL2.CnP on those other PEs. When the current translation regime is the EL2&0 regime, the value of the current ASID.
0b1	<p>The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply:</p> <ul style="list-style-type: none"> The translation table entries are pointed to by TTBR0_EL2. The translation tables relate to the same translation regime. If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID.

This bit is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNpredictable, see 'CONstrained UNpredictable behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR0_EL2 or TTBR0_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TTBR0_EL2

TTBR0_EL3, Translation Table Base Register 0 (EL3)

The TTBR0_EL3 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to TTBR0_EL3 are UNDEFINED.

Attributes

TTBR0_EL3 is a 64-bit register.

Field descriptions

When FEAT_D128 is implemented and TCR_EL3.D128 == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0								BADDRBADDR[47:1]																								
BADDRBADDR[47:1]																RES0CnP				SKL		CnP										
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:56]

Reserved, RES0.

BADDR, bits [55:5]

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[55:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using TTBR0_EL3.

This determines the number of levels to be skipped from the regular start level of the Stage 1 EL3 translation table walks using TTBR0_EL3.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes FEAT_TTCNP, indicates whether each entry that is pointed to by VSTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VSTTBR_EL2 are permitted to differ from the entries for VSTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VSTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This bit is permitted to be cached in a TLB.

Note

If the value of VSTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VSTTBR_EL2s do not point to the same translation table entries when using the current VMID, then the results of translations using VSTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is not implemented or TCR_EL3.D128 == 0:

Bits [63:48]

Reserved, RES0.

BADDR, [47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL3.T0SZ](#), the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of [TCR_EL3.PS](#) is not 0b110, then:

- Register bits[($x-1$):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of [TCR_EL3.PS](#) is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
 - Register bit[1] is RES0.
 - When $x > 6$, register bits[($x-1$):6] are RES0.
-

Note

[TCR_EL3.PS](#)==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of [ID_AA64MMFR0_EL1.PARange](#) indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of [TCR_EL3.PS](#) is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

When the value of [ID_AA64MMFR0_EL1.PARange](#) indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL3, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[($x-1$):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs.
0b1	The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3.

This bit is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL3s do not point to the same translation table entries the results of translations using TTBR0_EL3 are CONstrained UNpredictable, see 'CONstrained UNpredictable behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TTBR0_EL3

TTBR1_EL1, Translation Table Base Register 1 (EL1)

The TTBR1_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR1_EL1 bits [63:0] are architecturally mapped to AArch32 System register [TTBR1\[63:0\]](#).

TTBR1_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

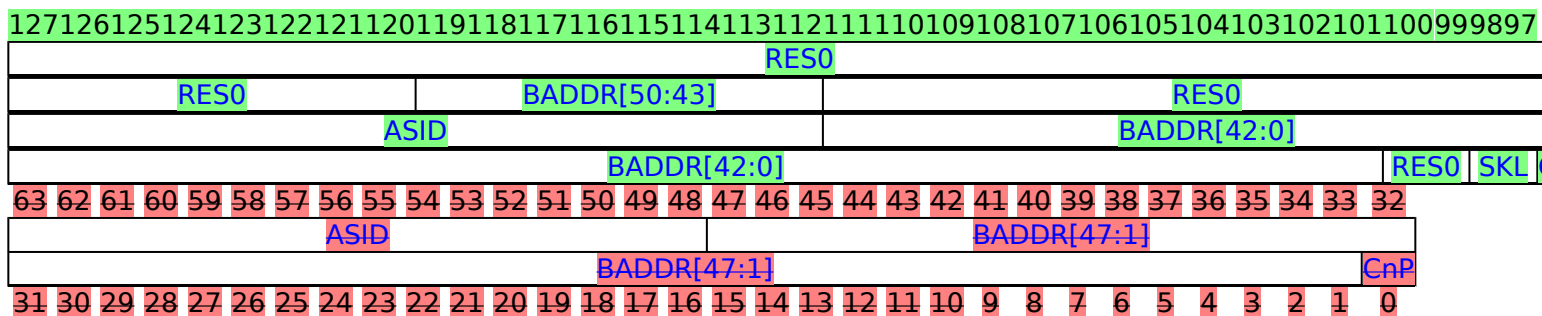

Attributes

TTBR1_EL1 is a: ~~64-bit register.~~

- 128-bit register when FEAT_D128 is implemented and TCR2_EL1.D128 == 1
- 64-bit register when FEAT_D128 is not implemented or TCR2_EL1.D128 == 0

Field descriptions

When FEAT_D128 is implemented and TCR2_EL1.D128 == 1:

Bits [127:88]

Reserved, RES0.

BADDR, bits [87:80, 47:5]

Translation table base address:

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[87:80, 47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR field is split as follows:

- BADDR[50:43] is TTBR1_EL1[87:80].
- BADDR[42:0] is TTBR1_EL1[47:5].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

ASID, bits [63:48]

An ASID for the translation table base address. The [TCR_EL1.A1](#) field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using [TTBR1_EL1](#).

This determines the number of levels to be skipped from the regular start level of the Stage 1 EL1&0 translation table walks using [TTBR1_EL1](#).

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

CnP	Meaning
0b0	<p>The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> The value of TTBR1_EL1.CnP on those other PEs. The value of the current ASID. If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
0b1	<p>The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply:</p> <ul style="list-style-type: none"> The translation table entries are pointed to by TTBR1_EL1. The translation tables relate to the same translation regime. The ASID is the same as the current ASID. If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see 'CONstrained UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or TCR2_EL1.D128 == 0:

ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL1.T1SZ](#), the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of [TCR_EL1.IPS](#) is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of [TCR_EL1.IPS](#) is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x>6, register bits[(x-1):6] are RES0.

Note

[TCR_EL1.IPS](#)==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of [ID_AA64MMFR0_EL1.PARange](#) indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of [TCR_EL1.IPS](#) is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

When the value of [ID_AA64MMFR0_EL1.PARange](#) indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]**When FEAT_TTCNP is implemented:**

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

CnP	Meaning
0b0	<p>The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> • The value of TTBR1_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
0b1	<p>The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply:</p> <ul style="list-style-type: none"> • The translation table entries are pointed to by TTBR1_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNpredictable, see 'CONstrained UNpredictable behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR1_EL1 or TTBR1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TTBR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b001

```

-------	----------------	-------

BADDR, bits [87:80, 47:5]

Translation table base address:

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[87:80, 47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on $\text{LOG2}(\text{StartTableSize})$, as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR field is split as follows:

- BADDR[50:43] is TTBR1_EL2[87:80].
- BADDR[42:0] is TTBR1_EL2[47:5].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using TTBR1_EL2.

This determines the number of levels to be skipped from the regular start level of the Stage 1 EL2&0 translation table walks using TTBR1_EL2.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]**When FEAT_TTCNP is implemented:**

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR1_EL2 for the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is not affected by: <ul style="list-style-type: none"> The value of TTBR1_EL2.CnP on those other PEs. The value of the current ASID.
0b1	The translation table entries pointed to by TTBR1_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1 and all of the following apply: <ul style="list-style-type: none"> The translation table entries are pointed to by TTBR1_EL2. The ASID is the same as the current ASID.

This bit is permitted to be cached in a TLB.

Note

- TTBR1_EL2 is accessible only when the value of HCR_EL2.E2H is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or TCR2_EL2.D128 == 0:

ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL2.T1SZ, the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of [TCR_EL2](#).{I}PS is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of [TCR_EL2](#).{I}PS is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x>6, register bits[(x-1):6] are RES0.

Note

The OA size specified by [TCR_EL2](#).{I}PS is determined as follows:

- The value of [TCR_EL2](#).PS when the value of [HCR_EL2](#).E2H is 0.
- The value of [TCR_EL2](#).IPS when the value of [HCR_EL2](#).E2H is 1.

[TCR_EL2](#).{I}PS==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of [ID_AA64MMFR0_EL1](#).PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of [TCR_EL2](#).{I}PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

When the value of [ID_AA64MMFR0_EL1](#).PARange indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]**When FEAT_TTCNP is implemented:**

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR1_EL2 for the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is not affected by: <ul style="list-style-type: none"> The value of TTBR1_EL2.CnP on those other PEs. The value of the current ASID.
0b1	The translation table entries pointed to by TTBR1_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1 and all of the following apply: <ul style="list-style-type: none"> The translation table entries are pointed to by TTBR1_EL2. The ASID is the same as the current ASID.

This bit is permitted to be cached in a TLB.

Note

- TTBR1_EL2 is accessible only when the value of [HCR_EL2.E2H](#) is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR1_EL2 or TTBR1_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

VBAR_EL1, Vector Base Address Register (EL1)

The VBAR_EL1 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL1.

Configuration

AArch64 System register VBAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [VBAR\[31:0\]](#).

Attributes

VBAR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Vector Base Address																															
Vector Base Address																RES0

VBAR_EL2, Vector Base Address Register (EL2)

The VBAR_EL2 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL2.

Configuration

AArch64 System register VBAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HVBAR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VBAR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Vector Base Address																															
Vector Base Address																RES0															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL2.

Note

If [FEAT_LVA3](#) is implemented:

- If [HCR_EL2.E2H](#) == 0b1:
 - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are **not** being used, bits [63:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If [HCR_EL2.E2H](#) == 0b0:
 - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are **not** being used, bits [63:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

Otherwise :

If [FEAT_LVA](#) is implemented:

- If [HCR_EL2.E2H](#) == 0b1:

-
- If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
 - If `HCR_EL2.E2H == 0b0`:
 - If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

If FEAT_LVA is not implemented:

- If `HCR_EL2.E2H == 0b1`:
 - If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
 - If `HCR_EL2.E2H == 0b0`:
 - If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
-

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

Accessing VBAR_EL2

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL2 using the mnemonic VBAR_EL2 or VBAR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

VBAR_EL3, Vector Base Address Register (EL3)

The VBAR_EL3 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to VBAR_EL3 are UNDEFINED.

Attributes

VBAR_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Vector Base Address																															
Vector Base Address										RES0

Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL3.

- If tagged addresses are not being used, bits [63:4852] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

Accessing VBAR_EL3

Accesses to this register use the following encodings in the System register encoding space:

VMPIDR_EL2, Virtualization Multiprocessor ID Register

The VMPIDR_EL2 characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by EL1 reads of [MPIDR_EL1](#).

Configuration

AArch64 System register VMPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VMPIDR\[31:0\]](#).

If EL2 is not implemented, reads of this register return the value of the [MPIDR_EL1](#) and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VMPIDR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																								Aff3								
RES1	U	RES0						MT	Aff2								Aff1								Aff0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of VMPIDR_EL2.Aff0 for more information.

Aff3 is not supported in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [31]

Reserved, RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of VMPIDR_EL2.Aff0 for more information about affinity levels.

MT	Meaning
0b0	Performance of PEs at the lowest affinity level is largely independent.
0b1	Performance of PEs at the lowest affinity level is very interdependent.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff2, bits [23:16]

Affinity level 2. See the description of VMPIDR_EL2.Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1. See the description of VMPIDR_EL2.Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior.

The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VMPIDR_EL2

Accesses to this register use the following encodings in the System register encoding space:

VNCR_EL2, Virtual Nested Control Register

The VNCR_EL2 characteristics are:

Purpose

When FEAT_NV2 is implemented, holds the base address that is used to define the memory location that is accessed by transformed reads and writes of System registers.

Configuration

This register is present only when FEAT_NV2 is implemented. Otherwise, direct accesses to VNCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VNCR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RESS							BADDR																									
BADDR												RES0																				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

RESS, bits [63:57:53]

Reserved, Sign extended. If the bits marked as RESS do not all have the same value, then there is a CONSTRAINED UNPREDICTABLE choice between:

- Generating an EL2 translation regime Translation abort on use of the VNCR_EL2 register. If FEAT_D128 is implemented:
- If the virtual address space for EL2 supports 56 bits, bits[63:57] of VNCR_EL2 are treated as the same value as bit[56] for all purposes other than reading back the register.
- If the virtual address space for EL2 supports 56 bits, bits[63:57] of VNCR_EL2 are treated as the same value as bit[56].
- If the virtual address space for EL2 supports 52 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52] for all purposes other than reading back the register.
- If the virtual address space for EL2 supports 52 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52].
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes other than reading back the register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52] for all purposes other than reading back the register.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52].

Where the EL2 translation regime has upper and lower address ranges, bit[56:52] is used to select between those address ranges to determine if the number address of space bits supports supported more by than the 48 address space bits.

BADDR, bits [56:12]

Base Address. If the virtual address space for EL2 does not support more than 48 bits, then bits [56:49] are RESS. If the virtual address space for EL2 does not support more than 52 bits, then bits [56:53] are RESS

When a register read/write is transformed to be a Load or Store, the address of the load/store is to SignOffset(VNCR_EL2.BADDR:Offset<11:0>, 64).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing VNCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VPIDR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																																	
Implementer								Variant				Architecture				PartNum														Revision			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Architecture, bits [19:16]

Architecture version. Defined values are:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID * registers.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VPIDR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VPIDR_EL2

VSTCR_EL2, Virtualization Secure Translation Control Register

The VSTCR_EL2 characteristics are:

Purpose

The control register for stage 2 of the Secure EL1&0 translation regime.

Configuration

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to VSTCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VSTCR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
RES0																																	SL2	RES0
RES1	SA	SW	RES0													TG0	RES0						SL0	T0SZ										
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

Any of the bits in VSTCR_EL2 are permitted to be cached in a TLB.

Bits [63:34]

Reserved, RES0.

SL2, bit [33]

When **FEAT_D128** is implemented and **VTCR_EL2.D128 == 1**:

This field is IGNORED.

When **FEAT_LPA2** is implemented and (**FEAT_D128** is not implemented or **VTCR_EL2.D128 == 0**):

Starting level of the Secure stage 2 translation lookup controlled by VSTCR_EL2.

If **VTCR_EL2.DS == 1**, then VSTCR_EL2.SL2, in combination with VSTCR_EL2.SL0, gives encodings for the Secure stage 2 translation table walk initial lookup level.

If **VTCR_EL2.DS == 0**, then VSTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [32]

Reserved, RES0.

Bit [31]

Reserved, RES1.

SA, bit [30]

Secure stage 2 translation output address space.

SA	Meaning
0b0	All stage 2 translations for the Secure IPA space access the Secure PA space.
0b1	All stage 2 translations for the Secure IPA space access the Non-secure PA space.

When the value of VSTCR_EL2.SW is 1, this bit behaves as 1 for all purposes other than reading back the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SW, bit [29]

Secure stage 2 translation address space.

SW	Meaning
0b0	All stage 2 translation table walks for the Secure IPA space are to the Secure PA space.
0b1	All stage 2 translation table walks for the Secure IPA space are to the Non-secure PA space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [28:16]

Reserved, RES0.

TG0, bits [15:14]

Secure stage 2 granule size for [VSTTBR_EL2](#).

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If FEAT_GTG is implemented, [ID_AA64MMFR0_EL1](#).{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for stage 2 translation.

If FEAT_GTG is not implemented, [ID_AA64MMFR0_EL1](#).{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value, or a size that has not been implemented, then for all purposes other than read back from this register, the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [13:8]

Reserved, RES0.

SL0, bits [7:6]

When FEAT_TTST is implemented and (FEAT_D128 is not implemented or VTCR_EL2.D128 == 0):

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

SL0	Meaning
0b00	If VSTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> If FEAT_LPA2 is not implemented, start at level 2. If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 2. If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b1, start at level -1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.
0b01	If VSTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> If FEAT_LPA2 is not implemented, start at level 1. If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 1. If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 01 and VSTCR_EL2.SL2 == 1 is reserved. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.
0b10	If VSTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> If FEAT_LPA2 is not implemented, start at level 0. If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 0. If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 10 and VSTCR_EL2.SL2 == 1 is reserved. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.
0b11	If VSTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> If FEAT_LPA2 is not implemented, start at level 3. If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 3. If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 11 and VSTCR_EL2.SL2 == 1 is reserved. If VSTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0.

If this field is programmed to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

SL0	Meaning
0b00	If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.
0b01	If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.
0b10	If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [VSTTBR_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for this field depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VSTCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VSTCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0110	0b010

```

VSTTBR_EL2, Virtualization Secure Translation Table Base Register

The VSTTBR_EL2 characteristics are:

Purpose

The base register for stage 2 of the Secure EL1&0 translation regime. Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Secure EL1&0 translation regime, and other information for this translation stage.

Configuration

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to VSTTBR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VSTTBR_EL2 is a 64-bit register.

Field descriptions

When FEAT_D128 is implemented and VTCR_EL2.D128 == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								BADDR																							
BADDR																								RES0CnP		SKL		CnP			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:56]

Reserved, RES0.

BADDR, bits [55:5]

- Bits A[55:x] of the stage 2 translation table base address bits are in register bits[55:x].
- Bits A[(x-1):0] of the stage 2 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level. Skip Level determines the number of levels to be skipped from the regular start level of the Secure Stage 2 translation table walk.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes FEAT_TTCNP, indicates whether each entry that is pointed to by VSTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VSTTBR_EL2 are permitted to differ from the entries for VSTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VSTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This bit is permitted to be cached in a TLB.

Note

If the value of VSTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VSTTBR_EL2s do not point to the same translation table entries when using the current VMID, then the results of translations using VSTTBR_EL2 are CONstrained UNPREDICTABLE, see 'CONstrained UNPREDICTABLE behaviors due to caching of control or data values'.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is not implemented or VTCR_EL2.D128 == 0:**Bits [63:48]**

Reserved, RES0.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x].

Note

A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

If the value of [VTCR_EL2](#).PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage [21](#) translation table base address, where z is determined as follows:
 - If $x \geq 6$ then $z=x$.
 - Otherwise, $z=6$.
- Register bits[5:2] hold bits[51:48] of the stage [21](#) translation table base address.
- When $z > x$ register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When $x > 6$ register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage [21](#) translation table base address are zero.

Note

When the value of [ID_AA64MMFR0_EL1](#).PARange indicates that the implementation does not support a 52-bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the Effective value of [VTCR_EL2](#).PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated. When the value of [ID_AA64MMFR0_EL1](#).PARange indicates that the implementation supports a 56 bit PA size, bits [55:52] of the stage 2 translation table base address are zero.

If the Effective value of [VTCR_EL2](#).PS is not 0b110, then:

- Register bits[47:x] hold bits[47:x] of the stage [21](#) translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

If any VSTTBR_EL2[47:1] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VSTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [VSTCR_EL2](#).T0SZ, the stage of translation, and the translation granule size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes FEAT_TTCNP, indicates whether each entry that is pointed to by VSTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VSTTBR_EL2 are permitted to differ from the entries for VSTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VSTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This bit is permitted to be cached in a TLB.

Note

If the value of VSTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VSTTBR_EL2s do not point to the same translation table entries when using the current VMID, then the results of translations using VSTTBR_EL2 are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VSTTBR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VSTTBR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0110	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if !IsCurrentSecurityState(SS_Secure) then
        UNDEFINED;
    elsif EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        X[t, 64] = NVMem[0x030];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if !IsCurrentSecurityState(SS_Secure) then
        UNDEFINED;
    else
        X[t, 64] = VSTTBR_EL2;
elsif PSTATE.EL == EL3 then
    if SCR_EL3.EEL2 == '0' then
        UNDEFINED;
    else
        X[t, 64] = VSTTBR_EL2;

```

MSR VSTTBR_EL2, <Xt>

op0	op1	CRn	CRm	op2
-----	-----	-----	-----	-----

0b11	0b100	0b0010	0b0110	0b000
------	-------	--------	--------	-------

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if !IsCurrentSecurityState(SS_Secure) then
        UNDEFINED;
    elsif EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x030] = X[t, 64];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else

VTCR_EL2, Virtualization Translation Control Register

The VTCR_EL2 characteristics are:

Purpose

The control register for stage 2 of the EL1&0 translation regime.

Configuration

AArch64 System register VTCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VTCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VTCR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37
RES0																			HAFTSL2	RES0DS	TL0	RES0D1	28	S2PO		
RES1	NSA	NSW	HWU62	HWU61	HWU60	HWU59	RES0	HD	HA	RES0VS	PS	TG0	SH0	ORGNO	IRGNO	SLO										
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5

Unless stated otherwise, anyAny of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Bits [63:4534]

Reserved, RES0.

HAFTSL2, bit [4433]

When **FEAT_HAFTFEAT_LPA2** is implemented:

Hardware managed Access Flag for Tables. Enables the Hardware managed Access Flag for Tables.

HAFT	Meaning
0b0	Hardware managed Access Flag for Tables is disabled.
0b1	Hardware managed Access Flag for Tables is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [43:42]

Reserved, RES0.

TL0, bit [41]**When FEAT_THE is implemented:**

Control bit to check for presence of MMU TopLevel0 permission attribute.

TL0	Meaning
0b0	This bit does not have any effect on Stage 2 translations.
0b1	Enables MMU TopLevel0 permission attribute check for TTBR0_EL1 and TTBR1_EL1 translations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [40:39]

Reserved, RES0.

D128, bit [38]**When FEAT_D128 is implemented:**

Enable 128-bit Page Table Descriptors. Enables VMSAv9-128 translation system for the Stage 2 Translation Process.

D128	Meaning
0b0	Translation system follows VMSA-64 translation process.
0b1	Translation system follows VMSAv9-128 translation process.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S2POE, bit [37]**When FEAT_S2POE is implemented:**

Enable Permission Overlay. Enables permission overlay in Stage 2 Permission model.

S2POE	Meaning
0b0	Overlay disabled.
0b1	Overaly enabled.

This bit is not permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S2PIE, bit [36]**When FEAT_S2PIE is implemented:**

Select Permission Model. Enables usage of permission indirection in Stage 2 Permission model.

S2PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

This field is RES1 when VTCR_EL2.D128 is set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TL1, bit [35]**When FEAT_THE is implemented:**

Control bit to check for presence of MMU TopLevel1 permission attribute.

TL1	Meaning
0b0	This bit does not have any effect on Stage 2 translations.
0b1	Enables MMU TopLevel1 permission attribute check for TTBR0_EL1 and TTBR1_EL1 translations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [34]**When FEAT_THE is implemented:**

AssuredOnly attribute enable. Indicates use of bit[58] of the stage 2 translation table block or page descriptor.

AssuredOnly	Meaning
0b0	Bit[58] of each stage 2 translation block or page descriptor do not indicate AssuredOnly attribute.
0b1	Bit[58] of each stage 2 translation block or page descriptor indicate AssuredOnly attribute.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SL2, bit [33]

When FEAT_LPA2 is implemented and (FEAT_D128 is not implemented or VTCR_EL2.D128 == 0):

Starting level of the stage 2 translation lookup controlled by VTCR_EL2.

If VTCR_EL2.DS == 1, then VTCR_EL2.SL2, in combination with VTCR_EL2.SL0, gives encodings for the stage 2 translation table walk initial lookup level.

If VTCR_EL2.DS == 0, then VTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is implemented and VTCR_EL2.D128 == 1:

This field is IGNORED.

Otherwise:

Reserved, RES0.

DS, bit [32]

When FEAT_LPA2 is implemented:

This field affects whether a 52-bit output address addressing can be used when described by 4KB and the 16KB translation granules in stage 2 of the EL1&0 or 16KB translation granules regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in Table descriptors are ignored by hardware.</p> <p>The minimum value of VTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</p> <p>The minimum value of VSTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</p> <p>Output address[51:48] is 0000.</p>
0b1	<p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] in translation descriptors hold output address[51:50].</p> <p>The shareability information of Block and Page descriptors for cacheable locations is determined by VTCR_EL2.SH0.</p> <p>The minimum value of VTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</p> <p>The minimum value of VSTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</p>
<p>Note</p> <p>As FEAT_LPA must be implemented if VTCR_EL2.DS == 1, the minimum values of VTCR_EL2.T0SZ and VSTCR_EL2.T0SZ are 12, as determined by that extension.</p> <p>For the TLBI range instructions affecting IPA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 00.</p>	
<p>Note</p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p>	

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

NSA, bit [30]

When FEAT_SEL2 is implemented:

Non-secure stage 2 translation output address space for the Secure EL1&0 translation regime.

NSA	Meaning
0b0	All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Secure PA space.
0b1	All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Non-secure PA space.

This bit behaves as 1 for all purposes other than reading back the value of the bit when one of the following is true:

- The value of VTCR_EL2.NSW is 1.
- The value of [VSTCR_EL2.SA](#) is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSW, bit [29]

When FEAT_SEL2 is implemented:

Non-secure stage 2 translation table address space for the Secure EL1&0 translation regime.

NSW	Meaning
0b0	All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Secure PA space.
0b1	All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Non-secure PA space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:23]

Reserved, RES0.

HD, bit [22]**When FEAT_HAFDBS is implemented:**

Hardware management of dirty state in stage 2 translations when EL2 is enabled in the current Security state.

HD	Meaning
0b0	Stage 2 hardware management of dirty state disabled.
0b1	Stage 2 hardware management of dirty state enabled, only if the VTCR_EL2.HA bit is also set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]**When FEAT_HAFDBS is implemented:**

Hardware Access flag update in stage 2 translations when EL2 is enabled in the current Security state.

HA	Meaning
0b0	Stage 2 Access flag update disabled.
0b1	Stage 2 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

VS, bit [19]**When FEAT_VMID16 is implemented:**

VMID Size.

VS	Meaning
0b0	8-bit VMID. The upper 8 bits of VTTBR_EL2 are ignored by the hardware, and treated as if they are all zeros, for every purpose except when reading back the register.
0b1	16-bit VMID. The upper 8 bits of VTTBR_EL2 are used for allocation and matching in the TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PS, bits [18:16]

Physical address Size for the second stage of translation.

PS	Meaning	Applies when
0b000	32 bits, 4GB.	
0b001	36 bits, 64GB.	
0b010	40 bits, 1TB.	
0b011	42 bits, 4TB.	
0b100	44 bits, 16TB.	
0b101	48 bits, 256TB.	
0b110	52 bits, 4PB.	
0b111	56 bits, 64PB.	When FEAT_D128 is implemented

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by VTCR_EL2 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [VTTBR_EL2](#).

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If FEAT_GTG is implemented, [ID_AA64MMFR0_EL1](#).{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for stage 2 translation.

If FEAT_GTG is not implemented, [ID_AA64MMFR0_EL1](#).{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [VTTBR_EL2](#) or [VSTTBR_EL2](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [VTTBR_EL2](#) or [VSTTBR_EL2](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [VTTBR_EL2](#) or [VSTTBR_EL2](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SLO, bits [7:6]

When FEAT_TTST is implemented and (FEAT_D128 is not implemented or VTCR_EL2.D128 == 0):

Starting level of the stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

SL0	Meaning
0b00	If VTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> • If FEAT_LPA2 is not implemented, start at level 2. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 2. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b1, start at level -1. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.
0b01	If VTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> • If FEAT_LPA2 is not implemented, start at level 1. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 1. • If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 01 and VTCR_EL2.SL2 == 1 is reserved. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.
0b10	If VTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> • If FEAT_LPA2 is not implemented, start at level 0. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 0. • If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 10 and VTCR_EL2.SL2 == 1 is reserved. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.
0b11	If VTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> • If FEAT_LPA2 is not implemented, start at level 3. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 3. • If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 11 and VTCR_EL2.SL2 == 1 is reserved. If VTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0.

If this field is programmed to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Starting level of the stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

SL0	Meaning
0b00	If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.
0b01	If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.
0b10	If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [VTTBR_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in 'The AArch64 Virtual Memory System Architecture'.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VTCR_EL2

Unless stated otherwise, any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VTCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0001	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        X[t, 64] = NVMem[0x040];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    X[t, 64] = VTCR_EL2;
elsif PSTATE.EL == EL3 then
    X[t, 64] = VTCR_EL2;

```

MSR VTCR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0001	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x040] = X[t, 64];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on $\text{LOG2}(\text{StartTableSize})$, as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR field is split as follows:

- BADDR[50:43] is VTTBR_EL2[87:80].
- BADDR[42:0] is VTTBR_EL2[47:5].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

VMID, bits [63:48]

VMID encoding when FEAT_VMID16 is implemented and VTCR_EL2.VS == 1

VMID, bits [15:0]

The VMID for the translation table.

If the implementation has an 8-bit VMID, bits [15:8] of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VMID encoding when FEAT_VMID16 is not implemented or VTCR_EL2.VS == 0

Bits [15:8]

Reserved, RES0.

VMID, bits [7:0]

The VMID for the translation table.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level. Skip Level determines the number of levels to be skipped from the regular start level of the Non-Secure Stage 2 translation table walk.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]**When FEAT_TTCNP is implemented:**

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This bit is permitted to be cached in a TLB.

Note

If the value of VTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or VTCR_EL2.D128 == 0:

VMID, bits [63:48]**VMID encoding when FEAT_VMID16 is implemented and VTCR_EL2.VS == 1****VMID, bits [15:0]**

The VMID for the translation table.

If the implementation has an 8-bit VMID, bits [15:8] of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VMID encoding when FEAT_VMID16 is not implemented or VTCR_EL2.VS == 0**Bits [15:8]**

Reserved, RES0.

VMID, bits [7:0]

The VMID for the translation table.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

Note

A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes FEAT_LPA, if the value of VTCR_EL2.PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 2¹ translation table base address, where z is determined as follows:
 - If $x \geq 6$ then $z=x$.
 - Otherwise, $z=6$.
- Register bits[5:2] hold bits[51:48] of the stage 2¹ translation table base address.
- When $z > x$ register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.

- When $x > 6$ register bits[($x-1$):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 2¹ translation table base address are zero.
- In an implementation that includes FEAT_TTCNP, bit[0] of the stage 2¹ translation table base address is zero.

If the Effective value of [VTCR_EL2](#).PS is not 0b110 then:

- Register bits[47: x] hold bits[47: x] of the stage 1 translation table base address.
- Register bits[($x-1$):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

If any VTTBR_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Bits[$x-1$:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [VTCR_EL2](#).T0SZ, the stage of translation, and the translation granule size.

Note

When the value of [ID_AA64MMFR0_EL1](#).PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of [VTCR_EL2](#).PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated. When the value of [ID_AA64MMFR0_EL1](#).PARange indicates that the implementation supports a 56 bit PA size, bits [55:52] of the stage 2 translation table base address are zero.

If the Effective value of [VTCR_EL2](#).PS is not 0b110 then:

- Register bits[47: x] hold bits[47: x] of the stage 2 translation table base address.
- Register bits[($x-1$):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

If any VTTBR_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Bits[$x-1$:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [VTCR_EL2](#).T0SZ, the stage of translation, and the translation granule size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]**When FEAT_TTCNP is implemented:**

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This bit is permitted to be cached in a TLB.

Note

If the value of VTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR_EL2 are CONstrained UNpredictable, see 'CONstrained UNpredictable behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing VTTBR_EL2

Accesses to this register use the following encodings in the System register encoding space:

ZCR_EL1, SVE Control Register (EL1)

The ZCR_EL1 characteristics are:

Purpose

This register controls aspects of SVE visible at Exception levels EL1 and EL0.

Configuration

This register is present only when FEAT_SVE is implemented. Otherwise, direct accesses to ZCR_EL1 are UNDEFINED.

This register has no effect when FEAT_SME is implemented and the PE is in Streaming SVE mode.

When [HCR_EL2](#).{E2H, TGE} == {1, 1} and EL2 is enabled in the current Security state, this register has no effect on execution at EL0.

Attributes

ZCR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
RES0																RAZ/WI						LEN									
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Non-streaming SVE vector length at EL1 of (LEN+1)*128 bits. This field also defines the Effective Non-streaming SVE vector length at EL0 when EL2 is not implemented, or EL2 is not enabled in the current Security state, or HCR_EL2.{E2H,TGE} is not {1,1}.

The Non-streaming SVE vector length can be any power multiple of two128 bits, from 128 bits to 2048 bits inclusive. An implementation can support a subset of the architecturally permitted lengths. An implementation is required to support all lengths that are powers of two, from 128 bits up to its maximum implemented Non-streaming SVE vector length.

When FEAT_SME is not implemented, or the PE is not in Streaming SVE mode, the Effective SVE vector length (VL) is equal to the Effective Non-streaming SVE vector length.

When FEAT_SME is implemented and the PE is in Streaming SVE mode, VL is equal to the Effective Streaming SVE vector length. See [SMCR_EL1](#).

For all purposes other than returning the result of a direct read of ZCR_EL1, the PE selects the Effective Non-streaming SVE vector length by performing checks in the following order:

1. If EL2 is implemented and enabled in the current Security state, and the requested length is greater than the Effective length at EL2, then the Effective length at EL2 is used.
2. If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.
3. Otherwise, the Effective length is the highest supported Non-streaming SVE vector length that is less than or equal to the requested length.

An indirect read of ZCR_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ZCR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic ZCR_EL1 or ZCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ZCR_EL1

op0	op1	CRn	CRm	op2

ZCR_EL2, SVE Control Register (EL2)

The ZCR_EL2 characteristics are:

Purpose

This register controls aspects of SVE visible at Exception levels EL2, EL1, and EL0.

Configuration

This register is present only when FEAT_SVE is implemented. Otherwise, direct accesses to ZCR_EL2 are UNDEFINED.

This register has no effect when EL2 is not enabled in the current Security state, or when FEAT_SME is implemented and the PE is in Streaming SVE mode.

Attributes

ZCR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Non-streaming SVE vector length at EL2 of (LEN+1)*128 bits. This field also defines the Effective Non-streaming SVE vector length at EL0 when EL2 is implemented and enabled in the current Security state, and HCR_EL2.{E2H,TGE} is {1,1}.

The Non-streaming SVE vector length can be any power multiple of two 128 bits, from 128 bits to 2048 bits inclusive. An implementation can support a subset of the architecturally permitted lengths. An implementation is required to support all lengths that are powers of two, from 128 bits up to its maximum implemented Non-streaming SVE vector length.

When FEAT_SME is not implemented, or the PE is not in Streaming SVE mode, the Effective SVE vector length (VL) is equal to the Effective Non-streaming SVE vector length.

When FEAT_SME is implemented and the PE is in Streaming SVE mode, VL is equal to the Effective Streaming SVE vector length. See [SMCR_EL2](#).

For all purposes other than returning the result of a direct read of ZCR_EL2, the PE selects the Effective Non-streaming SVE vector length by performing checks in the following order:

1. If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.

2. Otherwise, the Effective length is the highest supported Non-streaming SVE vector length that is less than or equal to the requested length.

An indirect read of ZCR_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ZCR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic ZCR_EL2 or ZCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ZCR_EL2

AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

Purpose

Disable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Configuration

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR0_ELO\[31:0\]](#).

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to External register [AMCNTENCLR0\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are UNDEFINED.

Attributes

AMCNTENCLR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RES0																RAZ/WI														P3	P2	P1	P0

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for [AMEVCNTR0<n>](#).

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR0<n> is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR0<n> is enabled. When written, disables AMEVCNTR0<n> .

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENCLR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0010	0b100

```

AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configuration

AArch32 System register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR1_ELO\[31:0\]](#).

AArch32 System register AMCNTENCLR1 bits [31:0] are architecturally mapped to External register [AMCNTENCLR1\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are UNDEFINED.

Attributes

AMCNTENCLR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter disable bit for [AMEVCNTR1<n>](#).

When N is less than 16, bits [15:N] are RAZ/WI, where N is the value in [AMCGCR.CG1NC](#).

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR1<n> is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR1<n> is enabled. When written, disables AMEVCNTR1<n> .

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENCLR1

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1 are UNDEFINED.

Note

The number of auxiliary activity monitor event counters implemented is zero exactly when [AMCFGR.NCG](#) == 0b0000.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0011	0b000

```

AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

Purpose

Enable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Configuration

AArch32 System register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENSET0_ELO\[31:0\]](#).

AArch32 System register AMCNTENSET0 bits [31:0] are architecturally mapped to External register [AMCNTENSET0\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are UNDEFINED.

Attributes

AMCNTENSET0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RES0																RAZ/WI														P3	P2	P1	P0

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter enable bit for [AMEVCNTR0<n>](#).

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR0<n> is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR0<n> is enabled. When written, enables AMEVCNTR0<n> .

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENSET0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0010	0b101

```

The AMCNTENSET1 characteristics are:

Purpose

Enable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configuration

AArch32 System register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENSET1_EL0\[31:0\]](#).

AArch32 System register AMCNTENSET1 bits [31:0] are architecturally mapped to External register [AMCNTENSET1\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are UNDEFINED.

Attributes

AMCNTENSET1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																		
																RES0																		P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter enable bit for AMEVCNTR1<n>.

When N is less than 16, bits [15:N] are RAZ/WI, where N is the value in [AMCGCR.CG1NC](#).

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR1<n> is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR1<n> is enabled. When written, enables AMEVCNTR1<n> .

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENSET1

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1 are UNDEFINED.

Note

The number of auxiliary activity monitor counters implemented is zero when [AMCFGR.NCG](#) == 0b0000.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0011	0b001

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 3.

If FEAT_AMUv1p1 is implemented, [HCR_EL2](#).AMVOFFEN is 1, [SCR_EL3](#).AMVOFFEN is 1, [HCR_EL2](#).{E2H, TGE} is not {1,1}, and EL2 is using AArch64 and is implemented in the current Security state, access to these registers at EL0 or EL1 return (PCount<63:0> - [AMEVCNTVOFF0<n>_EL2](#)<63:0>).

PCount is the physical count returned when AMEVCNTR0<n> is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMEVCNTR0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n> are UNDEFINED.

Note

[AMCGCR](#).CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm> ; Where m = 0-3

coproc	CRm	opc1
0b1111	0b000:m[3]	0b0:m[2:0]

```

AMEVTYPER1<n>, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n> characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter [AMEVCNTR1<n>](#) counts.

Configuration

AArch32 System register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch64 System register [AMEVTYPER1<n>_EL0\[31:0\]](#).

AArch32 System register AMEVTYPER1<n> bits [31:0] are architecturally mapped to External register [AMEVTYPER1<n>\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n> are UNDEFINED.

Attributes

AMEVTYPER1<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																evtCount															

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter [AMEVCNTR1<n>](#).

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter [AMEVCNTR1<n>](#), then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by [AMEVCNTR1<n>](#) might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter [AMEVCNTR1<n>](#) is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVTYPER1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n> are UNDEFINED.

Note

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15

CFPRCTX, Control Flow Prediction Restriction by Context

The CFPRCTX characteristics are:

Purpose

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Control flow predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when AArch32 is supported and FEAT_SPECRES is implemented. Otherwise, direct accesses to CFPRCTX are UNDEFINED.

Attributes

CFPRCTX is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				GVMIDNS				EL				VMID				RES0				GASID				ASID							

Bits [31:28]

Reserved, RES0.

GVMID, bit [27]

Execution of this instruction applies to all VMIDs or a specified VMID.

GV MID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

NS, bit [26]

Security State.

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

VMID, bits [23:16]

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#) or [ELUsingAArch32\(EL2\)](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#) and [!ELUsingAArch32\(EL2\)](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

Bits [15:9]

Reserved, RES0.

GASID, bit [8]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field is treated as 0.

ASID, bits [7:0]

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

Executing the CFPRCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0011	0b100

```

if PSTATE.EL == EL0 then

CLIDR, Cache Level ID Register

The CLIDR characteristics are:

Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

Configuration

AArch32 System register CLIDR bits [31:0] are architecturally mapped to AArch64 System register [CLIDR_EL1\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to CLIDR are UNDEFINED.

Attributes

CLIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ICB		LoUU		LoC		LoUIS		Ctype7		Ctype6		Ctype5		Ctype4		Ctype3		Ctype2		Ctype1											

ICB, bits [31:30]

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

ICB	Meaning
0b00	Not disclosed by this mechanism.
0b01	L1 cache is the highest Inner Cacheable level.
0b10	L2 cache is the highest Inner Cacheable level.
0b11	L3 cache is the highest Inner Cacheable level.

LoUU, bits [29:27]

Level of Unification Uniprocessor for the cache hierarchy.

For a description of the values of this field, see Terminology for Clean, Invalidate, and Clean and Invalidate instructions.

Note

This field does not describe the requirements for instruction cache invalidation. See [CTR.DIC](#).

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

LoC, bits [26:24]

Level of Coherence for the cache hierarchy.

For a description of the values of this field, see Terminology for Clean, Invalidate, and Clean and Invalidate instructions.

LoUIS, bits [23:21]

Level of Unification Inner Shareable for the cache hierarchy.

For a description of the values of this field, see Terminology for Clean, Invalidate, and Clean and Invalidate instructions.

Note

This field does not describe the requirements for instruction cache invalidation. See [CTR.DIC](#).

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 7 to 1

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy.

Ctype<n>	Meaning
0b000	No cache.
0b001	Instruction cache only.
0b010	Data cache only.
0b011	Separate instruction and data caches.
0b100	Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

Accessing CLIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b001	0b0000	0b0000	0b001

```

COSPRCTX, Clear Other Speculative Restriction by Context

The COSPRCTX characteristics are:

Purpose

Clear Other Speculative Prediction Restriction by Context applies to prediction resources not managed by another of the speculation restriction System instructions.

The actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively any predictions occurring after the instruction is complete and synchronized.

This instruction applies to all speculative access except:

- Cache Prefetch predictions.
- Data Value predictions.
- Control Flow predictions.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when AArch32 is supported and FEAT_SPECRES2 is implemented. Otherwise, direct accesses to COSPRCTX are UNDEFINED.

Attributes

COSPRCTX is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				GVMIDNS				EL				VMID				RES0				GASID		ASID									

Bits [31:28]

Reserved, RES0.

GVMID, bit [27]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMD	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

NS, bit [26]

Security State.

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

If the instruction is executed in Non-secure state, this field is treated as 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

VMID, bits [23:16]

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#) or [ELUsingAArch32\(EL2\)](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#) and [!ELUsingAArch32\(EL2\)](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

Bits [15:9]

Reserved, RES0.

GASID, bit [8]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [7:0]

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

Executing COSPRCTX

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0011	0b110

```

if PSTATE.EL == EL0 then

CPPRCTX, Cache Prefetch Prediction Restriction by Context

The CPPRCTX characteristics are:

Purpose

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

The actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control cache prefetch predictions occurring after the instruction is complete and synchronized.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when AArch32 is supported and FEAT_SPECRES is implemented. Otherwise, direct accesses to CPPRCTX are UNDEFINED.

Attributes

CPPRCTX is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				GVMIDNS				EL				VMID				RES0				GASID				ASID							

Bits [31:28]

Reserved, RES0.

GVMID, bit [27]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

NS, bit [26]

Security State.

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

If the instruction is executed in Non-secure state, this field is treated as 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

VMID, bits [23:16]

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#) or [ELUsingAArch32\(EL2\)](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#) and [!ELUsingAArch32\(EL2\)](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

Bits [15:9]

Reserved, RES0.

GASID, bit [8]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [7:0]

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

Executing the CPPRCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0011	0b111

```

if PSTATE.EL == EL0 then

DBGBCR<n>, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n> characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>](#). If EL2 is implemented and this breakpoint supports Context matching, [DBGBVR<n>](#) can be associated with a Breakpoint Extended Value Register [DBGBXVR<n>](#) for VMID matching.

Configuration

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGBCR<n>_EL1\[31:0\]](#).

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to External register [DBGBCR<n>_EL1\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DBGBCR<n> are UNDEFINED.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGBCR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								BT				LBN				SSC		HMC	RES0				BAS			RES0	PMC	E			

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. DBGBVR<n> is the address of an instruction.
0b0001	As 0b0000, but linked to a Context matching breakpoint.
0b0010	Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>.ContextID must match the CONTEXTIDR value.
0b0011	As 0b0010 with linking enabled.
0b0100	Unlinked instruction address mismatch. DBGBVR<n> is the address of an instruction to be stepped.
0b0101	As 0b0100, but linked to a Context matching breakpoint.
0b0110	Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>.ContextID is a Context ID compared against CONTEXTIDR .
0b0111	As 0b0110 with linking enabled.
0b1000	Unlinked VMID match. DBGBXVR<n>.VMID is a VMID compared against VTTBR.VMID .
0b1001	As 0b1000 with linking enabled.
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>.ContextID is a Context ID compared against CONTEXTIDR , and DBGBXVR<n>.VMID is a VMID compared against VTTBR.VMID .
0b1011	As 0b1010 with linking enabled.
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBXVR<n>.ContextID2 is a Context ID compared against CONTEXTIDR_EL2 .
0b1101	As 0b1100 with linking enabled.
0b1110	Unlinked Full Context ID match. DBGBVR<n>.ContextID is compared against CONTEXTIDR , and DBGBXVR<n>.ContextID2 is compared against CONTEXTIDR_EL2 .
0b1111	As 0b1110 with linking enabled.

For more information on Breakpoints and their constraints, see 'Breakpoint exceptions' and 'Reserved DBGBCR<n>.BT values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked [Breakpoint breakpoint Number number](#). For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types, this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>.E is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields.

For more information, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>.{SSC, HMC, PMC} values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>	Use for T32 instructions
0b1100	DBGBVR<n> +2	Use for T32 instructions
0b1111	DBGBVR<n>	Use for A32 instructions

All other values are reserved. For more information, see 'Reserved DBGBCR<n>.BAS values'.

For more information on using the BAS field in Address Match breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Step instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint
0b0011	DBGBVR<n>	Use for T32 instructions
0b1100	DBGBVR<n> +2	Use for T32 instructions
0b1111	DBGBVR<n>	Use for A32 instructions

All other values are reserved. For more information, see 'Reserved DBGBCR<n>.BAS values'.

For more information on using the BAS field in address mismatch breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint [DBGBVR<n>](#). Possible values are:

E	Meaning
0b0	Breakpoint disabled.
0b1	Breakpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15

DBGDEVID, Debug Device ID register 0

The DBGDEVID characteristics are:

Purpose

Adds to the information given by the [DBGDIDR](#) by describing other features of the debug implementation.

Configuration

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DBGDEVID are UNDEFINED.

This register is required in all implementations.

Attributes

DBGDEVID is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CIDMask				AuxRegs				DoubleLock				VirtExtns				VectorCatch				BPAAddrMask				WPAddrMask				PCSample			

CIDMask, bits [31:28]

Indicates the level of support for the Context ID matching breakpoint masking capability. Defined values are:

CIDMask	Meaning
0b0000	Context ID masking is not implemented.
0b0001	Context ID masking is implemented.

All other values are reserved. The value of this for Armv8 is 0b0000.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Permitted values for this field are:

AuxRegs	Meaning
0b0000	None supported.
0b0001	Support for External Debug Auxiliary Control Register, EDACR .

All other values are reserved.

DoubleLock, bits [23:20]

OS Double Lock implemented. Defined values are:

DoubleLock	Meaning
0b0000	OS Double Lock is not implemented. DBGOSDLR is RAZ/WI.
0b0001	OS Double Lock is implemented. DBGOSDLR is RW.

FEAT_DoubleLock implements the functionality identified by the value 0b0001.

All other values are reserved.

VirtExtns, bits [19:16]

Indicates whether EL2 is implemented. Defined values are:

VirtExtns	Meaning
0b0000	EL2 is not implemented.
0b0001	EL2 is implemented.

All other values are reserved.

VectorCatch, bits [15:12]

Defines the form of Vector Catch exception implemented. Defined values are:

VectorCatch	Meaning
0b0000	Address matching Vector Catch exception implemented.
0b0001	Exception matching Vector Catch exception implemented.

All other values are reserved.

BPAAddrMask, bits [11:8]

Indicates the level of support for the instruction address matching breakpoint masking capability. Defined values are:

BPAAddrMask	Meaning
0b0000	Breakpoint address masking might be implemented. If not implemented, DBGBCR<n> [28:24] is RAZ/WI.
0b0001	Breakpoint address masking is implemented.
0b1111	Breakpoint address masking is not implemented. DBGBCR<n> [28:24] is RES0.

All other values are reserved. The value of this for Armv8 is 0b1111.

WPAAddrMask, bits [7:4]

Indicates the level of support for the data address matching watchpoint masking capability. Defined values are:

WPAAddrMask	Meaning
0b0000	Watchpoint address masking might be implemented. If not implemented, DBGWCR<n>.MASK (Address mask) is RAZ/WI.
0b0001	Watchpoint address masking is implemented.
0b1111	Watchpoint address masking is not implemented. DBGWCR<n>.MASK (Address mask) is RES0.

All other values are reserved. The value of this for Armv8 is 0b0001.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the external debug registers space.
0b0010	Only EDPCSR and EDCIDS are implemented. This option is only permitted if EL3 and EL2 are not implemented.
0b0011	EDPCSR , EDCIDS , and EDVIDSR are implemented.

All other values are reserved.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of **PMU.PMDEVID.PCSample**. ~~PMDEVID.PCSample~~.

Accessing DBGDEVID

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b0010	0b111

```

DBGDIDR, Debug ID Register

The DBGDIDR characteristics are:

Purpose

Specifies which version of the Debug architecture is implemented, and some features of the debug implementation.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGDIDR are UNDEFINED.
If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WRPs				BRPs				CTX_CMPs				Version				RES1				RES0				SE_imp				RES0			

WRPs, bits [31:28]

NumberThe number of watchpoints implemented, minus 1.
IfPermitted values of this field are from FEAT_Debugv8p90b0001 isfor 2-implemented and 16 or more watchpoints are implemented, this field reads asto 0b1111for 16 implemented watchpoints.
The value of 0b0000 is reserved.
If AArch64 is implemented, this field has the same value as ID_AA64DFR0_EL1.WRPs.

BRPs, bits [27:24]

NumberThe number of breakpoints implemented, minus 1.
IfPermitted values of this field are from FEAT_Debugv8p90b0001 isfor 2-implemented and 16 or more breakpoints are implementedbreakpoint, this field reads asto 0b1111for 16 implemented breakpoints.
The value of 0b0000 is reserved.
If AArch64 is implemented, this field has the same value as ID_AA64DFR0_EL1.BRPs.

CTX_CMPs, bits [23:20]

The Context matching breakpoints must be the highest addressed breakpoints. For example, if six breakpoints are implemented and two are Context matching breakpoints, they must be breakpoints 4 and 5.
If AArch64 is implemented, this field has the same value as ID_AA64DFR0_EL1.CTX_CMPs.
NumberThe number of breakpoints that arecan context-awarebe used for Context matching, minus 1.

If Permitted values of this field are from FEAT_Debugv8p9 0b0000 is for implemented 1 and Context 16 matching or more breakpoints that are context-aware are implemented breakpoint, this field reads as to 0b1111 for 16 Context matching breakpoints.

Version, bits [19:16]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

Version	Meaning
0b0000	Not supported.
0b0001	Armv6, v6 Debug architecture, with System registers access.
0b0010	Armv6, v6.1 Debug architecture, with System registers access.
0b0011	Armv7, v7 Debug architecture, with only baseline System registers.
0b0100	Armv7, v7 Debug architecture, with all System registers implemented.
0b0101	Armv7, v7.1 Debug architecture, with System registers access.
0b0110	Armv8 debug architecture.
0b0111	Armv8 debug architecture with Virtualization Host Extensions.
0b1000	Armv8.2 debug architecture, FEAT_Debugv8p2.
0b1001	Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010	Armv8.8 debug architecture, FEAT_Debugv8p8.
0b1011	Armv8.9 debug architecture, FEAT_Debugv8p9.

All other values are reserved.

The values 0b0000, 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted in Armv8.

FEAT_VHE adds the functionality identified by the value 0b0111.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

FEAT_Debugv8p8 adds the functionality identified by the value 0b1010.

FEAT_Debugv8p9 adds the functionality identified by the value 0b1011.

From Armv8.1, when FEAT_VHE is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

From Armv8.9, the value 0b1010 is not permitted.

Bit [15]

Reserved, RES1.

nSUHD_imp, bit [14]

Previously indicated that Secure User Halting Debug is not implemented.

The value of this bit must match the value of the SE_imp bit.

Bit [13]

Reserved, RES0.

SE_imp, bit [12]

EL3 implemented. The meanings of the values of this bit are:

SE_imp	Meaning
0b0	EL3 not implemented.
0b1	EL3 implemented.

The value of this bit must match the value of the nSUHD_imp bit.

Bits [11:0]

Reserved, RES0.

Accessing DBGDIDR

Arm deprecates any access to this register from EL0.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0000	0b000

```

DBGWCR<n>, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n> characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>](#).

Configuration

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGWCR<n>_EL1\[31:0\]](#).

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to External register [DBGWCR<n>_EL1\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DBGWCR<n> are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWCR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															

When the E field is zero, all the other fields in the register are ignored.

Bits [31:29]

Reserved, RES0.

MASK, bits [28:24]

Address [Mask](#).mask. Only objects up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00001	Reserved.
0b00010	Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked ~~Breakpoint~~ ~~breakpoint~~ ~~Number~~ ~~number~~. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions', and 'Reserved DBGWCR<n>.{SSC, HMC, PAC} values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>](#) is being watched.

BAS	Description
0bxxxxxxx1	Match byte at DBGWVR<n>
0bxxxxxx1x	Match byte at DBGWVR<n>+1
0bxxxxx1xx	Match byte at DBGWVR<n>+2
0bxxxx1xxx	Match byte at DBGWVR<n>+3

In cases where [DBGWVR<n>](#) addresses a double-word:

BAS	Description, if DBGWVR<n> [2] == 0
0bxxx1xxxx	Match byte at DBGWVR<n>+4
0bxx1xxxxx	Match byte at DBGWVR<n>+5
0bx1xxxxxx	Match byte at DBGWVR<n>+6
0b1xxxxxxx	Match byte at DBGWVR<n>+7

If [DBGWVR<n>](#)[2] == 1, only BAS[3:0] are used and BAS[7:4] are ignored. Arm deprecates setting [DBGWVR<n>](#)[2] == 1.

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n. Possible values are:

E	Meaning
0b0	Watchpoint disabled.
0b1	Watchpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGWCR<n>

Accesses to this register use the following encodings in the System register encoding space:

DSPSR2, Debug Saved Process State Register 2

The DSPSR2 characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configuration

AArch32 System register DSPSR2 bits [31:0] are architecturally mapped to AArch64 System register [DSPSR_EL0\[63:32\]](#).

This register is present only when FEAT_Debugv8p9 is implemented. Otherwise, direct accesses to DSPSR2 are UNDEFINED.

Attributes

DSPSR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																PPEND		PM													

Bits [31:2]

Reserved, RES0.

PPEND, bit [1]

When FEAT_SEBEP is implemented:

PMU exception pending. Set to the value of PSTATE.PPEND on entering Debug state, and copied to PSTATE.PPEND on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PM, bit [0]

When FEAT_EBEP is implemented:

PMU exception mask. Set to the value of PSTATE.PM on entering Debug state, and copied to PSTATE.PM on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing DPSR2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b011	0b0100	0b0101	0b010

```

if !Halted() then
    UNDEFINED;
else
    R[t] = DPSR2;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b011	0b0100	0b0101	0b010

```

if !Halted() then
    UNDEFINED;
else
    DPSR2 = R[t];

```

DVPRCTX, Data Value Prediction Restriction by Context

The DVPRCTX characteristics are:

Purpose

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Data value predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when AArch32 is supported and FEAT_SPECRES is implemented. Otherwise, direct accesses to DVPRCTX are UNDEFINED.

Attributes

DVPRCTX is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				GVMIDNS				EL				VMID				RES0				GASID				ASID							

Bits [31:28]

Reserved, RES0.

GVMID, bit [27]

Execution of this instruction applies to all VMIDs or a specified VMID.

GV MID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

NS, bit [26]

Security State.

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

VMID, bits [23:16]

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#) or [ELUsingAArch32\(EL2\)](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#) and [!ELUsingAArch32\(EL2\)](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

Bits [15:9]

Reserved, RES0.

GASID, bit [8]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [7:0]

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

Executing the DVPRCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0011	0b101

```

if PSTATE.EL == EL0 then

ICC_AP1R<n>, Interrupt Controller Active Priorities Group 1 Registers, n = 0 - 3

The ICC_AP1R<n> characteristics are:

Purpose

Provides information about Group 1 active priorities.

Configuration

AArch32 System register ICC_AP1R<n> bits [31:0] (ICC_AP1R<n>_S) are architecturally mapped to AArch64 System register [ICC_AP1R<n>_EL1\[31:0\]](#) (ICC_AP1R<n>_EL1_S).

AArch32 System register ICC_AP1R<n> bits [31:0] (ICC_AP1R<n>_NS) are architecturally mapped to AArch64 System register [ICC_AP1R<n>_EL1\[31:0\]](#) (ICC_AP1R<n>_EL1_NS).

This register is present only when EL1 is capable of using AArch32 and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_AP1R<n> are UNDEFINED.

Attributes

ICC_AP1R<n> is a 32-bit register.

This register has the following instances:

- ICC_AP1R<n>, when when EL3 is not implemented
- ICC_AP1R<n>_S, when when EL3 is implemented
- ICC_AP1R<n>_NS, when when EL3 is implemented

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICC_AP1R<n>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP1R1 is only implemented in implementations that support 6 or more bits of preemption. ICC_AP1R2 and ICC_AP1R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by [ICH_VTR](#).PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- [ICC_AP0R<n>](#)
- Secure ICC_AP1R<n>
- Non-secure ICC_AP1R<n>

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-3

ICC_BPR1, Interrupt Controller Binary Point Register 1

The ICC_BPR1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

Configuration

AArch32 System register ICC_BPR1 bits [31:0] (ICC_BPR1_S) are architecturally mapped to AArch64 System register [ICC_BPR1_EL1\[31:0\]](#) (ICC_BPR1_EL1_S).

AArch32 System register ICC_BPR1 bits [31:0] (ICC_BPR1_NS) are architecturally mapped to AArch64 System register [ICC_BPR1_EL1\[31:0\]](#) (ICC_BPR1_EL1_NS).

This register is present only when EL1 is capable of using AArch32 and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_BPR1 are UNDEFINED.

In GIC implementations supporting two Security states, this register is Banked.

Attributes

ICC_BPR1 is a 32-bit register.

This register has the following instances:

- [ICC_BPR1](#), when when EL3 is not implemented
- [ICC_BPR1_S](#), when when EL3 is implemented
- [ICC_BPR1_NS](#), when when EL3 is implemented

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																	BinaryPoint														

Bits [31:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Writing 0 to this field will set this field to its reset value.

If EL3 is implemented and [ICC_MCTLR](#).CBPR_EL1S is 1:

- Accesses to this register at EL3 not in Monitor mode access the state of [ICC_BPR0](#).
- When [SCR_EL3](#).EEL2 is 1 and [HCR_EL2](#).IMO is 1, Secure accesses to this register at EL1 access the state of [ICV_BPR1](#).
- Otherwise, Secure accesses to this register at EL1 access the state of [ICC_BPR0](#).

If EL3 is implemented and [ICC_MCTLR.CBPR_EL1NS](#) is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR.IMO and SCR.IRQ:

HCR.IMO	SCR.IRQ	Behavior
0b0	0b0	Non-secure EL1 and EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b0	0b1	Non-secure EL1 and EL2 accesses trap to EL3.
0b1	0b0	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL2 writes ignored.
0b1	0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3.

If EL3 is not implemented and [ICC_CTLR.CBPR](#) is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR.IMO:

HCR.IMO	Behavior
0b0	Non-secure EL1 and EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.

This field resets to an IMPLEMENTATION DEFINED non-zero value.

Accessing ICC_BPR1

When the PE resets into an Exception level that is using AArch32, the reset value is equal to:

- For the Secure copy of the register, the minimum value of [ICC_BPR0](#) plus one.
- For the Non-secure copy of the register, the minimum value of [ICC_BPR0](#).

Where the minimum value of [ICC_BPR0](#) is IMPLEMENTATION DEFINED.

If EL3 is not implemented:

- If the PE is Secure this reset value is (minimum value of [ICC_BPR0](#) plus one).
- If the PE is Non-secure this reset value is (minimum value of [ICC_BPR0](#)).

An attempt to program the binary point field to a value less than the reset value sets the field to the reset value.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b011

```

ICC_CTLR, Interrupt Controller Control Register

The ICC_CTLR characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

AArch32 System register ICC_CTLR bits [31:0] (ICC_CTLR_S) are architecturally mapped to AArch64 System register [ICC_CTLR_EL1\[31:0\]](#) (ICC_CTLR_EL1_S).

AArch32 System register ICC_CTLR bits [31:0] (ICC_CTLR_NS) are architecturally mapped to AArch64 System register [ICC_CTLR_EL1\[31:0\]](#) (ICC_CTLR_EL1_NS).

This register is present only when EL1 is capable of using AArch32 and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_CTLR are UNDEFINED.

Attributes

ICC_CTLR is a 32-bit register.

This register has the following instances:

- ICC_CTLR, when when EL3 is not implemented
- ICC_CTLR_S, when when EL3 is implemented
- ICC_CTLR_NS, when when EL3 is implemented

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												ExtRange	RSS	RES0	A3V	SEIS	IDbits	PRIbits	RES0	PMHE	RES0		EOImode	CBPR							

Bits [31:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. BehaviorBehaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. <div>Note Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.</div>
0b1	CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of [ICC_CTLR_EL3.ExtRange](#).

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

A3V	Meaning
0b0	The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

If EL3 is implemented and using AArch32, this bit is an alias of [ICC_MCTLR.A3V](#).

If EL3 is implemented and using AArch64, this bit is an alias of [ICC_CTLR_EL3.A3V](#).

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

SEIS	Meaning
0b0	The CPU interface logic does not support local generation of SEIs.
0b1	The CPU interface logic supports local generation of SEIs.

If EL3 is implemented and using AArch32, this bit is an alias of [ICC_MCTLR.SEIS](#).

If EL3 is implemented and using AArch64, this bit is an alias of [ICC_CTLR_EL3.SEIS](#).

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is implemented and using AArch32, this field is an alias of [ICC_MCTLR.IDbits](#).

If EL3 is implemented and using AArch64, this field is an alias of [ICC_CTLR_EL3.IDbits](#).

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of [GICD_CTLR.DS](#).

The division between group priority and subpriority is defined in the binary point registers [ICC_BPR0](#) and [ICC_BPR1](#).

If EL3 is implemented and using AArch32, physical accesses return the value from [ICC_MCTLR.PRIBits](#).

If EL3 is implemented and using AArch64, physical accesses return the value from [ICC_CTLR_EL3.PRIBits](#).

If EL3 is not implemented, physical accesses return the value from this field.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

PMHE	Meaning
0b0	Disables use of ICC_PMR as a hint for interrupt distribution.
0b1	Enables use of ICC_PMR as a hint for interrupt distribution.

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of [ICC_MCTLR.PMHE](#).
- If EL3 is using AArch64, this bit is an alias of [ICC_CTLR_EL3.PMHE](#).
- If [GICD_CTLR.DS](#) == 0, this bit is read-only.
- If [GICD_CTLR.DS](#) == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read/write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

Bits [5:2]

Reserved, RES0.

EOImode, bit [1]

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

EOImode	Meaning
0b0	ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
0b1	ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of [ICC_MCTLR.EOImode_EL1](#){S, NS} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of [ICC_CTLR_EL3.EOImode_EL1](#){S, NS} where S or NS corresponds to the current Security state.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read/write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Group 1 interrupts.
0b1	ICC_BPR0 determines the preemption group for both Group 0 and Group 1 interrupts.

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of [ICC_MCTLR.CBPR_EL1](#){S,NS} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of [ICC_CTLR_EL3.CBPR_EL1](#){S,NS} where S or NS corresponds to the current Security state.
- If [GICD_CTLR.DS](#) == 0, this bit is read-only.
- If [GICD_CTLR.DS](#) == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read/write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

Accessing ICC_CTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b100

```

ICC_IGRPEN1, Interrupt Controller Interrupt Group 1 Enable register

The ICC_IGRPEN1 characteristics are:

Purpose

Controls whether Group 1 interrupts are enabled for the current Security state.

Configuration

AArch32 System register ICC_IGRPEN1 bits [31:0] (ICC_IGRPEN1_S) are architecturally mapped to AArch64 System register [ICC_IGRPEN1_EL1\[31:0\]](#) (ICC_IGRPEN1_EL1_S).

AArch32 System register ICC_IGRPEN1 bits [31:0] (ICC_IGRPEN1_NS) are architecturally mapped to AArch64 System register [ICC_IGRPEN1_EL1\[31:0\]](#) (ICC_IGRPEN1_EL1_NS).

This register is present only when EL1 is capable of using AArch32 and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_IGRPEN1 are UNDEFINED.

Attributes

ICC_IGRPEN1 is a 32-bit register.

This register has the following instances:

- ICC_IGRPEN1, when when EL3 is not implemented
- ICC_IGRPEN1_S, when when EL3 is implemented
- ICC_IGRPEN1_NS, when when EL3 is implemented

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															Enable

Bits [31:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 1 interrupts for the current Security state.

Enable	Meaning
0b0	Group 1 interrupts are disabled for the current Security state.
0b1	Group 1 interrupts are enabled for the current Security state.

Virtual accesses to this register update [ICH_VMCR.VENG1](#).

If EL3 is present:

- This bit is a read/write alias of [ICC_MGRPEN1.EnableGrp1{S, NS}](#) as appropriate if EL3 is using AArch32, or [ICC_IGRPEN1_EL3.EnableGrp1{S, NS}](#) as appropriate if EL3 is using AArch64.

- When this register is accessed at EL3, the copy of this register appropriate to the current setting of SCR.NS is accessed.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_IGRPEN1

The lowest Exception level at which this register can be accessed is governed by the Exception level to which IRQ is routed. This routing depends on SCR.IRQ, SCR.NS and HCR.IMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b111

```

ICC_SRE, Interrupt Controller System Register Enable register

The ICC_SRE characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL0 and EL1.

Configuration

AArch32 System register ICC_SRE bits [31:0] (ICC_SRE_S) are architecturally mapped to AArch64 System register [ICC_SRE_EL1\[31:0\]](#) (ICC_SRE_EL1_S).

AArch32 System register ICC_SRE bits [31:0] (ICC_SRE_NS) are architecturally mapped to AArch64 System register [ICC_SRE_EL1\[31:0\]](#) (ICC_SRE_EL1_NS).

This register is present only when EL1 is capable of using AArch32 and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SRE are UNDEFINED.

Attributes

ICC_SRE is a 32-bit register.

This register has the following instances:

- ICC_SRE, when when EL3 is not implemented
- ICC_SRE_S, when when EL3 is implemented
- ICC_SRE_NS, when when EL3 is implemented

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																DIBDFBSRE															

Bits [31:3]

Reserved, RES0.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and [GICD_CTLR](#).DS == 0, this field is a read-only alias of [ICC_MSRE](#).DIB.

If EL3 is implemented and [GICD_CTLR](#).DS == 1, and EL2 is not implemented, this field is a read/write alias of [ICC_MSRE](#).DIB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of [ICC_HSRE](#).DIB.

If [GICD_CTLR](#).DS == 1 and EL2 is implemented, this field is a read-only alias of [ICC_HSRE](#).DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and [GICD_CTLR.DS](#) == 0, this field is a read-only alias of [ICC_MSRE.DFB](#).

If EL3 is implemented and [GICD_CTLR.DS](#) == 1, and EL2 is not implemented, this field is a read/write alias of [ICC_MSRE.DFB](#).

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of [ICC_HSRE.DFB](#).

If [GICD_CTLR.DS](#) == 1 and EL2 is implemented, this field is a read-only alias of [ICC_HSRE.DFB](#).

In systems that do not support FIQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Accesses at EL1 to any ICC_* System register other than ICC_SRE are UNDEFINED.
0b1	The System register interface for the current Security state is enabled.

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When [ICC_SRE_EL3.SRE](#)==0 the Secure copy of this bit is RAZ/WI.
- When [ICC_SRE_EL3.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI.

If EL3 is implemented and using AArch32:

- When [ICC_MSRE.SRE](#)==0 the Secure copy of this bit is RAZ/WI.
- When [ICC_MSRE.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch64:

- When [ICC_SRE_EL2.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch32:

- When [ICC_HSRE.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_SRE

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while `ICC_SRE.SRE==0`, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

`MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}`

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b101

```

ICV_CTLR, Interrupt Controller Virtual Control Register

The ICV_CTLR characteristics are:

Purpose

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

Configuration

AArch32 System register ICV_CTLR bits [31:0] are architecturally mapped to AArch64 System register [ICV_CTLR_EL1\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_CTLR are UNDEFINED.

Attributes

ICV_CTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												ExtRange	RSS	RES0	A3V	SEIS	IDbits	PRIbits	RES0								EOLmode	CBPR			

Bits [31:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. Note Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.

ICV_CTLR.ExtRange is an alias of [ICC_CTLR](#).ExtRange.

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support local generation of SEIs.
0b1	The virtual CPU interface logic supports local generation of SEIs.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

PRbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation must implement at least 32 levels of physical priority (5 priority bits).

Note

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers [ICV_BPR0](#) and [ICV_BPR1](#).

Bits [7:2]

Reserved, RES0.

EOImode, bit [1]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

EOImode	Meaning
0b0	ICV_EOIR0 and ICV_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR are UNPREDICTABLE.
0b1	ICV_EOIR0 and ICV_EOIR1 provide priority drop functionality only. ICV_DIR provides interrupt deactivation functionality.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

CBPR	Meaning
0b0	ICV_BPR0 determines the preemption group for virtual Group 0 interrupts only. ICV_BPR1 determines the preemption group for virtual Group 1 interrupts.
0b1	Non-secure reads of ICV_BPR1 return ICV_BPR0 plus one, saturated to 0b111. Non-secure writes to ICV_BPR1 are ignored. Secure reads of ICV_BPR1 return ICV_BPR0 . Secure writes of ICV_BPR1 modify ICV_BPR0 .

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_CTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b100

ID_DFR0, Debug Feature Register 0

The ID_DFR0 characteristics are:

Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_DFR0 bits [31:0] are architecturally mapped to AArch64 System register [ID_DFR0_EL1\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to ID_DFR0 are UNDEFINED.

Attributes

ID_DFR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TraceFilt				PerfMon				MProfDbg				MMapTrc				CopTrc				MMapDbg				CopSDBG				CopDBG			

TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'.

Defined values are:

PerfMon	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv1 implemented.
0b0010	Performance Monitors Extension, PMUv2 implemented.
0b0011	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0011, and adds support for: <ul style="list-style-type: none"> Extended 16-bit PMEVTYPER<n>.evtCount field. If EL2 is implemented, the HDCR.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: <ul style="list-style-type: none"> 64-bit event counters. If EL2 is implemented, the HDCR.HCCD control. If EL3 is implemented, the SDCR.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: <ul style="list-style-type: none"> The PMCR.FZO and, if EL2 is implemented, HDCR.HPMFZO controls. If EL3 is implemented and using AArch64, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: <ul style="list-style-type: none"> Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1001	PMUv3 for Armv8.9. As 0b1000, and: <ul style="list-style-type: none"> Updates the definitions of existing PMU events. Adds support for the EDECR.PME control.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

FEAT_PMUv3p9 implements the functionality identified by the value 0b1001.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

Note

PMUv1 and PMUv2 are not permitted in an Armv8 implementation.

From Armv8.9, if FEAT_PMUv3 is implemented, the value 0b1000 is not permitted.

Note

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 and PMUv2 are not permitted in an Armv8 implementation.

MProfDbg, bits [23:20]

M-profile Debug. Support for memory-mapped debug model for M-profile processors. Defined values are:

MProfDbg	Meaning
0b0000	Not supported.
0b0001	Support for M-profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

MMapTrc, bits [19:16]

Memory-mapped Trace. Support for memory-mapped trace model. Defined values are:

MMapTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

CopTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

MMapDbg, bits [11:8]

Memory-mapped Debug. Support for Armv7 memory-mapped debug model for A and R-profile processors. Defined values are:

MMapDbg	Meaning
0b0000	Not supported.
0b0100	Support for Armv7, v7 Debug architecture, with memory-mapped access.
0b0101	Support for Armv7, v7.1 Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

The optional memory map defined by Armv8 is not compatible with Armv7.

CopSDBG, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A-profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDBG, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

CopDBG	Meaning
0b0000	Not supported.
0b0010	Armv6, v6 Debug architecture, with System registers access.
0b0011	Armv6, v6.1 Debug architecture, with System registers access.
0b0100	Armv7, v7 Debug architecture, with System registers access.
0b0101	Armv7, v7.1 Debug architecture, with System registers access.
0b0110	Armv8 debug architecture.
0b0111	Armv8 debug architecture with Virtualization Host Extensions.
0b1000	Armv8.2 debug architecture, FEAT_Debugv8p2.
0b1001	Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010	Armv8.8 debug architecture, FEAT_Debugv8p8.
0b1011	Armv8.9 debug architecture, FEAT_Debugv8p9.

All other values are reserved.

The values 0b0000, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted in Armv8.

FEAT_VHE adds the functionality identified by the value 0b0111.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

FEAT_Debugv8p8 adds the functionality identified by the value 0b1010.

FEAT_Debugv8p9 adds the functionality identified by the value 0b1011.

From Armv8.1, when FEAT_VHE is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

From Armv8.9, the value 0b1010 is not permitted.

Accessing ID_DFR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then

ID_ISAR6, Instruction Set Attribute Register 6

The ID_ISAR6 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), [ID_ISAR4](#), and [ID_ISAR5](#).

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR6 bits [31:0] are architecturally mapped to AArch64 System register [ID_ISAR6_EL1\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to ID_ISAR6 are UNDEFINED.

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_ISAR6 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CLRBHB	RES0			I8MM					BF16			SPECRES			SB				FHM				DP				JSCVT				

CLRBHB, bits [31:28]

Indicates support for the CLRBHB instruction in AArch32 state. Defined values are:

Reserved, RES0.

CLRBHB	Meaning
0b0000	CLRBHB instruction is not implemented.
0b0001	CLRBHB instruction is implemented.

All other values are reserved.

FEAT_CLRBHB implements the functionality identified by 0b0001.

From Armv8.9, the only permitted value is 0b0001.

I8MM, bits [27:24]

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.

All other values are reserved.

FEAT_AA32I8MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	VCVT, VCVTB, VCVTT, VDOT, VFMA, VFMA, and VMMLA instructions with BF16 operand or result types are implemented.

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

SPECRES, bits [19:16]

Indicates support for **predictionSpeculation** invalidation instructions in AArch32 state. Defined values are:

SPECRES	Meaning
0b0000	PredictionCFPRCTX, invalidationDVPRCTX, and CPPRCTX instructions are not implemented.
0b0001	CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.
0b0010	As 0b0001, and the COSPRCTX instruction is implemented.

All other values are reserved.

FEAT_SPECRES implements **From Armv8.5, the functionality only identifiedpermitted byvalue is** 0b0001.

FEAT_SPECRES2 implements the functionality identified by **0b0010**.

From Armv8.5, the value 0b0000 is not permitted.

From Armv8.9, the value 0b0001 is not permitted.

SB, bits [15:12]

Indicates support for SB instruction in AArch32 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point VFMA and VFMSL instructions in AArch32 state. Defined values are:

FHM	Meaning
0b0000	VFMAI and VMFSL instructions not implemented.
0b0001	VFMAI and VMFSL instructions implemented.

FEAT_FHM implements the functionality identified by the value 0b0001.

DP, bits [7:4]

Indicates support for dot product instructions in AArch32 state. Defined values are:

DP	Meaning
0b0000	No dot product instructions implemented.
0b0001	VUDOT and VSDOT instructions implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value 0b0001.

JSCVT, bits [3:0]

Indicates support for the Javascript conversion instruction in AArch32 state. Defined values are:

JSCVT	Meaning
0b0000	The VJCVT instruction is not implemented.
0b0001	The VJCVT instruction is implemented.

All other values are reserved.

In Armv8.0, the only permitted value is 0b0000.

FEAT_JSCVT implements the functionality identified by 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

Accessing ID_ISAR6

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b111

ID_PFR0, Processor Feature Register 0

The ID_PFR0 characteristics are:

Purpose

Gives top-level information about the instruction sets and other features supported by the PE in AArch32 state.

Must be interpreted with [ID_PFR1](#).

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_PFR0 bits [31:0] are architecturally mapped to AArch64 System register [ID_PFR0_EL1\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to ID_PFR0 are UNDEFINED.

Attributes

ID_PFR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RAS				DIT				AMU				CSV2				State3				State2				State1				State0			

RAS, bits [31:28]

RAS Extension version. ~~Defined values are:~~

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension implemented.
0b0010	FEAT_RASv1p1 implemented. As 0b0001, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.
0b0011	FEAT_RASv2 implemented. As 0b0010, and requires that error records accessed through System registers conform to RAS System Architecture v2.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 implements the functionality identified by the value 0b0010.

FEAT_RASv2 implements the functionality identified by the value 0b0011.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

From Armv8.4, when FEAT_DoubleFault is not implemented, and [ERRIDR.NUM](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

From In Armv8.2, the only permitted value is 0b00000b0001 is not permitted.

From Armv8.4, if FEAT_DoubleFault is implemented or [ERRIDR.NUM](#) is nonzero, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

Note

When the value of this field is 0b0001, [ID_PFR2.RAS_frac](#) indicates whether FEAT_RASv1p1 is implemented.

DIT, bits [27:24]

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch32 does not guarantee constant execution time of any instructions.
0b0001	AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [23:20]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

CSV2, bits [19:16]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	The implementation does not disclose whether FEAT_CSV2 is implemented.
0b0001	FEAT_CSV2 is implemented, but FEAT_CSV2_1p1 is not implemented.
0b0010	FEAT_CSV2_1p1 is implemented.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the value 0b0001.

FEAT_CSV2_1p1 implements the functionality identified by the value 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

State3, bits [15:12]

T32EE instruction set support. Defined values are:

State3	Meaning
0b0000	Not implemented.
0b0001	T32EE instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

State2, bits [11:8]

Jazelle extension support. Defined values are:

State2	Meaning
0b0000	Not implemented.
0b0001	Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.
0b0010	Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

State1, bits [7:4]

T32 instruction set support. Defined values are:

State1	Meaning
0b0000	T32 instruction set not implemented.
0b0001	T32 encodings before the introduction of Thumb-2 technology implemented: <ul style="list-style-type: none"> • All instructions are 16-bit. • A BL or BLX is a pair of 16-bit instructions. • 32-bit instructions other than BL and BLX cannot be encoded.
0b0011	T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

State0, bits [3:0]

A32 instruction set support. Defined values are:

State0	Meaning
0b0000	A32 instruction set not implemented.
0b0001	A32 instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR](#), increments.

Configuration

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to AArch64 System register [PMCCFILTR_EL0\[31:0\]](#).

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to External register [PMU.PMCCFILTR_EL0\[31:0\]](#)[PMCCFILTR_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMCCFILTR are UNDEFINED.

Attributes

PMCCFILTR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P	U	NSK	NSU	NSH	RES0				RLU	RES0																					

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR.NSK bit.

P	Meaning
0b0	Count cycles in EL1.
0b1	Do not count cycles in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMCCFILTR.RLU bit.

U	Meaning
0b0	Count cycles in EL0.
0b1	Do not count cycles in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

NSK, bit [29]**When EL3 is implemented:**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMCCFILTR.P, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSU, bit [28]**When EL3 is implemented:**

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMCCFILTR.U, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSH, bit [27]**When EL2 is implemented:**

EL2 (Hyp mode) filtering bit. Controls counting in EL2.

NSH	Meaning
0b0	Do not count cycles in EL2.
0b1	Count cycles in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [26:22]

Reserved, RES0.

RLU, bit [21]
When FEAT_RME is implemented:

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMCCFILTR.U bit, cycles in Realm EL0 are counted.

Otherwise, cycles in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [20:0]

Reserved, RES0.

Accessing PMCCFILTR

PMCCFILTR can also be accessed by using [PMXEVTYPER](#) with [PMSELR](#).SEL set to 0b11111.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b1111	0b111

```

PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' for more information.

[PMCCFILTER](#) determines the modes and states in which the PMCCNTR can increment.

Configuration

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to AArch64 System register [PMCCNTR_EL0\[63:0\]](#).

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to External register [PMU.PMCCNTR_EL0\[63:0\]](#)[PMCCNTR_EL0\[63:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMCCNTR are UNDEFINED.

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

Attributes

PMCCNTR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																CCNT															
																CCNT

CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR](#).{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR](#).C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1101	0b000

```

PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Configuration

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0_EL0\[31:0\]](#).

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to External register [PMU.PMCEID0\[31:0\]](#)[PMCEID0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0 are UNDEFINED.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID7

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b110

```

PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x0020 to 0x003F.

For more information about the Common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

Configuration

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID1_EL0\[31:0\]](#).

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to External register [PMU.PMCEID1\[31:0\]](#)[PMCEID1\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1 are UNDEFINED.

Attributes

PMCEID1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID7

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event (0x0020 + n).

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b111

```

The PMCNTENCLR characteristics are:

Purpose

Disables the Cycle Count Register, [PMCCNTR](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

PMCNTENCLR is used in conjunction with the [PMCNTENSET](#) register.

Configuration

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENCLR_EL0\[31:0\]](#).

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to External register [PMU.PMCNTENCLR_EL0\[31:0\]](#)[PMCNTENCLR_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMCNTENCLR are UNDEFINED.

Attributes

PMCNTENCLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

[PMCCNTR](#) disable bit. Disables the cycle counter register.

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, disables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n> is disabled. When written, has no effect.
0b1	When read, means that PMEVCNTR<n> is enabled. When written, disables PMEVCNTR<n> .

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENCLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b010

PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

Purpose

Enables the Cycle Count Register, [PMCCNTR](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

PMCNTENSET is used in conjunction with the [PMCNTENCLR](#) register.

Configuration

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENSET_ELO\[31:0\]](#).

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to External register [PMU.PMCNTENSET_ELO\[31:0\]](#)[PMCNTENSET_ELO\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMCNTENSET are UNDEFINED.

Attributes

PMCNTENSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

[PMCCNTR](#) enable bit. Enables the cycle counter register.

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, enables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter enable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#) if EL2 is using AArch64, or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n> is disabled. When written, has no effect.
0b1	When read, means that PMEVCNTR<n> event counter is enabled. When written, enables PMEVCNTR<n> .

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENSET

PMCR, Performance Monitors Control Register

The PMCR characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

AArch32 System register PMCR bits [31:0] are architecturally mapped to AArch64 System register [PMCR_EL0\[31:0\]](#).

AArch32 System register PMCR bits [7:0] are architecturally mapped to External register [PMU.PMCR_EL0\[7:0\]](#)~~[PMCR_EL0\[7:0\]](#)~~.

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR are UNDEFINED.

Attributes

PMCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMP								IDCODE								N		RES0	FZ	RES0	LP	LC	DP	X	D	C	P	E			

IMP, bits [31:24]

When FEAT_PMUv3p7 is not implemented:

Implementer code.

If this field is zero, then PMCR.IDCODE is RES0 and software must use [MIDR](#) to identify the PE.

Otherwise, this field and PMCR.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as [MIDR](#).Implementer.

Use of this field is deprecated.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

IDCODE, bits [23:16]

When PMCR.IMP != 0b00000000:

Identification code. Use of this field is deprecated.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of 0b000000-0b11111. If the value is 0b000000, then only [PMCCNTR](#) is implemented. If the value is 0b11111, then [PMCCNTR](#) and 31 event counters are implemented.

In an implementation that includes EL2:

- If EL2 is using AArch32, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of [HDCR](#).HPMN.
- If EL2 is using AArch64 and is enabled in the current Security state, reads of this field from EL1 and EL0 return the value of [MDCR_EL2](#).HPMN.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counter PMEVCNTR<n> does not count when PMOVSRR [(PMN-1):0] is nonzero and n is in the range of affected event counters.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and [PMCCNTR](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]**When FEAT_PMUv3p5 is implemented:**

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n> [31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n> [63:0].

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

If PMN is not 0, this bit affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and [PMCCNTR](#).

[PMEVCNTR<n>](#)[63:32] cannot be accessed directly in AArch32 state.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

LC, bit [6]

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR [31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR [63:0].

Arm deprecates use of [PMCR](#).LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DP, bit [5]**When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):**

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by PMCCNTR is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR is disabled in prohibited regions and when event counting is frozen: <ul style="list-style-type: none"> If FEAT_PMUv3p1 is implemented, EL2 is implemented, and HDCR.HPMD is 1, then cycle counting by PMCCNTR is disabled at EL2. If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR is disabled at EL3. If FEAT_PMUv3p7 is implemented and event counting is frozen by PMCR.FZO, then cycle counting by PMCCNTR is disabled. If EL3 is implemented, MDCR_EL3.SPME or SDCR.SPME is 0, and either FEAT_PMUv3p7 is not implemented, EL3 is using AArch32, or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR is disabled at EL3 and in Secure state. <p>If HDCR.HPMN is not 0, this is when event counting by event counters in the range [0..(HDCR.HPMN-1)] is prohibited or frozen.</p>

For more information, see 'Prohibiting event and cycle counting'.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

X, bit [4]**When the implementation includes a PMU event export bus:**

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR counts every clock cycle.
0b1	When enabled, PMCCNTR counts once every 64 clock cycles.

If PMCR.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR.D = 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR to zero.

Note

Resetting [PMCCNTR](#) does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

P	Meaning
0b0	No action.
0b1	If n is in the range of affected event counters, resets each event counter PMEVCNTR<n> to zero.

The effects of writing to this bit are:

- If EL2 is implemented and enabled in the current Security state, in EL0 and EL1, if PMN is not 0, a write of 1 to this bit resets event counters in the range [0 .. (PMN-1)].
- If EL2 is disabled in the current Security state, a write of 1 to this bit resets all the event counters.
- In EL2 and EL3, a write of 1 to this bit resets all the event counters.
- This field does not affect the operation of other event counters and [PMCCNTR](#).

Note

Resetting the event counters does not change the event counter overflow bits.

If FEAT_PMUv3p5 is implemented, the values of [HDCR](#).HLP and PMCR.LP are ignored and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

E	Meaning
0b0	PMCCNTR is disabled and event counters PMEVCNTR<n> , where n is in the range of affected event counters, are disabled.
0b1	PMCCNTR and event counters PMEVCNTR<n> where n is in the range of affected event counters, are enabled by PMCNTENSET .

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b000

```

PMEVCNTR<n>, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n> characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to AArch64 System register [PMEVCNTR<n>_EL0\[31:0\]](#).

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to External register [PMU.PMEVCNTR<n>_EL0\[31:0\]](#)~~PMEVCNTR<n>_EL0[31:0]~~.

This register is present only when AArch32 is supported and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMEVCNTR<n> are UNDEFINED.

Attributes

PMEVCNTR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Event counter n																															

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If FEAT_PMuV3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMEVCNTR<n> return bits [31:0] of the counter.
- Writes to PMEVCNTR<n> update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64, bits [63:32] are not required to be implemented.

If FEAT_PMuV3p5 is not implemented, the event counter is 32 bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>

PMEVCNTR<n> can also be accessed by using [PMXEVCNTR](#) with [PMSELR](#).SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMEVCNTR<n>](#) is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of [PMEVCNTR<n>](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR](#).{ER,EN} or [PMUSERENR_EL0](#).{ER,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, [HDCR](#).HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, [MDCR_EL2](#).HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [HDCR](#).HPMN and [MDCR_EL2](#).HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-30

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b10:m[4:3]	m[2:0]

```

PMEVTYPEPER<n>, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n> characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to AArch64 System register [PMEVTYPER<n>_EL0\[31:0\]](#).

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to External register [PMU.PMEVTYPER<n>_EL0\[31:0\]](#)~~[PMEVTYPER<n>_EL0\[31:0\]](#)~~.

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n> are UNDEFINED.

Attributes

PMEVTYPER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P	U	NSK	NSU	NSH	RES0	MT	RES0	RLU	RES0	evtCount[15:10]	evtCount[9:0]																				

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>.NSK bit.

P	Meaning
0b0	Count events in EL1.
0b1	Do not count events in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMEVTYPER<n>.RLU bit.

U	Meaning
0b0	Count events in EL0.
0b1	Do not count events in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]
When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMEVTYPER<n>.P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]
When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMEVTYPER<n>.U, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]
When EL2 is implemented:

EL2 (Hyp mode) filtering bit. Controls counting in EL2.

NSH	Meaning
0b0	Do not count events in EL2.
0b1	Count events in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

MT, bit [25]

When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this bit is RES0. See [ID_DFR1](#).MTPMU.

This bit is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and Disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:22]

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>.U bit, events in Realm EL0 are counted.

Otherwise, events in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [20:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter [PMEVCNTR<n>](#).

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<n>.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.

Note

Arm recommends this behavior for all implementations of FEAT_PMUv3.

Otherwise, if PMEVTYPER<n>.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>

PMEVTYPER<n> can also be accessed by using [PMXEVTYPER](#) with [PMSCLR](#).SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMEVTYPER<n>](#) is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of [PMEVTYPER<n>](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR](#).EN or [PMUSERENR_EL0](#).EN.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, [HDCR](#).HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, [MDCR_EL2](#).HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [HDCR](#).HPMN and [MDCR_EL2](#).HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-30

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b11:m[4:3]	m[2:0]

```

PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR](#), and the event counters [PMEVCNTR<n>](#). Reading the register shows which overflow interrupt requests are enabled.

PMINTENCLR is used in conjunction with the [PMINTENSET](#) register.

Configuration

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch64 System register [PMINTENCLR_EL1\[31:0\]](#).

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register [PMU.PMINTENCLR_EL1\[31:0\]](#) [PMINTENCLR_EL1\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32 and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMINTENCLR are UNDEFINED.

Attributes

PMINTENCLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

[PMCCNTR](#) overflow interrupt request disable bit.

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

P<n>	Meaning
0b0	When read, means that the PMEVCNTR<n> event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the PMEVCNTR<n> event counter interrupt request is enabled. When written, disables the PMEVCNTR<n> interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENCLR

Accesses to this register use the following encodings in the System register encoding space:

PMINTENSET, Performance Monitors Interrupt Enable Set register

The PMINTENSET characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR](#), and the event counters [PMEVCNTR<n>](#). Reading the register shows which overflow interrupt requests are enabled.

PMINTENSET is used in conjunction with the [PMINTENCLR](#) register.

Configuration

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to AArch64 System register [PMINTENSET_EL1\[31:0\]](#).

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to External register [PMU.PMINTENSET_EL1\[31:0\]](#)[PMINTENSET_EL1\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32 and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMINTENSET are UNDEFINED.

Attributes

PMINTENSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

[PMCCNTR](#) overflow interrupt request enable bit.

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

P<n>	Meaning
0b0	When read, means that the PMEVCNTR<n> event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the PMEVCNTR<n> event counter interrupt request is enabled. When written, enables the PMEVCNTR<n> interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENSET

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation to software.

Configuration

This register is present only when EL1 is capable of using AArch32 and FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are UNDEFINED.

Attributes

PMMIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	EDGE	THWIDTH	THWIDTH	BUS_WIDTH	BUS_WIDTH	BUS_SLOTS	BUS_SLOTS	SLOTS																							

Bits [31:**28**24]

Reserved, RES0.

EDGE, bits [27:24]

PMU event edge detection. Indicates implementation of the FEAT_PMUv3_EDGE feature.

EDGE	Meaning
0b0000	FEAT_PMUv3_EDGE is not implemented.
0b0001	FEAT_PMUv3_EDGE is implemented.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

THWIDTH, bits [23:20]

[PMEVTYPER<n>_ELO](#).TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the [PMEVTYPER<n>_ELO](#).TH field.

THWIDTH	Meaning
0b0000	FEAT_PMUv3_TH is not implemented.
0b0001	1 bit. PMEVTYPER<n>_EL0.TH[11:1] are RES0.
0b0010	2 bits. PMEVTYPER<n>_EL0.TH[11:2] are RES0.
0b0011	3 bits. PMEVTYPER<n>_EL0.TH[11:3] are RES0.
0b0100	4 bits. PMEVTYPER<n>_EL0.TH[11:4] are RES0.
0b0101	5 bits. PMEVTYPER<n>_EL0.TH[11:5] are RES0.
0b0110	6 bits. PMEVTYPER<n>_EL0.TH[11:6] are RES0.
0b0111	7 bits. PMEVTYPER<n>_EL0.TH[11:7] are RES0.
0b1000	8 bits. PMEVTYPER<n>_EL0.TH[11:8] are RES0.
0b1001	9 bits. PMEVTYPER<n>_EL0.TH[11:9] are RES0.
0b1010	10 bits. PMEVTYPER<n>_EL0.TH[11:10] are RES0.
0b1011	11 bits. PMEVTYPER<n>_EL0.TH[11] is RES0.
0b1100	12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to [PMEVTYPER<n>_EL0.TH](#) is $2^{(\text{PMMIR.THWIDTH})}$ minus one.

Note

[PMEVTYPER<n>_EL0.TH](#) cannot be accessed through [PMEVTYPER<n>](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as $\text{Log}_2(\text{number of bytes})$, plus one.

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

If the bus count information is not available, this field will read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMMIR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b110

```

PMOVSr, Performance Monitors Overflow Flag Status Register

The PMOVSr characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

Configuration

AArch32 System register PMOVSr bits [31:0] are architecturally mapped to AArch64 System register [PMOVSCLR_EL0\[31:0\]](#).

AArch32 System register PMOVSr bits [31:0] are architecturally mapped to External register [PMU.PMOVSCLR_EL0\[31:0\]](#) [PMOVSCLR_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMOVSr are UNDEFINED.

Attributes

PMOVSr is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Cycle counter overflow clear bit. Possible values are:

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

[PMCR](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR](#)[31:0] or unsigned overflow of [PMCCNTR](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n> has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMEVCNTR<n> has overflowed since this bit was last cleared. When written, clears the PMEVCNTR<n> overflow bit to 0.

If FEAT_PMUv3p5 is implemented, [MDCR_EL2.HLP](#), [HDCR.HLP](#), and [PMCR.LP](#) control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>](#)[31:0] or unsigned overflow of [PMEVCNTR<n>](#)[63:0]. [PMEVCNTR<n>](#)[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSr

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR](#), and each of the implemented event counters [PMEVCNTR<n>](#).

Configuration

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch64 System register [PMOVSSET_EL0\[31:0\]](#).

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register [PMU.PMOVSSET_EL0\[31:0\]](#)[PMOVSSET_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET are UNDEFINED.

Attributes

PMOVSSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Cycle counter overflow set bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

[PMCR](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR](#)[31:0] or unsigned overflow of [PMCCNTR](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow set bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n> has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMEVCNTR<n> has overflowed since this bit was last . When written, sets the PMEVCNTR<n> overflow bit to 1.

If FEAT_PMUv3p5 is implemented, [MDCR_EL2.HLP](#), [HDCR.HLP](#), and [PMCR.LP](#) control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>](#)[31:0] or unsigned overflow of [PMEVCNTR<n>](#)[63:0]. [PMEVCNTR<n>](#)[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSSET

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b011

PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

Purpose

Selects the current event counter [PMEVCNTR<n>](#) or the cycle counter, CCNT.

PMSELR is used in conjunction with [PMXEVTYPER](#) to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with [PMXVCNTR](#), to determine the value of a selected event counter.

Configuration

AArch32 System register PMSELR bits [31:0] are architecturally mapped to AArch64 System register [PMSELR_ELO\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSELR are UNDEFINED.

Attributes

PMSELR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																										SEL					

Bits [31:5]

Reserved, RES0.

SEL, bits [4:0]

Selects event counter, [PMEVCNTR<n>](#), where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to [PMXEVTYPER](#) or [PMXVCNTR](#) occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR.SEL is 0b11111, it selects the cycle counter and:

- A read of the [PMXEVTYPER](#) returns the value of [PMCCFILTR](#).
- A write of the [PMXEVTYPER](#) writes to [PMCCFILTR](#).
- A read or write of [PMXVCNTR](#) has CONSTRAINED UNPREDICTABLE effects. For more information, see [PMXVCNTR](#).

For more information about the results of accesses to event counters, see [PMXEVTYPER](#) and [PMXVCNTR](#).

For more information about the number of counters accessible at each Exception level, see [HDCR](#).HPMN and [MDCR_EL2](#).HPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSELR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b101

PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see 'SW_INCR'.

Configuration

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to AArch64 System register [PMSWINC_EL0\[31:0\]](#).

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to External register [PMU.PMSWINC_EL0\[31:0\]](#)[PMSWINC_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMSWINC are UNDEFINED.

Attributes

PMSWINC is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bit [31]

Reserved, RES0.

P<n>, bit [n], for n = 30 to 0

Event counter software increment bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

P<n>	Meaning
0b0	No action. The write to this bit is ignored.
0b1	If PMEVCNTR<n> is enabled and configured to count the software increment event, increments PMEVCNTR<n> by 1. If PMEVCNTR<n> is disabled, or not configured to count the software increment event, the write to this bit is ignored.

Accessing PMSWINC

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b100

PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

Purpose

Enables or disables EL0 ~~User mode~~ access to the Performance Monitors.

Configuration

AArch32 System register PMUSERENR bits [31:0] are architecturally mapped to AArch64 System register [PMUSERENR_ELO\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMUSERENR are UNDEFINED.

Attributes

PMUSERENR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								TID	RES0	CR	SW	CR	EN	SW	EN

Bits [31:74]

Reserved, RES0.

TID, bit [6]

When FEAT_PMuV3p9 is implemented:

Trap ID registers. Traps EL0 read access to common event identification registers.

TID	Meaning
0b0	Accesses to PMCEID<n> are not trapped by this mechanism.
0b1	EL0 read accesses to PMCEID<n> are trapped.

The register accesses affected by this control are:

- MRC reads of [PMCEID0](#), [PMCEID1](#), [PMCEID2](#), and [PMCEID3](#).

When trapped, reads are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES0.

ER, bit [3]

Event counters counter Readread enable.trap control:

When PMUSERENR.EN is 0, PMUSERENR.ER enables EL0 reads of the event counters and EL0 reads and writes of the select register.

ER	Meaning
0b0	EL0 reads of the event counters and EL0 reads and writes of the select register are disabled, unless enabled by PMUSERENR.EN. PMXVCNTR and PMEVCNTR<n>, and EL0 RW access to the PMSELR, are trapped to Undefined mode if PMUSERENR.EN is also 0.
0b1	EL0 Overrides reads PMUSERENR.EN of the event counters and EL0 enables reads RO and access writes of the select register are enabled, unless trapped by another control. to PMXVCNTR and PMEVCNTR<n>, and RW access to PMSELR.

The register accesses affected by this control are:

- MRC reads of PMEVCNTR<n> and PMXVCNTR.
- MRC and MCR accesses to PMSELR.

When disabled, reads and writes are UNDEFINED.

This field is ignored by the PE when PMUSERENR.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN0 value..

CR, bit [2]

Cycle counter Readread enable.trap control:

When PMUSERENR.EN is 0, PMUSERENR.CR enables EL0 reads of the cycle counter.

CR	Meaning
0b0	EL0 reads of the cycle counter are disabled, unless enabled by PMUSERENR.EN. PMCCNTR are trapped to Undefined mode if PMUSERENR.EN is also 0.
0b1	EL0 Overrides reads PMUSERENR.EN of and the enables cycle access counter are enabled, unless trapped by another control. to PMCCNTR.

The register accesses affected by this control are:

- MRC reads of PMCCNTR.
- MRRC reads of PMCCNTR.

When disabled, reads are UNDEFINED.

This field is ignored by the PE when PMUSERENR.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN0 value..

SW, bit [1]

Software increment register write Write trap enable.control:

When PMUSERENR.EN is 0, PMUSERENR.SW enables EL0 writes to the Software increment register.

SW	Meaning
0b0	EL0 writes to the Software increment register are disabled, unless enabled by PMUSERENR.EN. PMSWINC are trapped to Undefined mode if PMUSERENR.EN is also 0.
0b1	EL0 Overrides writes PMUSERENR.EN to and the enables Software access increment register are enabled, unless trapped by another control to PMSWINC.

The register accesses affected by this control are:

- MCR writes to PMSWINC.

When disabled, writes are UNDEFINED.

This field is ignored by the PE when PMUSERENR.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN0 value.

EN, bit [0]

- PMCR, PMOVSr, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXVCNTR, PMCNTENSET, PMCNTENCLR, PMOVSSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR, PMSWINC.
- If FEAT_PMUv3p1 is implemented, PMCEID2, and PMCEID3.
- If FEAT_PMUv3p4 is implemented, PMMIR.

Enable. Traps Enables EL0 read/write accesses to the Performance Monitors registers to PMU Undefined registers. mode, as follows:

EN	Meaning
0b0	While at EL0, accesses to PMU the specified registers at EL0 are trapped to Undefined mode, unless enabled overridden by one of PMUSERENR.{ER, CR, SW}.
0b1	EL0 While accesses at to EL0, PMU software registers can access enabled, all unless of trapped the by specified another control registers.

The register accesses affected by this control are:

- MRC or MCR accesses to PMCCFILTR, PMCCNTR, PMCNTENCLR, PMCNTENSET, PMCR, PMEVCNTR<n>, PMEVTYPER<n>, PMOVSr, PMOVSSET, PMSELR, PMXVCNTR, and PMXEVTYPER.
- MRC reads of the following registers:
 - PMCEID0 and PMCEID1.
 - If FEAT_PMUv3p1 is implemented, PMCEID2 and PMCEID3.
- MCR writes to PMSWINC.
- MRRC or MCRR accesses to PMCCNTR.

When trapped, reads and writes are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN0 value.

Accessing PMUSERENR

When FEAT_PMUv3p9 is implemented and EL1 is using AArch64, PMUSERENR_EL0 contains additional controls that affect the behavior of this register.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
--------	------	-----	-----	------

0b1111	0b000	0b1001	0b1110	0b000
--------	-------	--------	--------	-------

PMXEVCNTR, Performance Monitors Selected Event Count Register

The PMXEVCNTR characteristics are:

Purpose

Reads or writes the value of the selected event counter, [PMEVCNTR<n>](#). [PMSELR](#).SEL determines which event counter is selected.

Configuration

AArch32 System register PMXEVCNTR bits [31:0] are architecturally mapped to AArch64 System register [PMEVCNTR_EL0\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR are UNDEFINED.

Attributes

PMXEVCNTR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PMEVCNTR<n>																															

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, [PMEVCNTR<n>](#), where n is the value stored in [PMSELR](#).SEL.

If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMXEVCNTR return bits [31:0] of the counter.
- Writes to PMXEVCNTR update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64, bits [63:32] are not required to be implemented.

If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVCNTR

If FEAT_FGT is implemented and [PMSELR](#).SEL is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMEVCNTR](#) is as follows:

- If [PMSELR](#).SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and [PMSELR.SEL](#) is greater than or equal to the number of accessible event counters, then reads and writes of [PMXEVCNTR](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if [PMSELR.SEL](#) has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and [PMSELR.SEL](#) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR.{ER,EN}](#) or [PMUSERENR_EL0.{ER,EN}](#).

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, [HDCR.HPMN](#) identifies the number of accessible event counters.
- If EL2 is using AArch64, [MDCR_EL2.HPMN](#) identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [HDCR.HPMN](#) and [MDCR_EL2.HPMN](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1101	0b010

PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

Purpose

When [PMSELR.SEL](#) selects an event counter, this accesses a [PMEVTYPER<n>](#) register. When [PMSELR.SEL](#) selects the cycle counter, this accesses [PMCCFILTER](#).

Configuration

AArch32 System register PMXEVTYPER bits [31:0] are architecturally mapped to AArch64 System register [PMXEVTYPER_ELO\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER are UNDEFINED.

Attributes

PMXEVTYPER is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Event type register or PMCCFILTER																															

Bits [31:0]

Event type register or [PMCCFILTER](#).

When [PMSELR.SEL](#) == 31, this register accesses [PMCCFILTER](#).

Otherwise, this register accesses [PMEVTYPER<n>](#) where n is the value in [PMSELR.SEL](#).

Accessing PMXEVTYPER

If FEAT_FGT is implemented, and [PMSELR.SEL](#) is not 31 and is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMXEVTYPER](#) is as follows:

- If [PMSELR.SEL](#) selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented, and [PMSELR.SEL](#) is not 31 and is greater than or equal to the number of accessible event counters, then reads and writes of [PMXEVTYPER](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if [PMSELR.SEL](#) has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if [PMSELR.SEL](#) is 31.
- If EL2 is implemented and enabled in the current Security state, and [PMSELR.SEL](#) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR.EN](#) or [PMUSERENR_EL0.EN](#).

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, [HDCR.HPMN](#) identifies the number of accessible event counters.
- If EL2 is using AArch64, [MDCR_EL2.HPMN](#) identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [HDCR.HPMN](#) and [MDCR_EL2.HPMN](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1101	0b001

```

SCTLR, System Control Register

The SCTLR characteristics are:

Purpose

Provides the top level control of the system, including its memory system.

Configuration

AArch32 System register SCTLR bits [31:0] are architecturally mapped to AArch64 System register [SCTLR_EL1\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to SCTLR are UNDEFINED.

Some bits in the register are read-only. These bits relate to non-configurable features of an implementation, and are provided for compatibility with previous versions of the architecture.

Attributes

SCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6
DSSBS	TE	AF	TRE	RES0	EE	RES0	SPAN	RES1	RES0	UWXN	WXN	nTW	RES0	nTW	RES0	V	I	RES1	EnR	CTX	RES0	SED	ITD	UNK	

DSSBS, bit [31] When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to any mode in this security state except Hyp mode
0b1	PSTATE.SSBS is set to 1 on an exception to any mode in this security state except Hyp mode

Note

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to an Exception level that is executing at PL1 are taken to A32 or T32 state:

TE	Meaning
0b0	Exceptions, including reset, taken to A32 state.
0b1	Exceptions, including reset, taken to T32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

AFE, bit [29]

Access Flag Enable. When using the Short-descriptor translation table format for the PL1&0 translation regime, this bit enables use of the AP[0] bit in the translation descriptors as the Access flag, and restricts access permissions in the translation descriptors to the simplified model.

AFE	Meaning
0b0	In the Translation table descriptors, AP[0] is an access permissions bit. The full range of access permissions is supported. No Access flag is implemented.
0b1	In the Translation table descriptors, AP[0] is the Access flag. Only the simplified model for access permissions is supported.

When using the Long-descriptor translation table format, the VMSA behaves as if this bit is set to 1, regardless of the value of this bit.

The AFE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TRE, bit [28]

TEX remap enable. This bit enables remapping of the TEX[2:1] bits in the PL1&0 translation regime for use as two translation table bits that can be managed by the operating system. Enabling this remapping also changes the scheme used to describe the memory region attributes in the VMSA.

TRE	Meaning
0b0	TEX remap disabled. TEX[2:0] are used, with the C and B bits, to describe the memory region attributes.
0b1	TEX remap enabled. TEX[2:1] are reassigned for use as bits managed by the operating system. The TEX[0], C, and B bits are used to describe the memory region attributes, with the MMU remap registers.

When the value of [TTBCR.EAE](#) is 1, this bit is RES1.

The TRE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset, and the endianness of stage 1 translation table walks in the PL1&0 translation regime.

EE	Meaning
0b0	Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are little-endian.
0b1	Big-endian. PSTATE.E is set to 1 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support for data accesses at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception levels higher than EL0, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

SPAN, bit [23]

When FEAT_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1 from either Secure or Non-secure state, or to EL3 from Secure state when EL3 is using AArch32.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 in the following situations: <ul style="list-style-type: none"> In Non-secure state, on taking an exception to EL1. In Secure state, when EL3 is using AArch64, on taking an exception to EL1. In Secure state, when EL3 is using AArch32, on taking an exception to EL3.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [22]

Reserved, RES1.

Bit [21]

Reserved, RES0.

UWXN, bit [20]

Unprivileged write permission implies PL1 XN (Execute-never). This bit can force all memory regions that are writable at PL0 to be treated as XN for accesses from software executing at PL1.

UWXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable at PL0 forced to XN for accesses from software executing at PL1.

The UWXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the PL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the PL1&0 translation regime is forced to XN for accesses from software executing at PL1 or PL0.

This bit applies only when SCTLR.M bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to Undefined mode.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to Undefined mode.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Bits [15:14]

Reserved, RES0.

V, bit [13]

Vectors bit. This bit selects the base address of the exception vectors for exceptions taken to a PE mode other than Monitor mode or Hyp mode:

V	Meaning
0b0	Normal exception vectors. Base address is held in VBAR .
0b1	High exception vectors (Hivecs), base address 0xFFFF0000. This base address cannot be remapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

I, bit [12]

Instruction access Cacheability control, for accesses at EL1 and EL0:

I	Meaning
0b0	All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

Instruction accesses to Normal memory from EL1 and EL0 are Cacheable regardless of the value of the SCTLR.I bit if either:

- EL2 is using AArch32 and the value of [HCR.DC](#) is 1.
- EL2 is using AArch64 and the value of [HCR_EL2.DC](#) is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bit [11]

Reserved, RES1.

EnRCTX, bit [10]
When FEAT_SPECRES is implemented:

Enable EL0 access to the following AArch32 System CPFRCTX, instructions: DVPRCTX, and CPPRCTX instructions.

- [CFPRCTX](#).
- [DVPRCTX](#).
- [CPPRCTX](#).
- If FEAT_SPECRES2 is implemented, [COSPRCTX](#).

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1.
0b1	EL0 access to these instructions is enabled.

Note

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

SED	Meaning
0b0	SETEND instruction execution is enabled at PL0 and PL1.
0b1	SETEND instructions are UNDEFINED at PL0 and PL1.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

ITD	Meaning
0b0	All IT instruction functionality is enabled at PL1 and PL0.
0b1	Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED: <ul style="list-style-type: none"> All encodings of the IT instruction with hw1[3:0]!=1000. All encodings of the subsequent instruction with the following values for hw1: <ul style="list-style-type: none"> 11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. 1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'. 10100xxxxxxxxxxx: ADD Rd, PC, #imm 01001xxxxxxxxxxx: LDR Rd, [PC, #imm] 0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. 010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. <p>These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.</p> <p>It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:</p> <ul style="list-style-type: none"> A 16-bit instruction, that can only be followed by another 16-bit instruction. The first half of a 32-bit instruction. <p>This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.</p> <p>An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</p>

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the [SCTLR_EL1](#), [SCTLR_EL2](#), and [HSCTLR](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

UNK, bit [6]

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from PL1 and PL0:

CP15BEN	Meaning
0b0	PL0 and PL1 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is UNDEFINED.
0b1	PL0 and PL1 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the [SCTLR_EL1](#), [SCTLR_EL2](#), and [HSCTLR](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

When an implementation does not implement CP15BEN, access to this field is **RAO/WI**.

LSMAOE, bit [4]

When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL1 or EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Otherwise:

Reserved, RES1.

nTLSMD, bit [3]

When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Otherwise:

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL1 and EL0:

C	Meaning
0b0	All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, can be cached at all levels of data and unified cache.

The PE ignores SCTLR.C, ~~for Non-secure state~~ and data accesses to Normal memory from EL1 and EL0 are Cacheable, if either:

- EL2 is using AArch32 and the value of [HCR.DC](#) is 1.
- EL2 is using AArch64 and the value of [HCR_EL2.DC](#) is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

A	Meaning
0b0	Alignment fault checking disabled when executing at PL1 or PL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at PL1 or PL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL1 and EL0 stage 1 address translation disabled. See the SCTLR.I field for the behavior of instruction accesses to Normal memory.
0b1	EL1 and EL0 stage 1 address translation enabled.

~~TheIn the Non-secure state the~~ PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of the field if either:

- EL2 is using AArch32 and the value of [HCR.{DC, TGE}](#) is not {0, 0}.
- EL2 is using AArch64 and the value of [HCR_EL2.{DC, TGE}](#) is not {0, 0}.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing SCTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b000

```

TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
 - Would be required for the EL1&0 translation regime.
 - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to TLBIALL are UNDEFINED.

Attributes

TLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the TLBIALL instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b000

```

if PSTATE.EL == EL0 then

TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to TLBIASID are UNDEFINED.

Attributes

TLBIASID is a 32-bit System instruction.

Field descriptions

TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to TLBIMVA are UNDEFINED.

Attributes

TLBIMVA is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA												RES0				ASID															

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing the TLBIMVA instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b001

```

TLBIMVAAL, TLB Invalidate by VA, All ASID, Last level

The TLBIMVAAL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to TLBIMVAAL are UNDEFINED.

Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVAAL is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA												RES0																			

VA, bits [31:12]

TLBIMVAL, TLB Invalidate by VA, Last level

The TLBIMVAL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to TLBIMVAL are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVAL is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA												RES0				ASID															

VA, bits [31:12]

TPIDRURO, PL0 Read-Only Software Thread ID Register

The TPIDRURO characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configuration

AArch32 System register TPIDRURO bits [31:0] are architecturally mapped to AArch64 System register [TPIDRRO_EL0\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to TPIDRURO are UNDEFINED.

Note

The PE never updates this register.

Attributes

TPIDRURO is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Thread ID																															

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRURO

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b011

```

TPIDRURW, PL0 Read/Write Software Thread ID Register

The TPIDRURW characteristics are:

Purpose

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

Configuration

AArch32 System register TPIDRURW bits [31:0] are architecturally mapped to AArch64 System register [TPIDR_EL0\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to TPIDRURW are UNDEFINED.

Note

The PE never updates this register.

Attributes

TPIDRURW is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Thread ID																															

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRURW

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b010

```

VDISR, Virtual Deferred Interrupt Status Register

The VDISR characteristics are:

Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

Configuration

AArch32 System register VDISR bits [31:0] are architecturally mapped to AArch64 System register [VDISR_EL2\[31:0\]](#).

This register is present only when **EL1 is capable of using AArch32 and** FEAT_RAS is implemented. Otherwise, direct accesses to VDISR are UNDEFINED.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Attributes

VDISR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
A	RES0														AET	RES0	EXT	RES0	FS[4]	LPAE	RES0				FS[3:0]						

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VDESR.AET](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VDFSR.ExT](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt.

FS	Meaning
0b10110	Asynchronous SError interrupt.

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR[10].
- FS[3:0] is VDISR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to [TTBCR.EAE](#) when an ESB instruction defers a virtual SError interrupt.

LPAE	Meaning
0b0	Using the Short-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
A	RES0										AET		RES0	ExT	RES0	LPAE	RES0		STATUS												

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VDFSR.AET](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VDFSR.ExT](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

Set to [TTBCR.EAE](#) when an ESB instruction defers a virtual SError interrupt.

LPAE	Meaning
0b1	Using the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

STATUS	Meaning
0b010001	Asynchronous SError interrupt.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VDISR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

An indirect write to VDISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of [DISR](#) occurring in program order after the ESB instruction.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when [SCR.NS](#) == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

IndexSystem Register index by functional group

Below are indexes for registers with the following main functional groups:

- [ID](#)
- [Memory](#)
- [Other](#)
- [Exception](#)
- [Special](#)
- [PSTATE](#)
- [Cache](#)
- [Address](#)
- [TLB](#)
- [PMU](#)
- [Reset](#)
- [Thread](#)
- [IMP DEF](#)
- [Timer](#)
- [Debug](#)
- [CTI](#)
- [Virt](#)
- [Secure](#)
- [Float](#)
- [Legacy](#)
- [Trace](#)
- [GIC](#)
- [GICD](#)
- [GICR](#)
- [GICC](#)
- [GICV](#)
- [GICH](#)
- [GITS](#)
- [RAS](#)
- [MPAM](#)
- [Pointer authentication](#)
- [AMU](#)
- [Root](#)
- [GIC ITS registers](#)

In the ID functional group:

Exec state	Name	Description
AArch32	CCSIDR	Current Cache Size ID Register
AArch32	CCSIDR2	Current Cache Size ID Register 2
AArch32	CLIDR	Cache Level ID Register
AArch32	CSSELR	Cache Size Selection Register
AArch32	CTR	Cache Type Register
AArch32	ID_AFR0	Auxiliary Feature Register 0
AArch32	ID_DFR0	Debug Feature Register 0
AArch32	ID_DFR1	Debug Feature Register 1
AArch32	ID_ISAR0	Instruction Set Attribute Register 0
AArch32	ID_ISAR1	Instruction Set Attribute Register 1

AArch64	ESR_EL3	Exception Syndrome Register (EL3)
AArch64	FAR_EL1	Fault Address Register (EL1)
AArch64	FAR_EL2	Fault Address Register (EL2)
AArch64	FAR_EL3	Fault Address Register (EL3)
AArch64	HPFAR_EL2	Hypervisor IPA Fault Address Register
AArch64	IFSR32_EL2	Instruction Fault Status Register (EL2)
AArch64	ISR_EL1	Interrupt Status Register
AArch64	MFAR_EL3	Physical PA Fault Address Register (EL3)
AArch64	VBAR_EL1	Vector Base Address Register (EL1)
AArch64	VBAR_EL2	Vector Base Address Register (EL2)

Exec state	Name	Description
AArch64	VBAR_EL3	Vector Base Address Register (EL3)

In the Special functional group:

Exec state	Name	Description
AArch32	DLR	Debug Link Register
AArch32	DSPSR	Debug Saved Program Status Register
AArch32	ELR_hyp	Exception Link Register (Hyp mode)
AArch32	SPSR	Saved Program Status Register
AArch32	SPSR_abt	Saved Program Status Register (Abort mode)
AArch32	SPSR_fiq	Saved Program Status Register (FIQ mode)
AArch32	SPSR_hyp	Saved Program Status Register (Hyp mode)
AArch32	SPSR_irq	Saved Program Status Register (IRQ mode)
AArch32	SPSR_mon	Saved Program Status Register (Monitor mode)
AArch32	SPSR_svc	Saved Program Status Register (Supervisor mode)
AArch32	SPSR_und	Saved Program Status Register (Undefined mode)
AArch64	ELR_EL1	Exception Link Register (EL1)
AArch64	ELR_EL2	Exception Link Register (EL2)
AArch64	ELR_EL3	Exception Link Register (EL3)
AArch64	SPSR_EL1	Saved Program Status Register (EL1)
AArch64	SPSR_EL2	Saved Program Status Register (EL2)
AArch64	SPSR_EL3	Saved Program Status Register (EL3)
AArch64	SPSR_abt	Saved Program Status Register (Abort mode)
AArch64	SPSR_fiq	Saved Program Status Register (FIQ mode)
AArch64	SPSR_irq	Saved Program Status Register (IRQ mode)
AArch64	SPSR_und	Saved Program Status Register (Undefined mode)
AArch64	SP_EL0	Stack Pointer (EL0)
AArch64	SP_EL1	Stack Pointer (EL1)
AArch64	SP_EL2	Stack Pointer (EL2)
AArch64	SP_EL3	Stack Pointer (EL3)

In the PSTATE functional group:

Exec state	Name	Description
AArch32	APSR	Application Program Status Register
AArch32	CPSR	Current Program Status Register
AArch64	ALLINT	All Interrupt Mask Bit
AArch64	CurrentEL	Current Exception Level
AArch64	DAIF	Interrupt Mask Bits
AArch64	DIT	Data Independent Timing
AArch64	NZCV	Condition Flags
AArch64	PAN	Privileged Access Never
AArch64	PM	PMU Exception Mask
AArch64	SPSel	Stack Pointer Select
AArch64	SSBS	Speculative Store Bypass Safe
AArch64	SVCR	Streaming Vector Control Register
AArch64	TCO	Tag Check Override
AArch64	UAO	User Access Override

In the Cache functional group:

Exec state	Name	Description
AArch32	BPIALL	Branch Predictor Invalidate All
AArch32	BPIALLIS	Branch Predictor Invalidate All, Inner Shareable
AArch32	BPIMVA	Branch Predictor Invalidate by VA
AArch32	DCCIMVAC	Data Cache line Clean and Invalidate by VA to PoC
AArch32	DCCISW	Data Cache line Clean and Invalidate by Set/Way
AArch32	DCCMVAC	Data Cache line Clean by VA to PoC
AArch32	DCCMVAU	Data Cache line Clean by VA to PoU
AArch32	DCCSW	Data Cache line Clean by Set/Way
AArch32	DCIMVAC	Data Cache line Invalidate by VA to PoC

Exec state	Name	Description
AArch32	DCISW	Data Cache line Invalidate by Set/Way
AArch32	ICIALLU	Instruction Cache Invalidate All to PoU
AArch32	ICIALLUIS	Instruction Cache Invalidate All to PoU, Inner Shareable
AArch32	ICIMVAU	Instruction Cache line Invalidate by VA to PoU
AArch64	DC CGDSW	Clean of Data and Allocation Tags by Set/Way
AArch64	DC CGDVAC	Clean of Data and Allocation Tags by VA to PoC
AArch64	DC CGDVADP	Clean of Data and Allocation Tags by VA to PoDP
AArch64	DC CGDVAP	Clean of Data and Allocation Tags by VA to PoP
AArch64	DC CGSW	Clean of Allocation Tags by Set/Way
AArch64	DC CGVAC	Clean of Allocation Tags by VA to PoC
AArch64	DC CGVADP	Clean of Allocation Tags by VA to PoDP
AArch64	DC CGVAP	Clean of Allocation Tags by VA to PoP
AArch64	DC CIGDPAE	Clean and invalidate of data and allocation tags by PA to PoE
AArch64	DC CIGDPAPA	Clean and Invalidate of Data and Allocation Tags by PA to PoPA
AArch64	DC CIGDSW	Clean and Invalidate of Data and Allocation Tags by Set/Way
AArch64	DC CIGDVAC	Clean and Invalidate of Data and Allocation Tags by VA to PoC
AArch64	DC CIGSW	Clean and Invalidate of Allocation Tags by Set/Way
AArch64	DC CIGVAC	Clean and Invalidate of Allocation Tags by VA to PoC
AArch64	DC CIPAE	Data or unified Cache line Clean and Invalidate by PA to PoE
AArch64	DC CIPAPA	Data or unified Cache line Clean and Invalidate by PA to PoPA
AArch64	DC CISW	Data or unified Cache line Clean and Invalidate by Set/Way
AArch64	DC CIVAC	Data or unified Cache line Clean and Invalidate by VA to PoC
AArch64	DC CSW	Data or unified Cache line Clean by Set/Way
AArch64	DC CVAC	Data or unified Cache line Clean by VA to PoC
AArch64	DC CVADP	Data or unified Cache line Clean by VA to PoDP
AArch64	DC CVAP	Data or unified Cache line Clean by VA to PoP
AArch64	DC CVAU	Data or unified Cache line Clean by VA to PoU
AArch64	DC GVA	Data Cache set Allocation Tag by VA
AArch64	DC GZVA	Data Cache set Allocation Tags and Zero by VA
AArch64	DC IGDSW	Invalidate of Data and Allocation Tags by Set/Way
AArch64	DC IGDVAC	Invalidate of Data and Allocation Tags by VA to PoC
AArch64	DC IGSW	Invalidate of Allocation Tags by Set/Way
AArch64	DC IGVAC	Invalidate of Allocation Tags by VA to PoC
AArch64	DC ISW	Data or unified Cache line Invalidate by Set/Way
AArch64	DC IVAC	Data or unified Cache line Invalidate by VA to PoC
AArch64	DC ZVA	Data Cache Zero by VA
AArch64	IC IALLU	Instruction Cache Invalidate All to PoU
AArch64	IC IALLUIS	Instruction Cache Invalidate All to PoU, Inner Shareable
AArch64	IC IVAU	Instruction Cache line Invalidate by VA to PoU

In the Address functional group:

Exec state	Name	Description
AArch32	ATS12NSOPR	Address Translate Stages 1 and 2 Non-secure Only PL1 Read
AArch32	ATS12NSOPW	Address Translate Stages 1 and 2 Non-secure Only PL1 Write
AArch32	ATS12NSOUR	Address Translate Stages 1 and 2 Non-secure Only Unprivileged Read
AArch32	ATS12NSOUW	Address Translate Stages 1 and 2 Non-secure Only Unprivileged Write
AArch32	ATS1CPR	Address Translate Stage 1 Current state PL1 Read
AArch32	ATS1CPRP	Address Translate Stage 1 Current state PL1 Read PAN
AArch32	ATS1CPW	Address Translate Stage 1 Current state PL1 Write
AArch32	ATS1CPWP	Address Translate Stage 1 Current state PL1 Write PAN
AArch32	ATS1CUR	Address Translate Stage 1 Current state Unprivileged Read
AArch32	ATS1CUW	Address Translate Stage 1 Current state Unprivileged Write
AArch32	ATS1HR	Address Translate Stage 1 Hyp mode Read
AArch32	ATS1HW	Address Translate Stage 1 Hyp mode Write
AArch32	PAR	Physical Address Register
AArch64	AT S12E0R	Address Translate Stages 1 and 2 EL0 Read
AArch64	AT S12E0W	Address Translate Stages 1 and 2 EL0 Write
AArch64	AT S12E1R	Address Translate Stages 1 and 2 EL1 Read
AArch64	AT S12E1W	Address Translate Stages 1 and 2 EL1 Write
AArch64	AT S1E0R	Address Translate Stage 1 EL0 Read
AArch64	AT S1E0W	Address Translate Stage 1 EL0 Write
AArch64	AT S1E1R	Address Translate Stage 1 EL1 Read

Exec state	Name	Description
AArch64	AT S1E1RP	Address Translate Stage 1 EL1 Read PAN
AArch64	AT S1E1W	Address Translate Stage 1 EL1 Write
AArch64	AT S1E1WP	Address Translate Stage 1 EL1 Write PAN
AArch64	AT S1E2R	Address Translate Stage 1 EL2 Read
AArch64	AT S1E2W	Address Translate Stage 1 EL2 Write
AArch64	AT S1E3R	Address Translate Stage 1 EL3 Read
AArch64	AT S1E3W	Address Translate Stage 1 EL3 Write
AArch64	PAR_EL1	Physical Address Register

In the TLB functional group:

Exec state	Name	Description
AArch32	CFPRCTX	Control Flow Prediction Restriction by Context
AArch32	COSPRCTX	Clear Oher Speculative Restriction by Context
AArch32	CPPRCTX	Cache Prefetch Prediction Restriction by Context
AArch32	DTLBIALL	Data TLB Invalidate All
AArch32	DTLBIASID	Data TLB Invalidate by ASID match
AArch32	DTLBIMVA	Data TLB Invalidate by VA
AArch32	DVPRCTX	Data Value Prediction Restriction by Context
AArch32	ITLBIALL	Instruction TLB Invalidate All
AArch32	ITLBIASID	Instruction TLB Invalidate by ASID match
AArch32	ITLBIMVA	Instruction TLB Invalidate by VA
AArch32	TLBIALL	TLB Invalidate All
AArch32	TLBIALLH	TLB Invalidate All, Hyp mode
AArch32	TLBIALLHIS	TLB Invalidate All, Hyp mode, Inner Shareable
AArch32	TLBIALLIS	TLB Invalidate All, Inner Shareable
AArch32	TLBIALLNSNH	TLB Invalidate All, Non-Secure Non-Hyp
AArch32	TLBIALLNSNHIS	TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable
AArch32	TLBIASID	TLB Invalidate by ASID match
AArch32	TLBIASIDIS	TLB Invalidate by ASID match, Inner Shareable
AArch32	TLBIIPAS2	TLB Invalidate by Intermediate Physical Address, Stage 2
AArch32	TLBIIPAS2IS	TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable
AArch32	TLBIIPAS2L	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level
AArch32	TLBIIPAS2LIS	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, Inner Shareable
AArch32	TLBIMVA	TLB Invalidate by VA
AArch32	TLBIMVAA	TLB Invalidate by VA, All ASID
AArch32	TLBIMVAAIS	TLB Invalidate by VA, All ASID, Inner Shareable
AArch32	TLBIMVAAL	TLB Invalidate by VA, All ASID, Last level
AArch32	TLBIMVAALIS	TLB Invalidate by VA, All ASID, Last level, Inner Shareable
AArch32	TLBIMVAH	TLB Invalidate by VA, Hyp mode
AArch32	TLBIMVAHIS	TLB Invalidate by VA, Hyp mode, Inner Shareable
AArch32	TLBIMVAIS	TLB Invalidate by VA, Inner Shareable
AArch32	TLBIMVAL	TLB Invalidate by VA, Last level
AArch32	TLBIMVALH	TLB Invalidate by VA, Last level, Hyp mode
AArch32	TLBIMVALHIS	TLB Invalidate by VA, Last level, Hyp mode, Inner Shareable
AArch32	TLBIMVALIS	TLB Invalidate by VA, Last level, Inner Shareable
AArch64	TLBI ALLE1, TLBI ALLE1NXS	TLB Invalidate All, EL1
AArch64	TLBI ALLE1IS, TLBI ALLE1ISNXS	TLB Invalidate All, EL1, Inner Shareable
AArch64	TLBI ALLE1OS, TLBI ALLE1OSNXS	TLB Invalidate All, EL1, Outer Shareable
AArch64	TLBI ALLE2, TLBI ALLE2NXS	TLB Invalidate All, EL2

External register index by offset

Below are indexes for external registers in the following blocks:

- [AMU](#)
- [CTI](#)
- [Debug](#)
- [ETE](#)
- [GIC CPU interface](#)
- [GIC Distributor](#)
- [GIC ITS control](#)
- [GIC ITS translation](#)
- [GIC Redistributor](#)
- [GIC Virtual CPU interface](#)
- [GIC Virtual interface control](#)
- [MPAM](#)
- [PMU](#)
- [RAS](#)
- [TRBE](#)
- [Timer](#)

In the AMU block:

Offset	Name	Description	Access
$0x000 + (8 * n)$	AMEVCNTR0<n>[31:0]	Activity Monitors Event Counter Registers 0	RO
$0x004 + (8 * n)$	AMEVCNTR0<n>[63:32]	Activity Monitors Event Counter Registers 0	RO
$0x100 + (8 * n)$	AMEVCNTR1<n>[31:0]	Activity Monitors Event Counter Registers 1	RO
$0x104 + (8 * n)$	AMEVCNTR1<n>[63:32]	Activity Monitors Event Counter Registers 1	RO
$0x400 + (4 * n)$	AMEVTYPER0<n>	Activity Monitors Event Type Registers 0	RO
$0x480 + (4 * n)$	AMEVTYPER1<n>	Activity Monitors Event Type Registers 1	RO
0xC00	AMCNTENSET0	Activity Monitors Count Enable Set Register 0	RO
0xC04	AMCNTENSET1	Activity Monitors Count Enable Set Register 1	RO
0xC20	AMCNTENCLR0	Activity Monitors Count Enable Clear Register 0	RO
0xC24	AMCNTENCLR1	Activity Monitors Count Enable Clear Register 1	RO
0xCE0	AMCGCR	Activity Monitors Counter Group Configuration Register	RO
0xE00	AMCFGR	Activity Monitors Configuration Register	RO
0xE04	AMCR	Activity Monitors Control Register	RO
0xE08	AMIIDR	Activity Monitors Implementation Identification Register	RO

0xFAC	AMDEVAFF1	Activity Monitors Device Affinity Register 1	RO
0xFBC	AMDEVARCH	Activity Monitors Device Architecture Register	RO
0xFCC	AMDEVTYPE	Activity Monitors Device Type Register	RO
0xFD0	AMPIDR4	Activity Monitors Peripheral Identification Register 4	RO
0xFE0	AMPIDR0	Activity Monitors Peripheral Identification Register 0	RO
0xFE4	AMPIDR1	Activity Monitors Peripheral Identification Register 1	RO
0xFE8	AMPIDR2	Activity Monitors Peripheral Identification Register 2	RO

Offset	Name	Description	Access
0xFEC	AMPIDR3	Activity Monitors Peripheral Identification Register 3	RO
0xFF0	AMCIDR0	Activity Monitors Component Identification Register 0	RO
0xFF4	AMCIDR1	Activity Monitors Component Identification Register 1	RO
0xFF8	AMCIDR2	Activity Monitors Component Identification Register 2	RO
0xFFC	AMCIDR3	Activity Monitors Component Identification Register 3	RO

In the CTI block:

Offset	Name	Description	Access
0x000	CTICONTROL	CTI Control register	RW
0x010	CTIINTACK	CTI Output Trigger Acknowledge register	WO
0x014	CTIAPPSET	CTI Application Trigger Set register	RW
0x018	CTIAPPCLEAR	CTI Application Trigger Clear register	WO
0x01C	CTIAPPULSE	CTI Application Pulse register	WO
0x020 + (4 * n)	CTIINEN<n>	CTI Input Trigger to Output Channel Enable registers	RW
0x0A0 + (4 * n)	CTIOUTEN<n>	CTI Input Channel to Output Trigger Enable registers	RW
0x130	CTITRIGINSTATUS	CTI Trigger In Status register	RO
0x134	CTITRIGOUTSTATUS	CTI Trigger Out Status register	RO
0x138	CTICHINSTATUS	CTI Channel In Status register	RO
0x13C	CTICHOUTSTATUS	CTI Channel Out Status register	RO
0x140	CTIGATE	CTI Channel Gate Enable register	RW
0x144	ASICCTL	CTI External Multiplexer Control register	RO
0x150	CTIDEVCTL	CTI Device Control register	RW
0xF00	CTIITCTRL	CTI Integration mode Control register	RW
0xFA0	CTICLAIMSET	CTI CLAIM Tag Set register	RW
0xFA4	CTICLAIMCLR	CTI CLAIM Tag Clear register	RW
0xFA8	CTIDEVAFF0	CTI Device Affinity register 0	RO
0xFAC	CTIDEVAFF1	CTI Device Affinity register 1	RO
0xFB0	CTILAR	CTI Lock Access Register	WO
0xFB4	CTILSR	CTI Lock Status Register	RO
0xFB8	CTIAUTHSTATUS	CTI Authentication Status register	RO
0xFBC	CTIDEVARCH	CTI Device Architecture register	RO
0xFC0	CTIDEVID2	CTI Device ID register 2	RO
0xFC4	CTIDEVID1	CTI Device ID register 1	RO
0xFC8	CTIDEVID	CTI Device ID register 0	RO
0xFCC	CTIDEVTYPE	CTI Device Type register	RO
0xFD0	CTIPIDR4	CTI Peripheral Identification Register 4	RO
0xFE0	CTIPIDR0	CTI Peripheral Identification Register 0	RO
0xFE4	CTIPIDR1	CTI Peripheral Identification Register 1	RO
0xFE8	CTIPIDR2	CTI Peripheral Identification Register 2	RO
0xFEC	CTIPIDR3	CTI Peripheral Identification Register 3	RO
0xFF0	CTICIDR0	CTI Component Identification Register 0	RO
0xFF4	CTICIDR1	CTI Component Identification Register 1	RO
0xFF8	CTICIDR2	CTI Component Identification Register 2	RO

Offset	Name	Description	Access
0xFFC	CTICIDR3	CTI Component Identification Register 3	RO

In the Debug block:

Offset	Name	Description	Access
0x020	EDES	External Debug Event Status Register	RW
0x024	EDEC	External Debug Execution Control Register	RW
0x028	EDSCR2	External Debug Status and Control Register 2	RW
0x030	EDWAR[31:0]	External Debug Watchpoint Address Register	RO
0x034	EDWAR[63:32]	External Debug Watchpoint Address Register	RO
0x03C	EDHSR[63:32]	External Debug Halt Status Register	RO
0x038	EDHSR[31:0]	External Debug HaltingHalt SyndromeStatus Register	RO
0x080	DBGDTRRX_EL0	Debug Data Transfer Register, Receive	RW
0x084	EDITR	External Debug Instruction Transfer Register	WO
0x088	EDSCR	External Debug Status and Control Register	RW
0x08C	DBGDTRTX_EL0	Debug Data Transfer Register, Transmit	RW
0x090	EDRCR	External Debug Reserve Control Register	WO
0x094	EDACR	External Debug Auxiliary Control Register	RW
0x098	EDECCR	External Debug Exception Catch Control Register	RW
0x0A0	EDPCSR[31:0]	External Debug Program Counter Sample Register	RO
0x0A4	EDCIDS	External Debug Context ID Sample Register	RO
0x0A8	EDVIDSR	External Debug Virtual Context Sample Register	RO
0x0AC	EDPCSR[63:32]	External Debug Program Counter Sample Register	RO
0x300	OSLAR_EL1	OS Lock Access Register	WO
0x310	EDPRCR	External Debug Power/Reset Control Register	RW
0x314	EDPRSR	External Debug Processor Status Register	RO
0x400 + (16 * n)	DBGBVR<n>_EL1[63:0]	Debug Breakpoint Value Registers	RW
0x408 + (16 * n)	DBGBCR<n>_EL1	Debug Breakpoint Control Registers	RW
0x800 + (16 * n)	DBGWVR<n>_EL1[63:0]	Debug Watchpoint Value Registers	RW
0x808 + (16 * n)	DBGWCR<n>_EL1	Debug Watchpoint Control Registers	RW
0xD00	MIDR_EL1	Main ID Register	RO
0xD20	EDPFR[31:0]	External Debug Processor Feature Register	RO
0xD24	EDPFR[63:32]	External Debug Processor Feature Register	RO
0xD28	EDDFR[31:0]	External Debug Feature Register	RO
0xD2C	EDDFR[63:32]	External Debug Feature Register	RO
0xD48	EDDFR1	External Debug Feature Register 1	RO
0xD60	EDAA32PFR	External Debug Auxiliary Processor Feature Register	RO
0xF00	EDITCTRL	External Debug Integration mode Control register	RW
0xFA0	DBGCLAIMSET_EL1	Debug CLAIM Tag Set register	RW
0xFA4	DBGCLAIMCLR_EL1	Debug CLAIM Tag Clear register	RW
0xFA8	EDDEVAFF0	External Debug Device Affinity register 0	RO
0xFAC	EDDEVAFF1	External Debug Device Affinity register 1	RO
0xFB0	EDLAR	External Debug Lock Access Register	WO
0xFB4	EDLSR	External Debug Lock Status Register	RO

Offset	Name	Description	Access
0xFB8	DBGAUTHSTATUS_EL1	Debug Authentication Status register	RO
0xFBC	EDDEVARCH	External Debug Device Architecture register	RO
0xFC0	EDDEVID2	External Debug Device ID register 2	RO
0xFC4	EDDEVID1	External Debug Device ID register 1	RO
0xFC8	EDDEVID	External Debug Device ID register 0	RO
0xFCC	EDDEVTYPE	External Debug Device Type register	RO
0xFD0	EDPIDR4	External Debug Peripheral Identification Register 4	RO
0xFE0	EDPIDR0	External Debug Peripheral Identification Register 0	RO
0xFE4	EDPIDR1	External Debug Peripheral Identification Register 1	RO
0xFE8	EDPIDR2	External Debug Peripheral Identification Register 2	RO
0xFEC	EDPIDR3	External Debug Peripheral Identification Register 3	RO
0xFF0	EDCIDR0	External Debug Component Identification Register 0	RO
0xFF4	EDCIDR1	External Debug Component Identification Register 1	RO
0xFF8	EDCIDR2	External Debug Component Identification Register 2	RO
0xFFC	EDCIDR3	External Debug Component Identification Register 3	RO

In the ETE block:

Offset	Name	Description	Access
0x004	TRCPRGCTLR	Programming Control Register	RW
0x00C	TRCSTATR	Trace Status Register	RO
0x010	TRCCONFIGR	Trace Configuration Register	RW
0x018	TRCAUXCTLR	Auxiliary Control Register	RW

0xFF8	TRCCIDR2	Component Identification Register 2	RO
0xFFC	TRCCIDR3	Component Identification Register 3	RO

In the GIC CPU interface block:

Offset	Name	Description	Access
0x0000	GICC_CTLR	CPU Interface Control Register	RW
0x0004	GICC_PMR	CPU Interface Priority Mask Register	RW
0x0008	GICC_BPR	CPU Interface Binary Point Register	RW
0x000C	GICC_IAR	CPU Interface Interrupt Acknowledge Register	RO
0x0010	GICC_EOIR	CPU Interface End Of Interrupt Register	WO
0x0014	GICC_RPR	CPU Interface Running Priority Register	RO
0x0018	GICC_HPIR	CPU Interface Highest Priority Pending Interrupt Register	RO
0x001C	GICC_ABPR	CPU Interface Aliased Binary Point Register	RW
0x0020	GICC_AIAR	CPU Interface Aliased Interrupt Acknowledge Register	RO
0x0024	GICC_AEOIR	CPU Interface Aliased End Of Interrupt Register	WO
0x0028	GICC_AHPIR	CPU Interface Aliased Highest Priority Pending Interrupt Register	RO
0x002C	GICC_STATUSR	CPU Interface Status Register	RW
0x002C	GICC_STATUSR	CPU Interface Status Register	RW
0x00D0 + (4 * n)	GICC_APR<n>	CPU Interface Active Priorities Registers	RW
0x00E0 + (4 * n)	GICC_NSAPR<n>	CPU Interface Non-secure Active Priorities Registers	RW
0x00FC	GICC_IIDR	CPU Interface Identification Register	RO
0x1000	GICC_DIR	CPU Interface Deactivate Interrupt Register	WO

In the GIC Distributor block:

In the Dist_base block:

Offset	Name	Description	Access
0x0000	GICD_CTLR	Distributor Control Register	RW
0x0004	GICD_TYPER	Interrupt Controller Type Register	RO
0x0008	GICD_IIDR	Distributor Implementer Identification Register	RO
0x000C	GICD_TYPER2	Interrupt Controller Type Register 2	RO
0x0010	GICD_STATUSR	Error Reporting Status Register	RW
0x0010	GICD_STATUSR	Error Reporting Status Register	RW

Offset	Name	Description	Access
0x0040	GICD_SETSPI_NSR	Set Non-secure SPI Pending Register	WO
0x0048	GICD_CLRSPI_NSR	Clear Non-secure SPI Pending Register	WO
0x0050	GICD_SETSPI_SR	Set Secure SPI Pending Register	WO
0x0058	GICD_CLRSPI_SR	Clear Secure SPI Pending Register	WO
0x0080 + (4 * n)	GICD_IGROUPR<n>	Interrupt Group Registers	RW
0x0100 + (4 * n)	GICD_ISENABLER<n>	Interrupt Set-Enable Registers	RW
0x0180 + (4 * n)	GICD_ICENABLER<n>	Interrupt Clear-Enable Registers	RW
0x0200 + (4 * n)	GICD_ISPENDR<n>	Interrupt Set-Pending Registers	RW
0x0280 + (4 * n)	GICD_ICPENDR<n>	Interrupt Clear-Pending Registers	RW
0x0300 + (4 * n)	GICD_ISACTIVER<n>	Interrupt Set-Active Registers	RW
0x0380 + (4 * n)	GICD_ICACTIVER<n>	Interrupt Clear-Active Registers	RW
0x0400 + (4 * n)	GICD_IPRIORITYR<n>	Interrupt Priority Registers	RW

DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGAUTHSTATUS_EL1\[31:0\]](#).

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGAUTHSTATUS\[31:0\]](#).

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

DBGAUTHSTATUS_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0			RTNID		RTID		RES0					RLNID		RLID		RES0			SNID		SID		NSNID		NSID						

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.
0b10	Implemented and disabled. ExternalRootInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalRootInvasiveDebugEnabled() == TRUE.

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is ~~00~~, 0b00.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.
0b10	Implemented and disabled. ExternalRealmInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalRealmInvasiveDebugEnabled() == TRUE.

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is ~~00~~, 0b00.

Bits [11:8]

Reserved, RES0.

SNID, bits [7:6]**When FEAT_Debugv8p4 is implemented:**

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

Secure non-invasive debug.

SNID	Meaning
0b00	Not implemented. One EL3 is not implemented and the following Effective is value true: of SCR_EL3.NS is 1. <ul style="list-style-type: none"> EL3 is not implemented and the Effective value of SCR_EL3.NS is 1. FEAT_RME is implemented without Secure state.
0b10	Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

SID	Meaning
0b00	Not implemented. One of the following Effective values is true: <ul style="list-style-type: none"> EL3 is not implemented and the Effective value of SCR_EL3.NS is 1. FEAT_RME is implemented without Secure state.
0b10	Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSNID, bits [3:2]

When FEAT_Debugv8p4 is implemented:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

If the Effective value of SCR_EL3.NS is 1, or if EL3 is implemented and EL2 is not implemented, this field reads as 0b11.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10	Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

NSID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10	Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

Accessing DBGAUTHSTATUS_EL1

DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

Debug	0xFB8	DBGAUTHSTATUS_EL1
-------	-------	-------------------

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>_EL1](#).

Configuration

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGBCR<n>_EL1\[31:0\]](#).

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBCR<n>\[31:0\]](#).

DBGBCR<n>_EL1 is in the Core power domain.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBCR<n>_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LBN	XRES0	RES0	BT	MASK	LBN	BT	SSC	LBN	HMC	SSC	RES0	HMC	BAS	RES0	BAS	PMC	RES0	BT	PMC	E											

When the E field is zero, all the other fields in the register are ignored.

LBNX, Bits bits [31:3024]

When FEAT_Debugv8p9 is implemented:

Linked Breakpoint Number.

For Linked address matching breakpoints, with DBGBCR<n>_EL1.LBN, specifies the index of the breakpoint linked to.

For all other breakpoint types, this field is ignored and reads of the register return an UNKNOWN value.

This field extends DBGBCR<n>_EL1.LBN to support up to 64 implemented breakpoints.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [29]

Reserved, RES0.

MASK, bits [28:24]

When FEAT_ABLE is implemented:

Address Mask. Only address ranges up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00001	Reserved.
0b00010	Reserved.
0b00011..0b11111	Number address bits masked.

Indicates the number of masked address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

With DBGBCR<n>_EL1.BT2 when implemented, specifies breakpoint type.

BT	Meaning	Applies when
0b0000	Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.	
0b0001	Linked instruction address match. As 0b0000, but linked to a breakpointContext thatmatching has linking enabled.breakpoint.	
0b0010	Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, the Effective value of HCR_EL2.E2H is 1, and either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value. Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value.	When breakpoint n is context-aware
0b0011	As 0b0010, with linking enabled.	When breakpoint n is context-aware
0b0100	Unlinked instruction address mismatch. DBGBVR<n>_EL1 is the address of an instruction.instruction to be stepped.	When FEAT_ABLE is implemented or EL1 is using AArch32
0b0101	Linked instruction address mismatch. As 0b0100, but linked to a breakpointContext thatmatching has linking enabled.breakpoint.	When FEAT_ABLE is implemented or EL1 is using AArch32
0b0110	Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1 .	When FEAT_VHE is implemented and breakpoint n is context-aware
0b0111	As 0b0110, with linking enabled.	When FEAT_VHE is implemented and breakpoint n is context-aware
0b1000	Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID .	When EL2 is implemented and breakpoint n is context-aware

0b1001	As 0b1000, with linking enabled.	When EL2 is implemented and breakpoint n is context-aware
0b1010	Unlinked VMID and Context ID match. DBGBCR<n>_EL1 .ContextID is a Context ID compared against CONTEXTIDR_EL1 , and DBGBCR<n>_EL1 .VMID is a VMID compared against VTTBR_EL2 .VMID.	When EL2 is implemented and breakpoint n is context-aware
0b1011	As 0b1010, with linking enabled.	When EL2 is implemented and breakpoint n is context-aware
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBCR<n>_EL1 .ContextID2 is a Context ID compared against CONTEXTIDR_EL2 .	When FEAT_VHE is implemented and breakpoint n is context-aware
0b1101	As 0b1100, with linking enabled.	When FEAT_VHE is implemented and breakpoint n is context-aware
0b1110	Unlinked Full Context ID match. DBGBCR<n>_EL1 .ContextID is compared against CONTEXTIDR_EL1 , and DBGBCR<n>_EL1 .ContextID2 is compared against CONTEXTIDR_EL2 .	When FEAT_VHE is implemented and breakpoint n is context-aware
0b1111	As 0b1110, with linking enabled.	When FEAT_VHE is implemented and breakpoint n is context-aware

Constraints on breakpoint programming mean some values are reserved under certain conditions.

For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>_EL1.BT values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For Linked address matching breakpoints, with DBGBCR<n>_EL1.LBNX when implemented, specifies the index of the breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

For this all other breakpoint types, this field is ignored and when read the value of the DBGBCR<n>_EL1 register is return an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see [DBGBCR<n>_EL1.SSC](#) description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When AArch32 is supported:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions

All other values are reserved.

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint
0b0011	DBGBVR<n>_EL1	Use for stepping T32 instructions
0b1100	DBGBVR<n>_EL1	Use for stepping T32 instructions
	+ 2	
0b1111	DBGBVR<n>_EL1	Use for stepping A64 and A32 instructions

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [4:3]

Reserved, RES0.

BT2, bit [3]

When FEAT_ABLE is implemented:

Breakpoint Type 2. With DBGBCR<n>_EL1.BT, specifies breakpoint type.

BT2	Meaning
0b0	As DBGBCR<n>_EL1.BT.
0b1	As DBGBCR<n>_EL1.BT, but with linking enabled.
	This value is only defined for the following DBGBCR<n>_EL1.BT values: 0b0000, 0b0001, 0b0100, and 0b0101.
	All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the [DBGBCR<n>_EL1.SSC](#) description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>_EL1](#).

Configuration

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGWCR<n>_EL1\[31:0\]](#).

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWCR<n>\[31:0\]](#).

DBGWCR<n>_EL1 is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

Attributes

DBGWCR<n>_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LBN	XRES0	RES0	MASK	MASK	RES0	RES0	WT	WT	LBN	LBN	SSC	SSC	CHM	CHM	CBAS																

When the E field is zero, all the other fields in the register are ignored.

LBNX, Bits bits [31:3029]

When FEAT_Debugv8p9 is implemented:

Linked Breakpoint Number.

For Linked data address watchpoints, with DBGWCR<n>_EL1.LBN, specifies the index of the breakpoint linked to.

For all other watchpoint types, this field is ignored and reads of the register return an UNKNOWN value.

This field extends DBGWCR<n>_EL1.LBN to support up to 64 implemented breakpoints.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [29]

Reserved, RES0.

MASK, bits [28:24]

Address ~~Mask~~.mask. Only objects up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00001	Reserved.
0b00010	Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpointbreakpoint Number.number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

For Linked data address watchpoints, with DBGWCR<n>_EL1.LBNX when implemented, specifies the index of the breakpoint linked to.

For all other watchpoint types, this field is ignored and reads of the register return an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>_EL1](#) is being watched.

BAS	Description
xxxxxxx1	Match byte at DBGWVR<n>_EL1
xxxxxx1x	Match byte at DBGWVR<n>_EL1 + 1
xxxxx1xx	Match byte at DBGWVR<n>_EL1 + 2
xxx1xxx	Match byte at DBGWVR<n>_EL1 + 3

In cases where [DBGWVR<n>_EL1](#) addresses a double-word:

BAS	Description, if DBGWVR<n>_EL1[2] == 0
xxx1xxxx	Match byte at DBGWVR<n>_EL1 + 4
xx1xxxxx	Match byte at DBGWVR<n>_EL1 + 5
x1xxxxxx	Match byte at DBGWVR<n>_EL1 + 6
1xxxxxxx	Match byte at DBGWVR<n>_EL1 + 7

If [DBGWVR<n>_EL1\[2\]](#) == 1, only BAS[3:0] is used. Arm deprecates setting [DBGWVR<n>_EL1\[2\]](#) == 1.

The valid values for BAS are non-zero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the external debug component.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION				ARCHVER				ARCHPART											

ARCHITECT, bits [31:21]

Defines the architecture of the component. For debug, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is **RO**.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For debug, the revision defined by Armv8 is 0x0.

All other values are reserved.

Reads as 0b0000.

Access to this field is **RO**.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component. Defined values are:

ARCHVER	Meaning
0b0110	Armv8 debug architecture.
0b0111	Armv8 debug architecture with Virtualization Host Extensions.
0b1000	Armv8.2 debug architecture, FEAT_Debugv8p2.
0b1001	Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010	Armv8.8 debug architecture, FEAT_Debugv8p8.
0b1011	Armv8.9 debug architecture, FEAT_Debugv8p9.

EDDEVARCH.ARCHVER and EDDEVARCH.ARCHPART are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHVER is EDDEVARCH.ARCHID[15:12].

FEAT_VHE adds the functionality identified by the value 0b0111.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

FEAT_Debugv8p8 adds the functionality identified by the value 0b1010.

FEAT_Debugv8p9 adds the functionality identified by the value 0b1011.

From Armv8.1, when FEAT_VHE is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

From Armv8.9, the value 0b1010 is not permitted.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA15	Armv8-A debug architecture.

EDDEVARCH.ARCHVER and EDDEVARCH.ARCHPART are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHPART is EDDEVARCH.ARCHID[11:0].

Armv8-A debug architecture.

Access to this field is **RO**.

Accessing EDDEVARCH

EDDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFBC	EDDEVARCH

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5708; 21c5a6dd0fdaf10a712e2f2d6ffbbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				AuxRegs				RES0												DebugPower				PCSample							

Bits [31:28]

Reserved, RES0.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Defined values are:

AuxRegs	Meaning
0b0000	None supported.
0b0001	Support for External Debug Auxiliary Control Register, EDACR .

All other values are reserved.

Bits [23:8]

Reserved, RES0.

DebugPower, bits [7:4]

Indicates support for the FEAT_DoPD feature. Defined values are:

DebugPower	Meaning
0b0000	FEAT_DoPD not implemented. Registers in the external debug interface register map are implemented in a mix of the Debug and Core power domains.
0b0001	FEAT_DoPD implemented. All registers in the external debug interface register map are implemented in the Core power domain.

FEAT_DoPD implements the functionality added by the value 0b0001.

All other values are reserved.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the external debug registers space.
0b0010	Only EDPCSR and EDCIDSR are implemented. This option is only permitted if EL3 and EL2 are not implemented.
0b0011	EDPCSR , EDCIDSR , and EDVIDSR are implemented.

All other values are reserved.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMU.PMDEVID.PCSample](#). [PMDEVID.PCSample](#).

Accessing EDDEVID

EDDEVID can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC8	EDDEVID

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffbd6d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

EDDEVID1, External Debug Device ID register 1

The EDDEVID1 characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

- If FEAT_DoPD is implemented, this register is in the Core power domain.
- If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								HSR			PCSROffset				

Bits [31:8]

Reserved, RES0.

HSR, bits [7:4]

Indicates support for the External Debug Halt Status Register, (EDHSR). Defined values are:

HSR	Meaning
0b0000	EDHSR is not implemented, and the PE follows behaviors consistent with all of the EDHSR fields having a zero value.
0b0001	EDHSR is implemented.
0b0010	As 0b0001, but extends EDHSR to include the VNCR, CM, and WnR fields.

All other values are reserved.

- When FEAT_SME and FEAT_Debugv8p9 are not implemented, the only permitted value is 0b0000.
- If FEAT_SME is implemented, the permitted values are 0b0000 and 0b0001.
- When If FEAT_Debugv8p9FEAT_SME is not implemented, the values only permitted value is 0b0000 and 0b0001 are not permitted.

PCSROffset, bits [3:0]

Indicates the offset applied to PC samples returned by reads of EDPCSR. Permitted values of this field in Armv8 are:

PCSRoffset	Meaning
0b0000	EDPCSR not implemented.
0b0010	EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of `PMU.PMDEVID.PCSample.PMDEVID.PCSample`.

Accessing EDDEVID1

EDDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC4	EDDEVID1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5707; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

EDDFR, External Debug Feature Register

The EDDFR characteristics are:

Purpose

Provides top level information about the debug system.

Note

Debuggers must use [EDDEVARCH](#) to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

It is IMPLEMENTATION DEFINED whether EDDFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDDFR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN				ExtTrcBuffRES0				UNKNOWN												TraceFilt				UNKNOWN

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:60]

Reserved, UNKNOWN.

ExtTrcBuff, bits [59:56]

Trace Buffer External Mode Extension.

Reserved, RES0.

ExtTrcBuff	Meaning
0b0000	Trace Buffer Extension not implemented or Trace Buffer External Mode not implemented.
0b0001	Trace Buffer Extension implemented and Trace Buffer External Mode implemented.

All other values are reserved.

FEAT_TRBE_EXT implements the functionality identified by the value 0b0001.

Bits [55:44]

Reserved, UNKNOWN.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension is not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension is implemented.

All other values are reserved.

FEAT_TRF implements the functionality added by 0b0001.

From Armv8.4, the permitted values are 0b0000 and 0b0001.

Bits [39:32]

Reserved, UNKNOWN.

CTX_CMPs, bits [31:28]

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

If FEAT_Debugv8p9 is implemented and 16 or more breakpoints that are context-aware are implemented, this field reads as 0b1111.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64DFR0_EL1.CTX_CMPs.

SEBEP, bits [27:24]

This field either has the same value as ID_AA64DFR0_EL1.SESEBP or reads as zero.

Reserved, RES0.

WRPs, bits [23:20]

Access to this field is **RO**.

Number of watchpoints, minus 1.

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

If FEAT_Debugv8p9 is implemented and 16 or more watchpoints are implemented, this field reads as 0b1111.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64DFR0_EL1.WRPs.

The value of 0b0000 is reserved.

PMSS, bits [19:16]

This field either has the same value as ID_AA64DFR0_EL1.PMSS or reads as zero.

Reserved, RES0.

BRPs, bits [15:12]

Access to this field is **RO**.

Number of breakpoints, minus 1.

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

If FEAT_Debugv8p9 is implemented and 16 or more breakpoints are implemented, this field reads as 0b1111.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64DFR0_EL1](#).BRPs.

The This value field of has an 0b0000 IMPLEMENTATION DEFINED is reserved value.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and adds support for: <ul style="list-style-type: none"> Extended 16-bit PMU.PMEVTYPER<n>_EL0.evtCount field. PMEVTYPER<n>_EL0.evtCount field. If EL2 is implemented, the MDCR_EL2.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR_EL1 register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: <ul style="list-style-type: none"> 64-bit event counters. If EL2 is implemented, the MDCR_EL2.HCCD control. If EL3 is implemented, the MDCR_EL3.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: <ul style="list-style-type: none"> The PMU.PMCR_EL0.FZO and, if EL2 is implemented, PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO controls. If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: <ul style="list-style-type: none"> Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1001	PMUv3 for Armv8.9. As 0b1000, and: <ul style="list-style-type: none"> Updates the definitions of existing PMU events. Adds support for the PMUSERENR_EL0.UEN control and the PMUACR_EL1 register. Adds support for the EDEC.R.PME control.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

FEAT PMUv3p9 implements the functionality identified by the value 0b1001.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMuV3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMuV3 is implemented, the value 0b0111 is not permitted.

From Armv8.9, if FEAT_PMUv3 is implemented, the value 0b1000 is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a trace unit is implemented. Defined values are:

TraceVer	Meaning
0b0000	Trace unit System registers not implemented.
0b0001	Trace unit System registers implemented.

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a trace unit is implemented. A trace unit might nevertheless be implemented without a System register interface.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64DFR0_EL1.TraceVer](#).

Bits [3:0]

Reserved, UNKNOWN.

Accessing EDDFR

EDDFR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD28	EDDFR	31:0

This interface is accessible as follows:

- When `IsCorePowered()` and `!DoubleLockStatus()`, accesses to this register are **RO**.
- Otherwise, accesses to this register are **IMPDEF**.

Component	Offset	Instance	Range
Debug	0xD2C	EDDFR	63:32

This interface is accessible as follows:

- When `IsCorePowered()` and `!DoubleLockStatus()`, accesses to this register are **RO**.
- Otherwise, accesses to this register are **IMPDEF**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

EDDFR1, External Debug Feature Register 1

The EDDFR1 characteristics are:

Purpose

Provides top level information about the debug system in AArch64.

Configuration

If FEAT_DoPD is not implemented then it is IMPLEMENTATION DEFINED whether EDDFR1 is in the Core power domain or Debug power domain. If FEAT_DoPD is implemented then EDDFR1 is in the Core power domain.

Note

If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented.

Attributes

EDDFR1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0												EBEP				ITE				ABLE				PMICNTR				SPMU			
CTX_CMPS								WRPs								BRPs								SYSPMUID							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:52]

Reserved, RES0.

EBEP, bits [51:48]

This field either has the same value as [ID_AA64DFR1_EL1.EBEP](#) or reads as zero.

ITE, bits [47:44]

This field either has the same value as [ID_AA64DFR1_EL1.ITE](#) or reads as zero.

ABLE, bits [43:40]

Address Breakpoint Linking Extension. Defined values are:

ABLE	Meaning
0b0000	Address Breakpoint Linking Extension not implemented.
0b0001	Address Breakpoint Linking Extension implemented.

All other values are reserved.

FEAT_ABLE implements the functionality identified by the value 0b0001.

If FEAT_ABLE is not implemented, then the only permitted value is 0b0000.

From Armv9.4, when FEAT_ABLE is implemented, the value 0b0000 is not permitted.

PMICNTR, bits [39:36]

This field either has the same value as [ID_AA64DFR1_EL1.PMICNTR](#) or reads as zero.

SPMU, bits [35:32]

This field either has the same value as [ID_AA64DFR1_EL1.SPMU](#) or reads as zero.

CTX_CMPs, bits [31:24]

When FEAT_Debugv8p9 is implemented and EDDFR.CTX_CMPs == 0b1111:

Number of breakpoints that are context-aware, minus 1.

The value 0x00 means 16 breakpoints that are context-aware are implemented. Otherwise, this field is the number of breakpoints that are context-aware, minus 1.

The values 0x01 to 0x0F and 0x40 to 0xFF are reserved.

The value of this field is never greater than [ID_AA64DFR1_EL1.BRPs](#).

Otherwise:

Reserved, RES0.

WRPs, bits [23:16]

When FEAT_Debugv8p9 is implemented and EDDFR.WRPs == 0b1111:

Number of watchpoints, minus 1.

The value 0x00 means 16 watchpoints are implemented. Otherwise, this field is the number of watchpoints, minus 1.

The values 0x01 to 0x0F and 0x40 to 0xFF are reserved.

Otherwise:

Reserved, RES0.

BRPs, bits [15:8]

When FEAT_Debugv8p9 is implemented and EDDFR.BRPs == 0b1111:

Number of breakpoints, minus 1.

The value 0x00 means 16 breakpoints are implemented. Otherwise, this field is the number of breakpoints, minus 1.

The values 0x01 to 0x0F and 0x40 to 0xFF are reserved.

Otherwise:

Reserved, RES0.

SYSPMUID, bits [7:0]

This field either has the same value as [ID_AA64DFR1_EL1.SYSPMUID](#) or reads as zero.

Accessing EDDFR1

EDDFR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD48	EDDFR1

Accesses to this interface are **RO**.

EDECR, External Debug Execution Control Register

The EDECR characteristics are:

Purpose

Controls Halting debug events.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDECR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																TRBE	SS	TRCERCE	PMEOSUCE	RES0	SS	RCE	OSUCE	RES0	SS	RCE	OSUCE	RES0	SS	RCE	OSUCE

Bits [31:7]3

Reserved, RES0.

TRBE, bit [6]

When FEAT_Debugv8p9 is implemented and FEAT_TRBE_EXT is implemented:

Trace Buffer External Debug Request Enable.

TRBE	Meaning
0b0	Trace Buffer External Debug Request disabled.
0b1	Trace Buffer External Debug Request enabled.

This bit is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCE, bit [5]

When FEAT_ETEv1p3 is implemented and FEAT_Debugv8p9 is implemented:

ETE External Debug Request Enable.

TRCE	Meaning
0b0	ETE External Debug Request disabled.
0b1	ETE External Debug Request enabled.

This bit is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

PME, bit [4]

When FEAT_Debugv8p9 is implemented and FEAT_PMUv3p9 is implemented:

PMU Overflow External Debug Request Enable.

PME	Meaning
0b0	PMU Overflow External Debug Request disabled.
0b1	PMU Overflow External Debug Request enabled.

This bit is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [3]

Reserved, RES0.

SS, bit [2]

Halting step enable. Possible values of this field are:

SS	Meaning
0b0	Halting step debug event disabled.
0b1	Halting step debug event enabled.

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is CONSTRAINED UNPREDICTABLE as described in 'Changing the value of EDECR.SS when not in Debug state'.

The reset behavior of this field is:

- On a Cold reset, when FEAT_DoPD is implemented, this field resets to 0.
- On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 0.

RCE, bit [1]

When FEAT_DoPD is not implemented:

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Otherwise:

Reserved, RES0.

OSUCE, bit [0]

When FEAT_DoPD is not implemented:

OS Unlock Catch Enable.

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Accessing EDECR

EDECRC can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x024	EDECR

This interface is accessible as follows:

- When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus(), accesses to this register are **RO**.
- When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

EDHSR, External Debug HaltingHalt SyndromeStatus Register

The EDHSR characteristics are:

Purpose

HoldsProvides syndromeDebug informationHalt forStatus a debug event.information.

Configuration

This register is present only when (FEAT_SME is implemented and an implementation implements EDHSR) or FEAT_Debugv8p9 is implemented. Otherwise, direct accesses to EDHSR are RES0.

EDHSR is in the Core power domain.

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to EDHSR are RES0.

This register is only valid when the PE is in Debug state and [EDSCR](#).STATUS is 0b101011, indicating a Watchpoint debug event. Otherwise, it has an UNKNOWN value.

The field [EDDEVID1](#).HSR indicates support for this register.

Attributes

EDHSR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																
RES0								WPT				WPTV	WPF	FnP	RES0	VNCR	FnV	RES0	FnV	RES0	CM	RES0	WnR					RES0				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:24]

Reserved, RES0.

WPT, bits [23:18]

All other values are reserved.

Watchpoint number. When EDHSR.WPTV is 1number, holds0 theto index15 of a watchpoint that triggered the Watchpoint debug event.inclusive.

The reset behavior of this field is:

- On a WarmCold reset, this field resets to an architecturally UNKNOWN value.

WPTV, bit [17]

Watchpoint number valid.Valid.

WPTV	Meaning	Applies when
0b0	EDHSR.WPTV is not valid, and holds an UNKNOWN value.	When FEAT_SME is implemented and FEAT_Debugv8p9 is not implemented
0b1	EDHSR.WPTV is valid, and holds the number of a watchpoint that triggered the Watchpoint debug event. Debug state.	

When an entry to Debug state is triggered by a watchpoint match:

- If the PE sets any of FnV, FnP, or WPF to 1, then the PE sets WPTV to 1.
- If the PE sets all of FnV, FnP, and WPF to 0, then the PE sets WPTV to an IMPLEMENTATION DEFINED value, 0 or 1.

The reset behavior of this field is:

- On a WarmCold reset, this field resets to an architecturally UNKNOWN value.

WPF, bit [16]

Watchpoint match might be False.false-positive.

WPF	Meaning	Applies when
0b0	The watchpoint matched the original access or set of contiguous accesses.	
0b1	The watchpoint matched an access or set of contiguous accesses where the lowest accessed address was rounded down to the nearest multiple of 16 bytes and the highest accessed address was rounded up to the nearest multiple of 16 bytes minus 1, but the watchpoint might not have matched the original address of the access or set of contiguous accesses.	When (FEAT_SVE is implemented and FEAT_Debugv8p9 is implemented) or FEAT_SME is implemented

The reset behavior of this field is:

- On a WarmCold reset, this field resets to an architecturally UNKNOWN value.

FnP, bit [15]

This field only has meaning if the EDWAR is valid; that is, when the FnV field is 0. If the FnV field is 1, the FnP field is 0.

EDWAR FAR not Precise.

FnP	Meaning	Applies when
0b0	If the FnV field is 0, the EDWAR holds the virtual address of an access or set of contiguous accesses that triggered an entry to Debug state. EDWAR is valid, it holds the virtual address of an access or sequence of contiguous accesses that triggered the Watchpoint debug event.	
0b1	If the EDWAR holds any address within the smallest implemented translation granule that contains the virtual address of an access or set of contiguous accesses that triggered an entry to Debug state. EDWAR is valid, it holds any virtual address within the smallest implemented translation granule that contains the virtual address of an access or set of contiguous accesses that triggered the Watchpoint debug event.	When (FEAT_SVE is implemented and FEAT_Debugv8p9 is implemented) or FEAT_SME is implemented

The reset behavior of this field is:

- On a WarmCold reset, this field resets to an architecturally UNKNOWN value.

BitBits [14:11]

Reserved, RES0.

VNCR, bit [13]

When FEAT_NV2 is implemented and FEAT_Debugv8p9 is implemented:

VNCR_EL2 access. Indicates that the Watchpoint debug event came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The Watchpoint debug event was not generated by the use of VNCR_EL2 by EL1 code.
0b1	The Watchpoint debug event was generated by the use of VNCR_EL2 by EL1 code.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:11]

Reserved, RES0.

FnV, bit [10]

EDWAR FAR not Valid.

FnV	Meaning	Applies when
0b0	EDWAR The EDWAR is valid, and its value is as described by the FnP field.	
0b1	EDWAR The EDWAR is not valid, and holds an UNKNOWN value.	When (FEAT_SVE is implemented and FEAT_Debugv8p9 is implemented) or FEAT_SME is implemented

The reset behavior of this field is:

- On a WarmCold reset, this field resets to an architecturally UNKNOWN value.

BitBits [9:0]

Reserved, RES0.

CM, bit [8]

When FEAT_Debugv8p9 is implemented:

Cache maintenance. Indicates whether the Watchpoint debug event came from a cache maintenance instruction.

CM	Meaning
0b0	The Watchpoint debug event was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint debug event was generated by the execution of a cache maintenance instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not cache maintenance instructions, and therefore do not cause this bit to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

WnR, bit [6]

When FEAT_Debugv8p9 is implemented:

Write not Read. Indicates whether the Watchpoint debug event was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint debug event caused by an instruction reading from a memory location.
0b1	Watchpoint debug event caused by an instruction writing to a memory location.

For Watchpoint debug events on cache maintenance instructions, this bit is set to 1.

For Watchpoint debug events from an atomic instruction, this bit is set to 0 if a read of the location would have generated the Watchpoint debug event, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:0]

Reserved, RES0.

Accessing EDHSR

EDHSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x038	EDHSR

Component	Offset	Instance	Range
Debug	0x038	EDHSR	31:0

This interface is accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered() or OSLockStatus(), accesses to this register generate an error response.
- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are generate an error response. **RO**.

Component	Offset	Instance	Range
Debug	0x03C	EDHSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5708; 21c5a6dd0fdaf10a712e2f2d6ffdbbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

EDPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDPCSR are RES0.

EDPCSR[63:32] and EDPCSR[31:0] are accessed at 32-bit memory mapped addresses that are not contiguous.

If FEAT_VHE is implemented, the format of this register differs depending on the value of [EDSCR.SC2](#).

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDPCSR is a 64-bit register.

Field descriptions

When FEAT_VHE is not implemented or EDSCR.SC2 == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

PC Sample low word																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

PC Sample high word, EDPCSRhi. If [EDVIDSR.HV](#) == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from [EDVIDSR.{NS,E2,E3}](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#) to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#). The translation regime that EDPCSR samples can be determined from [EDVIDSR](#).{NS,E2,E3}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#) are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_VHE is implemented and EDSCR.SC2 == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NS	EL	RES0						PC Sample high word, EDPCSRhi																								
PC Sample low word																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

EL	Meaning
0b00	Sample is from EL0.
0b01	Sample is from EL1.
0b10	Sample is from EL2.
0b11	Sample is from EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [60:56]

Reserved, RES0.

Bits [55:32]

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, [EDCIDS](#)R, and [EDVIDS](#)R to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, [EDCIDS](#)R, and [EDVIDS](#)R. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, [EDCIDS](#)R, and [EDVIDS](#)R are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'

EDPCSR can be accessed through the external memory-mapped debug interface interfaces:

Component	Offset	Instance	Range
Debug	0x0A0	EDPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Component	Offset	Instance	Range
-----------	--------	----------	-------

Debug	0x0AC	EDPCSR	63:32
-------	-------	--------	-------

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

External register EDSCR bits [30:29] are architecturally mapped to AArch64 System register [MDCCSR_EL0\[30:29\]](#).

EDSCR is in the Core power domain.

Attributes

EDSCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TF	ORXfull	TXfull	IT	ORXO	TXU	PipeAdv	ITE	INTdis	TDAMA	SC2NS	RES0	SDD	NSE	HDE		RW		EL	AERR	STATUS											

TFO, bit [31]

When FEAT_TRF is implemented:

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

TFO	Meaning
0b0	Trace Filter controls are not affected.
0b1	Trace Filter controls in TRFCR_EL1 and TRFCR_EL2 are ignored.
	Trace Filter controls TRFCR and HTRFCR are ignored.

When [OSLSR_EL1](#).OSLK is 1, this bit can be indirectly read and written through the following System registers:

- [MDSCR_EL1](#).
- [DBGDSCRext](#).

This bit is ignored by the PE when any of the following is true:

- ExternalSecureNoninvasiveDebugEnabled() is FALSE and the Effective value of [MDCR_EL3](#).STE is 1.
- FEAT_RME is implemented, ExternalRealmNoninvasiveDebugEnabled() is FALSE, and the Effective value of [MDCR_EL3](#).RLTE is 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

TXfull, bit [29]

DTRTX full.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

ITO, bit [28]

ITR overrun. Set to 0 on entry to Debug state.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

RXO, bit [27]

DTRRX overrun.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

TXU, bit [26]

DTRTX underrun.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

PipeAdv, bit [25]

Pipeline Advance. Indicates that software execution is progressing.

PipeAdv	Meaning
0b0	No progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA .
0b1	Progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA .

The architecture does not define precisely when this field is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing. For example, a PE might set this field to 1 each time the PE retires one or more instructions, or at periodic intervals during the progression of an instruction.

When FEAT_MOPS is implemented, CPY, CPYF, SET, and SETG are examples of instructions that periodically make forward progress.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

ITE, bit [24]

ITR empty.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

INTdis, bits [23:22]

When FEAT_RME is implemented:

Interrupt disable. Disables taking interrupts in Non-debug state.

INTdis	Meaning
0b00	This bit has no effect on the masking of interrupts.
0b01	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked. If ExternalRootInvasiveDebugEnabled() is TRUE, then all interrupts taken to Root state are masked. If ExternalRealmInvasiveDebugEnabled() is TRUE, then all interrupts taken to Realm state are masked.

Note

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1](#).OSLK is 1, this field can be indirectly read and written through the following System registers:

- [MDSCR_EL1](#).
- [DBGDSCRext](#).

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_RME is implemented, bit[23] of this register is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

When FEAT_Debugv8p4 is implemented:

Interrupt disable. Disables taking interrupts in Non-debug state.

INTdis	Meaning
0b00	Masking of interrupts is controlled by PSTATE and interrupt routing controls.
0b01	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked.

Note

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1](#).OSLK is 1, this field can be indirectly read and written through the following System registers:

- [MDSCR_EL1](#).
- [DBGDSCRext](#).

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_Debugv8p4 is implemented, bit[23] of this register is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Interrupt disable. Disables taking interrupts in Non-debug state.

INTdis	Meaning
0b00	Masking of interrupts is controlled by PSTATE and interrupt routing controls.
0b01	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure EL1 are masked.
0b10	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure EL1 are masked.
0b11	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked.

Note

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1](#).OSLK is 1, this field can be indirectly read and written through the following System registers:

- [MDSCR_EL1](#).
- [DBGDSCRext](#).

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

Support for the values 0b01 and 0b10 is IMPLEMENTATION DEFINED. If these values are not supported, they are reserved. If programmed with a reserved value, the PE behaves as if INTdis has been programmed with a defined value, other than for a direct read of EDSCR, and the value returned by a read of EDSCR.INTdis is UNKNOWN.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

TDA, bit [21]

Traps accesses to the following debug System registers:

- AArch64: [DBGBCR<n>_EL1](#), [DBGBVR<n>_EL1](#), [DBGWCR<n>_EL1](#), [DBGWVR<n>_EL1](#).
- AArch32: [DBGBCR<n>](#), [DBGBVR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).

TDA	Meaning
0b0	Accesses to debug System registers do not generate a Software Access Debug event.
0b1	Accesses to debug System registers generate a Software Access Debug event, if OSLSR_EL1 .OSLK is 0 and if halting is allowed.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

MA, bit [20]

Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

MA	Meaning
0b0	Normal access mode.
0b1	Memory access mode.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and FEAT_PCSRv8p2 is not implemented:

Sample [CONTEXTIDR_EL2](#). Controls whether the PC Sample-based Profiling Extension samples [CONTEXTIDR_EL2](#) or [VTTBR_EL2](#).VMID.

SC2	Meaning
0b0	Sample VTTBR_EL2 .VMID.
0b1	Sample CONTEXTIDR_EL2 .

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NS, bit [18]

When FEAT_RME is implemented:

Non-secure status. Together with the NSE field, gives the current Security state:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

Otherwise:

Non-secure status. In Debug state, gives the current Security state:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.

- Otherwise, access to this field is **RO**.

Bit [17]

Reserved, RES0.

SDD, bit [16]**When FEAT_RME is implemented:**

EL3 debug disabled.

On entry to Debug state:

- If entering from EL3, SDD is set to 0.
- Otherwise, SDD is set to the inverse of `ExternalRootInvasiveDebugEnabled()`.

In Debug state, the value of SDD does not change, even if `ExternalRootInvasiveDebugEnabled()` changes.

In Non-debug state, SDD returns the inverse of `ExternalRootInvasiveDebugEnabled()`.

Access to this field is **RO**.

Otherwise:

Secure debug disabled.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of `ExternalSecureInvasiveDebugEnabled()`.

In Debug state, the value of the SDD bit does not change, even if `ExternalSecureInvasiveDebugEnabled()` changes.

In Non-debug state:

- SDD returns the inverse of `ExternalSecureInvasiveDebugEnabled()`. If the authentication signals that control `ExternalSecureInvasiveDebugEnabled()` change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

Access to this field is **RO**.

NSE, bit [15]**When FEAT_RME is implemented:**

Together with the NS field, this field gives the current Security state.

For a description of the values derived by evaluating NS and NSE together, see `EDSCR.NS`.

In Non-debug state, this bit is UNKNOWN.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

HDE, bit [14]

Halting debug enable.

HDE	Meaning
0b0	Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
0b1	Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

RW, bits [13:10]

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.

RW	Meaning	Applies when
0b1111	Any of the following: <ul style="list-style-type: none"> The PE is in Non-debug state. The PE is at EL0 using AArch64. The PE is not at EL0, and EL1, EL2, and EL3 are using AArch64. 	
0b1110	The PE is in Debug state at EL0. EL0 is using AArch32. EL1, EL2, and EL3 are using AArch64.	When AArch32 is supported
0b110x	The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is enabled in the current Security state and is using AArch64. If implemented, EL3 is using AArch64.	When AArch32 is supported and EL2 is implemented
0b10xx	The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is not implemented, disabled in the current Security state, or using AArch32. EL3 is using AArch64.	When AArch32 is supported and EL3 is implemented
0b0xxx	The PE is in Debug state. All Exception levels are using AArch32.	When AArch32 is supported

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **RAO/WI**.
- Otherwise, access to this field is **RO**.

EL, bits [9:8]

Exception level. In Debug state, gives the current Exception level of the PE.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

A, bit [7]

SError interrupt pending. In Debug state, indicates whether an SError interrupt is pending:

- If [HCR_EL2](#).{AMO, TGE} = {1, 0}, EL2 is enabled in the current Security state, and the PE is executing at EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

A	Meaning
0b0	No SError interrupt pending.
0b1	SErrror interrupt pending.

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

STATUS, bits [5:0]

Debug status flags.

STATUS	Meaning
0b000001	PE is restarting, exiting Debug state.
0b000010	PE is in Non-debug state.
0b000111	Breakpoint.
0b010011	External debug request.
0b011011	Halting step, normal.
0b011111	Halting step, exclusive.
0b100011	OS Unlock Catch.
0b100111	Reset Catch.
0b101011	Watchpoint.
0b101111	HLT instruction.
0b110011	Software access to debug register.
0b110111	Exception Catch.
0b111011	Halting step, no syndrome.

All other values of STATUS are reserved.

Access to this field is **RO**.

Accessing EDSCR

EDSCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x088	EDSCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

EDSCR2, External Debug Status and Control Register 2

The EDSCR2 characteristics are:

Purpose

Main control register 2 for the debug implementation.

Configuration

External register EDSCR2 bits [31:0] are architecturally mapped to AArch64 System register [MDSCR_EL1\[63:32\]](#).

This register is present only when FEAT_Debugv8p9 is implemented or FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to EDSCR2 are RES0.

EDSCR2 is in the Core power domain.

Attributes

EDSCR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																TTA		EBWE													

Bits [31:2]

Reserved, RES0.

TTA, bit [1]

When FEAT_TRBE_EXT is implemented or FEAT_ETEv1p3 is implemented:

Trap Trace Accesses.

Traps access to the following System registers:

AArch64: [TRBBASER_EL1](#), [TRBLIMITR_EL1](#), [TRBMAR_EL1](#), [TRBPTR_EL1](#), [TRBSR_EL1](#), [TRBTRG_EL1](#), [TRCACATR<n>](#), [TRCACVR<n>](#), [TRCAUTHSTATUS](#), [TRCAUXCTLR](#), [TRCBBCTLR](#), [TRCCCCTLR](#), [TRCCIDCCTLR0](#), [TRCCIDCCTLR1](#), [TRCCIDCVR<n>](#), [TRCCCLAIMCLR](#), [TRCCCLAIMSET](#), [TRCCNTCTLR<n>](#), [TRCCNTRLDVR<n>](#), [TRCCNTVR<n>](#), [TRCCONFIGR](#), [TRCDEVARCH](#), [TRCDEVID](#), [TRCEVENTCTL0R](#), [TRCEVENTCTL1R](#), [TRCEXTINSELR<n>](#), [TRCIDR0](#), [TRCIDR1](#), [TRCIDR2](#), [TRCIDR3](#), [TRCIDR4](#), [TRCIDR5](#), [TRCIDR6](#), [TRCIDR7](#), [TRCIDR8](#), [TRCIDR9](#), [TRCIDR10](#), [TRCIDR11](#), [TRCIDR12](#), [TRCIDR13](#), [TRCIMSPEC0](#), [TRCIMSPEC<n>](#), [TRCITEEDCR](#), [TRCOSLSR](#), [TRCPRGCTLR](#), [TRCQCTLR](#), [TRCRSCTLR<n>](#), [TRCRSR](#), [TRCSEQEVR<n>](#), [TRCSEQORSTEV](#), [TRCSEQSTR](#), [TRCSSCCR<n>](#), [TRCSSCSR<n>](#), [TRCSSPCICR<n>](#), [TRCSTALLCTLR](#), [TRCSTATR](#), [TRCSYNCPR](#), [TRCTRACEIDR](#), [TRCTSCTLR](#), [TRCVICTLR](#), [TRCVIIECTLR](#), [TRCVIPCSSCTLR](#), [TRCVISSCTLR](#), [TRCVIMDCCTLR0](#), [TRCVIMDCCTLR1](#), and [TRCVIMDCVR<n>](#).

TTA	Meaning
0b0	Accesses to trace System registers do not generate a Software Access debug event.
0b1	Accesses to trace System registers generate a Software Access debug event, if OSLSR_EL1 .OSLK is 0 and if halting is allowed.

When [OSLSR_EL1](#).OSLK is 1, this bit can be read and written through the [MDSCR_EL1](#) System register.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EBWE, bit [0]

When FEAT_Debugv8p9 is implemented:

Extended Breakpoint and Watchpoint Enable. Enables use of additional breakpoints or watchpoints.

EBWE	Meaning
0b0	Breakpoints and watchpoints above 15 are disabled.
0b1	Breakpoints and watchpoints above 15 are not affected by this field.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Accessing EDSCR2

EDSCR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x028	EDSCR2

This interface is accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered() or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

ERRDEVARCH, Device Architecture Register

The ERRDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

Configuration

ERRDEVARCH is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION				ARCHVER				ARCHPART											

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

ARCHITECT	Meaning
0b01000111011	JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.

This field reads as 0x23B.

AccessOther to values thisare fielddefined isby the JEDEC JEP106 standard. RO.

PRESENT, bit [20]

DEVARCH present.Present. Defines that ERRDEVARCHthe DEVARCH register is present.

PRESENT	Meaning
0b0	Device Architecture information not present.
0b1	Device Architecture information present.

This field reads as 1.

REVISION, bits [19:16]

When UInt(ERRDEVARCH.ARCHPART) == 0xA00 and ERRDEVARCH.ARCHVER == 0b0000:

Revision. Defines the architecture revision of the component.

REVISION	Meaning
0b0000	RAS System Architecture, error record group v1.0.
0b0001	RAS System Architecture, error record group v1.1. As 0b0000 and also: <ul style="list-style-type: none"> • Simplifies ERR<n>STATUS. • Adds support for additional ERR<n>MISC<m> registers. • Adds support for the optional RAS Timestamp Extension. • Adds support for the optional Common Fault Injection Model Extension.

All other values are reserved.

When UInt(ERRDEVARCH.ARCHPART) == 0xA00 and ERRDEVARCH.ARCHVER == 0b0001:

ARCHVER, bits [15:12]

~~Revision. Architecture Version.~~ Defines the architecture ~~revision~~version of the component.

REVISIONARCHVER	Meaning
0b0000	RAS System Architecture, error record group v2.0.v1.

All other values are reserved.

~~This field reads as 0b0000.~~

~~AccessARCHVER to and thisARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12]. RO.~~

When UInt(ERRDEVARCH.ARCHPART) == 0xA08 and ERRDEVARCH.ARCHVER == 0b0000:

Revision. Defines the architecture revision of the component.

REVISION	Meaning
0b0000	RAS System Architecture, fault injection group v1.0.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

ARCHVER, bits [15:12]

When UInt(ERRDEVARCH.ARCHPART) == 0xA00:

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0000	RAS System Architecture, error record group v1.
0b0001	RAS System Architecture, error record group v2. As 0b0000 and also defines fields in ERRDEVID that describe additional properties of this error record group.

All other values are reserved.

ERRDEVARCH.ARCHVER and ERRDEVARCH.ARCHPART are also defined as a single field, ERRDEVARCH.ARCHID, so that ERRDEVARCH.ARCHVER is ERRDEVARCH.ARCHID[15:12].

ERRDEVID, Device Configuration Register

The ERRDEVID characteristics are:

Purpose

Provides discovery information for the component.

Configuration

ERRDEVID is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVID is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										PFG		NUM		AGENT		MSI		NUM													

Bits [31:22:16]

Reserved, RES0.

PFG, bit [21]

When RAS System Architecture v2 is implemented:

Common Fault Injection Mechanism. Describes whether any Common Fault Injection Mechanism registers are implemented in the same page as this register.

PFG	Meaning
0b0	Any Common Fault Injection Mechanism registers are implemented in the same page as this register.
0b1	Any Common Fault Injection Mechanism registers are implemented in a separate fault injection group page.

Accessing this field has the following behavior:

- When ERRDEVID is part of a fault injection group, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RAZ.

AGENT, bit [20]

When RAS System Architecture v2 is implemented:

RAS agent. Describes whether the error record group containing ERRDEVID is part of a RAS agent that is not a System RAS agent.

AGENT	Meaning
0b0	The error record group containing ERRDEVID is a System RAS agent. That is, it directly generates any supported RAS interrupts.
0b1	The error record group containing ERRDEVID is not a System RAS agent. That is, it generates any supported RAS interrupts by signaling them to another RAS agent.

Accessing this field has the following behavior:

- When ERRDEVID is part of a fault injection group, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RAZ.

MSI, bits [19:16]

Message Signaled Interrupt registers. Describes whether the MSI registers are implemented.

MSI	Meaning
0b0000	It is IMPLEMENTATION DEFINED whether any MSI registers are implemented.
0b0001	An IMPLEMENTATION DEFINED form of MSI registers are implemented.
0b0010	The recommended layout form of MSI registers are implemented.
0b1111	MSI registers are not implemented.

All other values are reserved.

Accessing this field has the following behavior:

- When ERRDEVID is part of a RAS agent that is not a System RAS agent, access to this field is **RAO/WI**.
- When ERRDEVID is part of a fault injection group, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

NUM, bits [15:0]

Highest numbered index of the error records in this group, plus one. Each implemented record is owned by a node. A node might own multiple records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRDEVID

ERRDEVID can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFC8	ERRDEVID

Accesses to this interface are **RO**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffbbdd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

-------	----------------	-------

The ERR<n>CTLR characteristics are:

Purpose

The error control register contains enable bits for the node that writes to this record:

- Enabling error detection and correction.
- Enabling the critical error, error recovery, and fault handling interrupts.
- Enabling in-band error response for uncorrected errors.

For each bit, if the node does not support the feature, then the bit is RES0. The definition of each record is IMPLEMENTATION DEFINED.

Configuration

This register is present only when error record <n> is implemented and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>CTRL are RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>CTLR is a 64-bit register.

Field descriptions

63626160595857565554535251504948															47	46	45	44	43	42	41	40

IMPLEMENTATION DEFINED, bits [63:32]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

Bits [31:16]

Reserved, RES0.

WDFI, bit [15]

When RAS System Architecture v2 is implemented and ERR<n>FR.DFI == 0b11:

Fault handling interrupt for Deferred errors on writes enable, with ERR<n>CTLR.WFI.

When enabled by ERR<n>CTRL.{WDFI, WFI}:

- The fault handling interrupt is generated for errors recorded as Deferred error on writes.
- If the corresponding fault handling interrupt control for corrected error events, ERR<n>CTLR.WCFI, is not implemented, then the fault handling interrupt is generated for corrected error events on writes.

WDFI	Meaning
0b0	When ERR<n>CTLR.WFI == 0: Fault handling interrupt not generated for Deferred errors on writes. When ERR<n>CTLR.WFI == 1: Fault handling interrupt generated for Deferred errors on writes.
0b1	When ERR<n>CTLR.WFI == 0: Fault handling interrupt generated for Deferred errors on writes. When ERR<n>CTLR.WFI == 1: Fault handling interrupt not generated for Deferred errors on writes.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[14]

When RAS System Architecture v2 is implemented and ERR<n>FR.DFI == 0b10:

DFI, bit [0] of bit [14]

Fault handling interrupt for Deferred errors enable, with ERR<n>CTLR.FI.

When ERR<n>FR.DFI == 0b10, this control applies to errors on both reads and writes.

When enabled by ERR<n>CTLR.{DFI, FI}:

- The fault handling interrupt is generated for all errors recorded as Deferred error.
- If the fault handling interrupt control for corrected error events, ERR<n>CTLR.CFI, is not implemented, then the fault handling interrupt is generated for all corrected error events.

DFI	Meaning
0b0	When ERR<n>CTLR.FI == 0: Fault handling interrupt not generated for Deferred errors. When ERR<n>CTLR.FI == 1: Fault handling interrupt generated for Deferred errors.
0b1	When ERR<n>CTLR.FI == 0: Fault handling interrupt generated for Deferred errors. When ERR<n>CTLR.FI == 1: Fault handling interrupt not generated for Deferred errors.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When RAS System Architecture v2 is implemented and ERR<n>FR.DFI == 0b11:

RDFI, bit [0] of bit [14]

Fault handling interrupt for Deferred errors on reads enable, with ERR<n>CTLR.RFI.

When ERR<n>FR.DFI == 0b11, this field is named RDFI.

When enabled by ERR<n>CTLR.{RDFI, RFI}:

- The fault handling interrupt is generated for errors recorded as Deferred error on reads.
- If the corresponding fault handling interrupt control for corrected error events, ERR<n>CTLR.RCFI, is not implemented, then the fault handling interrupt is generated for corrected error events on reads.

RDFI	Meaning
0b0	When ERR<n>CTLR.RFI == 0: Fault handling interrupt not generated for Deferred errors on reads. When ERR<n>CTLR.RFI == 1: Fault handling interrupt generated for Deferred errors on reads.
0b1	When ERR<n>CTLR.RFI == 0: Fault handling interrupt generated for Deferred errors on reads. When ERR<n>CTLR.RFI == 1: Fault handling interrupt not generated for Deferred errors on reads.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CI, bit [13]

When ERR<n>FR.CI == 0b10:

Critical error interrupt enable. When enabled, the critical error interrupt is generated for a critical error condition.

CI	Meaning
0b0	Critical error interrupt not generated for critical errors. Critical errors are treated as Uncontained errors.
0b1	Critical error interrupt generated for critical errors.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CED, bit [12]

When RAS System Architecture v2 is implemented, ERR<n>FR.CEC != 0b000 and ERR<n>FR.CED == 1:

Disable error counting.

CED	Meaning
0b0	Error counter or counters enabled.
0b1	Error counter or counters disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WDUI, bit [11]**When ERR<n>FR.DUI == 0b11:**

Error recovery interrupt for Deferred errors on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on writes.

WDUI	Meaning
0b0	Error recovery interrupt not generated for Deferred errors on writes.
0b1	Error recovery interrupt generated for Deferred errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[10]**When ERR<n>FR.DUI == 0b10:****DUI, bit [0] of bit [10]**

Error recovery interrupt for Deferred errors enable.

When [ERR<n>FR.DUI == 0b10](#), this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Deferred error.

DUI	Meaning
0b0	Error recovery interrupt not generated for Deferred errors.
0b1	Error recovery interrupt generated for Deferred errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.DUI == 0b11:**RDUI, bit [0] of bit [10]**

Error recovery interrupt for Deferred errors on reads enable.

When [ERR<n>FR.DUI == 0b11](#), this field is named RDUI.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on reads.

RDUI	Meaning
0b0	Error recovery interrupt not generated for Deferred errors on reads.
0b1	Error recovery interrupt generated for Deferred errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WCFI, bit [9]

When ERR<n>FR.CFI == 0b11:

Fault handling interrupt for Corrected errors on writes enable.

When enabled:

- If the node implements Corrected error counters for writes, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see [ERR<n>MISC0](#).
- Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on writes.

WCFI	Meaning
0b0	Fault handling interrupt not generated for Corrected errors on writes.
0b1	Fault handling interrupt generated for Corrected errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[8]

When ERR<n>FR.CFI == 0b10:

CFI, bit [0] of bit [8]

- If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see [ERR<n>MISC0](#).
- Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error.

Fault handling interrupt for ~~corrected~~Corrected error eventserrors enable.

When [ERR<n>FR.CFI](#) == 0b10, this control applies to errors ~~on arising from~~ both reads and writes.

When enabled, the fault handling interrupt is generated for all corrected error events.:

CFI	Meaning
0b0	Fault handling interrupt not generated for corrected Corrected error events.errors.
0b1	Fault handling interrupt generated for corrected Corrected error events.errors.

If the node implements a corrected error counter or counters, and the counter or counters are enabled, then a corrected error event is defined as follows:

- A corrected error event occurs when a counter overflows and sets a counter overflow flag to 1.
- It is UNPREDICTABLE whether a corrected error event occurs when a software write sets a counter overflow flag to 1.
- It is UNPREDICTABLE whether a corrected error event occurs when a counter overflows and the overflow flag was previously set to 1.

Otherwise, a corrected error event occurs when the error record records an error as a Corrected error.

If the node implements a corrected error counter or counters and ERR<n>CTLR.CED is not implemented, then the counter or counters are always enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.CFI == 0b11:

RCFI, bit [0] of bit [8]

Fault handling interrupt for ~~corrected~~Corrected error events.errors on reads enable.

When [ERR<n>FR.CFI](#) == 0b11, this field is named RCFI.

- ~~If the node implements Corrected error counters for reads, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see [ERR<n>MISC0](#).~~
- ~~Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on reads.~~

When enabled, the fault handling interrupt is generated for corrected error events on reads.:

RCFI	Meaning
0b0	Fault handling interrupt not generated for corrected Corrected error events.errors on reads.
0b1	Fault handling interrupt generated for corrected Corrected error events.errors on reads.

If the node implements a corrected error counter or counters, and the counter or counters are enabled, then a corrected error event is defined as follows:

- A corrected error event occurs when a counter overflows and sets a counter overflow flag to 1.
- It is UNPREDICTABLE whether a corrected error event occurs when a software write sets a counter overflow flag to 1.
- It is UNPREDICTABLE whether a corrected error event occurs when a counter overflows and the overflow flag was previously set to 1.

Otherwise, a corrected error event occurs when the error record records an error as a Corrected error.

If the node implements a corrected error counter or counters and ERR<n>CTLR.CED is not implemented, then the counter or counters are always enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUE, bit [7]**When ERR<n>FR.UE == 0b11:**

In-band error response on writes enable.

When enabled, responses to writes that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

WUE	Meaning
0b0	In-band error response for uncorrected errors on writes disabled.
0b1	In-band error response for uncorrected errors on writes enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WFI, bit [6]**When ERR<n>FR.FI == 0b11:**

Fault handling interrupt on writes enable.

When enabled:

- The fault handling interrupt is generated for errors recorded as either Deferred error or Uncorrected error on writes.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
 - If the node implements Corrected error counters for writes, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
 - Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on writes.

WFI	Meaning
0b0	Fault handling interrupt on writes disabled.
0b1	Fault handling interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUI, bit [5]**When ERR<n>FR.UI == 0b11:**

Uncorrected error recovery interrupt on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on writes.

WUI	Meaning
0b0	Error recovery interrupt on writes disabled.
0b1	Error recovery interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[4]**When ERR<n>FR.UE == 0b10:****UE, bit [0] of bit [4]**

In-band error response enable.

When [ERR<n>FR.UE](#) == 0b10, this control applies to errors arising from both reads and writes.

When enabled, responses to transactions that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

UE	Meaning
0b0	In-band error response for uncorrected errors disabled.
0b1	In-band error response for uncorrected errors enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.UE == 0b11:**RUE, bit [0] of bit [4]**

In-band error response on reads enable.

When [ERR<n>FR.UE](#) == 0b11, this field is named RUE.

When enabled, responses to reads that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

RUE	Meaning
0b0	In-band error response for uncorrected errors on reads disabled.
0b1	In-band error response for uncorrected errors on reads enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[3]

When ERR<n>FR.FI == 0b10:

FI, bit [0] of bit [3]

Fault handling interrupt enable.

When `ERR<n>FR.FI == 0b10`, this control applies to errors ~~on arising from~~ both reads and writes.

When enabled:

- The fault handling interrupt is generated for all errors recorded as ~~either Deferred error or~~ Uncorrected error.
- If the fault handling interrupt ~~control for DeferredCorrected errors,~~ `ERR<n>CTLR.DFI` ~~control~~ is not implemented, ~~then the fault handling interrupt is generated for all errors recorded as Deferred error.:~~
 - ~~If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.~~
 - ~~Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error.~~
- ~~If the fault handling interrupt controls for Deferred errors and corrected error events,~~ `ERR<n>CTLR.{DFI, CFI}`, are not implemented, then the fault handling interrupt is generated for all corrected error events.

FI	Meaning
0b0	Fault handling interrupt disabled.
0b1	Fault handling interrupt enabled.

See `ERR<n>CTLR.CFI` for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.FI == 0b11:

RFI, bit [0] of bit [3]

Fault handling interrupt on reads enable.

When `ERR<n>FR.FI == 0b11`, this field is named RFI.

When enabled:

- The fault handling interrupt is generated for errors recorded as ~~either Deferred error or~~ Uncorrected error on reads.

- If the corresponding fault handling interrupt control for DeferredCorrected errors, ERR<n>CTLR.RDFI, control is not implemented, then the fault handling interrupt is generated for errors recorded as Deferred error on reads.:
 - If the node implements Corrected error counters for reads, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
 - Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on reads.
- If the corresponding fault handling interrupt controls for Deferred errors and corrected error events, ERR<n>CTLR.{RDFI, RCFI}, are not implemented, then the fault handling interrupt is generated for corrected error events on reads.

RFI	Meaning
0b0	Fault handling interrupt on reads disabled.
0b1	Fault handling interrupt on reads enabled.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[2]

When ERR<n>FR.UI == 0b10:

UI, bit [0] of bit [2]

Uncorrected error recovery interrupt enable.

When ERR<n>FR.UI == 0b10, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Uncorrected error.

UI	Meaning
0b0	Error recovery interrupt disabled.
0b1	Error recovery interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.UI == 0b11:

RUI, bit [0] of bit [2]

Uncorrected error recovery interrupt on reads enable.

When ERR<n>FR.UI == 0b11, this field is named RUI.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on reads.

RUI	Meaning
0b0	Error recovery interrupt on reads disabled.
0b1	Error recovery interrupt on reads enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMPLEMENTATION DEFINED, bit [1]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

ED, bit [0]

When ERR<n>FR.ED == 0b10:

Error reporting and logging enable. When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an IMPLEMENTATION DEFINED control for error injection.

ED	Meaning
0b0	Error reporting disabled.
0b1	Error reporting enabled.

It is IMPLEMENTATION DEFINED whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrected errors might result in corrupt data being silently propagated by the node.

Note

If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this field is set to 0 on Cold reset, meaning errors are not reported from Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. Otherwise, the Cold reset value is IMPLEMENTATION DEFINED. If the Cold reset value is 1, the reset values of other controls in this register are also IMPLEMENTATION DEFINED and should not be UNKNOWN.

The reset behavior of this field is:

- On an ErrorCold recovery reset, when RAS System Architecture v2 is implemented and ERR<n>FR.SRV == 1, this field resets to an 0 IMPLEMENTATION DEFINED value.
- On a Cold reset:
 - When RAS System Architecture v2 is not implemented or ERR<n>FR.SRV == 0, this field resets to an IMPLEMENTATION DEFINED value.
 - When RAS System Architecture v2 is implemented and ERR<n>FR.SRV == 1, this field resets to 0.

Otherwise:

Reserved, RES0.

Accessing ERR<n>CTRL

ERR<n>CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x008 + (64 * n)	ERR<n>CTLR

Accesses to this interface are **RW**.

ERR<n>FR, Error Record <n> Feature Register, n = 0 - 65534

The ERR<n>FR characteristics are:

Purpose

Defines whether <n> is the first record owned by a node:

- If <n> is the first error record owned by a node, then ERR<n>FR.ED is not 0b00.
- If <n> is not the first error record owned by a node, then ERR<n>FR.ED is 0b00.

If <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

Attributes

ERR<n>FR is a 64-bit register.

Field descriptions

When error record <n> is not the first error record owned by the node:

Bits [63:562]

Reserved, RES0.

NCE, bit [55]

When RAS System Architecture v2 is implemented and ERR<q>FR.CEC != 0b000:

No countable errors. Describes whether this error record supports recording countable errors.

NCE	Meaning
0b0	Records countable errors.
0b1	Does not record countable errors.

When ERR<q>FR.CEC != 0b000, at least one error record owned by the node records countable errors.

Otherwise:

Reserved, RES0.

CE, bits [54:53]**When ERR<n>FR.FRX == 1:**

Corrected Error recording. Describes the types of Corrected errors the error record can record, if any.

CE	Meaning
0b00	Does not record Corrected errors.
0b01	Records only transient or persistent Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to either 0b01 or 0b11.
0b10	Records only non-specific Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to 0b10.
0b11	Records all types of Corrected error.

Otherwise:

Reserved, RES0.

DE, bit [52]**When ERR<n>FR.FRX == 1:**

Deferred Error recording. Describes whether the error record supports recording Deferred errors.

DE	Meaning
0b0	Does not record Deferred errors.
0b1	Records Deferred errors.

Otherwise:

Reserved, RES0.

UEO, bit [51]**When ERR<n>FR.FRX == 1:**

Latent or Restartable Error recording. Describes whether the error record supports recording Latent or Restartable errors.

UEO	Meaning
0b0	Does not record Latent or Restartable errors.
0b1	Records Latent or Restartable errors.

Otherwise:

Reserved, RES0.

UER, bit [50]**When ERR<n>FR.FRX == 1:**

Signaled or Recoverable Error recording. Describes whether the error record supports recording Signaled or Recoverable errors.

UER	Meaning
0b0	Does not record Signaled or Recoverable errors.
0b1	Records Signaled or Recoverable errors.

Otherwise:

Reserved, RES0.

UEU, bit [49]**When ERR<n>FR.FRX == 1:**

Unrecoverable Error recording. Describes whether the error record supports recording Unrecoverable errors.

UEU	Meaning
0b0	Does not record Unrecoverable errors.
0b1	Records Unrecoverable errors.

Otherwise:

Reserved, RES0.

UC, bit [48]**When ERR<n>FR.FRX == 1:**

Uncontainable Error recording. Describes whether the error record supports recording Uncontainable errors.

UC	Meaning
0b0	Does not record Uncontainable errors.
0b1	Records Uncontainable errors.

Otherwise:

Reserved, RES0.

Bits [47:32]

Reserved, RES0.

FRX, bit [31]**When Error record <n> is implemented, RAS System Architecture v2 is implemented and ERR<n>FR.ERT == 0b00:**

Feature Register extension. Defines whether ERR<n>FR[54:48] describe the error types supported by this error record.

FRX	Meaning
0b0	ERR<n>FR[54:48] are RES0.
0b1	ERR<n>FR[54:48] are defined by the architecture.

If ERR<n>FR.FRX is 0, and error record <n> is implemented, then the error types supported by this error record are as described by the first error record of this node.

Otherwise:

Reserved, RES0.

Bits [30:4]

Reserved, RES0.

ERT, bits [3:2]**When RAS System Architecture v2 is implemented:**

Error Record Type. Defines the type of error record.

ERT	Meaning
0b00	Error record <n> not implemented or is a normal record that is not the first error record of the node.
0b01	Error record <n> is a continuation record of the previous error record, <n-1>.

All other values are reserved.

Otherwise:

Reserved, RES0.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is not the first error record owned the node.

ED	Meaning
0b00	Error record <n> is not implemented or is not the first error record owned by the node.

Access This to field this reads field is as RO0b00.

When error record <n> is the first error record owned by the node:**IMPLEMENTATION DEFINED, bits [63:56:55]****When RAS System Architecture v2 is not implemented and ERR<n>FR.FRX == != 01:**

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

NCE, bit [55]**When RAS System Architecture v2 is implemented and ERR<n>FR.CEC != 0b000:****NCE, bit [0] of bit [55:55]**

No countable errors. Describes whether this error record supports recording countable errors.

NCE	Meaning
0b0	Records countable errors.
0b1	Does not record countable errors.

When ERR<n>FR.CEC != 0b000, at least one error record owned by the node records countable errors.

When RAS System Architecture v2 is not implemented and ERR<n>FR.FRX == 0:**IMPLEMENTATION DEFINED, bit [0] of bit [55:55]**

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

CE, bits [54:53]**When ERR<n>FR.FRX == 1:**

Corrected Error recording. Describes the types of Corrected errors the node can record, if any.

CE	Meaning
0b00	Does not record Corrected errors.
0b01	Records only transient or persistent Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to either 0b01 or 0b11.
0b10	Records only non-specific Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to 0b10.
0b11	Records all types of Corrected error.

When RAS System Architecture v2 is not implemented and ERR<n>FR.FRX == 0Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

DE, bit [52]**When ERR<n>FR.FRX == 1:**

Deferred Error recording. Describes whether the node supports recording Deferred errors.

DE	Meaning
0b0	Does not record Deferred errors.
0b1	Records Deferred errors.

When RAS System Architecture v2 is not implemented and ERR<n>FR.FRX == 0Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

UEO, bit [51]**When ERR<n>FR.FRX == 1:**

Latent or Restartable Error recording. Describes whether the node supports recording Latent or Restartable errors.

UEO	Meaning
0b0	Does not record Latent or Restartable errors.
0b1	Records Latent or Restartable errors.

When RAS System Architecture v2 is not implemented and ERR<n>FR.FRX == 0 Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

UER, bit [50]**When ERR<n>FR.FRX == 1:**

Signaled or Recoverable Error recording. Describes whether the node supports recording Signaled or Recoverable errors.

UER	Meaning
0b0	Does not record Signaled or Recoverable errors.
0b1	Records Signaled or Recoverable errors.

When RAS System Architecture v2 is not implemented and ERR<n>FR.FRX == 0 Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

UEU, bit [49]**When ERR<n>FR.FRX == 1:**

Unrecoverable Error recording. Describes whether the node supports recording Unrecoverable errors.

UEU	Meaning
0b0	Does not record Unrecoverable errors.
0b1	Records Unrecoverable errors.

When RAS System Architecture v2 is not implemented and ERR<n>FR.FRX == 0 Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

UC, bit [48]**When ERR<n>FR.FRX == 1:**

Uncontainable Error recording. Describes whether the node supports recording Uncontainable errors.

UC	Meaning
0b0	Does not record Uncontainable errors.
0b1	Records Uncontainable errors.

When RAS System Architecture v2 is not implemented and ERR<n>FR.FRX == 0 Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [47:32]

Reserved for identifying IMPLEMENTATION DEFINED controls.

FRX, bit [31]**When RAS System Architecture v1.1 is implemented:**

Feature Register extension. Defines whether ERR<n>FR[63:48] are architecturally defined.

FRX	Meaning
0b0	ERR<n>FR[63:48] are IMPLEMENTATION DEFINED.
0b1	ERR<n>FR[63:48] are defined by the architecture.

Otherwise:

Reserved, RES0.

CED, Bits bit [30:26]**When RAS System Architecture v2 is implemented and ERR<n>FR.CEC != 0b000:**

Error counter disable. Indicates whether the node implements a control to disable any implemented Corrected error counters.

CED	Meaning
0b0	Error counter disable control is not implemented and the error counter(s) are always enabled. ERR<n>CTLR.CED is RES0.
0b1	Enabling and disabling of error counter(s) is supported and controlled by ERR<n>CTLR.CED.

Otherwise:

Reserved, RES0.

SRV, bit [29]**When RAS System Architecture v2 is implemented:**

Status Reset Value. Indicates how node <n> and each error record <m> owned by node <n> is reset.

SRV	Meaning
0b0	Node <n> and each error record <m> owned by node <n> are reset as follows: <ul style="list-style-type: none"> ERR<m>STATUS.{AV, V, MV} are set to {0, 0, 0} on a Cold reset and preserved on Error Recovery reset. ERR<n>CTLR.ED is set to an IMPLEMENTATION DEFINED value on a Cold reset and preserved on Error Recovery reset.
0b1	Node <n> and each error record <m> owned by node <n> are reset as follows: <ul style="list-style-type: none"> ERR<m>STATUS.{AV, V, MV} are set to architecturally UNKNOWN values on a Cold reset and preserved on Error Recovery reset. ERR<n>CTLR.ED is set to 0 on both Cold reset and Error Recovery reset.

All other values are reserved.

Otherwise:

Reserved, RES0.

RV, bit [28]

When RAS System Architecture v2 is implemented:

Reset Valid. Indicates whether each error record <m> implemented by the node includes the Reset Valid flag, ERR<m>STATUS.RV.

RV	Meaning
0b0	ERR<m>STATUS.RV is RES0.
0b1	ERR<m>STATUS.RV is a R/W1C bit set to 1 on Error Recovery reset.

All other values are reserved.

Otherwise:

Reserved, RES0.

DFI, bits [27:26]

When RAS System Architecture v2 is implemented and ERR<n>FR.FI != 0b00:

Fault handling interrupt for deferred errors control. Indicates whether the enabling and disabling of fault handling interrupts on deferred errors is supported by the node.

DFI	Meaning
0b00	Does not support the enabling and disabling of fault handling interrupts on deferred errors. ERR<n>CTLR.DFI is RES0.
0b10	Enabling and disabling of fault handling interrupts on deferred errors is supported and controllable using ERR<n>CTLR.DFI.
0b11	Enabling and disabling of fault handling interrupts on deferred errors is supported, and controllable using ERR<n>CTLR.WDFI for writes and ERR<n>CTLR.RDFI for reads.

All other values are reserved.

Otherwise:

Reserved, RES0.

TS, bits [25:24]

Timestamp Extension. Indicates whether, for each error record <m> owned by this node, [ERR<m>MISC3](#) is used as the timestamp register, and, if it is, the timebase used by the timestamp.

TS	Meaning
0b00	Does not support a timestamp register.
0b01	Implements a timestamp register in ERR<n>MISC3 for each error record <m> owned by the node. The timestamp uses the same timebase as the system Generic Timer.
Note For an error record that has an affinity to a PE, this is the same timer that is visible through CNTPCT_ELO at the highest Exception level on that PE.	
0b10	Implements a timestamp register in ERR<m>MISC3 for each error record <m> owned by the node. The timestamp uses an IMPLEMENTATION DEFINED timebase.

All other values are reserved.

CI, bits [23:22]

Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented by the node.

CI	Meaning
0b00	Does not support the critical error interrupt. ERR<n>CTLR.CI is RES0.
0b01	Critical error interrupt is supported and always enabled. ERR<n>CTLR.CI is RES0.
0b10	Critical error interrupt is supported and controllable using ERR<n>CTLR.CI .

All other values are reserved.

INJ, bits [21:20]

Fault Injection Extension. Indicates whether the Common Fault Injection Model Extension is implemented by the node.

INJ	Meaning
0b00	Does not support the Common Fault Injection Model Extension.
0b01	Supports the Common Fault Injection Model Extension. See ERR<n>PFGF for more information.

All other values are reserved.

CEO, bits [19:18]**When ERR<n>FR.CEC != 0b000:**

Corrected Error overwrite. Indicates the behavior of the node when a second or subsequent Corrected error is recorded and a first Corrected error has previously been recorded by an error record <m> owned by the node.

CEO	Meaning
0b00	Keeps the previous error syndrome.
0b01	If ERR<m>STATUS.OF is 1 before the Corrected error is counted, then the error record keeps the previous syndrome. Otherwise the previous syndrome is overwritten.

All other values are reserved.

The second or subsequent Corrected error is counted by the Corrected error counter, regardless of the value of this field. If counting the error causes unsigned overflow of the counter, then [ERR<m>STATUS.OF](#) is set to 1.

This means that, if no other error is subsequently recorded that overwrites the syndrome:

- If ERR<n>FR.CEO is 0b00, the error record holds the syndrome for the first recorded Corrected error.
- If ERR<n>FR.CEO is 0b01, the error record holds the syndrome for the most recently recorded Corrected error before the counter overflows.

Otherwise:

Reserved, RES0.

DUI, bits [17:16]

When ERR<n>FR.UI != 0b00:

Error recovery interrupt for deferred errors control. Indicates whether the enabling and disabling of error recovery interrupts on deferred errors is supported by the node.

DUI	Meaning
0b00	Does not support the enabling and disabling of error recovery interrupts on deferred errors. ERR<n>CTLR.DUI is RES0.
0b10	Enabling and disabling of error recovery interrupts on deferred errors is supported and controllable using ERR<n>CTLR.DUI .
0b11	Enabling and disabling of error recovery interrupts on deferred errors is supported, and controllable using ERR<n>CTLR.WDUI for writes and ERR<n>CTLR.RDUI for reads.

All other values are reserved.

Otherwise:

Reserved, RES0.

RP, bit [15]

When ERR<n>FR.CEC != 0b000:

Repeat counter. Indicates whether the node implements a second Corrected error counter in [ERR<m>MISC0](#) for each error record <m> owned by the node that can record countable errors.

RP	Meaning
0b0	Implements a single Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.
0b1	Implements a first (repeat) counter and a second (other) counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. The repeat counter is the same size as the primary error counter.

Otherwise:

Reserved, RES0.

CEC, bits [14:12]

Corrected Error Counter. Indicates whether the node implements the standard Corrected error counter mechanisms in [ERR<m>MISC0](#) for each error record <m> owned by the node that can record countable errors.

CEC	Meaning
0b000	Does not implement the standard Corrected error counter model.
0b010	Implements an 8-bit Corrected error counter in ERR<m>MISC0 [39:32] for each error record <m> owned by the node that can record countable errors.
0b100	Implements a 16-bit Corrected error counter in ERR<m>MISC0 [47:32] for each error record <m> owned by the node that can record countable errors.

All other values are reserved.

Note

Implementations might include other error counter models, or might include the standard model and not indicate this in ERR<n>FR.

CFI, bits [11:10]

When ERR<n>FR.FI != 0b00:

Fault handling interrupt for corrected errors control. Indicates whether the enabling and disabling of fault handling interrupts on corrected errors is supported by the node.

CFI	Meaning
0b00	Does not support the enabling and disabling of fault handling interrupts on corrected errors. ERR<n>CTLR .CFI is RES0.
0b10	Enabling and disabling of fault handling interrupts on corrected errors is supported and controllable using ERR<n>CTLR .CFI.
0b11	Enabling and disabling of fault handling interrupts on corrected errors is supported, and controllable using ERR<n>CTLR .WCFI for writes and ERR<n>CTLR .RCFI for reads.

All other values are reserved.

Otherwise:

Reserved, RES0.

UE, bits [9:8]

In-band error response (External Abort). Indicates whether the in-band error response and associated controls are implemented by the node.

UE	Meaning
0b00	Does not support the in-band error response. ERR<n>CTLR .UE is RES0.
0b01	In-band error response is supported and always enabled. ERR<n>CTLR .UE is RES0.
0b10	In-band error response is supported and controllable using ERR<n>CTLR .UE.
0b11	In-band error response is supported, and controllable using ERR<n>CTLR .WUE for writes and ERR<n>CTLR .RUE for reads.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

FI, bits [7:6]

Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are implemented by the node.

FI	Meaning
0b00	Does not support the fault handling interrupt. ERR<n>CTLR.FI is RES0.
0b01	Fault handling interrupt is supported and always enabled. ERR<n>CTLR.FI is RES0.
0b10	Fault handling interrupt is supported and controllable using ERR<n>CTLR.FI .
0b11	Fault handling interrupt is supported, and controllable using ERR<n>CTLR.WFI for writes and ERR<n>CTLR.RFI for reads.

UI, bits [5:4]

Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are implemented by the node.

UI	Meaning
0b00	Does not support the error handling interrupt. ERR<n>CTLR.UI is RES0.
0b01	Error handling interrupt is supported and always enabled. ERR<n>CTLR.UI is RES0.
0b10	Error handling interrupt is supported and controllable using ERR<n>CTLR.UI .
0b11	Error handling interrupt is supported, and controllable using ERR<n>CTLR.WUI for writes and ERR<n>CTLR.RUI for reads.

IMPLEMENTATION DEFINED, bits [3:2]

IMPLEMENTATION DEFINED.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is **a normal record and** the first record owned the node, and whether the node implements the controls for enabling and disabling error reporting and logging.

ED	Meaning
0b01	Error reporting and logging always enabled. ERR<n>CTLR.ED is RES0.
0b10	Error reporting and logging is controllable using ERR<n>CTLR.ED .

All other values are reserved.

When RAS System Architecture v2 is implemented and error record <n> is a proxy for a RAS agent:

**Bits [63:4]**

Reserved, RES0.

ERT, bits [3:2]

Error Record Type. Defines the type of error record.

ERT	Meaning
0b01	Error record is a proxy for a RAS agent.

All other values are reserved.

Access to this field is **RO**.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is not a true error record.

ED	Meaning
0b11	Error record <n> is not an error record.

Access to this field is **RO**.

Accessing ERR<n>FR

ERR<n>FR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x000 + (64 * n)	ERR<n>FR

Accesses to this interface are **RO**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

ERR<n>STATUS, Error Record <n> Primary Status Register, n = 0 - 65534

The ERR<n>STATUS characteristics are:

Purpose

Contains status information for error record <n>, including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An IMPLEMENTATION DEFINED extended error code.

Within this register:

- ERR<n>STATUS.{AV, V, MV} are valid bits that define whether error record <n> registers are valid.
- ERR<n>STATUS.{UE, OF, CE, DE, UET} encode the types of error or errors recorded.
- ERR<n>STATUS.{CI, ER, PN, IERR, SERR} are syndrome fields.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>STATUS are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>STATUS, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>STATUS is a 64-bit register.

Field descriptions

When RAS System Architecture v1.1 is implemented:

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

- On a Cold reset:
 - When RAS System Architecture v2 is not implemented or ERR<n>FR.SRV == 0, this field resets to 0.
 - When RAS System Architecture v2 is implemented and ERR<n>FR.SRV == 1, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

The reset behavior of this field is:

- On a Cold reset:
 - When RAS System Architecture v2 is not implemented or ERR<n>FR.SRV == 0, this field resets to 0.
 - When RAS System Architecture v2 is implemented and ERR<n>FR.SRV == 1, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

ER, bit [28]

Error Reported.

ER	Meaning
0b0	No in-band error response (External Abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: <ul style="list-style-type: none"> The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected. The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is not implemented and the component always reports errors.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

Note

An in-band error response signaled by the component might be masked and not generate any exception.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **UNKNOWN/WI** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE == 0
 - this field can be set to 0b1 by a Deferred error
- Access is **UNKNOWN/WI** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - this field is never set to 0b1 by a Deferred error
- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.
- ERR<n>STATUS.V was previously 1, a Corrected error counter is not implemented, and a Corrected error is recorded.
- ERR<n>STATUS.V was previously 1, and a type of error other than a Corrected error is recorded.

Otherwise, this field is unchanged when an error is recorded.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.
- A direct write to this field that clears this field to zero might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
0b0	Since this field was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed.
0b1	Since this field was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

MV, bit [26]

When error record <n> includes an additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The contents of the ERR<n>MISC<m> registers contain additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- **On a Cold reset:**
 - When RAS System Architecture v2 is not implemented or ERR<n>FR.SRV == 0, this field resets to 0.
 - When RAS System Architecture v2 is implemented and ERR<n>FR.SRV == 1, this field resets to an architecturally UNKNOWN value.
- **On a Cold reset, this field resets to 0.**

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **UNKNOWN/WI** if any of the following are true:
 - ERR<n>STATUS.V == 0
 - ERR<n>STATUS.DE == 0 and ERR<n>STATUS.UE == 0
- Otherwise, access to this field is **W1C**.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

Note

Software might use the information in the error record registers to determine what recovery is necessary.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **UNKNOWN/WI** if any of the following are true:
 - ERR<n>STATUS.V == 0
 - ERR<n>STATUS.UE == 0
- Otherwise, access to this field is **W1C**.

CI, bit [19]

Critical Error. Indicates whether a critical error condition has been recorded.

CI	Meaning
0b0	No critical error condition.
0b1	Critical error condition.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

RV, Bits bit [18:16]**When RAS System Architecture v2 is implemented:**

Reset Valid. When ERR<n>STATUS.V is 1, indicating the error record is valid, this field indicates whether the error was recorded before or after the most recent Error Recovery reset.

RV	Meaning
0b0	If the error record is valid then it was recorded after the last Error Recovery reset.
0b1	If the error record is valid then it was recorded before the last Error Recovery reset.

This field is set to 0 when an error is recorded.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to 1.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

Bits [17:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **UNKNOWN/WI** if all of the following are true:
 - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
 - ERR<n>STATUS.V == 0
- Access is **UNKNOWN/WI** if all of the following are true:
 - ERR<q>PFGF.SYN == 0
 - ERR<n>STATUS.V == 0
- Otherwise, access to this field is **RW**.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, nSEI pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A	Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **UNKNOWN/WI** if all of the following are true:
 - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
 - ERR<n>STATUS.V == 0
- Access is **UNKNOWN/WI** if all of the following are true:
 - ERR<q>PFGF.SYN == 0
 - ERR<n>STATUS.V == 0
- Otherwise, access to this field is **RW**.

When RAS System Architecture v1.0 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
AV	V	UE	ER	OF	MV	CE	DE	PN	UET	RES0						IERR						SERR									
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

- On a Cold reset:
 - When RAS System Architecture v2 is not implemented or ERR<n>FR.SRV == 0, this field resets to 0.
 - When RAS System Architecture v2 is implemented and ERR<n>FR.SRV == 1, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

The reset behavior of this field is:

- On a Cold reset:
 - When RAS System Architecture v2 is not implemented or ERR<n>FR.SRV == 0, this field resets to 0.
 - When RAS System Architecture v2 is implemented and ERR<n>FR.SRV == 1, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.OF == 1
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

ER, bit [28]

Error Reported.

ER	Meaning
0b0	No in-band error response (External Abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: <ul style="list-style-type: none"> The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected. The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is not implemented and the component always reports errors.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

Note

An in-band error response signaled by the component might be masked and not generate any exception.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0, if this field is never set to 1 by a Deferred error.
- Clearing ERR<n>STATUS.{UE,DE} to {0,0}, if this field can be set to 1 by a Deferred error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **UNKNOWN/WI** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE == 0
 - this field can be set to 0b1 by a Deferred error
- Access is **UNKNOWN/WI** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - this field is never set to 0b1 by a Deferred error
- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 1.
- A Deferred error is detected, ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE != 0b00. ERR<n>STATUS.CE might be updated for the new Corrected error.

- A Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is set to 1 when one of the following occurs:

- A Deferred error is detected and ERR<n>STATUS.UE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, and ERR<n>STATUS.{UE, DE} != {0, 0}.
- A Corrected error counter is implemented, ERR<n>STATUS.{UE, DE} != {0, 0}, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is cleared to 0 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0.
- A Deferred error is detected, ERR<n>STATUS.UE == 0, and ERR<n>STATUS.DE == 0.
- A Corrected error is detected, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE == 0b00.

The IMPLEMENTATION DEFINED clearing of this field might also depend on the value of the other error status fields.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.
- A direct write to this field that clears this field to 0 might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
0b0	<p>If ERR<n>STATUS.UE == 1, then no error syndrome for an Uncorrected error has been discarded.</p> <p>If ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1, then no error syndrome for a Deferred error has been discarded.</p> <p>If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and a Corrected error counter is implemented, then the counter has not overflowed.</p> <p>If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, ERR<n>STATUS.CE != 0b00, and no Corrected error counter is implemented, then no error syndrome for a Corrected error has been discarded.</p> <hr/> <p>Note</p> <p>This field might have been set to 1 when an error syndrome was discarded and later cleared to 0 when a higher priority syndrome was recorded.</p> <hr/>
0b1	At least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

MV, bit [26]

When error record <n> includes an additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The contents of the ERR<n>MISC<m> registers contain additional information for an error recorded by this record. The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- On a Cold reset:
 - When RAS System Architecture v2 is not implemented or ERR<n>FR.SRV == 0, this field resets to 0.
 - When RAS System Architecture v2 is implemented and ERR<n>FR.SRV == 1, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.OF == 1
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.OF == 1
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing both ERR<n>STATUS.{DE, UE} to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **UNKNOWN/WI** if any of the following are true:
 - ERR<n>STATUS.V == 0
 - ERR<n>STATUS.DE == 0 and ERR<n>STATUS.UE == 0
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- Access is **RO** if all of the following are true:

- ERR<n>STATUS.UE != 0
- ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

Note

Software might use the information in the error record registers to determine what recovery is necessary.

If this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **UNKNOWN/WI** if any of the following are true:
 - ERR<n>STATUS.V == 0
 - ERR<n>STATUS.UE == 0
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Bits [19:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **UNKNOWN/WI** if all of the following are true:
 - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
 - ERR<n>STATUS.V == 0
- Access is **UNKNOWN/WI** if all of the following are true:
 - ERR<q>PFGF.SYN == 0
 - ERR<n>STATUS.V == 0
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **RW**.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, nSEI pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A	Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **UNKNOWN/WI** if all of the following are true:
 - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
 - ERR<n>STATUS.V == 0
- Access is **UNKNOWN/WI** if all of the following are true:
 - ERR<q>PFGF.SYN == 0
 - ERR<n>STATUS.V == 0
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- Access is **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **RW**.

Accessing ERR<n>STATUS

ERR<n>STATUS.{AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI} are write-one-to-clear (W1C) fields, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero. ERR<n>STATUS.{IERR, SERR} are read/write (RW) fields, although the set of implemented valid values is IMPLEMENTATION DEFINED. See also [ERR<n>PFGF.SYN](#).

After reading ERR<n>STATUS, software must clear the valid fields in the register to allow new errors to be recorded. However, between reading the register and clearing the valid fields, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to ERR<n>STATUS.{UE, DE, CE} are ignored if ERR<n>STATUS.OF is 1 and is not being cleared to 0.
- Writes to ERR<n>STATUS.V are ignored if any of ERR<n>STATUS.{UE, DE, CE} are nonzero and are not being cleared to zero.
- Writes to ERR<n>STATUS.{AV, MV} and the ERR<n>STATUS.{ER, PN, UET, IERR, SERR} syndrome fields are ignored if the highest priority nonzero error status field is not being cleared to zero. The error status fields in priority order from highest to lowest, are ERR<n>STATUS.UE, ERR<n>STATUS.DE, and ERR<n>STATUS.CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

- Any of ERR<n>STATUS.{V, UE, OF, CE, DE} are nonzero before the write.
- The write does not clear the nonzero ERR<n>STATUS.{V, UE, OF, CE, DE} fields to zero by writing ones to the applicable field or fields.

Some of the fields in ERR<n>STATUS are also defined as UNKNOWN where certain combinations of ERR<n>STATUS.{V, DE, UE} are zero. The rules for writes to ERR<n>STATUS allow a node to implement such a field as a fixed read-only value.

For example, when RAS System Architecture v1.1 is implemented, a write to ERR<n>STATUS when ERR<n>STATUS.V is 1 results in either ERR<n>STATUS.V field being cleared to zero, or ERR<n>STATUS.V not changing. Since all fields in ERR<n>STATUS, other than ERR<n>STATUS.{AV, V, MV}, usually read as UNKNOWN values when ERR<n>STATUS.V is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid fields in the register to allow new errors to be recorded, Arm recommends that software:

- Read ERR<n>STATUS and determine which fields need to be cleared to zero.
- Write ones to all the W1C fields that are nonzero in the read value.

An exception is when the node supports writing to these fields as part of fault injection. See also [ERR<n>PFGF.SYN](#).

Component	Offset	Instance
RAS	0x010 + (64 * n)	ERR<n>STATUS

- When $ERR<n>STATUS.V \neq 0$, $ERR<n>STATUS.V$ is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented, accesses to this register are **RO**.
- When $ERR<n>STATUS.UE \neq 0$, $ERR<n>STATUS.UE$ is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented, accesses to this register are **RO**.
- When $ERR<n>STATUS.OF \neq 0$, $ERR<n>STATUS.OF$ is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented, accesses to this register are **RO**.
- When $ERR<n>STATUS.CE \neq 0b00$, $ERR<n>STATUS.CE$ is not being cleared to 0b00 in the same write and RAS System Architecture v1.1 is implemented, accesses to this register are **RO**.
- When $ERR<n>STATUS.DE \neq 0$, $ERR<n>STATUS.DE$ is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented, accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

The GICD_INMIR<n>E characteristics are:

Holds whether the corresponding SPI in the extended SPI range has the non-maskable property.

This register is present only when FEAT_GICv3p1 is implemented and FEAT_GICv3_NMI is implemented. Otherwise, direct accesses to GICD_INMIR<n>E are RES0.

When [GICD_TYPER](#).ESPI is 0 or [GICD_TYPER](#).NMI is 0, these registers are RES0.

When [GICD_TYPER](#).ESPI is 1: the number of implemented GICD_INMIR<n>E registers is ([GICD_TYPER](#).ESPI range+1). Registers are numbered from 0.

GICD_INMIR<n>E is a 32-bit register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
NMI31	NMI30	NMI29	NMI28	NMI27	NMI26	NMI25	NMI24	NMI23	NMI22	NMI21	NMI20	NMI19	NMI18	NMI17	NMI16	NMI15	NMI14

NMI<x>	Meaning
0b0	Interrupt does not have the non-maskable property.
0b1	Interrupt has the non-maskable property.

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IROUTER<n>, Interrupt Routing Registers, n = 32 - 1019

The GICD_IROUTER<n> characteristics are:

Purpose

When affinity routing is enabled, provides routing information for the SPI with INTID n.

Configuration

These registers are available in all configurations of the GIC. If the GIC implementation supports two Security states, these registers are Common.

The maximum value of n is given by (32*(GICD_TYPER.ITLinesNumber+1) - 1). [GICD_IROUTER<n>](#) registers where n=0 to 31 are reserved.

Attributes

GICD_IROUTER<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																								Aff3								
Interrupt_Routing_Mode	RES0								Aff2								Aff1								Aff0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Interrupt_Routing_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

Interrupt_Routing_Mode	Meaning
0b0	Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.
0b1	Interrupts routed to any PE defined as a participating node.

If GICD_IROUTER<n>.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending behavior is CONSTRAINED UNPREDICTABLE:

- The interrupt is not forwarded to any PE, direct reads return the written value
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the UNKNOWN implemented PE
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the written value

WhenIn implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI. GICD_TYPER.No1N is 1, 1 of N distribution is not supported. Setting this field to 1 is CONSTRAINED UNPREDICTABLE, the permitted behaviors are:

- The field behaves as if set to 0 for all purposes.
- The field behaves as if set to 0 for all purposes other than a direct-read of the register.
- The interrupt is treated as not targeting any PE.

When this bit is set to 1, GICD_IROUTER<n>.{Aff3, Aff2, Aff1, Aff0} are UNKNOWN.

Note

An implementation might choose to make the Aff<n> fields RO when this field is 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:24]

Reserved, RES0.

Aff2, bits [23:16]

Affinity level 2.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For an SPI with INTID m:

- The corresponding GICD_IROUTER<n> register number, n, is given by $n = m$.
- The offset of the GICD_IROUTER<n> register is $0 \times 6000 + 8n$.

Accessing GICD_IROUTER<n>

These registers are used only when affinity routing is enabled. When affinity routing is not enabled:

- These registers are RES0. An implementation is permitted to make the register RAZ/WI in this case.
- The `GICD_ITARGETSR<n>` registers provide interrupt routing information.

Note

When affinity routing becomes enabled for a Security state (for example, following a reset or following a write to [GICD_CTLR](#)) the value of all writeable fields in this register is UNKNOWN for that Security state. When the group of an interrupt changes so the ARE setting for the interrupt changes to 1, the value of this register is UNKNOWN for that interrupt.

If `GICD_CTLR.DS==0`, unless the `GICD_NSACR<n>` registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any `GICD_IROUTER<n>` registers that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

Note

For each interrupt, a GIC implementation might support fewer than 256 values for an affinity level. In this case, some bits of the corresponding affinity level field might be RO. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IROUTER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x6000 + (8 * n)	GICD_IROUTER<n>

Accesses to this interface are **RW**.

-------	----------------	-------

VSGI, bit [26]**When FEAT_GICv4p1 is implemented:**

Indicates whether vSGIs are supported.

VSGI	Meaning
0b0	Direct injection of SGIs not supported.
0b1	Direct injection of SGIs supported.

Otherwise:

Reserved, RES0.

CommonLPIAff, bits [25:24]

Indicates the affinity scope level of at the which CommonLPIAff Redistributors group share an LPI Configuration table.

CommonLPIAff	Meaning
0b00	All Redistributors are must members share of an the LPI same Configuration CommonLPIAff group table.
0b01	All Redistributors with the same Aff3 value are must members share of an the LPI same Configuration CommonLPIAff group table.
0b10	All Redistributors with the same Aff3.Aff2 value are must members share of an the LPI same Configuration CommonLPIAff group table.
0b11	All Redistributors with the same Aff3.Aff2.Aff1 value are must members share of an the LPI same Configuration CommonLPIAff group table.

Redistributors in the same CommonLPIAff group must use the same copy of the LPI Configuration table, and if GICv4.1 is implemented the same copy of the vPE Configuration table.

Processor_Number, bits [23:8]

A unique identifier for the PE. When [GITS_TYPER.PTA](#) == 0, an ITS uses this field to identify the interrupt target.

When affinity routing is disabled for a Security state, this field indicates which [GICD_ITARGETSR<n>](#) corresponds to this Redistributor.

RVPEID, bit [7]**When FEAT_GICv4p1 is implemented:**

Indicates how the resident vPE is specified.

RVPEID	Meaning
0b0	GICR_VPENDBASER records the address of the vPE's Virtual Pending Table.
0b1	GICR_VPENDBASER records vPEID.

Otherwise:

Reserved, RES0.

MPAM, bit [6]**When FEAT_GICv3p1 is implemented:**

MPAM

MPAM	Meaning
0b0	MPAM not supported.
0b1	MPAM supported.

Otherwise:

Reserved, RES0.

DPGS, bit [5]

Sets support for [GICR_CTLR.DPG*](#) bits.

DPGS	Meaning
0b0	GICR_CTLR.DPG* bits are not supported.
0b1	GICR_CTLR.DPG* bits are supported.

Last, bit [4]

Indicates whether this Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

Last	Meaning
0b0	This Redistributor is not the highest-numbered Redistributor in a series of contiguous Redistributor pages.
0b1	This Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

DirectLPI, bit [3]

Indicates whether this Redistributor supports direct injection of LPIs.

DirectLPI	Meaning
0b0	This Redistributor does not support direct injection of LPIs. The GICR_SETLPIR , GICR_CLRLPIR , GICR_INVLPIR , GICR_INVALLR , and GICR_SYNCRR registers are either not implemented, or have an IMPLEMENTATION DEFINED purpose.
0b1	This Redistributor supports direct injection of LPIs. The GICR_SETLPIR , GICR_CLRLPIR , GICR_INVLPIR , GICR_INVALLR , and GICR_SYNCRR registers are implemented.

Dirty, bit [2]

Controls the functionality of [GICR_VPENDBASER.Dirty](#).

Dirty	Meaning
0b0	GICR_VPENDBASER.Dirty is UNKNOWN when GICR_VPENDBASER.Valid == 1.
0b1	GICR_VPENDBASER.Dirty indicates when the Virtual Pending Table has been parsed when GICR_VPENDBASER.Valid is written from 0 to 1.

When [GICR_TYPER.VLPIS](#) == 0, this field is RES0.

Note

In GICv4p1 implementations this field is RES1.

(old)htmldiff from-(new)

MPAMCFG_DIS, MPAM Partition Configuration Disable Register

The MPAMCFG_DIS characteristics are:

Purpose

Disables a PARTID configuration as set in other MPAMCFG registers.

MPAMCFG_DIS_s disables a Secure PARTID. MPAMCFG_DIS_ns disables a Non-secure PARTID. MPAMCFG_DIS_rl disables a Realm PARTID. MPAMCFG_DIS_rt disables a Root PARTID.

Configuration

The power domain of MPAMCFG_DIS is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_ENDIS == 1. Otherwise, direct accesses to MPAMCFG_DIS are RES0.

Attributes

MPAMCFG_DIS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NFU																PARTID															

NFU, bit [31]
When MPAMF_IDR.HAS_NFU == 1:

No Future Use. Software indicates that the PARTID disabled with NFU of 1 will not be used again and will be reconfigured and reenabled before being used again.

NFU	Meaning
0b0	Control settings of the disabled PARTID must be retained.
0b1	Control settings of the disabled PARTID may take an UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:16]

Reserved, RES0.

PARTID, bits [15:0]

Selects the PARTID to disable.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

(old)

htmldiff from-

(new)

MPAMCFG_PART_SEL, MPAM Partition Configuration Selection Register

The MPAMCFG_PART_SEL characteristics are:

Purpose

Selects a partition ID to configure.

MPAMCFG_PART_SEL_s selects a Secure PARTID to configure. MPAMCFG_PART_SEL_ns selects a Non-secure PARTID to configure. MPAMCFG_PART_SEL_rt selects a Root PARTID to configure. MPAMCFG_PART_SEL_rl selects a Realm PARTID to configure.

After setting this register with a PARTID, software (usually a hypervisor) can perform a series of accesses to MPAMCFG registers to configure parameters for MPAM resource controls to use when requests have that PARTID.

Configuration

The power domain of MPAMCFG_PART_SEL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and (MPAMF_IDR.HAS_CCAP_PART == 1, or MPAMF_IDR.HAS_CPOR_PART == 1, or MPAMF_IDR.HAS_MBW_PART == 1, or MPAMF_IDR.HAS_PRI_PART == 1, or MPAMF_IDR.HAS_PARTID_NRW == 1, or (MPAMF_IDR.EXT == 0 and MPAMF_IDR.HAS_IMPL_IDR == 1) or (MPAMF_IDR.EXT == 1, MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.NO_IMPL_PART == 0)). Otherwise, direct accesses to MPAMCFG_PART_SEL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_PART_SEL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				RIS				RES0				INTERNAL				PARTID_SEL															

Bits [31:28]

Reserved, RES0.

RIS, bits [27:24]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MPAMCFG registers and describe with MPAMF ID registers.

Otherwise:

Reserved, RES0.

Bits [23:17]

Reserved, RES0.

INTERNAL, bit [16]

Internal PARTID.

If [MPAMF_IDR.HAS_PARTID_NRW = 1](#):

If [MPAMF_IDR.HAS_PARTID_NRW == 0](#), this field is RAZ/WI. **0b1**:

INTERNAL	Meaning
0b0	PARTID_SEL is interpreted as a request PARTID and ignored except for use with MPAMCFG_INTPARTID register access.
0b1	PARTID_SEL is interpreted as an internal PARTID and used for access to MPAMCFG control settings except for MPAMCFG_INTPARTID .

If PARTID narrowing is implemented as indicated by [MPAMF_IDR.HAS_PARTID_NRW = 1](#), when accessing other MPAMCFG registers the value of the MPAMCFG_PART_SEL.INTERNAL bit is checked for these conditions:

- When the [MPAMCFG_INTPARTID](#) register is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 0, an Unexpected_INTERNAL error is set in [MPAMF_ESR](#).
- When an MPAMCFG register other than [MPAMCFG_INTPARTID](#) is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 1, [MPAMF_ESR](#) is set to indicate an intPARTID_Range error.

In either error case listed here, the value returned by a read operation is UNPREDICTABLE, and the control settings are not affected by a write.

When [MPAMF_IDR.HAS_PARTID_NRW == 0](#), access to this field is **RAZ/WI**.

PARTID_SEL, bits [15:0]

Selects the partition ID to configure.

Reads and writes to other MPAMCFG registers are indexed by PARTID_SEL and by the NS bit used to access MPAMCFG_PART_SEL to access the configuration for a single partition.

Accessing MPAMCFG_PART_SEL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_PART_SEL_s must only be accessible from the Secure MPAM feature page. MPAMCFG_PART_SEL_ns must only be accessible from the Non-secure MPAM feature page.

MPAMCFG_PART_SEL_s and MPAMCFG_PART_SEL_ns must be separate registers. The Secure instance (MPAMCFG_PART_SEL_s) accesses the PARTID selector used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_PART_SEL_ns) accesses the PARTID selector used for Non-secure PARTIDs.

MPAMCFG_PART_SEL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0100	MPAMCFG_PART_SEL_s

Accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0100	MPAMCFG_PART_SEL_ns

Accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0100	MPAMCFG_PART_SEL_rt

When FEAT_RME is implemented, accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0100	MPAMCFG_PART_SEL_rl

When FEAT_RME is implemented, accesses to this interface are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

MPAMF_ERR_MSI_ADDR_H, MPAM Error MSI High-part Address Register

The MPAMF_ERR_MSI_ADDR_H characteristics are:

Purpose

MPAMF_ERR_MSI_ADDR_H is a 32-bit read/write register for the high part of the MPAM error MSI address.

MPAMF_ERR_MSI_ADDR_H_s is the high part of the MSI write address for error interrupts related to Secure PARTIDs. MPAMF_ERR_MSI_ADDR_H_ns is the high part of the MSI write address for error interrupts related to Non-secure PARTIDs. MPAMF_ERR_MSI_ADDR_H_rt is the high part of the MSI write address for error interrupts related to Root PARTIDs. MPAMF_ERR_MSI_ADDR_H_rl is the high part of the MSI write address for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_ADDR_H is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_ADDR_H are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ADDR_H is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												MSI_ADDR_H																			

Bits [31:20]

Reserved, RES0.

MSI_ADDR_H, bits [19:0]

MSI write address bits[51:32].

Accessing MPAMF_ERR_MSI_ADDR_H

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMF_ERR_MSI_ADDR_H_s must only be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_rt must only be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_rl must only be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_ADDR_H_s, MPAMF_ERR_MSI_ADDR_H_ns, MPAMF_ERR_MSI_ADDR_H_rt, and MPAMF_ERR_MSI_ADDR_H_rl must be separate registers:

- The Secure instance (MPAMF_ERR_MSI_ADDR_H_s) accesses the high part of the memory address for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ADDR_H_ns) accesses the high part of the memory address for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ADDR_H_rt) accesses the high part of the memory address for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ADDR_H_rl) accesses the high part of the memory address for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_ADDR_H can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00E4	MPAMF_ERR_MSI_ADDR_H_s

Accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00E4	MPAMF_ERR_MSI_ADDR_H_ns

Accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00E4	MPAMF_ERR_MSI_ADDR_H_rt

When FEAT_RME is implemented, accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00E4	MPAMF_ERR_MSI_ADDR_H_rl

When FEAT_RME is implemented, accesses to this interface are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

Copyright © 2010-2022 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

- The Secure instance (MPAMF_ERR_MSI_ADDR_L_s) accesses the low part of the memory address for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ADDR_L_ns) accesses the low part of the memory address for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ADDR_L_rt) accesses the low part of the memory address for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ADDR_L_rl) accesses the low part of the memory address for MSI write to signal an MPAM error used for Realm PARTIDs.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00E0	MPAMF_ERR_MSI_ADDR_L_s

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00E0	MPAMF_ERR_MSI_ADDR_L_ns

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00E0	MPAMF_ERR_MSI_ADDR_L_rt

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x00E0	MPAMF_ERR_MSI_ADDR_L_r1

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

(old)

htmldiff from-

(new)

Note: This encoding matches the VMSAv8-64 stage 2 MemAttr[3:0] field as described in the Arm ARM, except that the following encodings are Reserved (not UNPREDICTABLE) and behave as Device-nGnRnE: 0b0100, 0b1000, and 0b1100.

MSI_MEMATTR	Meaning
0b0000	Device-nGnRnE.
0b0001	Device-nGnRE.
0b0010	Device-nGRE.
0b0011	Device-GRE.
0b0100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b0101	Normal Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal Inner Write-Through Cacheable, Outer Non-cacheable.
0b0111	Normal Inner Write-Back Cacheable, Outer Non-cacheable.
0b1000	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1001	Normal Inner Non-Cachable, Outer Write-Through Cacheable.
0b1010	Normal Inner Write-Through Cacheable, Outer Write-Through Cacheable.
0b1011	Normal Inner Write-Back Cacheable, Outer Write-Through Cacheable.
0b1100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1101	Normal Inner Non-cacheable, Outer Write-Back Cacheable.
0b1110	Normal Inner Write-Through Cacheable, Outer Write-Back Cacheable.
0b1111	Normal Inner Write-Back Cacheable, Outer Write-Back Cacheable.

When this field specifies a Device memory type, the contents of MPAMF_ERR_MSI_ATTR.MSI_SH are IGNORED and Shareability is effectively Outer Shareable.

Device types may be implemented as any Device type with more than 'n' characters. For example, if this field is set to 0b0010, an implementation may treat the MSI write as the specified type, Device-nGRE, or as Device-nGnRE or as Device-nGnRnE.

Reserved encodings 0b0100, 0b1000, and 0b1100 must be implemented to behave the same as the 0b0000 encoding.

Bits [23:1]

Reserved, RES0.

MSIEN, bit [0]

Error interrupt MSI Enable.

MSIEN	Meaning
0b0	MPAM error MSI writes are not generated to signal enabled MPAM error interrupts. When error MSI writes are disabled, hardwired error interrupts could be generated.
0b1	MPAM error MSI writes are generated to signal enabled MPAM error interrupts. When error MSI writes are enabled, hardwired error interrupts are not generated.

The value of this field affects whether hardwired error interrupts are generated.

The reset behavior of this field is:

- On a MSC reset, this field resets to 0.

Accessing MPAMF_ERR_MSI_ATTR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMF_ERR_MSI_ATTR_s must only be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_ATTR_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ATTR_rt must only be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ATTR_rl must only be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_ATTR_s, MPAMF_ERR_MSI_ATTR_ns, MPAMF_ERR_MSI_ATTR_rt, and MPAMF_ERR_MSI_ATTR_rl must be separate registers:

- The Secure instance (MPAMF_ERR_MSI_ATTR_s) accesses the memory access attributes for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ATTR_ns) accesses the memory access attributes for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ATTR_rt) accesses the memory access attributes for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ATTR_rl) accesses the memory access attributes for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_ATTR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF BASE s	0x00EC	MPAMF ERR MSI ATTR s

Accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE ns	0x00EC	MPAMF_ERR MSI ATTR ns

Accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00EC	MPAMF_ERR_MSI_ATTR_rt

When FEAT RME is implemented, accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x00EC	MPAMF_ERR_MSI_ATTR_r1

When FEAT RME is implemented, accesses to this interface are **RW**.

3005/0907/2022 15:17:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

MPAMF_ERR_MSI_DATA, MPAM Error MSI Data Register

The MPAMF_ERR_MSI_DATA characteristics are:

Purpose

MPAMF_ERR_MSI_DATA is a 32-bit read/write register for the MPAM error MSI data.

MPAMF_ERR_MSI_DATA_s is the data for the MSI write for error interrupts related to Secure PARTIDs.
 MPAMF_ERR_MSI_DATA_ns is the data for the MSI write for error interrupts related to Non-secure PARTIDs.
 MPAMF_ERR_MSI_DATA_rt is the data for the MSI write for error interrupts related to Root PARTIDs.
 MPAMF_ERR_MSI_DATA_rl is the data for the MSI write for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_DATA is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_DATA are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_DATA is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																MSI_DATA															

MSI_DATA, bits [31:0]

MSI data to be written to ITS to signal an MSI.

Accessing MPAMF_ERR_MSI_DATA

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMF_ERR_MSI_DATA_s must only be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_DATA_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_DATA_rt must only be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_DATA_rl must only be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_DATA_s, MPAMF_ERR_MSI_DATA_ns, MPAMF_ERR_MSI_DATA_rt, and MPAMF_ERR_MSI_DATA_rl must be separate registers:

- The Secure instance (MPAMF_ERR_MSI_DATA_s) accesses the data for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_DATA_ns) accesses the data for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_DATA_rt) accesses the data for MSI write to signal an MPAM error used for Root PARTIDs.

- The Realm instance (MPAMF_ERR_MSI_DATA_rl) accesses the data for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_DATA can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00E8	MPAMF_ERR_MSI_DATA_s

Accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00E8	MPAMF_ERR_MSI_DATA_ns

Accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00E8	MPAMF_ERR_MSI_DATA_rt

When FEAT_RME is implemented, accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x00E8	MPAMF_ERR_MSI_DATA_r1

When FEAT_RME is implemented, accesses to this interface are **RW**.

MSMON_CAPT_EVNT, MPAM Capture Event Generation Register

The MSMON_CAPT_EVNT characteristics are:

Purpose

Generates a local capture event when written with bit[0] as 1.

MSMON_CAPT_EVNT_s generates local capture events for Secure monitor instances only or for Secure and Non-secure monitor instances. MSMON_CAPT_EVNT_ns generates local capture events for Non-secure monitor instances only. MSMON_CAPT_EVNT_rt generates local capture events for Root monitor instances only or for Root, Secure, Realm, and Non-secure monitor instances. MSMON_CAPT_EVNT_rl generates local capture events for Realm monitor instances or for for Realm monitor instances or Realm and Non-secure monitor instances.

Configuration

The power domain of MSMON_CAPT_EVNT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.HAS_LOCAL_CAPT_EVNT == 1. Otherwise, direct accesses to MSMON_CAPT_EVNT are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CAPT_EVNT is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																ALL		NOW													

Bits [31:2]

Reserved, RES0.

ALL, bit [1]

In the Secure instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Secure and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.

In the Non-secure instance of this register, this **field** is RAZ/WI.

In the Root instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Root, Realm, Secure, and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Root monitor instances within this MSC that are configured with CAPT_EVNT = 7.

In the Realm instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Realm and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Realm monitor instances within this MSC that are configured with CAPT_EVNT = 7.

This bit always reads as zero.

ALL	Meaning
0b0	Send capture event only to monitor instances in the same MPAM feature page as this register.
0b1	Send capture event to monitor instances in certain MPAM feature pages as described in the ALL field of this register.

NOW, bit [0]

When written as 1, this bit causes an event to those monitor instances described in the ALL field that have CAPT_EVNT set to the value of 7.

When this bit is written as 0, no event is signaled.

This bit always reads as zero.

Accessing MSMON_CAPT_EVNT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CAPT_EVNT_s must only be accessible from the Secure MPAM feature page. MSMON_CAPT_EVNT_ns must only be accessible from the Non-secure MPAM feature page.

MSMON_CAPT_EVNT_s and MSMON_CAPT_EVNT_ns must be separate registers. The Secure instance (MSMON_CAPT_EVNT_s) can generate local capture events for Secure monitor instances only or for Secure and Non-secure monitor instances, and the Non-secure instance (MSMON_CAPT_EVNT_ns) can generate local capture events for Non-secure monitor instances only.

MSMON_CAPT_EVNT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0808	MSMON_CAPT_EVNT_s

Accesses to this interface are **WO/RAZ**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0808	MSMON_CAPT_EVNT_ns

Accesses to this interface are **WO/RAZ**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0808	MSMON_CAPT_EVNT_rt

When FEAT_RME is implemented, accesses to this interface are **WO/RAZ**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0808	MSMON_CAPT_EVNT_rl

When FEAT_RME is implemented, accesses to this interface are **WO/RAZ**.

(old)**htmldiff from-****(new)**

The MSMON_CFG_CSU_CTL characteristics are:

Purpose

Controls the CSU monitor selected by [MSMON_CFG_MON_SEL](#).

MSMON_CFG_CSU_CTL_s controls the Secure cache storage usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_ns controls Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_rt controls the monitor configuration for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_rl controls the monitor configuration for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If `MPAMF_IDR.HAS_RIS` is 1, the monitor instance configuration accessed is for the resource instance currently selected by `MSMON_CFG_MON_SEL.RIS` and the monitor instance of that resource instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

Configuration

The power domain of MSMON_CFG_CSU_CTL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_CTL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON CFG CSU CTL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18
ENCAPT_EVNT				CAPT_RESET		OFLOW_STATUS		OFLOW_INTR		OFLOW_FRZ		OFLOW_CAPT	
SUBTYPE				RES0		CEVNT		OFLW		MAT			

EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

CAPT_EVNT, bits [30:28]

Capture event selector.

Select the event that triggers capture from the following:

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional, but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the Security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

When MPAMF_CSUMON_IDR.HAS_CAPTURE == 0, access to this field is **RAZ/WI**.

CAPT_RESET, bit [27]

Reset after capture.

Controls whether the value of [MSMON_CSU](#) is reset to zero immediately after being copied to [MSMON_CSU_CAPTURE](#).

CAPT_RESET	Meaning
0b0	Monitor is not reset on capture.
0b1	Monitor is reset on capture.

Because the CSU monitor type produces a measurement rather than a count, it might not make sense to ever reset the value after a capture. If there is no reason to ever reset a CSU monitor, this field is RAZ/WI.

When MPAMF_CSUMON_IDR.HAS_CAPTURE == 0, access to this field is **RAZ/WI**.

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of [MSMON_CSU](#) has overflowed.

If [MPAMF_CSUMON_IDR.HAS_CEVNT_OFLW](#) is 1 or [MPAMF_CSUMON_IDR.HAS_OFLOW_LNKG](#) is 1, then a store to [MSMON_CSU](#) when this field is 1 resets this field to 0.

OFLOW_STATUS	Meaning
0b0	No overflow has occurred.
0b1	At least one overflow has occurred since this bit was last written to zero.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

OFLOW_INTR, bit [25]

Overflow Interrupt.

Controls whether an overflow interrupt is generated when the value of [MSMON_CSU](#) has overflowed.

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_CSU .
0b1	On overflow, an implementation-specific interrupt is signaled.

WhenIf MSMON_CFG_CSU_CTL.OFLOW_INTR is 0, not supported by the implementation, this field is **RAZ/WI**.

OFLOW_FRZ, bit [24]

Freeze Monitor on Overflow.

Controls whether the value of [MSMON_CSU.VALUE](#) freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	Monitor count wraps on overflow.
0b1	Monitor count freezes on overflow. The frozen value might be 0 or another value if the monitor overflowed with an increment larger than 1.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

When a [MSMON_CSU.VALUE](#) of a monitor instance is frozen it does not change until [MSMON_CSU](#) register for that instance has been written.

OFLOW_CAPT, bit [23]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_OFLOW_CAPT == 1:

Capture Monitor on Overflow.

OFLOW_CAPT	Meaning
0b0	Monitor is not captured on an overflow or when affected by an overflow linkage event.
0b1	Monitor is captured and the MSMON_CSU .{NRDY, VALUE} fields are copied to the monitor instance's capture register on an overflow or when affected by an overflow linkage event. The monitor instance treats an overflow of this monitor instance as a private capture event. If MSMON_CFG_MBWU_CTL.CEVNT_OFLW is 1, this monitor instance also treats an overflow linkage event as a capture event. If the OFLOW_FRZ field is 1, the monitor does not continue to count after the overflow or overflow linkage event. If the CAPT_RESET field is 1, the monitor instance resets to 0.

Otherwise:

Reserved, RES0.

SUBTYPE, bits [22:20]

Subtype. Type of cache storage usage counted by this monitor.

This field is not currently used for CSU monitors, but reserved for future use.

This field is RAZ/WI.

Bit [19]

Reserved, RES0.

CEVNT_OFLW, bit [18]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_CEVNT_OFLW == 1:

Capture Event performs overflow behavior.

CEVNT_OFLW	Meaning
0b0	On a capture event matching the CAPT_EVNT field, the capture behaviors are performed. The MSMON_CSU .{VALUE, NRDY} fields are transferred to the monitor instance's capture register.
0b1	On a capture event matching the CAPT_EVNT field, the monitor instance treats a capture event as an overflow and the overflow behaviors are performed. The behavior is controlled by the MSMON_CFG_CSU_CTL .{OFLOW_FRZ, OFLOW_CAPT, CAPT_RESET} fields. The MSMON_CFG_CSU_CTL .OFLOW_STATUS field is set for this monitor instance.

Otherwise:

Reserved, RES0.

MATCH_PMG, bit [17]

Match PMG.

Controls whether the monitor measures only storage used with PMG matching [MSMON_CFG_CSU_FLT](#).PMG.

MATCH_PMG	Meaning
0b0	The monitor measures storage used with any PMG value.
0b1	The monitor only measures storage used with the PMG value matching MSMON_CFG_CSU_FLT .PMG.

If MATCH_PMG is 1 and MATCH_PARTID is 0, it is CONSTRAINED UNPREDICTABLE whether the monitor instance:

- Measures the storage used with matching PMG and with any PARTID.
- Measures no storage usage, that is, [MSMON_CSU](#).VALUE is zero.
- Measures the storage used with matching PMG and PARTID, that is, treats MATCH_PARTID as == 1.

MATCH_PARTID, bit [16]

Match PARTID.

Controls whether the monitor measures only storage used with PARTID matching [MSMON_CFG_CSU_FLT](#).PARTID.

MATCH_PARTID	Meaning
0b0	The monitor measures storage used with any PARTID value.
0b1	The monitor only measures storage used with the PARTID value matching MSMON_CFG_CSU_FLT .PARTID.

Bits [15:11]

Reserved, RES0.

OFLOW_LNKG, bits [10:8]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_OFLOW_LNKG == 1:

Overflow linkage event.

Controls signaling of a capture event on overflow of this monitor instance.

OFLOW_LNKG	Meaning
0b000	Overflow of the monitor instance only affects this monitor instance.
0b001	Overflow of this monitor instance signals Capture Event 1.
0b010	Overflow of this monitor instance signals Capture Event 2.
0b011	Overflow of this monitor instance signals Capture Event 3.
0b100	Overflow of this monitor instance signals Capture Event 4.
0b101	Overflow of this monitor instance signals Capture Event 5.
0b110	Overflow of this monitor instance signals Capture Event 6.
0b111	Reserved.

Otherwise:

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The CSU monitor is TYPE = 0x43.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x43.

Access to this field is **RO**.

Accessing MSMON_CFG_CSU_CTL

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_CFG_CSU_CTL_s must only be accessible from the Secure MPAM feature page.
- MSMON_CFG_CSU_CTL_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_CSU_CTL_rt must only be accessible from the Root MPAM feature page.
- MSMON_CFG_CSU_CTL_rl must only be accessible from the Realm MPAM feature page.

MSMON_CFG_CSU_CTL_s, MSMON_CFG_CSU_CTL_ns, MSMON_CFG_CSU_CTL_rt, and MSMON_CFG_CSU_CTL_rl must be separate registers:

- The Secure instance (MSMON_CFG_CSU_CTL_s) accesses the cache storage usage monitor controls used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_CSU_CTL_ns) accesses the cache storage usage monitor controls used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_CSU_CTL_rt) accesses the cache storage usage monitor controls used for Root PARTIDs.
- The Realm instance (MSMON_CFG_CSU_CTL_rl) accesses the cache storage usage monitor controls used for Realm PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

Accesses to this interface are **RW**.

Accesses to this interface are **RW**.

When FEAT_RME is implemented, accesses to this interface are **RW**.

When FEAT RME is implemented, accesses to this interface are **RW**.

(new)

MSMON_CFG_MBWU_CTL, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Control Register

The MSMON CFG MBWU CTL characteristics are:

Purpose

Controls the MBWU monitor selected by [MSMON CFG MON SEL](#).

MSMON_CFG_MBWU_CTL_s controls the Secure memory bandwidth usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_ns controls Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_rt controls the monitor configuration for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_rl controls the monitor configuration for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR](#).HAS_RIS is 1, the monitor instance configuration accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL](#).RIS and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

Configuration

The power domain of MSMON_CFG_MBWU_CTL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_CTL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MBWU_CTL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18
ENCAPT EVNT				CAPT RESET		OFLOW STATUS		OFLOW INTR		OFLOW FRZ		OFLOW CAPT	
SUBTYPE				SCLEN		CEVNT		OFLW		MA			

EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

CAPT EVNT, bits [30:28]

Capture event selector.

When the selected capture event occurs, [MSMON_MBWU](#) of the monitor instance is copied to [MSMON_MBWU_CAPTURE](#) of the same instance. If the long counter is also implemented, [MSMON_MBWU_L](#) is also copied to [MSMON_MBWU_L_CAPTURE](#).

Select the event that triggers capture from the following:

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional, but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the Security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

When [MPAMF_MBWUMON_IDR.HAS_CAPTURE](#) == 0, access to this field is **RAZ/WI**.

If capture is not implemented for the MBWU monitor type as indicated by [MPAMF_MBWUMON_IDR.HAS_CAPTURE](#) = 0, this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset [MSMON_MBWU](#).VALUE after capture.

Controls whether the VALUE field of the monitor instance is reset to zero immediately after being copied to the corresponding capture register.

CAPT_RESET	Meaning
0b0	MSMON_MBWU .VALUE field of the monitor instance is not reset on capture.
0b1	MSMON_MBWU .VALUE field of the monitor instance is reset on capture.

If capture is not implemented for the MBWU monitor type as indicated by [MPAMF_MBWUMON_IDR.HAS_CAPTURE](#) = 0, this field is RAZ/WI.

This control bit affects both [MSMON_MBWU](#) and [MSMON_MBWU_L](#) in implementations that include [MSMON_MBWU_L](#).

When [MPAMF_MBWUMON_IDR.HAS_CAPTURE](#) == 0, access to this field is **RAZ/WI**.

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of [MSMON_MBWU](#) has overflowed.

OFLOW_STATUS	Meaning
0b0	MSMON_MBWU .VALUE has not overflowed.
0b1	MSMON_MBWU .VALUE has overflowed at least once since this bit was last written to zero.

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

Overflow status for [MSMON_MBWU_L](#).VALUE is reported in [MSMON_CFG_MBWU_CTL](#).OFLOW_STATUS_L.

If [MPAMF_MBWUMON_IDR.HAS_CEVTN_OFLW](#) is 1 or [MPAMF_MBWUMON_IDR.HAS_OFLOW_LNKG](#) is 1, then a store to [MSMON_MBWU](#) when this field is 1 resets this field to 0.

OFLOW_INTR, bit [25]

Enable interrupt on overflow of [MSMON_MBWU](#).VALUE.

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_MBWU.VALUE .
0b1	An implementation-specific interrupt is signaled on an overflow of MSMON_MBWU.VALUE .

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

If overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.

Interrupt enable for overflow of [MSMON_MBWU_L.VALUE](#) is controlled by [MSMON_CFG_MBWU_CTL.OFLOW_INTR_L](#).

When [MSMON_CFG_MBWU_CTL.OFLOW_INTR](#) == 0, access to this field is RAZ/WI.

OFLOW_FRZ, bit [24]

Freeze monitor instance on overflow.

Controls whether [MSMON_MBWU.VALUE](#) field of the monitor instance freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	MSMON_MBWU.VALUE field of the monitor instance wraps on overflow.
0b1	MSMON_MBWU.VALUE field of the monitor instance freezes on overflow. If the increment that caused the overflow was 1, the frozen value is the post-increment value of 0. If the increment that caused the overflow was larger than 1, the frozen value of the monitor might be 0 or a larger value less than the final increment.

If overflow is not possible for the instance of the MBWU monitor in the implementation, this field is RAZ/WI.

When a [MSMON_MBWU.VALUE](#) of a monitor instance is frozen it does not change until [MSMON_CSU](#) register for that instance has been written. If the monitor implements both [MSMON_MBWU](#) and [MSMON_MBWU_L](#) registers, both are frozen. A write to a frozen register unfreezes the count for just that register.

This control bit affects both [MSMON_MBWU](#) and [MSMON_MBWU_L](#) in implementations that include [MSMON_MBWU_L](#).

OFLOW_CAPT, bit [23]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_OFLOW_CAPT == 1:

Capture Monitor on Overflow.

OFLOW_CAPT	Meaning
0b0	Monitor register MSMON_MBWU is not captured on an overflow or when affected by an overflow linkage event.
0b1	Monitor register MSMON_MBWU is captured and the MSMON_MBWU .{NRDY, VALUE} fields are copied to the monitor instance's MSMON_MBWU_CAPTURE register on an overflow or when affected by an overflow linkage event. The monitor instance treats an overflow of this monitor instance as a private capture event. If MSMON_CFG_MBWU_CTL.CEVNT_OFLW is 1, this monitor instance also treats an overflow linkage event as a capture event. If OFLOW_FRZ is 1, the monitor does not continue to count after the overflow or overflow linkage event. If CAPT_RESET is 1, the monitor instance resets to 0.

This bit does not control whether [MSMON_MBWU_L](#) is captured on an overflow or overflow linkage event. See [MSMON_CFG_MBWU_CTL.OFLOW_CAPT_L](#).

Otherwise:

Reserved, RES0.

SUBTYPE, bits [22:20]

Subtype. Type of bandwidth counted by this monitor.

This field is not currently used for MBWU monitors, but reserved for future use.

This field is RAZ/WI.

SCLEN, bit [19]

[MSMON_MBWU.VALUE](#) Scaling Enable.

Enables scaling of [MSMON_MBWU.VALUE](#) by [MPAMF_MBWUMON_IDR.SCALE](#).

SCLEN	Meaning
0b0	MSMON_MBWU.VALUE has bytes counted by the monitor instance.
0b1	MSMON_MBWU.VALUE has bytes counted by the monitor instance, shifted right by MPAMF_MBWUMON_IDR.SCALE .

CEVNT_OFLW, bit [18]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_CEVNT_OFLW == 1:

Capture Event performs overflow behavior.

CEVNT_OFLW	Meaning
0b0	On a capture event matching the CAPT_EVNT field the capture behaviors are performed. The NRDY and VALUE fields are transferred to the monitor instance's capture register.
0b1	On a capture event matching the CAPT_EVNT field the monitor instance treats a capture event as an overflow and the overflow behaviors are performed. The behavior is controlled by the MSMON_CFG_MBWU_CTL.{OFLOW_FRZ, OFLOW_CAPT, OFLOW_CAPT_L, CAPT_RESET} fields. The MSMON_CFG_MBWU_CTL.{OFLOW_STATUS, OFLOW_STATUS_L} fields are set for this monitor instance.

Otherwise:

Reserved, RES0.

MATCH_PMG, bit [17]

Match PMG.

Controls whether the monitor instance only counts data transferred with PMG matching [MSMON_CFG_MBWU_FLT.PMG](#).

MATCH_PMG	Meaning
0b0	The monitor instance counts data transferred with any PMG value.
0b1	The monitor instance only counts data transferred with the PMG value matching MSMON_CFG_MBWU_CTL.PMG .

MATCH_PARTID, bit [16]

Match PARTID.

Controls whether the monitor instance counts only data transferred with PARTID matching [MSMON_CFG_MBWU_CTL.PARTID](#).

MATCH_PARTID	Meaning
0b0	The monitor instance counts data transferred with any PARTID value.
0b1	The monitor instance only counts data transferred with the PARTID value matching MSMON_CFG_MBWU_CTL.PARTID .

OFLOW_STATUS_L, bit [15]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Overflow Status of [MSMON_MBWU_L.VALUE](#) of the monitor instance.

Indicates whether [MSMON_MBWU_L.VALUE](#) has overflowed.

OFLOW_STATUS_L	Meaning
0b0	MSMON_MBWU_L.VALUE has not overflowed.
0b1	MSMON_MBWU_L.VALUE has overflowed at least once since this bit was last written to zero.

If [MPAMF_MBWUMON_IDR.HAS_LONG](#) == 0, this bit is RES0.

Overflow status of [MSMON_MBWU.VALUE](#) is reported in [MSMON_CFG_MBWU_CTL.OFLOW_STATUS](#).

If [MPAMF_MBWUMON_IDR.HAS_CEVTN_OFLW](#) is 1 or [MPAMF_MBWUMON_IDR.HAS_OFLOW_LNKG](#) is 1, then a store to [MSMON_MBWU_L](#) when this field is 1 resets this field to 0.

Otherwise:

Reserved, RES0.

OFLOW_INTR_L, bit [14]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_LONG == 1:

Overflow Interrupt for [MSMON_MBWU_L](#).

Controls whether an MPAM overflow interrupt is generated when [MSMON_MBWU_L.VALUE](#) overflows.

OFLOW_INTR_L	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_MBWU_L.VALUE .
0b1	An implementation-specific interrupt is signaled on overflow of MSMON_MBWU_L.VALUE .

If the overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.

When [MSMON_CFG_MBWU_CTL.OFLOW_INTR_L](#) overflow == is 0, not accessible to for an MBWU monitor in the MSC implementation, this field is RAZ/WI. **RAZ/WI.**

Otherwise:

Reserved, RES0.

OFLOW_CAPT_L, bit [13]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_MBWUMON_IDR.HAS_LONG == 1 and MPAMF_MBWUMON_IDR.HAS_OFLOW_CAPT == 1:

Capture Long Monitor on Overflow.

Controls whether [MSMON_MBWU_L](#) is copied to [MSMON_MBWU_L_CAPTURE](#) on an overflow or an overflow linkage event.

OFLOW_CAPT_L	Meaning
0b0	Monitor register MSMON_MBWU_L is not captured on an overflow or when affected by an overflow linkage event.
0b1	Monitor register MSMON_MBWU_L is captured on an overflow or when affected by an overflow linkage event. If OFLOW_FRZ is 1, the monitor does not continue to count after the overflow or overflow linkage event. If CAPT_RESET is 1, the monitor instance resets to 0.

If this bit is 1, this monitor instance treats an overflow of this monitor instance as a private capture event.

If this bit is 1, this monitor instance also treats overflow linkage events for which it qualifies as a private capture event.

Otherwise:

Reserved, RES0.

Bits [12:11]

Reserved, RES0.

OFLOW_LNKG, bits [10:8]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_OFLOW_LNKG == 1:

Overflow linkage event.

Controls signaling of a capture event on overflow of this monitor instance.

OFLOW_LNKG	Meaning
0b000	Overflow of the monitor instance only affects this monitor instance.
0b001	Overflow of this monitor instance signals Capture Event 1.
0b010	Overflow of this monitor instance signals Capture Event 2.
0b011	Overflow of this monitor instance signals Capture Event 3.
0b100	Overflow of this monitor instance signals Capture Event 4.
0b101	Overflow of this monitor instance signals Capture Event 5.
0b110	Overflow of this monitor instance signals Capture Event 6.
0b111	Reserved.

Otherwise:

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The MBWU monitor is TYPE = 0x42.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x42.

Access to this field is **RO**.

Accessing MSMON_CFG_MBWU_CTL

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_CFG_MBWU_CTL_s must only be accessible from the Secure MPAM feature page.
- MSMON_CFG_MBWU_CTL_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MBWU_CTL_rt must only be accessible from the Root MPAM feature page.
- MSMON_CFG_MBWU_CTL_rl must only be accessible from the Realm MPAM feature page.

MSMON_CFG_MBWU_CTL_s, MSMON_CFG_MBWU_CTL_ns, MSMON_CFG_MBWU_CTL_rt, and MSMON_CFG_MBWU_CTL_rl must be separate registers:

- The Secure instance (MSMON_CFG_MBWU_CTL_s) accesses the memory bandwidth usage monitor controls used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_MBWU_CTL_ns) accesses the memory bandwidth usage monitor controls used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_MBWU_CTL_rt) accesses the memory bandwidth usage monitor controls used for Root PARTIDs.
- The Realm instance (MSMON_CFG_MBWU_CTL_rl) accesses the memory bandwidth usage monitor controls used for Realm PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_MBWU_CTL access the monitor configuration settings for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_MBWU_CTL access the monitor configuration settings for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CFG_MBWU_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0828	MSMON_CFG_MBWU_CTL_s

Accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0828	MSMON_CFG_MBWU_CTL_ns

Accesses to this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0828	MSMON_CFG_MBWU_CTL_rt

When FEAT_RME is implemented, accesses to this interface are **RW**.

Component	Frame	Offset	Instance
-----------	-------	--------	----------

MPAM	MPAMF_BASE_r1	0x0828	MSMON_CFG_MBWU_CTL_r1
------	---------------	--------	-----------------------

When FEAT_RME is implemented, accesses to this interface are **RW**.

MSMON_CSU_OFSR, MPAM CSU Monitor Overflow Status Register

The MSMON_CSU_OFSR characteristics are:

Purpose

MSMON_CSU_OFSR is a 32-bit read-only register that shows bitmap of CSU monitor instance overflow status for a contiguous group of 32 monitor instances.

MSMON_CSU_OFSR_s gives a bitmap of pending CSU overflow status for 32 Secure CSU monitor instances.
 MSMON_CSU_OFSR_ns gives a bitmap of pending CSU overflow status for 32 Non-secure CSU monitor instances.
 MSMON_CSU_OFSR_rt gives a bitmap of pending CSU overflow status for 32 Root CSU monitor instances.
 MSMON_CSU_OFSR_rl gives a bitmap of pending CSU overflow status for 32 Realm CSU monitor instances.

Configuration

The power domain of MSMON_CSU_OFSR is IMPLEMENTATION DEFINED.

This register is present only when **FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_CSU == 1 and MPAMF_CSUMON_IDR.HAS_OFSR == 1**. Otherwise, direct accesses to MSMON_CSU_OFSR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU_OFSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
OFPND31	OFPND30	OFPND29	OFPND28	OFPND27	OFPND26	OFPND25	OFPND24	OFPND23	OFPND22	OFPND21	OFPND20

OFPND<i>, bit [i], for i = 31 to 0

Overflow status bitmap for CSU monitor instances. The RIS and the contiguous range of CSU monitor instances are set in [MSMON_CFG_MON_SEL](#). i of 0 corresponds to the CSU monitor instance [MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0](#).

OFPND<i>	Meaning
0b0	CSU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) does not have a pending overflow.
0b1	CSU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) has a pending overflow.

After reading [MSMON_OFLOW_SR](#) to determine that a CSU monitor instance has a pending overflow and which RIS values have pending overflows, an interrupt service routine could poll groups of 32 monitor instances in a RIS for pending monitors by reading this bitmap and incrementing [MSMON_CFG_MON_SEL.MON_SEL](#) by 32.

Accessing MSMON_CSU_OFSR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- `MSMON_CSU_OFSR_s` must only be accessible from the Secure MPAM feature page.
- `MSMON_CSU_OFSR_ns` must only be accessible from the Non-secure MPAM feature page.
- `MSMON_CSU_OFSR_rt` must only be accessible from the Root MPAM feature page.
- `MSMON_CSU_OFSR_rl` must only be accessible from the Realm MPAM feature page.

MSMON_CSU_OFSR_s, MSMON_CSU_OFSR_ns, MSMON_CSU_OFSR_rt, and MSMON_CSU_OFSR_rl must be separate registers:

- The Secure instance (MSMON_CSU_OFSR_s) accesses the CSU monitor overflow status bitmap used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSU_OFSR_ns) accesses the CSU monitor overflow status bitmap used for Non-secure PARTIDs.
- The Root instance (MSMON_CSU_OFSR_rt) accesses the CSU monitor overflow status bitmap used for Root PARTIDs.
- The Realm instance (MSMON_CSU_OFSR_rl) accesses the CSU monitor overflow status bitmap used for Realm PARTIDs.

MSMON_CSU_OFSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0858	MSMON_CSU_OFSR_s

Accesses to this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0858	MSMON_CSU_OFSR_ns

Accesses to this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0858	MSMON_CSU_OFSR_rt

When FEAT_RME is implemented, accesses to this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x0858	MSMON_CSU_OFSR_r1

When FEAT_RME is implemented, accesses to this interface are **RO**.

3005/0907/2022 15:17:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

MSMON_MBWU_OFSR, MPAM MBWU Monitor Overflow Status Register

The MSMON_MBWU_OFSR characteristics are:

Purpose

MSMON_MBWU_OFSR is a 32-bit read-only register that shows bitmap of MBWU monitor instance overflow status for a contiguous group of 32 monitor instances.

MSMON_MBWU_OFSR_s gives a bitmap of pending MBWU overflow status for 32 Secure MBWU monitor instances. MSMON_MBWU_OFSR_ns gives a bitmap of pending MBWU overflow status for 32 Non-secure MBWU monitor instances. MSMON_MBWU_OFSR_rt gives a bitmap of pending MBWU overflow status for 32 Root MBWU monitor instances. MSMON_MBWU_OFSR_rl gives a bitmap of pending MBWU overflow status for 32 Realm MBWU monitor instances.

Configuration

The power domain of MSMON_MBWU_OFSR is IMPLEMENTATION DEFINED.

This register is present only when **FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1 and MPAMF_MBWUMON_IDR.HAS_OFSR == 1**. Otherwise, direct accesses to MSMON_MBWU_OFSR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_OFSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
OFPND31	OFPND30	OFPND29	OFPND28	OFPND27	OFPND26	OFPND25	OFPND24	OFPND23	OFPND22	OFPND21	OFPND20

OFPND<i>, bit [i], for i = 31 to 0

Overflow status bitmap for MBWU monitor instances. The RIS and the contiguous range of MBWU monitor instances are set in [MSMON_CFG_MON_SEL](#). i of 0 corresponds to the MBWU monitor instance [MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0](#).

OFPND<i>	Meaning
0b0	MBWU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) does not have a pending overflow.
0b1	MBWU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) has a pending overflow.

After reading [MSMON_OFLOW_SR](#) to determine that an MBWU monitor instance has a pending overflow and which RIS values have pending overflows, an interrupt service routine could poll groups of 32 monitor instances in a RIS for pending monitors by reading this bitmap and incrementing [MSMON_CFG_MON_SEL.MON_SEL](#) by 32.

A pending overflow may be in either the [MSMON_CFG_MBWU_CTL.OFLOW_STATUS](#) or [MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L](#) field.

Accessing MSMON_MBWU_OFSR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_MBWU_OFSR_s must only be accessible from the Secure MPAM feature page.
- MSMON_MBWU_OFSR_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_OFSR_rt must only be accessible from the Root MPAM feature page.
- MSMON_MBWU_OFSR_rl must only be accessible from the Realm MPAM feature page.

MSMON_MBWU_OFSR_s, MSMON_MBWU_OFSR_ns, MSMON_MBWU_OFSR_rt, and MSMON_MBWU_OFSR_rl must be separate registers:

- The Secure instance (MSMON_MBWU_OFSR_s) accesses the MBWU monitor overflow status bitmap used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_OFSR_ns) accesses the MBWU monitor overflow status bitmap used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_OFSR_rt) accesses the MBWU monitor overflow status bitmap used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_OFSR_rl) accesses the MBWU monitor overflow status bitmap used for Realm PARTIDs.

MSMON_MBWU_OFSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0898	MSMON_MBWU_OFSR_s

Accesses to this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0898	MSMON_MBWU_OFSR_ns

Accesses to this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0898	MSMON_MBWU_OFSR_rt

When FEAT_RME is implemented, accesses to this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0898	MSMON_MBWU_OFSR_rl

When FEAT_RME is implemented, accesses to this interface are **RO**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffbd6d6d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

MSMON_OFLOW_SR, MPAM Monitor Overflow Status Register

The MSMON_OFLOW_SR characteristics are:

Purpose

MSMON_OFLOW_SR is a 32-bit read-only register that shows MPAM monitor overflow status for this MSC.

MSMON_OFLOW_SR_s gives the status of overflows of Secure MPAM monitors. MSMON_OFLOW_SR_ns gives the status of overflows of Non-secure MPAM monitors. MSMON_OFLOW_SR_rt gives the status of overflows of Root MPAM monitors. MSMON_OFLOW_SR_rl gives the status of overflows of Realm MPAM monitors.

Configuration

The power domain of MSMON_OFLOW_SR is IMPLEMENTATION DEFINED.

This register is present only when **FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.HAS_OFLOW_SR == 1**. Otherwise, direct accesses to MSMON_OFLOW_SR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_SR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CSU_OFLOW_PND	MBWU_OFLOW_PND	RES0														RIS_PND15	RIS_PND14	RIS_PND13	RIS_PND12	RIS_PND11	RIS_PND10	RIS_PND9	RIS_PND8	RIS_PND7	RIS_PND6	RIS_PND5	RIS_PND4	RIS_PND3	RIS_PND2	RIS_PND1	RIS_PND0

CSU_OFLOW_PND, bit [31]

At least one cache storage usage monitor has OFLOW_STATUS of 1 in [MSMON_CFG_CSU_CTL](#).

CSU_OFLOW_PND	Meaning
0b0	There are no cache storage usage monitor instances where MSMON_CFG_CSU_CTL .OFLOW_STATUS is 1.
0b1	MSMON_CFG_CSU_CTL for at least one of the cache storage usage monitor instances has OFLOW_STATUS set to 1.

This field clears when [MSMON_CFG_CSU_CTL](#).OFLOW_STATUS has been reset to 0 for all CSU monitor instances in this MSC.

MBWU_OFLOW_PND, bit [30]

At least one memory bandwidth usage monitor instance has OFLOW_STATUS or OFLOW_STATUS_L of 1 in [MSMON_CFG_MBWU_CTL](#).

MBWU_OFLOW_PND	Meaning
0b0	There are no memory bandwidth usage monitor instances where MSMON_CFG_MBWU_CTL.OFLOW_STATUS is 1.
0b1	MSMON_CFG_MBWU_CTL for at least one of the memory bandwidth usage monitor instances has either OFLOW_STATUS or OFLOW_STATUS_L set to 1.

This field clears when [MSMON_CFG_MBWU_CTL.OFLOW_STATUS](#) and [MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L](#) have been reset to 0 for all MBWU monitor instances in this MSC.

Bits [29:16]

Reserved, RES0.

RIS_PND<r>, bit [r], for r = 15 to 0

Overflow status by RIS.

RIS_PND<r>	Meaning
0b0	RIS r has no unread overflows of any type of monitor.
0b1	RIS r has at least one unread overflow in at least one of the monitor types.

Combined with the CSU_OFLOW_PND and MBWU_OFLOW_PND flags in this register, an interrupt service routine could poll only the monitor types indicated in monitors for the resource instances flagged in this field.

Bit r is set when any monitor instance of any type in resource instance r has OFLOW_STATUS or OFLOW_STATUS_L set to 1.

Accessing MSMON_OFLOW_SR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_OFLOW_SR_s must only be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_SR_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_SR_rt must only be accessible from the Root MPAM feature page.
- MSMON_OFLOW_SR_rl must only be accessible from the Realm MPAM feature page.

MSMON_OFLOW_SR_s, MSMON_OFLOW_SR_ns, MSMON_OFLOW_SR_rt, and MSMON_OFLOW_SR_rl must be separate registers:

- The Secure instance (MSMON_OFLOW_SR_s) accesses the monitor overflow status summary of Secure monitors.
- The Non-secure instance (MSMON_OFLOW_SR_ns) accesses the monitor overflow status summary of Non-secure monitors.
- The Root instance (MSMON_OFLOW_SR_rt) accesses the monitor overflow status summary of Root monitors.
- The Realm instance (MSMON_OFLOW_SR_rl) accesses the monitor overflow status summary of Realm monitors.

MSMON_OFLOW_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08F0	MSMON_OFLOW_SR_s

Accesses to this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08F0	MSMON_OFLOW_SR_ns

Accesses to this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08F0	MSMON_OFLOW_SR_rt

When FEAT_RME is implemented, accesses to this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08F0	MSMON_OFLOW_SR_rl

When FEAT_RME is implemented, accesses to this interface are **RO**.

TRBAUTHSTATUS, Authentication Status Register

The TRBAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBAUTHSTATUS are RES0.

[TRBAUTHSTATUS](#) is in the Core power domain.

Attributes

TRBAUTHSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	RTNID	RTID						RES0					RLNID	RLID		RES0	SNID	SID	NSNID	NSID											

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

RTNID	Meaning
0b00	Not implemented.

Access to this field is **RO**.

RTID, bits [25:24]

Root invasive debug.

This field has the same value as [DBGAUTHSTATUS_EL1](#).RTID.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

RLNID	Meaning
0b00	Not implemented.

Access to this field is **RO**.

RLID, bits [13:12]

Realm invasive debug.

This field has the same value as [DBGAUTHSTATUS_EL1](#).RLID.

Bits [11:8]

Reserved, RES0.

SNID, bits [7:6]

Secure non-invasive debug.

SNID	Meaning
0b00	Not implemented.

Access to this field is **RO**.

SID, bits [5:4]

Secure invasive debug.

This field has the same value as [DBGAUTHSTATUS_EL1](#).SID.

NSNID, bits [3:2]

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented.

Access to this field is **RO**.

NSID, bits [1:0]

Non-secure invasive debug.

This field has the same value as [DBGAUTHSTATUS_EL1](#).NSID.

Accessing TRBAUTHSTATUS

TRBAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFB8	TRBAUTHSTATUS

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRBBASER_EL1, Trace Buffer Base Address Register

The TRBBASER_EL1 characteristics are:

Purpose

Defines the base address for the trace buffer.

Configuration

External register TRBBASER_EL1 bits [63:0] are architecturally mapped to AArch64 System register [TRBBASER_EL1\[63:0\]](#).

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBBASER_EL1 are RES0.

Attributes

TRBBASER_EL1 is a 64-bit register.

Field descriptions

BASE, bits [63:12]

Trace Buffer Base pointer address. ([TRBBASER_EL1](#).BASE << 12) is the address of the first byte in the trace buffer. Bits [11:0] of the Base pointer address are always zero. If the smallest implemented translation granule is not 4KB, then [TRBBASER_EL1](#)[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log₂(smallest implemented translation granule).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing TRBBASER_EL1

The PE might ignore a write to [TRBBASER_EL1](#) if any of the following apply:

- [TRBLIMITR_EL1](#).E == 1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- [TRBLIMITR_EL1](#).XE == 1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

TRBBASER_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

TRBBASER_EL1, Trace Buffer Base Address Register

TRBE	0x000	TRBBASER_EL1
------	-------	--------------

Accesses to this interface are **RW**.

TRBCIDR3, Component Identification Register 3

The TRBCIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBCIDR3 are RES0.

[TRBCIDR3](#) is in the Core power domain.

Attributes

TRBCIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_3							

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Component identification preamble, segment 3.

Reads as 0xB1.

Access to this field is **RO**.

Accessing TRBCIDR3

TRBCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFFC	TRBCIDR3

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

no old file	htmldiff from-	(new)
-------------	----------------	-------

TRBDEVAFF, Device Affinity Register

The TRBDEVAFF characteristics are:

Purpose

For additional information, see the CoreSight Architecture Specification.

Reads the same value as the [MPIDR_EL1](#) register for the PE that this trace buffer has affinity with.

Depending on the IMPLEMENTATION DEFINED nature of the system, it might be possible that [TRBDEVAFF](#) is read before system firmware has configured the trace buffer and/or the PE or group of PEs that the trace buffer has affinity with. When this is the case, [TRBDEVAFF](#) reads as zero.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBDEVAFF are RES0.

[TRBDEVAFF](#) is in the Core power domain.

Attributes

TRBDEVAFF is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																	MPIDR_EL1														
																	MPIDR_EL1														
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MPIDR_EL1, bits [63:0]

Read-only copy of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing TRBDEVAFF

TRBDEVAFF can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFA8	TRBDEVAFF

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRBDEVARCH, Trace Buffer Device Architecture Register

The TRBDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBDEVARCH are RES0.

[TRBDEVARCH](#) is in the Core power domain.

Attributes

TRBDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION			ARCHVER			ARCHPART													

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

ARCHITECT	Meaning
0b01000111011	JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.

Access to this field is **RO**.

PRESENT, bit [20]

DEVARCH present. Defines that [TRBDEVARCH](#) register is present.

PRESENT	Meaning
0b0	Device Architecture information not present.
0b1	Device Architecture information present.

This field reads as 1.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

REVISION	Meaning
0b0000	Revision 0.

All other values are reserved.

Access to this field is **RO**.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0000	Trace Buffer Extension version 1.

All other values are reserved.

[TRBDEVARCH](#).ARCHVER and [TRBDEVARCH](#).ARCHPART are also defined as a single field, [TRBDEVARCH](#).ARCHID, so that [TRBDEVARCH](#).ARCHVER is [TRBDEVARCH](#).ARCHID[15:12].

Access to this field is **RO**.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA18	Armv9-A Trace Buffer Extension.

[TRBDEVARCH](#).ARCHVER and [TRBDEVARCH](#).ARCHPART are also defined as a single field, [TRBDEVARCH](#).ARCHID, so that [TRBDEVARCH](#).ARCHPART is [TRBDEVARCH](#).ARCHID[11:0].

Access to this field is **RO**.

Accessing TRBDEVARCH

TRBDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFBC	TRBDEVARCH

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRBDEVID, Device Configuration Register

The TRBDEVID characteristics are:

Purpose

Provides discovery information for the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBDEVID are RES0.
[TRBDEVID](#) is in the Core power domain.

Attributes

TRBDEVID is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																												MPAM			

Bits [31:4]

Reserved, RES0.

MPAM, bits [3:0]

MPAM extensions. Indicates support for Memory Partitioning and Monitoring (MPAM) and the Trace Buffer MPAM extensions.

MPAM	Meaning
0b0000	MPAM not implemented by Trace Buffer Unit.
0b0001	MPAM implemented by Trace Buffer Unit, using default PARTID and PMG values.
0b0010	Trace Buffer MPAM extensions implemented.

When FEAT_MPAM is not implemented by the PE, this field reads as 0b0000.
When FEAT_MPAM is implemented by the PE, the value 0b0000 is not permitted.
FEAT_TRBE_MPAM implements the functionality identified by the value 0b0010.

Accessing TRBDEVID

TRBDEVID can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFC8	TRBDEVID

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRBDEVID1, Device Configuration Register 1

The TRBDEVID1 characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBDEVID1 are RES0.

[TRBDEVID1](#) is in the Core power domain.

Attributes

TRBDEVID1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG_MAX								PARTID_MAX															

Bits [31:24]

Reserved, RES0.

PMG_MAX, bits [23:16] When FEAT_TRBE_MPAM is implemented:

Largest permitted PMG value. The [TRBMPAM](#).PMG field must implement at least enough bits to represent [TRBDEVID1](#).PMG_MAX.

Otherwise:

Reserved, RES0.

PARTID_MAX, bits [15:0] When FEAT_TRBE_MPAM is implemented:

Largest permitted PARTID value. The [TRBMPAM](#).PARTID field must implement at least enough bits to represent [TRBDEVID1](#).PARTID_MAX.

Otherwise:

Reserved, RES0.

Accessing TRBDEVID1

TRBDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFC4	TRBDEVID1

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRBDEVID2, Device Configuration Register 2

The TRBDEVID2 characteristics are:

Purpose

Provides discovery information for the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBDEVID2 are RES0.
[TRBDEVID2](#) is in the Core power domain.

Attributes

TRBDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRBDEVID2

TRBDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFC0	TRBDEVID2

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

htmldiff from-

(new)

TRBDEVTYPE, Device Type Register

The TRBDEVTYPE characteristics are:

Purpose

Provides discovery information for the component. If the part number field is not recognized, a debugger can report the information that is provided by [TRBDEVTYPE](#) about the component instead.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBDEVTYPE are RES0.

[TRBDEVTYPE](#) is in the Core power domain.

Attributes

TRBDEVTYPE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												SUB				MAJOR			

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Component sub-type.

SUB	Meaning
0b0010	When MAJOR == 0x1 (Trace sink): Trace buffer or router.

This field reads as 0x2.

MAJOR, bits [3:0]

Component major type.

MAJOR	Meaning
0b0001	Trace sink.

Other values are defined by the CoreSight Architecture.

Access to this field is **RO**.

Accessing TRBDEVTYPE

TRBDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFCC	TRBDEVTYPE

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRBIDR_EL1, Trace Buffer ID Register

The TRBIDR_EL1 characteristics are:

Purpose

Describes constraints on using the Trace Buffer Unit to an external debugger.

Configuration

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBIDR_EL1 are RES0.

Attributes

TRBIDR_EL1 is a 64-bit register.

Field descriptions

Bits [63:6]

Reserved, RES0.

Bit [5]

Reserved, RAO.

P, bit [4]

This field reads as an UNKNOWN value.

Align, bits [3:0]

Defines the minimum alignment constraint for writes to [TRBPTR_EL1](#) and [TRBTRG_EL1](#).

Align	Meaning
0b0000	Byte.
0b0001	Halfword.
0b0010	Word.
0b0011	Doubleword.
0b0100	16 bytes.
0b0101	32 bytes.
0b0110	64 bytes.
0b0111	128 bytes.
0b1000	256 bytes.
0b1001	512 bytes.
0b1010	1KB.
0b1011	2KB.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRBIDR_EL1

TRBIDR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x030	TRBIDR_EL1

Accesses to this interface are **RO**.

30/09/2022 15:58; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96f

TRBITCTRL, Integration Mode Control Register

The TRBITCTRL characteristics are:

Purpose

A component can use [TRBITCTRL](#) to dynamically switch between functional mode and integration mode. In integration mode, topology detection is enabled. After switching to integration mode and performing integration tests or topology detection, reset the system to ensure correct behavior of CoreSight and other connected system components.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBITCTRL are RES0.

[TRBITCTRL](#) is in the Core power domain.

Attributes

TRBITCTRL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															IME

Bits [31:1]

Reserved, RES0.

IME, bit [0]

When topology detection or integration functionality is implemented:

Integration Mode Enable.

IME	Meaning
0b0	Component functional mode.
0b1	Component integration mode. Support for topology detection and integration testing is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRBITCTRL

The PE might ignore a write to TRBITCTRL if any of the following apply:

- [TRBLIMITR_EL1](#).E == 1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- [TRBLIMITR_EL1](#).XE == 1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

TRBITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xF00	TRBITCTRL

This interface is accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered() or !AllowExternalTraceAccess(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

TRBLAR, Lock Access Register

The TRBLAR characteristics are:

Purpose

For components that implement the Software Lock, used to lock and unlock the Software Lock. This component does not implement the Software Lock.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBLAR are RES0.

[TRBLAR](#) is in the Core power domain.

Attributes

TRBLAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																WI															

Bits [31:0]

Reserved, WI.

Software Lock Key. The Software Lock is not implemented.

This field ignores writes.

Accessing TRBLAR

TRBLAR can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFB0	TRBLAR

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **WO**.

TRBLIMITR_EL1, Trace Buffer Limit Address Register

The TRBLIMITR_EL1 characteristics are:

Purpose

Defines the top address for the trace buffer, and controls the trace buffer modes and enable.

Configuration

External register TRBLIMITR_EL1 bits [63:0] are architecturally mapped to AArch64 System register [TRBLIMITR_EL1\[63:0\]](#).

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBLIMITR_EL1 are RES0.

Attributes

TRBLIMITR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
																LIMIT																					
LIMIT												RES0										XE		nVM		TM		FM		E							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

LIMIT, bits [63:12]

Trace buffer Limit pointer address. ([TRBLIMITR_EL1](#).LIMIT << 12) is the address of the last byte in the trace buffer plus one. Bits [11:0] of the Limit pointer address are always zero. If the smallest implemented translation granule is not 4KB, then [TRBLIMITR_EL1](#)[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log₂(smallest implemented translation granule).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

XE, bit [6]

Trace Buffer Unit External mode enable. Controls whether the Trace Buffer Unit is enabled when SelfHostedTraceEnabled() == FALSE.

XE	Meaning
0b0	Trace Buffer Unit is not enabled by this control.
0b1	If SelfHostedTraceEnabled() is FALSE, the Trace Buffer Unit is enabled.

If SelfHostedTraceEnabled() == TRUE, then [TRBLIMITR_EL1](#).E controls whether the Trace Buffer Unit is enabled.

All output is discarded by the Trace Buffer Unit when the Trace Buffer Unit is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

nVM, bit [5]

Address mode.

nVM	Meaning
0b0	The trace buffer pointers are virtual addresses.
0b1	The trace buffer pointers are: <ul style="list-style-type: none"> • Physical address in the owning security state if the owning translation regime has no stage 2 translation. • Intermediate physical addresses in the owning security state if the owning translation regime has stage 2 translations.

When SelfHostedTraceEnabled() == FALSE, the trace buffer pointers are always physical addresses.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When !SelfHostedTraceEnabled(), access to this field is **RES1**.
- Otherwise, access to this field is **RW**.

TM, bits [4:3]

Trigger mode.

TM	Meaning
0b00	Stop on trigger. Flush trace, then stop collection and set TRBSR_EL1 .IRQ to 1 on Trigger Event.
0b01	IRQ on trigger. Continue collection and set TRBSR_EL1 .IRQ to 1 on Trigger Event.
0b11	Ignore trigger. Continue collection and leave TRBSR_EL1 .IRQ unchanged on Trigger Event.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

FM, bits [2:1]

Trace buffer mode.

FM	Meaning
0b00	Fill mode. Stop collection and set TRBSR_EL1 .IRQ to 1 on current write pointer wrap.
0b01	Wrap mode. Continue collection and set TRBSR_EL1 .IRQ to 1 on current write pointer wrap.
0b11	Circular Buffer mode. Continue collection and leave TRBSR_EL1 .IRQ unchanged on current write pointer wrap.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Trace Buffer Unit enable. Controls whether the Trace Buffer Unit is enabled when SelfHostedTraceEnabled() == TRUE.

E	Meaning
0b0	Trace Buffer Unit is not enabled by this control.
0b1	If SelfHostedTraceEnabled() is TRUE, the Trace Buffer Unit is enabled.

If FEAT_TRBE_EXT is implemented and SelfHostedTraceEnabled() == FALSE, then [TRBLIMITR_EL1.XE](#) controls whether the Trace Buffer Unit is enabled.

If FEAT_TRBE_EXT is not implemented, then the Trace Buffer Unit is disabled when SelfHostedTraceEnabled() == FALSE.

All output is discarded by the Trace Buffer Unit when the Trace Buffer Unit is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing TRBLIMITR_EL1

The PE might ignore a write to [TRBLIMITR_EL1](#), other than a write that modifies [TRBLIMITR_EL1.E](#) or [TRBLIMITR_EL1.XE](#) as appropriate, if any of the following apply:

- [TRBLIMITR_EL1.E](#) == 1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- [TRBLIMITR_EL1.XE](#) == 1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

TRBLIMITR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x010	TRBLIMITR_EL1

Accesses to this interface are **RW**.

TRBLSR, Lock Status Register

The TRBLSR characteristics are:

Purpose

Indicates the Software Lock is not implemented.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBLSR are RES0.
[TRBLSR](#) is in the Core power domain.

Attributes

TRBLSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																RAZ		SLI													

Bits [31:3]

Reserved, RES0.

Bits [2:1]

Reserved, RAZ.
Not thirty-two bit. Describes the size of the [TRBLAR](#) register.
This field reads-as-zero.

SLI, bit [0]

Indicates the Software Lock is not implemented.

SLI	Meaning
0b0	Software Lock is not implemented. Writes to the TRBLAR are ignored.
0b1	Software Lock is implemented.

Access to this field is **RAZ/WI**.

Accessing TRBLSR

TRBLSR can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

TRBLSR, Lock Status Register

TRBE	0xFB4	TRBLSR
------	-------	--------

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRBMAR_EL1, Trace Buffer Memory Attribute Register

The TRBMAR_EL1 characteristics are:

Purpose

Controls Trace Buffer Unit accesses to memory.

Configuration

External register TRBMAR_EL1 bits [63:0] are architecturally mapped to AArch64 System register [TRBMAR_EL1\[63:0\]](#).

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBMAR_EL1 are RES0.

Attributes

TRBMAR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0												PAS		SH		Attr															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:12]

Reserved, RES0.

PAS, bits [11:10]

When EL3 is implemented:

Physical address specifier. Defines the PAS attribute for memory addressed by the buffer.

PAS	Meaning	Applies when
0b00	Secure.	
0b01	Non-secure.	
0b10	Root.	When FEAT_RME is implemented
0b11	Realm.	When FEAT_RME is implemented

All other values are reserved.

If the Trace Buffer Unit is using external mode and the IMPLEMENTATION DEFINED authentication interface prohibits invasive debug of the Security state corresponding to the physical address space selected by [TRBMAR_EL1](#).PAS, then when the Trace Buffer Unit receives trace data from the trace unit, it does not write the trace data to memory and generates a trace buffer management event. That is, if any of the following apply:

- ExternalInvasiveDebugEnabled() == FALSE.
- ExternalSecureInvasiveDebugEnabled() == FALSE and [TRBMAR_EL1](#).PAS is 0b00.
- FEAT_RME is implemented, ExternalRootInvasiveDebugEnabled() == FALSE, and [TRBMAR_EL1](#).PAS is 0b10.
- FEAT_RME is implemented, ExternalRealmInvasiveDebugEnabled() == FALSE, and [TRBMAR_EL1](#).PAS is 0b11.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bits [9:8]

Trace buffer shareability domain. Defines the shareability domain for Normal memory used by the trace buffer.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when [TRBMAR_EL1.Attr](#) specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Attr, bits [7:0]

When TRBMAR_EL1.Attr == 0bxxxx0000:

Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the cacheability attributes, for memory addressed by the trace buffer.

Attr	Meaning	Applies when
0x00	Device-nGnRnE memory.	
0x40	Normal memory, Inner Non-cacheable, Outer Non-cacheable with the XS attribute set to 0.	When FEAT_XS is implemented
0xA0	Normal memory, Inner Write-through Cacheable, Outer Write-through Cacheable, Non-transient, Read-Allocate with the XS attribute set to 0.	When FEAT_XS is implemented
0xF0	Tagged Normal memory, Outer Write-Back Non-transient, Read-allocate Write-allocate.	When FEAT_MTE2 is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

When TRBMAR_EL1.Attr == 0b0000xxxx and TRBMAR_EL1.Attr != 0b00000000:

Trace buffer memory attributes. Defines the Device memory attributes for memory addressed by the trace buffer.

Attr	Meaning	Applies when
0x04	Device-nGnRE memory.	
0x08	Device-nGRE memory.	
0x0C	Device-GRE memory.	
0x01	Device-nGnRnE memory with the XS attribute set to 0.	When FEAT_XS is implemented
0x05	Device-nGnRE memory with the XS attribute set to 0.	When FEAT_XS is implemented
0x09	Device-nGRE memory with the XS attribute set to 0.	When FEAT_XS is implemented
0x0D	Device-GRE memory with the XS attribute set to 0.	When FEAT_XS is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

When TRBMAR_EL1.Attr != 0bxxxx0000 and TRBMAR_EL1.Attr != 0b0000xxxx:

Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the Outer and Inner cacheability attributes, for memory addressed by the trace buffer.

Attr	Meaning
0b0001xxxx	Normal memory, Outer Write-Through Transient, Write-allocate.
0b0010xxxx	Normal memory, Outer Write-Through Transient, Read-allocate.
0b0011xxxx	Normal memory, Outer Write-Through Transient, Read-allocate Write-allocate.
0b0100xxxx	Normal memory, Outer Non-cacheable.
0b0101xxxx	Normal memory, Outer Write-Back Transient, Write-allocate.
0b0110xxxx	Normal memory, Outer Write-Back Transient, Read-allocate.
0b0111xxxx	Normal memory, Outer Write-Back Transient, Read-allocate Write-allocate.
0b1000xxxx	Normal memory, Outer Write-Through Non-transient, No allocate.
0b1001xxxx	Normal memory, Outer Write-Through Non-transient, Write-allocate.
0b1010xxxx	Normal memory, Outer Write-Through Non-transient, Read-allocate.
0b1011xxxx	Normal memory, Outer Write-Through Non-transient, Read-allocate Write-allocate.
0b1100xxxx	Normal memory, Outer Write-Back Non-transient, No allocate.
0b1101xxxx	Normal memory, Outer Write-Back Non-transient, Write-allocate.
0b1110xxxx	Normal memory, Outer Write-Back Non-transient, Read-allocate.
0b1111xxxx	Normal memory, Outer Write-Back Non-transient, Read-allocate Write-allocate.
0bxxxx0001	Normal memory, Inner Write-Through Transient, Write-allocate.
0bxxxx0010	Normal memory, Inner Write-Through Transient, Read-allocate.
0bxxxx0011	Normal memory, Inner Write-Through Transient, Read-allocate Write-allocate.
0bxxxx0100	Normal memory, Inner Non-cacheable.
0bxxxx0101	Normal memory, Inner Write-Back Transient, Write-allocate.
0bxxxx0110	Normal memory, Inner Write-Back Transient, Read-allocate.
0bxxxx0111	Normal memory, Inner Write-Back Transient, Read-allocate Write-allocate.
0bxxxx1000	Normal memory, Inner Write-Through Non-transient, No allocate.
0bxxxx1001	Normal memory, Inner Write-Through Non-transient, Write-allocate.
0bxxxx1010	Normal memory, Inner Write-Through Non-transient, Read-allocate.
0bxxxx1011	Normal memory, Inner Write-Through Non-transient, Read-allocate Write-allocate.
0bxxxx1100	Normal memory, Inner Write-Back Non-transient, No allocate.
0bxxxx1101	Normal memory, Inner Write-Back Non-transient, Write-allocate.
0bxxxx1110	Normal memory, Inner Write-Back Non-transient, Read-allocate.
0bxxxx1111	Normal memory, Inner Write-Back Non-transient, Read-allocate Write-allocate.

The reset behavior of this field is:

- On a Cold reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRBMAR_EL1

The PE might ignore a write to [TRBMAR_EL1](#) if any of the following apply:

- [TRBLIMITR_EL1](#).E == 1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- [TRBLIMITR_EL1](#).XE == 1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

TRBMAR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x028	TRBMAR_EL1

Accesses to this interface are **RW**.

TRBMPAM, Trace Buffer MPAM Configuration Register

The TRBMPAM characteristics are:

Purpose

Defines the PARTID, PMG, and MPAM_SP values used by the trace buffer unit.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBMPAM are RES0.

Attributes

TRBMPAM is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																			
RES0								EN		MPAM_SP				PMG								PARTID													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:27]

Reserved, RES0.

EN, bit [26]

Enable. Enables use of non-default MPAM values.

EN	Meaning
0b0	Use default MPAM values.
0b1	Use TRBMPAM .{PARTID, PMG, MPAM_SP}.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

MPAM_SP, bits [25:24]

Partition Identifier space. Selects the PARTID space.

MPAM_SP	Meaning	Applies when
0b00	PARTID is in the Secure PARTID space.	
0b01	PARTID is in the Non-secure PARTID space.	
0b10	PARTID is in the Root PARTID space.	When FEAT_RME is implemented
0b11	PARTID is in the Realm PARTID space.	When FEAT_RME is implemented

All other values are reserved.

If `SecureNoninvasiveDebugEnabled() == FALSE`, the value `0b00` is treated as `0b01`.

If `FEAT_RME` is implemented and `RootNoninvasiveDebugEnabled() == FALSE`, the value `0b10` is treated as `0b01`.

If `FEAT_RME` is implemented and `RealmNoninvasiveDebugEnabled() == FALSE`, the value `0b11` is treated as `0b01`.

This field is ignored by the PE when `SelfHostedTraceEnabled() == TRUE`.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PMG, bits [23:16]

Performance Monitoring Group. Selects the PMG.

Only sufficient low-order bits are required to represent the [TRBDEVID1](#).PMG_MAX. Higher-order bits are RES0.

This field is ignored by the PE when `SelfHostedTraceEnabled() == TRUE`.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition Identifier. Selects the PARTID.

Only sufficient low-order bits are required to represent the [TRBDEVID1](#).PARTID_MAX. Higher-order bits are RES0.

This field is ignored by the PE when `SelfHostedTraceEnabled() == TRUE`.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBMPAM

TRBMPAM can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x040	TRBMPAM

Accesses to this interface are **RW**.

TRBPIDR0, Peripheral Identification Register 0

The TRBPIDR0 characteristics are:

Purpose

Provides discovery information about the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPIDR0 are RES0.
[TRBPIDR0](#) is in the Core power domain.

Attributes

TRBPIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PART_0							

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, bits [7:0].
The part number is selected by the designer of the component, and is stored in [TRBPIDR1](#).PART_1 and [TRBPIDR0](#).PART_0.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

Accessing TRBPIDR0

TRBPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFE0	TRBPIDR0

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRBPIDR1, Peripheral Identification Register 1

The TRBPIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPIDR1 are RES0.

[TRBPIDR1](#) is in the Core power domain.

Attributes

TRBPIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								DES 0				PART 1			

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0]. [TRBPIDR1](#).DES_0 and [TRBPIDR2](#).DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, bits [11:8].

The part number is selected by the designer of the component, and is stored in [TRBPIDR1](#).PART_1 and [TRBPIDR0](#).PART_0.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRBPIDR1

TRBPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFE4	TRBPIDR1

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRBPIDR2, Peripheral Identification Register 2

The TRBPIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPIDR2 are RES0.

[TRBPIDR2](#) is in the Core power domain.

Attributes

TRBPIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																REVISION		JEDEC		DES 1											

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component major revision. [TRBPIDR2.REVISION](#) and [TRBPIDR3.REVAND](#) together form the revision number of the component, with [TRBPIDR2.REVISION](#) being the most significant part and [TRBPIDR3.REVAND](#) the least significant part. When a component is changed, [TRBPIDR2.REVISION](#) or [TRBPIDR3.REVAND](#) are increased to ensure that software can differentiate the different revisions of the component. [TRBPIDR3.REVAND](#) should be set to 0b0000 when [TRBPIDR2.REVISION](#) is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. [TRBPIDR1.DES_0](#) and [TRBPIDR2.DES_1](#) together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the

implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRBPIDR2

TRBPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFE8	TRBPIDR2

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

30/09/2022 15:58; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96f

TRBPIDR3, Peripheral Identification Register 3

The TRBPIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPIDR3 are RES0.

[TRBPIDR3](#) is in the Core power domain.

Attributes

TRBPIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
												RES0															REVAND			CMOD		

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Component minor revision. [TRBPIDR2](#).REVISION and [TRBPIDR3](#).REVAND together form the revision number of the component, with [TRBPIDR2](#).REVISION being the most significant part and [TRBPIDR3](#).REVAND the least significant part. When a component is changed, [TRBPIDR2](#).REVISION or [TRBPIDR3](#).REVAND are increased to ensure that software can differentiate the different revisions of the component. [TRBPIDR3](#).REVAND should be set to 0b0000 when [TRBPIDR2](#).REVISION is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components is zero then the components are identical.

- If the CMOD fields of both components have the same nonzero value then this does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is nonzero, they might not be identical, even though they have the same Unique Component Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRBPIDR3

TRBPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFEC	TRBPIDR3

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

30/09/2022 15:58; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96f

TRBPIDR4, Peripheral Identification Register 4

The TRBPIDR4 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPIDR4 are RES0.

[TRBPIDR4](#) is in the Core power domain.

Attributes

TRBPIDR4 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SIZE			DES 2				

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component.

The distance from the start of the address space used by this component to the end of the component identification registers.

A value of 0b0000 means one of the following is true:

- The component uses a single 4KB block.
- The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.

Any other value means the component occupies $2^{\text{TRBPIDR4.SIZE}}$ 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

Reads as 0b0000.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1. The code identifies the designer of the component, which might not be the same as the

implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value 0x4.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRBPIDR4

TRBPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFD0	TRBPIDR4

This interface is accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRBPTR_EL1, Trace Buffer Write Pointer Register

The TRBPTR_EL1 characteristics are:

Purpose

Defines the current write pointer for the trace buffer.

Configuration

External register TRBPTR_EL1 bits [63:0] are architecturally mapped to AArch64 System register [TRBPTR_EL1\[63:0\]](#).

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPTR_EL1 are RES0.

Attributes

TRBPTR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																PTR															
																PTR															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PTR, bits [63:0]

Trace Buffer current write pointer address.

Defines the virtual address of the next entry to be written to the trace buffer.

The architecture places restrictions on the values that software can write to the pointer.

Note

As a result of the restrictions an implementation might treat some of PTR[M:0] as RES0, where M is defined by [TRBIDR_EL1](#).Align.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBPTR_EL1

The PE might ignore a write to [TRBPTR_EL1](#) if any of the following apply:

- [TRBLIMITR_EL1](#).E == 1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- [TRBLIMITR_EL1](#).XE == 1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

TRBPTR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x008	TRBPTR_EL1

Accesses to this interface are **RW**.

TRBSR_EL1, Trace Buffer Status/syndrome Register

The TRBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software for a trace buffer management event.

Configuration

External register TRBSR_EL1 bits [63:0] are architecturally mapped to AArch64 System register [TRBSR_EL1\[63:0\]](#).

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBSR_EL1 are RES0.

Attributes

TRBSR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:56]

Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MSS2 encoding for other trace buffer management events

23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																							

Bits [23:0]

Reserved, RES0.

MSS2 encoding for a buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer

Bits [23:8]

Reserved, RES0.

AssuredOnly, bit [7]

When FEAT_THE is implemented, TRBSR_EL1.EC == 0b100101 and GetTRBSR_EL1_FSC() == 0b0011xx:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]

When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetTRBSR_EL1_FSC() == 0b0011xx:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort due to Base Permissions.
0b1	Data Abort due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]

When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetTRBSR_EL1_FSC() == 0b0011xx:

DirtyBit flag. If a memory access generates a Data Abort (Write Access) for a Permission fault (When using Indirect Permission), then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to state of nDirty / Dirty bit.
0b1	Permission Fault is due to state of nDirty / Dirty bit.

Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

EC, bits [31:26]

Event Class. Top-level description of the cause of the trace buffer management event.

EC	Meaning	MSS	Applies when
0b000000	Other trace buffer management event. All trace buffer management events other than those described by the other defined event class codes.	MSS encoding for other trace buffer management events	
0b011110	Granule Protection Check fault on write to trace buffer, other than Granule Protection Fault (GPF). That is, any of the following: <ul style="list-style-type: none"> Granule Protection Table (GPT) address size fault. GPT walk fault. Synchronous External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for other trace buffer management events	When FEAT_RME is implemented
0b011111	Buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for a buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	
0b100101	Stage 2 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [25:24]

Reserved, RES0.

DAT, bit [23]

Data. Indicates when the Trace Buffer Unit has trace data that has not yet been written to memory.

DAT	Meaning
0b0	Internal buffers are empty. All Trace operations Accepted by the Trace Buffer Unit will Complete in finite time.
0b1	Internal buffers are not empty.

When [TRBSR_EL1](#).{DAT, S} is {0, 1}, meaning Collection is stopped and the Trace Buffer Unit internal buffers are empty, then all trace data has been written to memory. An additional Data Synchronization Barrier may be required to ensure that the writes are Complete. When [TRBSR_EL1](#).DAT is 0 and Collection is not stopped, there may still be trace data held by the trace unit that the Trace Buffer Unit has not Accepted.

That is, [TRBSR_EL1](#).DAT reads as 1 when the Trace Buffer Unit has Accepted trace data from the trace unit, but has not yet written it to memory.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IRQ, bit [22]

Maintenance interrupt status.

IRQ	Meaning
0b0	Maintenance interrupt is not asserted.
0b1	Maintenance interrupt is asserted.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

TRG, bit [21]

Triggered.

TRG	Meaning
0b0	No Detected Trigger has been observed since this field was last cleared to zero.
0b1	A Detected Trigger has been observed since this field was last cleared to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

WRAP, bit [20]

Wrapped.

WRAP	Meaning
0b0	The current write pointer has not wrapped since this field was last cleared to zero.
0b1	The current write pointer has wrapped since this field was last cleared to zero.

For each byte of trace the Trace Buffer Unit Accepts and writes to the trace buffer at the address in the current write pointer; if the current write pointer is equal to the Limit pointer minus one, the current write pointer is wrapped by setting it to the Base pointer, and this field is set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

EA, bit [18]

When the PE sets this bit as the result of an External Abort:

External Abort.

EA	Meaning
0b0	An External Abort has not been asserted.
0b1	An External Abort has been asserted and detected by the Trace Buffer Unit.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [17]

Stopped.

S	Meaning
0b0	Collection has not been stopped.
0b1	Collection is stopped.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [16]

Reserved, RES0.

MSS, bits [15:0]

Management event Specific Syndrome. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for other trace buffer management events

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										BSC					

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Trace buffer status code.

BSC	Meaning
0b000000	Collection not stopped, or access not allowed.
0b000001	Trace buffer filled. Collection stopped because the current write pointer wrapped to the base pointer and the trace buffer mode is Fill mode.
0b000010	Trigger Event. Collection stopped because of a Trigger Event. See TRBTRG_EL1 for more information.
0b000011	Manual Stop. Collection stopped because of a Manual Stop event. See TRBCR .ManStop for more information.

All other values are reserved.

MSS encoding for a buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault Status Code.

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented

0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

Accessing TRBSR_EL1

The PE might ignore a write to [TRBSR_EL1](#) if any of the following apply:

- [TRBLIMITR_EL1](#).E == 1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- [TRBLIMITR_EL1](#).XE == 1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

TRBSR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x018	TRBSR_EL1

Accesses to this interface are **RW**.

TRBTRG_EL1, Trace Buffer Trigger Counter Register

The TRBTRG_EL1 characteristics are:

Purpose

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

Configuration

External register TRBTRG_EL1 bits [63:0] are architecturally mapped to AArch64 System register [TRBTRG_EL1\[63:0\]](#).

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBTRG_EL1 are RES0.

Attributes

TRBTRG_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																TRG															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

TRG, bits [31:0]

Trigger count.

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

[TRBTRG_EL1](#) decrements by 1 for every byte of trace written to the trace buffer when all of the following are true:

- [TRBTRG_EL1](#) is nonzero.
- [TRBSR_EL1](#).TRG is 1.

The architecture places restrictions on the values that software can write to the counter.

Note

As a result of the restrictions an implementation might treat some of TRG[M:0] as RES0, where M is defined by [TRBIDR_EL1](#).Align.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBTRG_EL1

The PE might ignore a write to [TRBTRG_EL1](#) if any of the following apply:

- [TRBLIMITR_EL1](#).E == 1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- [TRBLIMITR_EL1](#).XE == 1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

TRBTRG_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x020	TRBTRG_EL1

Accesses to this interface are **RW**.

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [17]**When TRCIDR6.EXLEVEL_RL_EL1 == 1:**

Realm EL1 address comparison control. Controls whether a comparison can occur at EL1 in Realm state.

EXLEVEL_RL_EL1	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator performs comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator does not perform comparisons in Realm EL1.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator does not perform comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator performs comparisons in Realm EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [16]**When TRCIDR6.EXLEVEL_RL_EL0 == 1:**

Realm EL0 address comparison control. Controls whether a comparison can occur at EL0 in Realm state.

EXLEVEL_RL_EL0	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator performs comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator does not perform comparisons in Realm EL0.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator does not perform comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator performs comparisons in Realm EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [14]**When Non-secure EL2 is implemented:**

Non-secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Non-secure state.

EXLEVEL_NS_EL2	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL2.
0b1	The Address Comparator does not perform comparisons in Non-secure EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [13]**When Non-secure EL1 is implemented:**

Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.

EXLEVEL_NS_EL1	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL1.
0b1	The Address Comparator does not perform comparisons in Non-secure EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [12]**When Non-secure EL0 is implemented:**

Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.

EXLEVEL_NS_EL0	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL0.
0b1	The Address Comparator does not perform comparisons in Non-secure EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [11]**When EL3 is implemented:**

EL3 address comparison control. Controls whether a comparison can occur at EL3.

EXLEVEL_S_EL3	Meaning
0b0	The Address Comparator performs comparisons in EL3.
0b1	The Address Comparator does not perform comparisons in EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [10]**When EL2 is implemented and FEAT_SEL2 is implemented:**

Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.

EXLEVEL_S_EL2	Meaning
0b0	The Address Comparator performs comparisons in Secure EL2.
0b1	The Address Comparator does not perform comparisons in Secure EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [9]**When Secure EL1 is implemented:**

Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.

EXLEVEL_S_EL1	Meaning
0b0	The Address Comparator performs comparisons in Secure EL1.
0b1	The Address Comparator does not perform comparisons in Secure EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_ELO, bit [8]**When Secure EL0 is implemented:**

Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

EXLEVEL_S_ELO	Meaning
0b0	The Address Comparator performs comparisons in Secure EL0.
0b1	The Address Comparator does not perform comparisons in Secure EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

CONTEXT, bits [6:4]**When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:**

Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:

CONTEXT	Meaning	Applies when
0b000	Comparator 0.	
0b001	Comparator 1.	When UInt(TRCIDR4.NUMCIDC) > 1 or UInt(TRCIDR4.NUMVMIDC) > 1
0b010	Comparator 2.	When UInt(TRCIDR4.NUMCIDC) > 2 or UInt(TRCIDR4.NUMVMIDC) > 2
0b011	Comparator 3.	When UInt(TRCIDR4.NUMCIDC) > 3 or UInt(TRCIDR4.NUMVMIDC) > 3
0b100	Comparator 4.	When UInt(TRCIDR4.NUMCIDC) > 4 or UInt(TRCIDR4.NUMVMIDC) > 4
0b101	Comparator 5.	When UInt(TRCIDR4.NUMCIDC) > 5 or UInt(TRCIDR4.NUMVMIDC) > 5
0b110	Comparator 6.	When UInt(TRCIDR4.NUMCIDC) > 6 or UInt(TRCIDR4.NUMVMIDC) > 6
0b111	Comparator 7.	When UInt(TRCIDR4.NUMCIDC) > 7 or UInt(TRCIDR4.NUMVMIDC) > 7

The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CONTEXTTYPE, bits [3:2]**When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:**

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons.

CONTEXTTYPE	Meaning	Applies when
0b00	The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators.	
0b01	The Address Comparator is dependent on the Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Context Identifier Comparator and the address comparison match.	When TRCIDR4.NUMCIDC != 0b0000
0b10	The Address Comparator is dependent on the Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Virtual Context Identifier Comparator and the address comparison match.	When TRCIDR4.NUMVMIDC != 0b0000
0b11	The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if the Context Identifier Comparator, the Virtual Context Identifier Comparator, and address comparison all match.	When TRCIDR4.NUMCIDC != 0b0000 and TRCIDR4.NUMVMIDC != 0b0000

If [TRCIDR4.NUMCIDC](#) == 0b0000, then bit [2] is RES0.

If [TRCIDR4.NUMVMIDC](#) == 0b0000, then bit [3] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCACVR<n>, Address Comparator Value Register <n>, n = 0 - 15

The TRCACVR<n> characteristics are:

Purpose

Contains the address value.

Configuration

External register TRCACVR<n> bits [63:0] are architecturally mapped to AArch64 System register [TRCACVR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and $\text{UInt}(\text{TRCIDR4.NUMACPAIRS}) * 2 > n$. Otherwise, direct accesses to TRCACVR<n> are RES0.

Attributes

TRCACVR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ADDRESS, bits [63:0]

Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in the TRCACVR<n>. This requires that the trace analyzer always programs all implemented bits of the TRCACVR<n>.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an UNKNOWN value, where P is defined as the maximum virtual address size supported by the PE.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value, and a read of the register returns the written value.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCACVR<n>

Must be programmed if any of the following are true:

- [TRCBBCTLR](#).RANGE[n/2] == 1.
- [TRCRSCTLR<a>](#).GROUP == 0b0100 and [TRCRSCTLR<a>](#).SAC[n] == 1.
- [TRCRSCTLR<a>](#).GROUP == 0b0101 and [TRCRSCTLR<a>](#).ARC[n/2] == 1.

- [TRCVIIECTLR](#).EXCLUDE[n/2] == 1.
- [TRCVIIECTLR](#).INCLUDE[n/2] == 1.
- [TRCVISSCTLR](#).START[n] == 1.
- [TRCVISSCTLR](#).STOP[n] == 1.
- TRCSSCCR<>.ARC[n/2] == 1.
- TRCSSCCR<>.SAC[n] == 1.
- [TRCQCTLR](#).RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCACVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x400 + (8 * n)	TRCACVR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCAUTHSTATUS, Authentication Status Register

The TRCAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCAUTHSTATUS bits [31:0] are architecturally mapped to AArch64 System register [TRCAUTHSTATUS\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCAUTHSTATUS are RES0.

Attributes

TRCAUTHSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				RTNID	RTID	RES0				RLNID	RLID	HNID	HID	SNID	SID	NSNID	NSID														

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTNID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLNID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.

HNID, bits [11:10]

Hyp Non-invasive Debug. Indicates whether a separate enable control for EL2 non-invasive debug features is implemented and enabled.

HNID	Meaning
0b00	Separate Hyp non-invasive debug enable not implemented, or EL2 non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

HID, bits [9:8]

Hyp Invasive Debug. Indicates whether a separate enable control for EL2 invasive debug features is implemented and enabled.

HID	Meaning
0b00	Separate Hyp invasive debug enable not implemented, or EL2 invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

SNID, bits [7:6]

Secure Non-invasive Debug. Indicates whether Secure non-invasive debug features are implemented and enabled.

SNID	Meaning
0b00	Secure non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

When EL3 is implemented, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b00.

When EL3 is not implemented and the PE is Secure, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

SID, bits [5:4]

Secure Invasive Debug. Indicates whether Secure invasive debug features are implemented and enabled.

SID	Meaning
0b00	Secure invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

NSNID, bits [3:2]

Non-secure Non-invasive Debug. Indicates whether Non-secure non-invasive debug features are implemented and enabled.

NSNID	Meaning
0b00	Non-secure non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

When EL3 is implemented, this field reads as 0b11.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b11.

When EL3 is not implemented and the PE is Secure, this field reads as 0b00.

NSID, bits [1:0]

Non-secure Invasive Debug. Indicates whether Non-secure invasive debug features are implemented and enabled.

NSID	Meaning
0b00	Non-secure invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

Accessing TRCAUTHSTATUS

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

External debugger accesses to this register are unaffected by the OS Lock.

TRCAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFB8	TRCAUTHSTATUS

This interface is accessible as follows:

- When `!IsTraceCorePowered()`, accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCAUXCTLR, Auxiliary Control Register

The TRCAUXCTLR characteristics are:

Purpose

The function of this register is IMPLEMENTATION DEFINED.

Configuration

External register TRCAUXCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCAUXCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCAUXCTLR are RES0.

Attributes

TRCAUXCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Accessing TRCAUXCTLR

If this register is nonzero then it might cause the behavior of a trace unit to contradict this architecture specification. See the documentation of the specific implementation for information about the IMPLEMENTATION DEFINED support for this register.

TRCAUXCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x018	TRCAUXCTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCBBCTLR, Branch Broadcast Control Register

The TRCBBCTLR characteristics are:

Purpose

Controls the regions in the memory map where branch broadcasting is active.

Configuration

External register TRCBBCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCBBCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented**, TRCIDR0.TRCBB == 1 and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCBBCTLR are RES0.

Attributes

TRCBBCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										MODE	RANGE[7]	RANGE[6]	RANGE[5]	RANGE[4]	RANGE[3]	RANGE[2]	RANGE[1]	RANGE[0]													

Bits [31:9]

Reserved, RES0.

MODE, bit [8]

Mode.

MODE	Meaning
0b0	Exclude Mode. Branch broadcasting is not active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then branch broadcasting is active for all instructions.
0b1	Include Mode. Branch broadcasting is active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then the behavior of the trace unit is CONSTRAINED UNPREDICTABLE. That is, the trace unit might or might not consider any instructions to be in a branch broadcasting region.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Address range field.

Selects whether Address Range Comparator <m> is used with branch broadcasting.

RANGE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected.
0b1	The address range that Address Range Comparator <m> defines, is selected.

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCBBCTLR

Must be programmed if [TRCCONFIGR](#).BB == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCBBCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x03C	TRCBBCTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

(old)

htmldiff from-

(new)

The TRCCCTLR characteristics are:

Purpose

Set the threshold value for cycle counting.

Configuration

External register TRCCCTL bits [31:0] are architecturally mapped to AArch64 System register [TRCCCTL\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and TRCIDR0.TRCCCI == 1. Otherwise, direct accesses to TRCCCCTLR are RES0.

Attributes

TRCCCCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0													
											RESO																	THRESHOLD																

Bits [31:12]

Reserved, RES0.

THRESHOLD, bits [11:0]

Sets the threshold value for instruction trace cycle counting.

The minimum threshold value that can be programmed into THRESHOLD is given in [TRCIDR3.CCITMIN](#). If the THRESHOLD value is smaller than the value in [TRCIDR3.CCITMIN](#) then the behavior is CONSTRAINED UNPREDICTABLE. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

Writing a value of zero when [TRCCONFIGR](#).CCI enables instruction trace cycle counting results in CONSTRAINED UNPREDICTABLE behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCCTLR

Must be programmed if [TRCCONFIGR.CCI](#) == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCCTLR can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

TRCCCCTLR, Cycle Count Control Register

ETE	0x038	TRCCCCTLR
-----	-------	-----------

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCCIDCCTLR0, Context Identifier Comparator Control Register 0

The TRCCIDCCTLR0 characteristics are:

Purpose

Contains Context identifier mask values for the [TRCCIDCVR<n>](#) registers, for n = 0 to 3.

Configuration

External register TRCCIDCCTLR0 bits [31:0] are architecturally mapped to AArch64 System register [TRCCIDCCTLR0\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented**, $\text{UInt}(\text{TRCIDR4.NUMCIDC}) > 0x0$ and $\text{UInt}(\text{TRCIDR2.CIDSIZE}) > 0$. Otherwise, direct accesses to TRCCIDCCTLR0 are RES0.

Attributes

TRCCIDCCTLR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	
COMP3[7]	COMP3[6]	COMP3[5]	COMP3[4]	COMP3[3]	COMP3[2]	COMP3[1]	COMP3[0]	COMP2[7]	COMP2[6]	COMP2[5]	COMP2[4]

COMP3[<m>], bit [m+24], for m = 7 to 0
When $\text{UInt}(\text{TRCIDR4.NUMCIDC}) > 3$:

TRCCIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR3. Each bit in this field corresponds to a byte in TRCCIDCVR3.

COMP3[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 2:

TRCCIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR2. Each bit in this field corresponds to a byte in TRCCIDCVR2.

COMP2[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 1:

TRCCIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR1. Each bit in this field corresponds to a byte in TRCCIDCVR1.

COMP1[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 0:

TRCCIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0.

COMP0[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if $m \geq \text{TRCIDR2.CIDSIZE}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTRL0

If software uses the [TRCCIDCVR<n>](#) registers, for n = 0 to 3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCCIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in **TRCCIDCVR<n>** is not 0x00, the behavior of the Context Identifier Comparator is **CONSTRAINED UNPREDICTABLE**. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCTL0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x680	TRCCIDCCTLR0

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCCIDCCTLR1, Context Identifier Comparator Control Register 1

The TRCCIDCCTLR1 characteristics are:

Purpose

Contains Context identifier mask values for the [TRCCIDCVR<n>](#) registers, for n = 4 to 7.

Configuration

External register TRCCIDCCTLR1 bits [31:0] are architecturally mapped to AArch64 System register [TRCCIDCCTLR1\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented**, $\text{UInt}(\text{TRCIDR4.NUMCIDC}) > 0x4$ and $\text{UInt}(\text{TRCIDR2.CIDSIZE}) > 0$. Otherwise, direct accesses to TRCCIDCCTLR1 are RES0.

Attributes

TRCCIDCCTLR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	
COMP7[7]	COMP7[6]	COMP7[5]	COMP7[4]	COMP7[3]	COMP7[2]	COMP7[1]	COMP7[0]	COMP6[7]	COMP6[6]	COMP6[5]	COMP6[4]

COMP7[<m>], bit [m+24], for m = 7 to 0
When $\text{UInt}(\text{TRCIDR4.NUMCIDC}) > 7$:

TRCCIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR7. Each bit in this field corresponds to a byte in TRCCIDCVR7.

COMP7[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 6:

TRCCIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR6. Each bit in this field corresponds to a byte in TRCCIDCVR6.

COMP6[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 5:

TRCCIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR5. Each bit in this field corresponds to a byte in TRCCIDCVR5.

COMP5[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 4:

TRCCIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR4. Each bit in this field corresponds to a byte in TRCCIDCVR4.

COMP4[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if $m \geq \text{TRCIDR2.CIDSIZE}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCTRL1

If software uses the [TRCCIDCVR<n>](#) registers, for n = 4 to 7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCCIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in **TRCCIDCVR<n>** is not 0x00, the behavior of the Context Identifier Comparator is **CONSTRAINED UNPREDICTABLE**. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCTLR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x684	TRCCIDCCTLR1

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

TRCCIDCVR<n>, Context Identifier Comparator Value Registers <n>, n = 0 - 7

The TRCCIDCVR<n> characteristics are:

Purpose

Contains a Context identifier value.

Configuration

External register TRCCIDCVR<n> bits [63:0] are architecturally mapped to AArch64 System register [TRCCIDCVR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and $UInt(TRCIDR4.NUMCIDC) > n$. Otherwise, direct accesses to TRCCIDCVR<n> are RES0.

Attributes

TRCCIDCVR<n> is a 64-bit register.

Field descriptions

VALUE, bits [63:0]

Context identifier value. The width of this field is indicated by [TRCIDR2.CIDSIZE](#). Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Context identifier is zero until the PE updates the Context identifier.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCIDCVR<n>

Must be programmed if any of the following are true:

- [TRCRSCTLR<a>](#).GROUP == 0b0110 and [TRCRSCTLR<a>](#).CID[n] == 1.
- [TRCACATR<a>](#).CONTEXTTYPE == 0b01 or 0b11 and [TRCACATR<a>](#).CONTEXT == n.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x600 + (8 * n)	TRCCIDCVR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffbbdd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCCIDR0, Component Identification Register 0

The TRCCIDR0 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCCIDR0 are RES0.

Attributes

TRCCIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_0							

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Component identification preamble, segment 0.

Reads as 0x0D.

Access to this field is **RO**.

Accessing TRCCIDR0

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFF0	TRCCIDR0

This interface is accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCCIDR3, Component Identification Register 3

The TRCCIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCCIDR3 are RES0.

Attributes

TRCCIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_3							

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Component identification preamble, segment 3.

Reads as 0xB1.

Access to this field is **RO**.

Accessing TRCCIDR3

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFFC	TRCCIDR3

This interface is accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCCLAIMSET, Claim Tag Set Register

The TRCCLAIMSET characteristics are:

Purpose

In conjunction with [TRCCLAIMCLR](#), provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCCLAIMSET bits [31:0] are architecturally mapped to AArch64 System register [TRCCLAIMSET\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCCLAIMSET are RES0.

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as 0b1111.

Attributes

TRCCLAIMSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18		
SET[31]	SET[30]	SET[29]	SET[28]	SET[27]	SET[26]	SET[25]	SET[24]	SET[23]	SET[22]	SET[21]	SET[20]	SET[19]	SET[18]	SE	

SET[<m>], bit [m], for m = 31 to 0

Claim Tag Set. Indicates whether Claim Tag bit <m> is implemented, and is used to set Claim Tag bit <m> to 1.

SET[<m>]	Meaning
0b0	On a read: Claim Tag bit <m> is not implemented. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is implemented. On a write: Set Claim Tag bit <m> to 1.

This bit reads-as-zero and ignores writes if m > the number of Claim Tag bits.

Access to this field is **RAO/W1S**.

Accessing TRCCLAIMSET

TRCCLAIMSET can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFA0	TRCCLAIMSET

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.

- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

-------	----------------	-------

RLDSELF	Meaning
0b0	Normal mode. The Counter is in Normal mode.
0b1	Self-reload mode. The Counter is in Self-reload mode.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDEVENT_TYPE, bit [15]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes a reload event for Counter <n>.

RLDEVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCCNTCTLR<n>.RLDEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.RLDEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

RLDEVENT_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.TYPE controls whether TRCCNTCTLR<n>.RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes a reload event for Counter <n>.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

CNTEVENT_TYPE, bit [7]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes Counter <n> to decrement.

CNTEVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCCNTCTLR<n>.CNTEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.CNTEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

CNTEVENT_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.TYPE controls whether TRCCNTCTLR<n>.CNTEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes Counter <n> to decrement.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCNTCTL<n>

Must be programmed if `TRCRSCTLR<a>.GROUP == 0b0010` and `TRCRSCTLR<a>.COUNTERS[n] == 1`.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCNTCTLR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x150 + (4 * n)	TRCCNTCTLR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

htmldiff from-

(new)

TRCCNTRLDVR<n>, Counter Reload Value Register <n>, n = 0 - 3

The TRCCNTRLDVR<n> characteristics are:

Purpose

This sets or returns the reload count value for Counter <n>.

Configuration

External register TRCCNTRLDVR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCCNTRLDVR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and $UInt(TRCIDR5.NUMCNTR) > n$. Otherwise, direct accesses to TRCCNTRLDVR<n> are RES0.

Attributes

TRCCNTRLDVR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																VALUE															

Bits [31:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the reload value for Counter <n>. When a reload event occurs for Counter <n> then the trace unit copies the VALUE<n> field into Counter <n>.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTRLDVR<n>

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0010 and [TRCRSCTLR<a>](#).COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCNTRLDVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	$0 \times 140 + (4 * n)$	TRCCNTRLDVR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

The TRCCNTVR<n> characteristics are:

This sets or returns the value of Counter <n>.

External register TRCCNTVR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCCNTVR<n>[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented and UInt(TRCIDR5.NUMCNTR) > n. Otherwise, direct accesses to TRCCNTVR<n> are RES0.

TRCCNTVR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																VALUE															

Bits [31:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the count value of Counter.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCNTVR<n>

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0010 and [TRCRSCTLR<a>](#).COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCCNTVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	$0 \times 160 + (4 * n)$	TRCCNTVR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.

- Otherwise, accesses to this register are **RW**.

TRCCONFIGR, Trace Configuration Register

The TRCCONFIGR characteristics are:

Purpose

Controls the tracing options.

Configuration

External register TRCCONFIGR bits [31:0] are architecturally mapped to AArch64 System register [TRCCONFIGR\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCCONFIGR are RES0.

Attributes

TRCCONFIGR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19		18		17		16		15		14	13		12		11		10	9	8		7		6		5		

Bits [31:19:16]

Reserved, RES0.

ITO, bit [18]

When TRCIDR0.ITE == 1:

Instrumentation Trace Override.

ITO	Meaning
0b0	Instrumentation Trace Override disabled.
0b1	Instrumentation Trace Override enabled.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [17:16]

Reserved, RES0.

VMIDOPT, bit [15]**When TRCIDR2.VMIDOPT == 0b01:**

Virtual context identifier selection control.

VMIDOPT	Meaning
0b0	VTTBR_EL2 .VMID is used as the Virtual context identifier.
0b1	CONTEXTIDR_EL2 .PROCID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == 0b00:

Reserved, RES0.

Virtual context identifier selection control.

[VTTBR_EL2](#).VMID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == 0b10:

Reserved, RES1.

Virtual context identifier selection control.

[CONTEXTIDR_EL2](#).PROCID is used as the Virtual context identifier.

Otherwise:

Reserved, RES0.

QE, bits [14:13]**When TRCIDR0.QSUPP == 0b01:**

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b01	Q elements with instruction counts are enabled.
	Q elements without instruction counts are disabled.

All other values are reserved.

When TRCIDR0.QSUPP == 0b10:

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b11	Q elements with instruction counts are enabled.
	Q elements without instruction counts are enabled.

All other values are reserved.

When TRCIDR0.QSUPP == 0b11:

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b01	Q elements with instruction counts are enabled. Q elements without instruction counts are disabled.
0b11	Q elements with instruction counts are enabled. Q elements without instruction counts are enabled.

All other values are reserved.

Otherwise:

Reserved, RES0.

RS, bit [12]**When TRCIDR0.RETSTACK == 1:**

Return stack control.

RS	Meaning
0b0	Return stack is disabled.
0b1	Return stack is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TS, bit [11]**When TRCIDR0.TSSIZE != 0b00000:**

Global timestamp tracing control.

TS	Meaning
0b0	Global timestamp tracing is disabled.
0b1	Global timestamp tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [10:8]

Reserved, RES0.

VMID, bit [7]**When TRCIDR2.VMIDSIZE != 0b000000:**

Virtual context identifier tracing control.

VMID	Meaning
0b0	Virtual context identifier tracing is disabled.
0b1	Virtual context identifier tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CID, bit [6]**When TRCIDR2.CIDSIZE != 0b000000:**

Context identifier tracing control.

CID	Meaning
0b0	Context identifier tracing is disabled.
0b1	Context identifier tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

CCI, bit [4]**When TRCIDR0.TRCCCI == 1:**

Cycle counting instruction tracing control.

CCI	Meaning
0b0	Cycle counting instruction tracing is disabled.
0b1	Cycle counting instruction tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

The reset behavior of this field is:

Reserved, RES1.

TRCDEVARCH, Device Architecture Register

The TRCDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCDEVARCH bits [31:0] are architecturally mapped to AArch64 System register [TRCDEVARCH\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCDEVARCH are RES0.

Attributes

TRCDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION				ARCHVER				ARCHPART											

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

ARCHITECT	Meaning
0b01000111011	JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

PRESENT, bit [20]

DEVARCH Present. Defines that the DEVARCH register is present.

PRESENT	Meaning
0b0	Device Architecture information not present.
0b1	Device Architecture information present.

This field reads as 1.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

REVISION	Meaning
0b0000	ETEv1.0, FEAT ETE.
0b0001	ETEv1.1, FEAT ETEv1p1.
0b0010	ETEv1.2, FEAT ETEv1p2.
0b0011	ETEv1.3, FEAT ETEv1p3.

All other values are reserved.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0101	ETEv1.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0x5.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA13	Arm PE trace architecture.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA13.

Accessing TRCDEVARCH

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFBC	TRCDEVARCH

This interface is accessible as follows:

- When `!IsTraceCorePowered()`, accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

The TRCDEVID characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCDEVID bits [31:0] are architecturally mapped to AArch64 System register [TRCDEVID\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCDEVID are RES0.

Attributes

TRCDEVID is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCDEVID

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVID can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFC8	TRCDEVID

This interface is accessible as follows:

- When `!IsTraceCorePowered()`, accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCDEVTYPE, Device Type Register

The TRCDEVTYPE characteristics are:

Purpose

Provides discovery information for the component. If the part number field is not recognized, a debugger can report the information that is provided by TRCDEVTYPE about the component instead.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCDEVTYPE are RES0.

Attributes

TRCDEVTYPE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												SUB			MAJOR				

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Component sub-type.

SUB	Meaning
0b0001	When MAJOR == 0x3 (Trace source): Associated with a PE.

This field reads as 0x1.

MAJOR, bits [3:0]

Component major type.

MAJOR	Meaning
0b0011	Trace source.

Other values are defined by the CoreSight Architecture.

This field reads as 0x3.

Accessing TRCDEVTYPE

External debugger accesses to this register are unaffected by the OS Lock.

Component	Offset	Instance
ETE	0xFCC	TRCDEVTYPE

This interface is accessible as follows:

- When `!IsTraceCorePowered()`, accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCEVENTCTL0R, Event Control 0 Register

The TRCEVENTCTL0R characteristics are:

Purpose

Controls the generation of ETEEvents.

Configuration

External register TRCEVENTCTL0R bits [31:0] are architecturally mapped to AArch64 System register [TRCEVENTCTL0R\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and TRCIDR4.NUMRSPAIR != 0b0000. Otherwise, direct accesses to TRCEVENTCTL0R are RES0.

Attributes

TRCEVENTCTL0R is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5
EVENT3_TYPE	RES0	EVENT3_SEL	EVENT2_TYPE	RES0	EVENT2_SEL	EVENT1_TYPE	RES0	EVENT1_SEL	EVENT0_TYPE	RES0	EVENT0_SEL	EVENT0_TYPE	RES0	EVENT0_SEL	EVENT0_TYPE	RES0	EVENT0_SEL	EVENT0_TYPE	RES0	EVENT0_SEL	EVENT0_TYPE	RES0	EVENT0_SEL	EVENT0_TYPE	RES0	EVENT0_SEL

EVENT3_TYPE, bit [31]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 3:

Chooses the type of Resource Selector.

EVENT3_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT3.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT3.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:29]

Reserved, RES0.

EVENT3_SEL, bits [28:24]**When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 3:**

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.TYPE controls whether TRCEVENTCTL0R.EVENT3.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R.INSTEN\[3\]](#) == 1, then Event element 3 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT2_TYPE, bit [23]**When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 2:**

Chooses the type of Resource Selector.

EVENT2_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT2.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT2.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [22:21]

Reserved, RES0.

EVENT2_SEL, bits [20:16]**When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 2:**

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.TYPE controls whether TRCEVENTCTL0R.EVENT2.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[2] == 1, then Event element 2 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT1_TYPE, bit [15]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 1:

Chooses the type of Resource Selector.

EVENT1_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT1.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT1.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [14:13]

Reserved, RES0.

EVENT1_SEL, bits [12:8]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 1:

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.TYPE controls whether TRCEVENTCTL0R.EVENT1.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[1] == 1, then Event element 1 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT0_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

EVENT0_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT0.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT0.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT0_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.TYPE controls whether TRCEVENTCTL0R.EVENT0.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R.INSTEN\[0\]](#) == 1, then Event element 0 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Component	Offset	Instance
ETE	0x020	TRCEVENTCTL0R

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

TRCEVENTCTL1R, Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

Purpose

Controls the behavior of the ETEEvents that [TRCEVENTCTL0R](#) selects.

Configuration

External register TRCEVENTCTL1R bits [31:0] are architecturally mapped to AArch64 System register [TRCEVENTCTL1R\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCEVENTCTL1R are RES0.

Attributes

TRCEVENTCTL1R is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2		
RES0														OE		LPOVERRIDE		LPOVERRIDE		ATB		ATB		RES0		INSTEN[3]		INSTEN[32]		INSTEN[31]	

Bits [31:14]13

Reserved, RES0.

OE, bit [13]

When TRCIDR5.OE == 1:

ETE Trace Output Enable control.

OE	Meaning
0b0	Trace output to any IMPLEMENTATION DEFINED trace output interface is disabled.
0b1	Trace output to any IMPLEMENTATION DEFINED trace output interface is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Otherwise:

Reserved, RES0.

LPOVERRIDE, bit [12]

When TRCIDR5.LPOVERRIDE == 1:

Low-power Override Mode select.

LPOVERRIDE	Meaning
0b0	Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.
0b1	Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation.

Otherwise:

Reserved, RES0.

ATB, bit [11]**When TRCIDR5.ATBTRIG == 1:**

AMBA Trace Bus (ATB) trigger enable.

If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:

- ATID == 0x7D.
- ATDATA to the value of [TRCTRACEIDR](#).

If the width of ATDATA is greater than the width of [TRCTRACEIDR](#).TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.

If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

ATB	Meaning
0b0	ATB trigger is disabled.
0b1	ATB trigger is enabled.

Otherwise:

Reserved, RES0.

Bits [10:4]

Reserved, RES0.

INSTEN[<m>], bit [m], for m = 3 to 0

Event element control.

INSTEN[<m>]	Meaning
0b0	The trace unit does not generate an Event element <m>.
0b1	The trace unit generates an Event element <m>.

This bit is RES0 if m >= the number indicated by [TRCIDR0](#).NUMEVENT.

Accessing TRCEVENTCTL1R

Must be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCEVENTCTL1R can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x024	TRCEVENTCTL1R

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCEXTINSELN<n>, External Input Select Register <n>, n = 0 - 3

The TRCEXTINSELN<n> characteristics are:

Purpose

Use this to set, or read, which External Inputs are resources to the trace unit.

The name TRCEXTINSELN is an alias of TRCEXTINSELN0.

Configuration

External register TRCEXTINSELN<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCEXTINSELN<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and $UInt(TRCIDR5.NUMEXTINSEL) > n$. Otherwise, direct accesses to TRCEXTINSELN<n> are RES0.

Attributes

TRCEXTINSELN<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																evtCount															

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range 0x0000 to 0x003F are common architectural and microarchitectural events.
- PMU event numbers in the range 0x0040 to 0x00BF are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range 0x00C0 to 0x03FF are IMPLEMENTATION DEFINED PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range 0x0000 to 0x003F, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED PMU events, it is UNPREDICTABLE what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

UNPREDICTABLE means the PMU event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common IMPLEMENTATION DEFINED PMU events, then no PMU event is counted and the value read back on evtCount is the value written.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCEXTINSEL_R<n>

Must be programmed if any of the following is true: `TRCRSCTLR<a>.GROUP == 0b0000` and `TRCRSCTLR<a>.EXTIN[n] == 1`.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCEXTINSEL_R<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x120 + (4 * n)	TRCEXTINSEL<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCIDR0, ID Register 0

The TRCIDR0 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR0 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR0\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCIDR0 are RES0.

Attributes

TRCIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
RES0	COMMTRANS	COMMOPT	TSSIZE	TSMARK	ITERES0	RES0	RES0	TRCEXDATA	TRCEXDATA	QSUPP	QSUPP	QFILT	QFILT	COND	COND	COND	COND

Bit [31]

Reserved, RES0.

COMMTRANS, bit [30]

Transaction Start element behavior.

COMMTRANS	Meaning
0b0	Transaction Start elements are P0 elements.
0b1	Transaction Start elements are not P0 elements.

COMMOPT, bit [29]

Indicates the contents and encodings of Cycle count packets.

COMMOPT	Meaning
0b0	Commit mode 0.
0b1	Commit mode 1.

The Commit mode defines the contents and encodings of Cycle Count packets, in particular how Commit elements are indicated by these packets. See the descriptions of these packets for more details.

Accessing this field has the following behavior:

- Access is **RAO/WI** if all of the following are true:
 - TRCIDR0.TRCCCI == 1
 - UInt(TRCIDR8.MAXSPEC) == 0x0
- When TRCIDR0.TRCCCI == 0, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

TSSIZE, bits [28:24]

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.

TSSIZE	Meaning
0b00000	Global timestamping not implemented.
0b01000	Global timestamping implemented with a 64-bit timestamp value.

All other values are reserved.

This field reads as 0b01000.

TSMARK, bit [23]**When FEAT_ETEv1p1 is implemented:**

Indicates whether Timestamp Marker elements are generated.

TSMARK	Meaning
0b0	Timestamp Marker elements are not generated.
0b1	Timestamp Marker elements are generated.

Otherwise:

Reserved, RES0.

ITE, Bits bit [22:18]**When FEAT_ETEv1p3 is implemented:**

Indicates whether Instrumentation Trace is implemented.

ITE	Meaning
0b0	Instrumentation Trace not implemented.
0b1	Instrumentation Trace implemented.

This field has the value 1 if FEAT_ITE is implemented.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [21:18]

Reserved, RES0.

TRCEXDATA, bit [17]**When TRCIDR0.TRCDATA != 0b00:**

Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

TRCEXDATA	Meaning
0b0	Tracing of data transfers for exceptions and exception returns not implemented.
0b1	Tracing of data transfers for exceptions and exception returns implemented.

Otherwise:

Reserved, RES0.

QSUPP, bits [16:15]

Indicates that the trace unit implements Q element support.

QSUPP	Meaning
0b00	Q element support is not implemented.
0b01	Q element support is implemented, and only supports Q elements with instruction counts.
0b10	Q element support is implemented, and only supports Q elements without instruction counts.
0b11	Q element support is implemented, and supports: <ul style="list-style-type: none"> • Q elements with instruction counts. • Q elements without instruction counts.

QFILT, bit [14]

Indicates if the trace unit implements Q element filtering.

QFILT	Meaning
0b0	Q element filtering is not implemented.
0b1	Q element filtering is implemented.

If TRCIDR0.QSUPP == 0b00 then this field is 0.

CONDTYPE, bits [13:12]**When TRCIDR0.TRCCOND == 1:**

Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

CONDTYPE	Meaning
0b00	Conditional instructions are traced with an indication of whether they pass or fail their condition code check.
0b01	Conditional instructions are traced with an indication of the APSR condition flags.

All other values are reserved.

Otherwise:

Reserved, RES0.

NUMEVENT, bits [11:10]**When TRCIDR4.NUMRSPAIR == 0b0000:**

Indicates the number of ETEEvents implemented.

NUMEVENT	Meaning
0b00	The trace unit supports 0 ETEEvents.

All other values are reserved.

When TRCIDR4.NUMRSPAIR != 0b0000:

Indicates the number of ETEEvents implemented.

NUMEVENT	Meaning
0b00	The trace unit supports 1 ETEEvent.
0b01	The trace unit supports 2 ETEEvents.
0b10	The trace unit supports 3 ETEEvents.
0b11	The trace unit supports 4 ETEEvents.

Otherwise:

Reserved, RES0.

RETSTACK, bit [9]

Indicates if the trace unit supports the return stack.

RETSTACK	Meaning
0b0	Return stack not implemented.
0b1	Return stack implemented.

Bit [8]

Reserved, RES0.

TRCCCI, bit [7]

Indicates if the trace unit implements cycle counting.

TRCCCI	Meaning
0b0	Cycle counting not implemented.
0b1	Cycle counting implemented.

This field reads as 1.

TRCCOND, bit [6]

Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

TRCCOND	Meaning
0b0	Conditional instruction tracing not implemented.
0b1	Conditional instruction tracing implemented.

This field reads as 0.

TRCBB, bit [5]

Indicates if the trace unit implements branch broadcasting.

TRCBB	Meaning
0b0	Branch broadcasting not implemented.
0b1	Branch broadcasting implemented.

This field reads as 1.

TRCIDR1, ID Register 1

The TRCIDR1 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR1 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR1\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR1 are RES0.

Attributes

TRCIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DESIGNER								RES0								RES1				TRCARCHMAJ				TRCARCHMIN				REVISION			

DESIGNER, bits [31:24]

Indicates which company designed the trace unit. The permitted values of this field are the same as [MIDR_EL1](#).Implementer.

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RES1.

TRCARCHMAJ, bits [11:8]

Major architecture version.

TRCARCHMAJ	Meaning
0b1111	If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH .

All other values are reserved.

This field reads as 0b1111.

TRCARCHMIN, bits [7:4]

Minor architecture version.

TRCARCHMIN	Meaning
0b1111	If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH .

All other values are reserved.

This field reads as 0b1111.

REVISION, bits [3:0]

Implementation revision.

Returns an IMPLEMENTATION DEFINED value that identifies the revision of the trace unit.

Arm deprecates any use of this field and recommends that implementations set this field to zero.

Accessing TRCIDR1

TRCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1E4	TRCIDR1

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

3005/0907/2022 1517:5808: 21c5a6dd0fdaf10a712e2f2d6ffdbbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCIDR2, ID Register 2

The TRCIDR2 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR2 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR2\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCIDR2 are RES0.

Attributes

TRCIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WFXMODE	VMIDOPT	CCSIZE		DVSIZE		DASIZE		VMIDSIZE		CIDSIZE		IASIZE																			

WFXMODE, bit [31]

Indicates whether WFI, WFIT, WFE, and WFET instructions are classified as P0 instructions:

WFXMODE	Meaning
0b0	WFI, WFIT, WFE, and WFET instructions are not classified as P0 instructions.
0b1	WFI, WFIT, WFE, and WFET instructions are classified as P0 instructions.

VMIDOPT, bits [30:29]

Indicates the options for Virtual context identifier selection.

VMIDOPT	Meaning
0b00	Virtual context identifier selection not supported. TRCCONFIGR .VMIDOPT is RES0.
0b01	Virtual context identifier selection supported. TRCCONFIGR .VMIDOPT is implemented.
0b10	Virtual context identifier selection not supported. TRCCONFIGR .VMIDOPT is RES1.

All other values are reserved.

If TRCIDR2.VMIDSIZE == 0b000000 then this field is 0b00.

If TRCIDR2.VMIDSIZE != 0b000000 then this field is 0b10.

CCSIZE, bits [28:25]**When TRCIDR0.TRCCCI == 1:**

Indicates the size of the cycle counter.

CCSIZE	Meaning
0b0000	The cycle counter is 12 bits in length.
0b0001	The cycle counter is 13 bits in length.
0b0010	The cycle counter is 14 bits in length.
0b0011	The cycle counter is 15 bits in length.
0b0100	The cycle counter is 16 bits in length.
0b0101	The cycle counter is 17 bits in length.
0b0110	The cycle counter is 18 bits in length.
0b0111	The cycle counter is 19 bits in length.
0b1000	The cycle counter is 20 bits in length.

All other values are reserved.

Otherwise:

Reserved, RES0.

DVSIZE, bits [24:20]**When TRCIDR0.TRCDATA != 0b00:**

Indicates the data value size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

DVSIZE	Meaning
0b00000	Data value tracing not implemented.
0b00100	Data value tracing has a maximum of 32-bit data values.
0b01000	Data value tracing has a maximum of 64-bit data values.

All other values are reserved.

Otherwise:

Reserved, RES0.

DASIZE, bits [19:15]**When TRCIDR0.TRCDATA != 0b00:**

Indicates the data address size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

DASIZE	Meaning
0b00000	Data address tracing not implemented.
0b00100	Data address tracing has a maximum of 32-bit data addresses.
0b01000	Data address tracing has a maximum of 64-bit data addresses.

All other values are reserved.

Otherwise:

Reserved, RES0.

htmldiff from-

(new)

TRCIDR3, ID Register 3

The TRCIDR3 characteristics are:

Purpose

Returns the base architecture of the trace unit.

Configuration

External register TRCIDR3 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR3\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCIDR3 are RES0.

Attributes

TRCIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
NOOVERFLOW	NUMPROC[2:0]	SYSSTALL	STALLCTL	SYNCPR	TRCERR	RES0	EXLEVEL_NS_EL2	EXLEVEL_NS_EL1	EXLEVEL_NS_EL0	EXLEVEL_NS_EL3	EXLEVEL_NS_EL4

NOOVERFLOW, bit [31]

Indicates if overflow prevention is implemented.

NOOVERFLOW	Meaning
0b0	Overflow prevention is not implemented.
0b1	Overflow prevention is implemented.

If TRCIDR3.STALLCTL == 0 then this field is 0.

NUMPROC, bits [13:12, 30:28]

Indicates the number of PEs available for tracing.

NUMPROC	Meaning
0b00000	The trace unit can trace one PE.

This field reads as 0b00000.

The NUMPROC field is split as follows:

- NUMPROC[2:0] is TRCIDR3[30:28].
- NUMPROC[4:3] is TRCIDR3[13:12].

SYSSTALL, bit [27]

Indicates if stalling of the PE is permitted.

SYSSTALL	Meaning
0b0	Stalling of the PE is not permitted.
0b1	Stalling of the PE is permitted.

The value of this field might be dynamic and change based on system conditions.

If TRCIDR3.STALLCTL == 0 then this field is 0.

STALLCTL, bit [26]

Indicates if trace unit implements stalling of the PE.

STALLCTL	Meaning
0b0	Stalling of the PE is not implemented.
0b1	Stalling of the PE is implemented.

SYNCPR, bit [25]

Indicates if an implementation has a fixed synchronization period.

SYNCPR	Meaning
0b0	TRCSYNCPR is read/write so software can change the synchronization period.
0b1	TRCSYNCPR is read-only so the synchronization period is fixed.

This field reads as 0.

TRCERR, bit [24]

Indicates forced tracing of System Error exceptions is implemented.

TRCERR	Meaning
0b0	Forced tracing of System Error exceptions is not implemented.
0b1	Forced tracing of System Error exceptions is implemented.

This field reads as 1.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]

Indicates if Non-secure EL2 is implemented.

EXLEVEL_NS_EL2	Meaning
0b0	Non-secure EL2 is not implemented.
0b1	Non-secure EL2 is implemented.

EXLEVEL_NS_EL1, bit [21]

Indicates if Non-secure EL1 is implemented.

EXLEVEL_NS_EL1	Meaning
0b0	Non-secure EL1 is not implemented.
0b1	Non-secure EL1 is implemented.

EXLEVEL_NS_EL0, bit [20]

Indicates if Non-secure EL0 is implemented.

EXLEVEL_NS_EL0	Meaning
0b0	Non-secure EL0 is not implemented.
0b1	Non-secure EL0 is implemented.

EXLEVEL_S_EL3, bit [19]

Indicates if EL3 is implemented.

EXLEVEL_S_EL3	Meaning
0b0	EL3 is not implemented.
0b1	EL3 is implemented.

EXLEVEL_S_EL2, bit [18]

Indicates if Secure EL2 is implemented.

EXLEVEL_S_EL2	Meaning
0b0	Secure EL2 is not implemented.
0b1	Secure EL2 is implemented.

EXLEVEL_S_EL1, bit [17]

Indicates if Secure EL1 is implemented.

EXLEVEL_S_EL1	Meaning
0b0	Secure EL1 is not implemented.
0b1	Secure EL1 is implemented.

EXLEVEL_S_EL0, bit [16]

Indicates if Secure EL0 is implemented.

EXLEVEL_S_EL0	Meaning
0b0	Secure EL0 is not implemented.
0b1	Secure EL0 is implemented.

Bits [15:14]

Reserved, RES0.

CCITMIN, bits [11:0]

Indicates the minimum value that can be programmed in [TRCCCCTLR.THRESHOLD](#).

If [TRCIDR0.TRCCCI](#) == 1 then the minimum value of this field is 0x001.

If [TRCIDR0.TRCCCI](#) == 0 then this field is zero.

Accessing TRCIDR3

TRCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1EC	TRCIDR3

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCIDR4, ID Register 4

The TRCIDR4 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR4 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR4\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCIDR4 are RES0.

Attributes

TRCIDR4 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMVMIDC	NUMCIDC	NUMSSCC	NUMRSPAIR	NUMPC	RES0	SUPPDAC	NUMDVC	NUMACPAIRS																							

NUMVMIDC, bits [31:28]

Indicates the number of Virtual Context Identifier Comparators that are available for tracing.

NUMVMIDC	Meaning
0b0000	No Virtual Context Identifier Comparators are available.
0b0001	The implementation has one Virtual Context Identifier Comparator.
0b0010	The implementation has two Virtual Context Identifier Comparators.
0b0011	The implementation has three Virtual Context Identifier Comparators.
0b0100	The implementation has four Virtual Context Identifier Comparators.
0b0101	The implementation has five Virtual Context Identifier Comparators.
0b0110	The implementation has six Virtual Context Identifier Comparators.
0b0111	The implementation has seven Virtual Context Identifier Comparators.
0b1000	The implementation has eight Virtual Context Identifier Comparators.

All other values are reserved.

NUMCIDC, bits [27:24]

Indicates the number of Context Identifier Comparators that are available for tracing.

NUMC IDC	Meaning
0b0000	No Context Identifier Comparators are available.
0b0001	The implementation has one Context Identifier Comparator.
0b0010	The implementation has two Context Identifier Comparators.
0b0011	The implementation has three Context Identifier Comparators.
0b0100	The implementation has four Context Identifier Comparators.
0b0101	The implementation has five Context Identifier Comparators.
0b0110	The implementation has six Context Identifier Comparators.
0b0111	The implementation has seven Context Identifier Comparators.
0b1000	The implementation has eight Context Identifier Comparators.

All other values are reserved.

NUMSSCC, bits [23:20]

Indicates the number of Single-shot Comparator Controls that are available for tracing.

NUMSSCC	Meaning
0b0000	No Single-shot Comparator Controls are available.
0b0001	The implementation has one Single-shot Comparator Control.
0b0010	The implementation has two Single-shot Comparator Controls.
0b0011	The implementation has three Single-shot Comparator Controls.
0b0100	The implementation has four Single-shot Comparator Controls.
0b0101	The implementation has five Single-shot Comparator Controls.
0b0110	The implementation has six Single-shot Comparator Controls.
0b0111	The implementation has seven Single-shot Comparator Controls.
0b1000	The implementation has eight Single-shot Comparator Controls.

All other values are reserved.

NUMRSPAIR, bits [19:16]

Indicates the number of resource selector pairs that are available for tracing.

NUMRSPAIR	Meaning
0b0000	The implementation has zero resource selectors.
0b0001	The implementation has two resource selector pairs.
0b0010	The implementation has three resource selector pairs.
0b0011	The implementation has four resource selector pairs.
0b0100	The implementation has five resource selector pairs.
0b0101	The implementation has six resource selector pairs.
0b0110	The implementation has seven resource selector pairs.
0b0111	The implementation has eight resource selector pairs.
0b1000	The implementation has nine resource selector pairs.
0b1001	The implementation has ten resource selector pairs.
0b1010	The implementation has eleven resource selector pairs.
0b1011	The implementation has twelve resource selector pairs.
0b1100	The implementation has thirteen resource selector pairs.
0b1101	The implementation has fourteen resource selector pairs.
0b1110	The implementation has fifteen resource selector pairs.
0b1111	The implementation has sixteen resource selector pairs.

All other values are reserved.

NUMPC, bits [15:12]

Indicates the number of PE Comparator Inputs that are available for tracing.

NUMPC	Meaning
0b0000	No PE Comparator Inputs are available.
0b0001	The implementation has one PE Comparator Input.
0b0010	The implementation has two PE Comparator Inputs.
0b0011	The implementation has three PE Comparator Inputs.
0b0100	The implementation has four PE Comparator Inputs.
0b0101	The implementation has five PE Comparator Inputs.
0b0110	The implementation has six PE Comparator Inputs.
0b0111	The implementation has seven PE Comparator Inputs.
0b1000	The implementation has eight PE Comparator Inputs.

All other values are reserved.

Bits [11:9]

Reserved, RES0.

SUPPDAC, bit [8]

When TRCIDR4.NUMACPAIRS != 0b0000:

Indicates whether data address comparisons are implemented. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

SUPPDAC	Meaning
0b0	Data address comparisons not implemented.
0b1	Data address comparisons implemented.

This field reads as 0.

Otherwise:

Reserved, RES0.

NUMDVC, bits [7:4]

Indicates the number of data value comparators. Data value comparators are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

NUMDVC	Meaning
0b0000	No data value comparators implemented.
0b0001	One data value comparator implemented.
0b0010	Two data value comparators implemented.
0b0011	Three data value comparators implemented.
0b0100	Four data value comparators implemented.
0b0101	Five data value comparators implemented.
0b0110	Six data value comparators implemented.
0b0111	Seven data value comparators implemented.
0b1000	Eight data value comparators implemented.

All other values are reserved.

This field reads as 0b0000.

NUMACPAIRS, bits [3:0]

Indicates the number of Address Comparator pairs that are available for tracing.

NUMACPAIRS	Meaning
0b0000	No Address Comparator pairs are available.
0b0001	The implementation has one Address Comparator pair.
0b0010	The implementation has two Address Comparator pairs.
0b0011	The implementation has three Address Comparator pairs.
0b0100	The implementation has four Address Comparator pairs.
0b0101	The implementation has five Address Comparator pairs.
0b0110	The implementation has six Address Comparator pairs.
0b0111	The implementation has seven Address Comparator pairs.
0b1000	The implementation has eight Address Comparator pairs.

All other values are reserved.

Accessing TRCIDR4

TRCIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1F0	TRCIDR4

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCIDR5, ID Register 5

The TRCIDR5 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR5 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR5\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCIDR5 are RES0.

Attributes

TRCIDR5 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OE	RES0	NUMCNTR	NUMSEQSTATE	RES0	LPOVERRIDE	ATBTRIG	TRACEIDSIZE	RES0	NUMEXTINSEL	NUMEXTIN																					

OE, bit [31]

Indicates support for the ETE Trace Output Enable.

Reserved, RES0.

OE	Meaning
0b0	ETE Trace Output Enable is not implemented.
0b1	ETE Trace Output Enable is implemented.

When FEAT_ETEv1p3 is implemented and when any IMPLEMENTATION DEFINED trace output interface is implemented, this field is 1.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

NUMCNTR, bits [30:28]

Indicates the number of Counters that are available for tracing.

NUMCNTR	Meaning
0b000	No Counters are available.
0b001	One Counter implemented.
0b010	Two Counters implemented.
0b011	Three Counters implemented.
0b100	Four Counters implemented.

All other values are reserved.

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0b000.

NUMSEQSTATE, bits [27:25]

Indicates if the Sequencer is implemented and the number of Sequencer states that are implemented.

NUMSEQSTATE	Meaning
0b000	The Sequencer is not implemented.
0b100	Four Sequencer states are implemented.

All other values are reserved.

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0b000.

Bit [24]

Reserved, RES0.

LPOVERRIDE, bit [23]

Indicates support for Low-power Override Mode.

LPOVERRIDE	Meaning
0b0	The trace unit does not support Low-power Override Mode.
0b1	The trace unit supports Low-power Override Mode.

ATBTRIG, bit [22]

Indicates if the implementation can support ATB triggers.

ATBTRIG	Meaning
0b0	The implementation does not support ATB triggers.
0b1	The implementation supports ATB triggers.

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0.

TRACEIDSIZE, bits [21:16]

Indicates the trace ID width.

TRACEIDSIZE	Meaning
0b000000	The external trace interface is not implemented.
0b000111	The implementation supports a 7-bit trace ID.

All other values are reserved.

Note that AMBA ATB requires a 7-bit trace ID width.

Bits [15:12]

Reserved, RES0.

NUMEXTINSEL, bits [11:9]

Indicates how many External Input Selector resources are implemented.

NUMEXTINSEL	Meaning
0b000	No External Input Selector resources are available.
0b001	1 External Input Selector resource is available.
0b010	2 External Input Selector resources are available.
0b011	3 External Input Selector resources are available.
0b100	4 External Input Selector resources are available.

All other values are reserved.

NUMEXTIN, bits [8:0]

Indicates how many External Inputs are implemented.

NUMEXTIN	Meaning
0b11111111	Unified PMU event selection.

All other values are reserved.

Accessing TRCIDR5

TRCIDR5 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1F4	TRCIDR5

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCIDR6, ID Register 6

The TRCIDR6 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR6 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR6\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCIDR6 are RES0.

Attributes

TRCIDR6 is a 32-bit register.

Field descriptions

313029282726252423222120191817161514131211109876543	2	1	0
RES0	EXLEVEL_RL_EL2	EXLEVEL_RL_EL1	EXLEVEL_RL_EL0

Bits [31:3]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [2]

Indicates if Realm EL2 is implemented.

EXLEVEL_RL_EL2	Meaning
0b0	Realm EL2 is not implemented.
0b1	Realm EL2 is implemented.

EXLEVEL_RL_EL1, bit [1]

Indicates if Realm EL1 is implemented.

EXLEVEL_RL_EL1	Meaning
0b0	Realm EL1 is not implemented.
0b1	Realm EL1 is implemented.

EXLEVEL_RL_EL0, bit [0]

Indicates if Realm EL0 is implemented.

EXLEVEL_RL_EL0	Meaning
0b0	Realm EL0 is not implemented.
0b1	Realm EL0 is implemented.

Accessing TRCIDR6

TRCIDR6 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1F8	TRCIDR6

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCIDR7, ID Register 7

The TRCIDR7 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR7 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR7\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR7 are RES0.

Attributes

TRCIDR7 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCIDR7

TRCIDR7 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1FC	TRCIDR7

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCIDR8, ID Register 8

The TRCIDR8 characteristics are:

Purpose

Returns the maximum speculation depth of the instruction trace element stream.

Configuration

External register TRCIDR8 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR8\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR8 are RES0.

Attributes

TRCIDR8 is a 32-bit register.

Field descriptions

MAXSPEC, bits [31:0]

Indicates the maximum speculation depth of the instruction trace element stream. This is the maximum number of P0 elements in the trace element stream that can be speculative at any time.

Accessing TRCIDR8

TRCIDR8 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x180	TRCIDR8

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCIMSPEC0, IMP DEF Register 0

The TRCIMSPEC0 characteristics are:

Purpose

TRCIMSPEC0 shows the presence of any IMPLEMENTATION DEFINED features, and provides an interface to enable the features that are provided.

Configuration

External register TRCIMSPEC0 bits [31:0] are architecturally mapped to AArch64 System register [TRCIMSPEC0\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented and FEAT_TRC_EXT is** implemented. Otherwise, direct accesses to TRCIMSPEC0 are RES0.

Attributes

TRCIMSPEC0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								EN		SUPPORT					

Bits [31:8]

Reserved, RES0.

EN, bits [7:4]

When TRCIMSPEC0.SUPPORT != 0b0000:

Enable. Controls whether the IMPLEMENTATION DEFINED features are enabled.

EN	Meaning
0b0000	The IMPLEMENTATION DEFINED features are not enabled. The trace unit must behave as if the IMPLEMENTATION DEFINED features are not supported.
0b0001	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0010	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0011	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0100	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0101	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0110	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0111	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1000	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1001	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1010	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1011	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1100	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1101	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1110	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1111	The trace unit behavior is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

Reserved, RES0.

Indicates whether the implementation supports IMPLEMENTATION DEFINED features.

Use of nonzero values requires written permission from Arm.

Access to this field is **RO**.

TRCIMSPEC0 can be accessed through the external debug interface:

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

Copyright © 2010-2022 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(new)

TRCIMSPEC<n>, IMP DEF Register <n>, n = 1 - 7

The TRCIMSPEC<n> characteristics are:

Purpose

These registers might return information that is specific to an implementation, or enable features specific to an implementation to be programmed. The product Technical Reference Manual describes these registers.

Configuration

External register TRCIMSPEC<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCIMSPEC<n>\[31:0\]](#).
This register is present only when the trace unit implements this OPTIONAL register, **FEAT_ETE is implemented** and **FEAT_TRC_EXT** ~~FEAT_ETE~~ is implemented. Otherwise, direct accesses to TRCIMSPEC<n> are RES0.

Attributes

TRCIMSPEC<n> is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.
This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

Accessing TRCIMSPEC<n>

TRCIMSPEC<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1C0 + (4 * n)	TRCIMSPEC<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

(old)

htmldiff from-

(new)

TRCITCTRL, Integration Mode Control Register

The TRCITCTRL characteristics are:

Purpose

A component can use TRCITCTRL to dynamically switch between functional mode and integration mode. In integration mode, topology detection is enabled. After switching to integration mode and performing integration tests or topology detection, reset the system to ensure correct behavior of CoreSight and other connected system components.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCITCTRL are RES0.

Attributes

TRCITCTRL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																IME															

Bits [31:1]

Reserved, RES0.

IME, bit [0] When topology detection or integration functionality is implemented:

Integration Mode Enable.

IME	Meaning
0b0	Component functional mode.
0b1	Component integration mode. Support for topology detection and integration testing is enabled.

Otherwise:

Reserved, RES0.

Accessing TRCITCTRL

External debugger accesses to this register are IMPLEMENTATION DEFINED when the trace unit is not in the Idle state.

TRCITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

TRCITCTRL, Integration Mode Control Register

ETE	0xF00	TRCITCTRL
-----	-------	-----------

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

TRCITEEDCR, Instrumentation Trace Extension External Debug Control Register

The TRCITEEDCR characteristics are:

Purpose

Controls instrumentation trace filtering.

Configuration

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented and TRCIDR0.ITE == 1. Otherwise, direct accesses to TRCITEEDCR are RES0.

Attributes

TRCITEEDCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								RL	S	NS	E3	E2	E1	E0	

Bits [31:7]

Reserved, RES0.

RL, bit [6] When FEAT_RME is implemented:

Instrumentation Trace in Realm state.

RL	Meaning
0b0	Instrumentation trace prohibited in Realm state.
0b1	Instrumentation trace permitted in Realm state.

Used in conjunction with [TRCCONFIGR.ITO](#) and [TRCITEEDCR.E<m>](#) to control whether Instrumentation trace is permitted or prohibited in Realm state.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [5]**When Secure state is implemented:**

Instrumentation Trace in Secure state.

S	Meaning
0b0	Instrumentation trace prohibited in Secure state.
0b1	Instrumentation trace permitted in Secure state.

Used in conjunction with [TRCCONFIGR.ITO](#) and [TRCITEEDCR.E<m>](#) to control whether Instrumentation trace is permitted or prohibited in Secure state.

This field is ignored when `SelfHostedTraceEnabled()` returns TRUE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NS, bit [4]**When Any of Non-secure EL2, EL1, or EL0 are implemented:**

Instrumentation Trace in Non-secure state.

NS	Meaning
0b0	Instrumentation trace prohibited in Non-secure state.
0b1	Instrumentation trace permitted in Non-secure state.

Used in conjunction with [TRCCONFIGR.ITO](#) and [TRCITEEDCR.E<m>](#) to control whether Instrumentation trace is permitted or prohibited in Non-secure state.

This field is ignored when `SelfHostedTraceEnabled()` returns TRUE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [3]**When EL3 is implemented:**

Instrumentation Trace Enable at EL3.

E3	Meaning
0b0	Instrumentation trace prohibited at EL3.
0b1	Instrumentation trace permitted at EL3.

This field is ignored when `SelfHostedTraceEnabled()` returns TRUE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E<m>, bit [m], for m = 2 to 0

Instrumentation Trace Enable at EL<m>.

E<m>	Meaning
0b0	Instrumentation trace prohibited at EL<m>.
0b1	Instrumentation trace permitted at EL<m>.

Used in conjunction with [TRCCONFIGR.ITO](#), [TRCITEEDCR.NS](#), [TRCITEEDCR.S](#), and [TRCITEEDCR.RL](#) to control whether Instrumentation trace is permitted or prohibited at EL<m> in the specified security states.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

E<2> is RES0 if EL2 is not implemented in any security states.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCITEEDCR

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCITEEDCR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x048	TRCITEEDCR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

TRCLAR, Lock Access Register

The TRCLAR characteristics are:

Purpose

Used to lock and unlock the Software Lock.

Note that ETE does not implement the Software Lock.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and the Software Lock is implemented. Otherwise, direct accesses to TRCLAR are RES0.

Attributes

TRCLAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																KEY															

KEY, bits [31:0]

When Software Lock is implemented:

Software Lock Key.

A value of 0xC5ACCE55 unlocks the Software Lock.

Any other value locks the Software Lock.

Otherwise:

Reserved, RES0.

Accessing TRCLAR

External debugger accesses to this register are unaffected by the OS Lock.

TRCLAR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFB0	TRCLAR

This interface is accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **WO**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffbbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCLSR, Lock Status Register

The TRCLSR characteristics are:

Purpose

Indicates whether the Software Lock is implemented, and the current status of the Software Lock.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCLSR are RES0.

Attributes

TRCLSR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Software lock size.
Reads as 0b0.
Access to this field is **RO**.

SLK, bit [1]

The current Software Lock status.

SLK	Meaning
0b0	Software Lock is unlocked.
0b1	Software Lock is locked. Writes to the other registers in this component, except for the TRCLAR , are ignored.

This field reads as 0.

SLI, bit [0]

Indicates whether the Software Lock is implemented.

SLI	Meaning
0b0	Software Lock is not implemented. Writes to the TRCLAR are ignored.
0b1	Software Lock is implemented.

This field reads as 0.

Accessing TRCLSR

External debugger accesses to this register are unaffected by the OS Lock.

TRCLSR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFB4	TRCLSR

This interface is accessible as follows:

- When `!IsTraceCorePowered()`, accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

RES0 OSLM[2:1] RES0 OSLK OSLM[0]

Bits [31:5]

Reserved, RES0.

OSLM, bits [4:3, 0]

OS Lock model.

OSLM	Meaning
0b000	Trace OS Lock is not implemented.
0b010	Trace OS Lock is implemented.
0b100	Trace OS Lock is not implemented, and the trace unit is controlled by the PE OS Lock.

All other values are reserved.

This field reads as 0b100.

The OSLM field is split as follows:

- OSLM[2:1] is TRCOSLSR[4:3].
- OSLM[0] is TRCOSLSR[0].

Bit [2]

Reserved, RES0.

OSLK, bit [1]

OS Lock status.

OSLK	Meaning
0b0	The OS Lock is unlocked.
0b1	The OS Lock is locked.

Note that this field indicates the state of the PE OS Lock.

Accessing TRCOSLSR

External debugger accesses to this register are unaffected by the OS Lock.

TRCOSLSR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x304	TRCOSLSR

This interface is accessible as follows:

- When `!AllowExternalTraceAccess()` or `!IsTraceCorePowered()`, accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCPDSR, PowerDown Status Register

The TRCPDSR characteristics are:

Purpose

Indicates the power status of the trace unit.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPDSR are RES0.

Attributes

TRCPDSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												OSLK		RES0		STICKYPD		POWER	

Bits [31:6]

Reserved, RES0.

OSLK, bit [5]

OS Lock Status.

OSLK	Meaning
0b0	The OS Lock is unlocked.
0b1	The OS Lock is locked.

Note that this field indicates the state of the PE OS Lock.

Bits [4:2]

Reserved, RES0.

STICKYPD, bit [1]

Sticky powerdown status. Indicates whether the trace register state is valid.

STICKYPD	Meaning
0b0	The state of TRCOSLSR and the trace registers are valid.
0b1	The state of TRCOSLSR and the trace registers might not be valid.

This field is set to 1 if the power to the trace unit core power domain is removed and the trace unit register state is not valid.

The STICKYPD field is read-sensitive. On a read of the TRCPDSR, this field is cleared to 0 after the register has been read.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 1.

POWER, bit [0]

Power Status.

POWER	Meaning
0b0	The trace unit core power domain is not powered. All trace unit registers are not accessible and they all return an error response.
0b1	The trace unit core power domain is powered. Trace unit registers are accessible.

Access to this field is **RAO/WI**.

Accessing TRCPDSR

External debugger accesses to this register are unaffected by the OS Lock.

TRCPDSR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x314	TRCPDSR

This interface is accessible as follows:

- When `!IsTraceCorePowered()`, accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

RES0																								PART_0							

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, bits [7:0].

The part number is selected by the designer of the component, and is stored in [TRCPIDR1](#).PART_1 and TRCPIDR0.PART_0.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR0

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFE0	TRCPIDR0

This interface is accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffbbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCPIDR1, Peripheral Identification Register 1

The TRCPIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPIDR1 are RES0.

Attributes

TRCPIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								DES 0			PART 1				

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0]. TRCPIDR1.DES_0 and TRCPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, bits [11:8].

The part number is selected by the designer of the component, and is stored in TRCPIDR1.PART_1 and TRCPIDR0.PART_0.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

TRCPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFE4	TRCPIDR1

- When `!IsTraceCorePowered()`, accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCPIDR2, Peripheral Identification Register 2

The TRCPIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCPIDR2 are RES0.

Attributes

TRCPIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																REVISION				JEDEC		DES 1									

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component major revision. TRCPIDR2.REVISION and [TRCPIDR3.REVAND](#) together form the revision number of the component, with TRCPIDR2.REVISION being the most significant part and [TRCPIDR3.REVAND](#) the least significant part. When a component is changed, TRCPIDR2.REVISION or [TRCPIDR3.REVAND](#) are increased to ensure that software can differentiate the different revisions of the component. [TRCPIDR3.REVAND](#) should be set to 0b0000 when TRCPIDR2.REVISION is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. [TRCPIDR1.DES_0](#) and TRCPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR2

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFE8	TRCPIDR2

This interface is accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCPIDR3, Peripheral Identification Register 3

The TRCPIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCPIDR3 are RES0.

Attributes

TRCPIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												REVAND				CMOD			

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Component minor revision. [TRCPIDR2.REVISION](#) and TRCPIDR3.REVAND together form the revision number of the component, with [TRCPIDR2.REVISION](#) being the most significant part and TRCPIDR3.REVAND the least significant part. When a component is changed, [TRCPIDR2.REVISION](#) or TRCPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. TRCPIDR3.REVAND should be set to 0b0000 when [TRCPIDR2.REVISION](#) is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.

- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR3

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFEC	TRCPIDR3

This interface is accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCPIDR4, Peripheral Identification Register 4

The TRCPIDR4 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPIDR4 are RES0.

Attributes

TRCPIDR4 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SIZE			DES 2				

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component.

The distance from the start of the address space used by this component to the end of the component identification registers.

A value of 0b0000 means one of the following is true:

- The component uses a single 4KB block.
- The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.

Any other value means the component occupies $2^{\text{TRCPIDR4.SIZE}}$ 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

Reads as 0b0000.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value 0x4.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR4

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFD0	TRCPIDR4

This interface is accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCPIDR5, Peripheral Identification Register 5

The TRCPIDR5 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPIDR5 are RES0.

Attributes

TRCPIDR5 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCPIDR5

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR5 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFD4	TRCPIDR5

This interface is accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

Copyright © 2010-2022 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCPIDR6, Peripheral Identification Register 6

The TRCPIDR6 characteristics are:

Purpose

Provides discovery information about the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPIDR6 are RES0.

Attributes

TRCPIDR6 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCPIDR6

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR6 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFD8	TRCPIDR6

This interface is accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCPIDR7, Peripheral Identification Register 7

The TRCPIDR7 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPIDR7 are RES0.

Attributes

TRCPIDR7 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCPIDR7

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR7 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFDC	TRCPIDR7

This interface is accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

TRCPRGCTLR, Programming Control Register

The TRCPRGCTLR characteristics are:

Purpose

Enables the trace unit.

Configuration

External register TRCPRGCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCPRGCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented and FEAT_TRC_EXT is** implemented. Otherwise, direct accesses to TRCPRGCTLR are RES0.

Attributes

TRCPRGCTLR is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

EN, bit [0]

Trace unit enable.

EN	Meaning
0b0	The trace unit is disabled.
0b1	The trace unit is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Accessing TRCPRGCTLR

Must be programmed.

TRCPRGCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x004	TRCPRGCTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.

- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCQCTLR, Q Element Control Register

The TRCQCTLR characteristics are:

Purpose

Controls when Q elements are enabled.

Configuration

External register TRCQCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCQCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and TRCIDR0.QFILT == 1. Otherwise, direct accesses to TRCQCTLR are RES0.

Attributes

TRCQCTLR is a 32-bit register.

Field descriptions

313029282726252423222120191817161514131211109	8	7	6	5	4	3	2
RES0	MODE	RANGE[7]	RANGE[6]	RANGE[5]	RANGE[4]	RANGE[3]	RANGE[2]

Bits [31:9]

Reserved, RES0.

MODE, bit [8]

Selects whether the Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:

MODE	Meaning
0b0	Exclude mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map.
0b1	Include Mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0 then Q elements are disabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Specifies whether Address Range Comparator <m> controls Q elements.

RANGE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected.
0b1	The address range that Address Range Comparator <m> defines, is selected.

This bit is RES0 if $m \geq \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCQCTLR

Must be programmed if [TRCCONFIGR.QE](#) != 0b00.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCQCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x044	TRCQCTL

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCRSCTLR<n>, Resource Selection Control Register <n>, n = 2 - 31

The TRCRSCTLR<n> characteristics are:

Purpose

Controls the selection of the resources in the trace unit.

Configuration

External register TRCRSCTLR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCRSCTLR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and $(\text{UInt}(\text{TRCIDR4.NUMRSPAIR}) + 1) * 2 > n$. Otherwise, direct accesses to TRCRSCTLR<n> are RES0.

Resource selector 0 always returns FALSE.

Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

Attributes

TRCRSCTLR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										PAIRINV	INV	GROUP				SELECT															

Bits [31:22]

Reserved, RES0.

PAIRINV, bit [21]

When $n \bmod 2 == 0$:

Controls whether the combined result from a resource selector pair is inverted.

PAIRINV	Meaning
0b0	Do not invert the combined output of the 2 resource selectors.
0b1	Invert the combined output of the 2 resource selectors.

If:

- A is the register TRCRSCTLR<n>.
- B is the register TRCRSCTLR<n+1>.

Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:

- 0b000 -> A and B.

- 0b001 -> Reserved.
- 0b010 -> not(A) and B.
- 0b011 -> not(A) and not(B).
- 0b100 -> not(A) or not(B).
- 0b101 -> not(A) or B.
- 0b110 -> Reserved.
- 0b111 -> A or B.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

INV, bit [20]

Controls whether the resource, that TRCRSCTLR<n>.GROUP and TRCRSCTLR<n>.SELECT selects, is inverted.

INV	Meaning
0b0	Do not invert the output of this selector.
0b1	Invert the output of this selector.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

GROUP, bits [19:16]

Selects a group of resources.

GROUP	Meaning	SELECT
0b0000	External Input Selectors.	SELECT encoding for External Input Selectors
0b0001	PE Comparator Inputs.	SELECT encoding for PE Comparator Inputs
0b0010	Counters and Sequencer.	SELECT encoding for Counters and Sequencer
0b0011	Single-shot Comparator Controls.	SELECT encoding for Single-shot Comparator Controls
0b0100	Single Address Comparators.	SELECT encoding for Single Address Comparators
0b0101	Address Range Comparators.	SELECT encoding for Address Range Comparators
0b0110	Context Identifier Comparators.	SELECT encoding for Context Identifier Comparators
0b0111	Virtual Context Identifier Comparators.	SELECT encoding for Virtual Context Identifier Comparators

All other values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT, bits [15:0]

Resource Specific Controls. Contains the controls specific to the resource group selected by GROUP, described in the following sections.

SELECT encoding for External Input Selectors

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												EXTIN[3]	EXTIN[2]	EXTIN[1]	EXTIN[0]

Bits [15:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

Selects one or more External Inputs.

EXTIN[<m>]	Meaning
0b0	Ignore EXTIN <m>.
0b1	Select EXTIN <m>.

This bit is RES0 if m >= [TRCIDR5](#).NUMEXTINSEL.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for PE Comparator Inputs

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PECOMP[7]	PECOMP[6]	PECOMP[5]	PECOMP[4]	PECOMP[3]	PECOMP[2]	PECOMP[1]	PECOMP[0]

Bits [15:8]

Reserved, RES0.

PECOMP[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs.

PECOMP[<m>]	Meaning
0b0	Ignore PE Comparator Input <m>.
0b1	Select PE Comparator Input <m>.

This bit is RES0 if m >= [TRCIDR4](#).NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Counters and Sequencer

15	14	13	12	11	10	9	8	7	6	5	4	3	2
RES0								SEQUENCER[3]	SEQUENCER[2]	SEQUENCER[1]	SEQUENCER[0]	COUNTERS[3]	COUNTERS[2]

Bits [15:8]

Reserved, RES0.

SEQUENCER[<m>], bit [m+4], for m = 3 to 0

Sequencer states.

SEQUENCER[<m>]	Meaning
0b0	Ignore Sequencer state <m>.
0b1	Select Sequencer state <m>.

This bit is RES0 if m >= [TRCIDR5](#).NUMSEQSTATE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COUNTERS[<m>], bit [m], for m = 3 to 0

Counters resources at zero.

COUNTERS[<m>]	Meaning
0b0	Ignore Counter <m>.
0b1	Select Counter <m> is zero.

This bit is RES0 if m >= [TRCIDR5](#).NUMCNTR.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single-shot Comparator Controls

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	SINGLE_SHOT[7]	SINGLE_SHOT[6]	SINGLE_SHOT[5]	SINGLE_SHOT[4]	SINGLE_SHOT[3]	SINGLE_SHOT[2]	SINGLE_SHOT[1]	SINGLE_SHOT[0]	RES0	RES0	RES0	RES0	RES0	RES0	RES0

Bits [15:8]

Reserved, RES0.

SINGLE_SHOT[<m>], bit [m], for m = 7 to 0

Selects one or more Single-shot Comparator Controls.

SINGLE_SHOT[<m>]	Meaning
0b0	Ignore Single-shot Comparator Control <m>.
0b1	Select Single-shot Comparator Control <m>.

This bit is RES0 if m >= [TRCIDR4](#).NUMSSCC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single Address Comparators

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SAC[15]	SAC[14]	SAC[13]	SAC[12]	SAC[11]	SAC[10]	SAC[9]	SAC[8]	SAC[7]	SAC[6]	SAC[5]	SAC[4]	SAC[3]	SAC[2]	SAC[1]	SAC[0]

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators.

SAC[<m>]	Meaning
0b0	Ignore Single Address Comparator <m>.
0b1	Select Single Address Comparator <m>.

This bit is RES0 if m >= 2 × [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Address Range Comparators

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								ARC[7]	ARC[6]	ARC[5]	ARC[4]	ARC[3]	ARC[2]	ARC[1]	ARC[0]

Bits [15:8]

Reserved, RES0.

ARC[<m>], bit [m], for m = 7 to 0

Selects one or more Address Range Comparators.

ARC[<m>]	Meaning
0b0	Ignore Address Range Comparator <m>.
0b1	Select Address Range Comparator <m>.

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Context Identifier Comparators

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								CID[7]	CID[6]	CID[5]	CID[4]	CID[3]	CID[2]	CID[1]	CID[0]

Bits [15:8]

Reserved, RES0.

CID[<m>], bit [m], for m = 7 to 0

Selects one or more Context Identifier Comparators.

CID[<m>]	Meaning
0b0	Ignore Context Identifier Comparator <m>.
0b1	Select Context Identifier Comparator <m>.

This bit is RES0 if m >= [TRCIDR4](#).NUMCIDC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Virtual Context Identifier Comparators

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								VMID[7]	VMID[6]	VMID[5]	VMID[4]	VMID[3]	VMID[2]	VMID[1]	VMID[0]

Bits [15:8]

Reserved, RES0.

VMID[<m>], bit [m], for m = 7 to 0

Selects one or more Virtual Context Identifier Comparators.

VMID[<m>]	Meaning
0b0	Ignore Virtual Context Identifier Comparator <m>.
0b1	Select Virtual Context Identifier Comparator <m>.

This bit is RES0 if m >= [TRCIDR4.NUMVMIDC](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCRSCTLR<n>

Must be programmed if any of the following are true:

- [TRCCNTCTLR<a>.RLDEVENT.TYPE](#) == 0 and [TRCCNTCTLR<a>.RLDEVENT.SEL](#) == n.
- [TRCCNTCTLR<a>.RLDEVENT.TYPE](#) == 1 and [TRCCNTCTLR<a>.RLDEVENT.SEL](#) == n/2.
- [TRCCNTCTLR<a>.CNTEVENT.TYPE](#) == 0 and [TRCCNTCTLR<a>.CNTEVENT.SEL](#) == n.
- [TRCCNTCTLR<a>.CNTEVENT.TYPE](#) == 1 and [TRCCNTCTLR<a>.CNTEVENT.SEL](#) == n/2.
- [TRCEVENTCTL0R.EVENT0.TYPE](#) == 0 and [TRCEVENTCTL0R.EVENT0.SEL](#) == n.
- [TRCEVENTCTL0R.EVENT0.TYPE](#) == 1 and [TRCEVENTCTL0R.EVENT0.SEL](#) == n/2.
- [TRCEVENTCTL0R.EVENT1.TYPE](#) == 0 and [TRCEVENTCTL0R.EVENT1.SEL](#) == n.
- [TRCEVENTCTL0R.EVENT1.TYPE](#) == 1 and [TRCEVENTCTL0R.EVENT1.SEL](#) == n/2.
- [TRCEVENTCTL0R.EVENT2.TYPE](#) == 0 and [TRCEVENTCTL0R.EVENT2.SEL](#) == n.
- [TRCEVENTCTL0R.EVENT2.TYPE](#) == 1 and [TRCEVENTCTL0R.EVENT2.SEL](#) == n/2.
- [TRCEVENTCTL0R.EVENT3.TYPE](#) == 0 and [TRCEVENTCTL0R.EVENT3.SEL](#) == n.
- [TRCEVENTCTL0R.EVENT3.TYPE](#) == 1 and [TRCEVENTCTL0R.EVENT3.SEL](#) == n/2.
- [TRCSEQEVR<a>.B.TYPE](#) == 0 and [TRCSEQEVR<a>.B.SEL](#) == n.
- [TRCSEQEVR<a>.B.TYPE](#) == 1 and [TRCSEQEVR<a>.B.SEL](#) == n/2.
- [TRCSEQEVR<a>.F.TYPE](#) == 0 and [TRCSEQEVR<a>.F.SEL](#) == n.
- [TRCSEQEVR<a>.F.TYPE](#) == 1 and [TRCSEQEVR<a>.F.SEL](#) == n/2.
- [TRCSEQRSTEV.RST.TYPE](#) == 0 and [TRCSEQRSTEV.RST.SEL](#) == n.
- [TRCSEQRSTEV.RST.TYPE](#) == 1 and [TRCSEQRSTEV.RST.SEL](#) == n/2.
- [TRCTSCTLR.EVENT.TYPE](#) == 0 and [TRCTSCTLR.EVENT.SEL](#) == n.
- [TRCTSCTLR.EVENT.TYPE](#) == 1 and [TRCTSCTLR.EVENT.SEL](#) == n/2.
- [TRCVICTLR.EVENT.TYPE](#) == 0 and [TRCVICTLR.EVENT.SEL](#) == n.
- [TRCVICTLR.EVENT.TYPE](#) == 1 and [TRCVICTLR.EVENT.SEL](#) == n/2.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCRSCTLR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x200 + (4 * n)	TRCRSCTLR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

TRCRSR, Resources Status Register

The TRCRSR characteristics are:

Purpose

Use this to set, or read, the status of the resources.

Configuration

External register TRCRSR bits [31:0] are architecturally mapped to AArch64 System register [TRCRSR\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCRSR are RES0.

Attributes

TRCRSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												TA	EVENT[3]	EVENT[2]	EVENT[1]	EVENT[0]	RES0	EXTIN[3]	EXTIN[2]	EXTIN[1]	EXTIN[0]										

Bits [31:13]

Reserved, RES0.

TA, bit [12]

Tracing active.

TA	Meaning
0b0	Tracing is not active.
0b1	Tracing is active.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

EVENT[<m>], bit [m+8], for m = 3 to 0

Untraced status of ETEEvents.

EVENT[<m>]	Meaning
0b0	An ETEEvent <m> has not occurred.
0b1	An ETEEvent <m> has occurred while the resources were in the Paused state.

This bit is RES0 if [TRCIDR4](#).NUMRSPAIR == 0 || m > [TRCIDR0](#).NUMEVENT.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

(old)

htmldiff from-

(new)

TRCSEQEVR<n>, Sequencer State Transition Control Register <n>, n = 0 - 2

The TRCSEQEVR<n> characteristics are:

Purpose

Moves the Sequencer state:

- Backwards, from state n+1 to state n when a programmed resource event occurs.
- Forwards, from state n to state n+1 when a programmed resource event occurs.

Configuration

External register TRCSEQEVR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCSEQEVR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQEVR<n> are RES0.

Attributes

TRCSEQEVR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																B TYPE		RES0		B SEL				F TYPE		RES0		F SEL			

Bits [31:16]

Reserved, RES0.

B_TYPE, bit [15]

Chooses the type of Resource Selector.

Backward field. Defines whether the backward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == 0x14 then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

B_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQEVR<n>.B.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.B.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.B.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

B_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.B.TYPE controls whether TRCSEQEVR<n>.B.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Backward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

F_TYPE, bit [7]

Chooses the type of Resource Selector.

Backward field. Defines whether the forward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == 0x12 then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

F_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQEVR<n>.F.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.F.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.F.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

F_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.F.TYPE controls whether TRCSEQEVR<n>.F.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Forward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQEVR<n>

Must be programmed if [TRCRSCTLR<a>.GROUP == 0b0010](#) and [TRCRSCTLR<a>.SEQUENCER != 0b0000](#).

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSEQEVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x100 + (4 * n)	TRCSEQEVR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6ffdbbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCSEQRSTEV, Sequencer Reset Control Register

The TRCSEQRSTEV characteristics are:

Purpose

Moves the Sequencer to state 0 when a programmed resource event occurs.

Configuration

External register TRCSEQRSTEV bits [31:0] are architecturally mapped to AArch64 System register [TRCSEQRSTEV\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQRSTEV are RES0.

Attributes

TRCSEQRSTEV is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8		7		6	5	4	3	2	1	0
RES0																								RST_TYPE		RES0		RST_SEL					

Bits [31:8]

Reserved, RES0.

RST_TYPE, bit [7]

Chooses the type of Resource Selector.

RST_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQRSTEV.RST.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQRSTEV.RST.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQRSTEV.RST.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

TRCSEQSTR, Sequencer State Register

The TRCSEQSTR characteristics are:

Purpose

Use this to set, or read, the Sequencer state.

Configuration

External register TRCSEQSTR bits [31:0] are architecturally mapped to AArch64 System register [TRCSEQSTR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQSTR are RES0.

Attributes

TRCSEQSTR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															STATE

Bits [31:2]

Reserved, RES0.

STATE, bits [1:0]

Set or returns the state of the Sequencer.

STATE	Meaning
0b00	State 0.
0b01	State 1.
0b10	State 2.
0b11	State 3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQSTR

Must be programmed if [TRCRSCTLR<a>.GROUP](#) == 0b0010 and [TRCRSCTLR<a>.SEQUENCER](#) != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSEQSTR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x11C	TRCSEQSTR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

TRCSSCCR<n>, Single-shot Comparator Control Register <n>, n = 0 - 7

The TRCSSCCR<n> characteristics are:

Purpose

Controls the corresponding Single-shot Comparator Control resource.

Configuration

External register TRCSSCCR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCSSCCR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and UInt(TRCIDR4.NUMSSCC) > n. Otherwise, direct accesses to TRCSSCCR<n> are RES0.

Attributes

TRCSSCCR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	
							RES0	RST	ARC[7]	ARC[6]	ARC[5]	ARC[4]	ARC[3]	ARC[2]	ARC[1]	ARC[0]	SAC[15]	SAC[14]	SAC[13]	SAC[12]	SAC[11]

Bits [31:25]

Reserved, RES0.

RST, bit [24]

Selects the Single-shot Comparator Control mode.

RST	Meaning
0b0	The Single-shot Comparator Control is in single-shot mode.
0b1	The Single-shot Comparator Control is in multi-shot mode.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

ARC[<m>], bit [m+16], for m = 7 to 0

Selects one or more Address Range Comparators for Single-shot control.

ARC[<m>]	Meaning
0b0	The Address Range Comparator <m>, is not selected for Single-shot control.
0b1	The Address Range Comparator <m>, is selected for Single-shot control.

This bit is RES0 if m >= [TRCIDR4.NUMACPAIRS](#).

The reset behavior of this field is:

Selects one or more Single Address Comparators for Single-shot control.

SAC[<m>]	Meaning
0b0	The Single Address Comparator <m>, is not selected for Single-shot control.
0b1	The Single Address Comparator <m>, is selected for Single-shot control.

This bit is RES0 if $m \geq 2 \times \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSSCCR<n>

Must be programmed if any [TRCRSCTLR<a>](#).GROUP == 0b0011 and [TRCRSCTLR<a>](#).SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSSCCR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	$0x280 + (4 * n)$	TRCSSCCR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

TRCSSCSR<n>, Single-shot Comparator Control Status Register <n>, n = 0 - 7

The TRCSSCSR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

External register TRCSSCSR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCSSCSR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and $UInt(TRCIDR4.NUMSSCC) > n$. Otherwise, direct accesses to TRCSSCSR<n> are RES0.

Attributes

TRCSSCSR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0												
STATUS		PENDING																										RES0								PCD		VD		DA		INST	

STATUS, bit [31]

Single-shot Comparator Control status. Indicates if any of the comparators selected by this Single-shot Comparator control have matched. The selected comparators are defined by [TRCSSCCR<n> .ARC](#), [TRCSSCCR<n> .SAC](#), and [TRCSSPCICR<n> .PC](#).

STATUS	Meaning
0b0	No match has occurred. When the first match occurs, this field takes a value of 1. It remains at 1 until explicitly modified by a write to this register.
0b1	One or more matches has occurred. If TRCSSCCR<n> .RST == 0 then: <ul style="list-style-type: none"> There is only one match and no more matches are possible. Software must reset this field to 0 to re-enable the Single-shot Comparator Control.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

PENDING, bit [30]

Single-shot pending status. The Single-shot Comparator Control fired while the resources were in the Paused state.

PENDING	Meaning
0b0	No match has occurred.
0b1	One or more matches has occurred.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [29:4]

Reserved, RES0.

PC, bit [3]

PE Comparator Input support. Indicates if the Single-shot Comparator Control supports PE Comparator Inputs.

PC	Meaning
0b0	This Single-shot Comparator Control does not support PE Comparator Inputs. Selecting any PE Comparator Inputs using the associated TRCSSPCICR<n> results in CONSTRAINED UNPREDICTABLE behavior of the Single-shot Comparator Control resource. The Single-shot Comparator Control might match unexpectedly or might not match.
0b1	This Single-shot Comparator Control supports PE Comparator Inputs.

Access to this field is **RO**.

DV, bit [2]

Data value comparator support. Data value comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

DV	Meaning
0b0	This Single-shot Comparator Control does not support data value comparisons.
0b1	This Single-shot Comparator Control supports data value comparisons.

This field reads as 0.

Access to this field is **RO**.

DA, bit [1]

Data Address Comparator support. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

DA	Meaning
0b0	This Single-shot Comparator Control does not support data address comparisons.
0b1	This Single-shot Comparator Control supports data address comparisons.

This field reads as 0.

Access to this field is **RO**.

INST, bit [0]

Instruction Address Comparator support. Indicates if the Single-shot Comparator Control supports instruction address comparisons.

INST	Meaning
0b0	This Single-shot Comparator Control does not support instruction address comparisons.
0b1	This Single-shot Comparator Control supports instruction address comparisons.

TRCSSPCICR<n>, Single-shot Processing Element Comparator Input Control Register <n>, n = 0 - 7

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSSPCICR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x2C0 + (4 * n)	TRCSSPCICR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCSTALLCTLR, Stall Control Register

The TRCSTALLCTLR characteristics are:

Purpose

Enables trace unit functionality that prevents trace unit buffer overflows.

Configuration

External register TRCSTALLCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCSTALLCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and TRCIDR3.STALLCTL == 1. Otherwise, direct accesses to TRCSTALLCTLR are RES0.

Attributes

TRCSTALLCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0														NOOVERFLOW					RES0			ISTALL		RES0			LEVEL				

Bits [31:14]

Reserved, RES0.

NOOVERFLOW, bit [13]

When TRCIDR3.NOOVERFLOW == 1:

Trace overflow prevention.

NOOVERFLOW	Meaning
0b0	Trace unit buffer overflow prevention is disabled.
0b1	Trace unit buffer overflow prevention is enabled.

Note that enabling this feature might cause a significant performance impact.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

TRCSTATR, Trace Status Register

The TRCSTATR characteristics are:

Purpose

Returns the trace unit status.

Configuration

External register TRCSTATR bits [31:0] are architecturally mapped to AArch64 System register [TRCSTATR\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCSTATR are RES0.

Attributes

TRCSTATR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																PMSTABLE		IDLE													

Bits [31:2]

Reserved, RES0.

PMSTABLE, bit [1]

Programmers' model stable.

PMSTABLE	Meaning
0b0	The programmers' model is not stable.
0b1	The programmers' model is stable.

Accessing this field has the following behavior:

- When the trace unit is enabled, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

IDLE, bit [0]

Idle status.

IDLE	Meaning
0b0	The trace unit is not idle.
0b1	The trace unit is idle.

(new)

TRCSYNCP, Synchronization Period Register

The TRCSYNCP characteristics are:

Purpose

Controls how often trace protocol synchronization requests occur.

Configuration

External register TRCSYNCP bits [31:0] are architecturally mapped to AArch64 System register [TRCSYNCP\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCSYNCP are RES0.

Attributes

TRCSYNCP is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																												PERIOD			

Bits [31:5]

Reserved, RES0.

PERIOD, bits [4:0]

Defines the number of bytes of trace between each periodic trace protocol synchronization request.

PERIOD	Meaning
0b00000	Trace protocol synchronization is disabled.
0b01000	Trace protocol synchronization request occurs after 2^8 bytes of trace.
0b01001	Trace protocol synchronization request occurs after 2^9 bytes of trace.
0b01010	Trace protocol synchronization request occurs after 2^{10} bytes of trace.
0b01011	Trace protocol synchronization request occurs after 2^{11} bytes of trace.
0b01100	Trace protocol synchronization request occurs after 2^{12} bytes of trace.
0b01101	Trace protocol synchronization request occurs after 2^{13} bytes of trace.
0b01110	Trace protocol synchronization request occurs after 2^{14} bytes of trace.
0b01111	Trace protocol synchronization request occurs after 2^{15} bytes of trace.
0b10000	Trace protocol synchronization request occurs after 2^{16} bytes of trace.
0b10001	Trace protocol synchronization request occurs after 2^{17} bytes of trace.
0b10010	Trace protocol synchronization request occurs after 2^{18} bytes of trace.
0b10011	Trace protocol synchronization request occurs after 2^{19} bytes of trace.
0b10100	Trace protocol synchronization request occurs after 2^{20} bytes of trace.

Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is CONSTRAINED UNPREDICTABLE and one of the following behaviors occurs:

- No trace protocol synchronization requests are generated by this counter.
- Trace protocol synchronization requests occur at the specified period.
- Trace protocol synchronization requests occur at some other UNKNOWN period which can vary.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSYNCP

Must be programmed if [TRCIDR3.SYNCP](#) == 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSYNCP can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x034	TRCSYNCP

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

TRCTRAIDR, Trace ID Register

The TRCTRAIDR characteristics are:

Purpose

Sets the trace ID for instruction trace.

Configuration

External register TRCTRAIDR bits [31:0] are architecturally mapped to AArch64 System register [TRCTRAIDR\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented and FEAT_TRC_EXT is** implemented. Otherwise, direct accesses to TRCTRAIDR are RES0.

Attributes

TRCTRAIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0														TRACEID																	

Bits [31:7]

Reserved, RES0.

TRACEID, bits [6:0]

Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of [TRCIDR5](#).TRACEIDSIZE. Unimplemented bits are RES0.

If an implementation supports AMBA ATB, then:

- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause UNPREDICTABLE behavior of the trace capture infrastructure.

See the AMBA ATB Protocol Specification for information about which ATID values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCTRAIDR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCTRACEIDR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x040	TRCTRACEIDR

This interface is accessible as follows:

- When OSLockStatus(), or !IsTraceCorePowered() or !AllowExternalTraceAccess(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

TRCTSCTLR, Timestamp Control Register

The TRCTSCTLR characteristics are:

Purpose

Controls the insertion of global timestamps in the trace stream.

Configuration

External register TRCTSCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCTSCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and TRCIDR0.TSSIZE != 0b00000. Otherwise, direct accesses to TRCTSCTLR are RES0.

Attributes

TRCTSCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								EVENT_TYPE		RES0		EVENT_SEL			

Bits [31:8]

Reserved, RES0.

EVENT_TYPE, bit [7] When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

EVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCTSCTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCTSCTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCTSCTLR.EVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCVICTLR, ViewInst Main Control Register

The TRCVICTLR characteristics are:

Purpose

Controls instruction trace filtering.

Configuration

External register TRCVICTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCVICTLR\[31:0\]](#).

This register is present only when FEAT_ETE is **implemented** and FEAT_TRC_EXT is **implemented**. Otherwise, direct accesses to TRCVICTLR are RES0.

Attributes

TRCVICTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
RES0	EXLEVEL_RL_EL2	EXLEVEL_RL_EL1	EXLEVEL_RL_EL0	RES0	EXLEVEL_NS_EL2	EXLEVEL_NS_EL1	EXLEVEL_NS_EL0	RES0	EXLEVEL_RL_EL2	EXLEVEL_RL_EL1	EXLEVEL_RL_EL0

Bits [31:27]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [26]

When TRCIDR6.EXLEVEL_RL_EL2 == 1:

Filter instruction trace for EL2 in Realm state.

EXLEVEL_RL_EL2	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit generates instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit does not generate instruction trace for EL2 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit does not generate instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit generates instruction trace for EL2 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [25]**When TRCIDR6.EXLEVEL_RL_EL1 == 1:**

Filter instruction trace for EL1 in Realm state.

EXLEVEL_RL_EL1	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit generates instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit does not generate instruction trace for EL1 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit does not generate instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit generates instruction trace for EL1 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [24]**When TRCIDR6.EXLEVEL_RL_EL0 == 1:**

Filter instruction trace for EL0 in Realm state.

EXLEVEL_RL_EL0	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit generates instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit does not generate instruction trace for EL0 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit does not generate instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit generates instruction trace for EL0 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]**When Non-secure EL2 is implemented:**

Filter instruction trace for EL2 in Non-secure state.

EXLEVEL_NS_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [21]**When Non-secure EL1 is implemented:**

Filter instruction trace for EL1 in Non-secure state.

EXLEVEL_NS_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_ELO, bit [20]**When Non-secure ELO is implemented:**

Filter instruction trace for ELO in Non-secure state.

EXLEVEL_NS_ELO	Meaning
0b0	The trace unit generates instruction trace for ELO in Non-secure state.
0b1	The trace unit does not generate instruction trace for ELO in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [19]**When EL3 is implemented:**

Filter instruction trace for EL3.

EXLEVEL_S_EL3	Meaning
0b0	The trace unit generates instruction trace for EL3.
0b1	The trace unit does not generate instruction trace for EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [18]**When EL2 is implemented and FEAT_SEL2 is implemented:**

Filter instruction trace for EL2 in Secure state.

EXLEVEL_S_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [17]**When Secure EL1 is implemented:**

Filter instruction trace for EL1 in Secure state.

EXLEVEL_S_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_ELO, bit [16]**When Secure ELO is implemented:**

Filter instruction trace for ELO in Secure state.

EXLEVEL_S_ELO	Meaning
0b0	The trace unit generates instruction trace for ELO in Secure state.
0b1	The trace unit does not generate instruction trace for ELO in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:12]

Reserved, RES0.

TRCERR, bit [11]**When TRCIDR3.TRCERR == 1:**

Controls the forced tracing of System Error exceptions.

TRCERR	Meaning
0b0	Forced tracing of System Error exceptions is disabled.
0b1	Forced tracing of System Error exceptions is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCRESET, bit [10]

Controls the forced tracing of PE Resets.

TRCRESET	Meaning
0b0	Forced tracing of PE Resets is disabled.
0b1	Forced tracing of PE Resets is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SSSTATUS, bit [9]

ViewInst start/stop function status.

SSSTATUS	Meaning
0b0	Stopped State. The ViewInst start/stop function is in the stopped state.
0b1	Started State. The ViewInst start/stop function is in the started state.

Before software enables the trace unit, it must write to this field to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this field to 1. Arm recommends that the value of this field is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is UNKNOWN and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing [TRCPRGCTLR.EN](#) or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access is **RES1** if all of the following are true:
 - TRCIDR4.NUMACPAIRS == 0b0000
 - TRCIDR4.NUMPC == 0b0000
- Otherwise, access to this field is **RW**.

Bit [8]

Reserved, RES0.

EVENT_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

EVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCVICTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCVICTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

TRCVIIECTLR, ViewInst Include/Exclude Control Register

The TRCVIIECTLR characteristics are:

Purpose

Use this to select, or read, the Address Range Comparators for the ViewInst include/exclude function.

Configuration

External register TRCVIIECTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCVIIECTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and $UInt(TRCIDR4.NUMACPAIRS) > 0$. Otherwise, direct accesses to TRCVIIECTLR are RES0.

Attributes

TRCVIIECTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								EXCLUDE[7]		EXCLUDE[6]		EXCLUDE[5]		EXCLUDE[4]		EXCLUDE[3]		EXCLUDE[2]		EXCLUDE[1]		EXCLUDE[0]									

Bits [31:24]

Reserved, RES0.

EXCLUDE[<m>], bit [m+16], for m = 7 to 0

Exclude Address Range Comparator <m>. Selects whether Address Range Comparator <m> is in use with the ViewInst exclude function.

EXCLUDE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected for the ViewInst exclude function.
0b1	The address range that Address Range Comparator <m> defines, is selected for the ViewInst exclude function.

This bit is RES0 if $m \geq \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [15:8]

Reserved, RES0.

The TRCVIPCSSCTLR characteristics are:

Use this to select, or read, which PE Comparator Inputs can control the ViewInst start/stop function.

External register TRCVIPCSSCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCVIPCSSCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and UInt(TRCIDR4.NUMPC) > 0. Otherwise, direct accesses to TRCVIPCSSCTLR are RES0.

TRCVIPCSSCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6
RES0								STOP[7]	STOP[6]	STOP[5]	STOP[4]	STOP[3]	STOP[2]	STOP[1]	STOP[0]	RES0								START[7]	START[6]

Reserved, RES0.

Selects whether PE Comparator Input <m> is in use with ViewInst start/stop function, for the purpose of stopping trace.

STOP[<m>]	Meaning
0b0	The PE Comparator Input <m>, is not selected as a stop resource.
0b1	The PE Comparator Input <m>, is selected as a stop resource.

This bit is RES0 if $m \geq \text{TRCIDR4.NUMPC}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Reserved, RES0.

START[<m>], bit [m], for m = 7 to 0

Selects whether PE Comparator Input <m> is in use with ViewInst start/stop function, for the purpose of starting trace.

START[<m>]	Meaning
0b0	The PE Comparator Input <m>, is not selected as a start resource.
0b1	The PE Comparator Input <m>, is selected as a start resource.

This bit is RES0 if $m \geq \text{TRCIDR4.NUMPC}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVIPCSSCTLR

Must be programmed if [TRCIDR4](#).NUMPC != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVIPCSSCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x08C	TRCVIPCSSCTL

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

TRCVISSCTLR, ViewInst Start/Stop Control Register

The TRCVISSCTLR characteristics are:

Purpose

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

Configuration

External register TRCVISSCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCVISSCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and `UInt(TRCIDR4.NUMACPAIRS) > 0`. Otherwise, direct accesses to TRCVISSCTLR are RES0.

Attributes

TRCVISSCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19
STOP[15]	STOP[14]	STOP[13]	STOP[12]	STOP[11]	STOP[10]	STOP[9]	STOP[8]	STOP[7]	STOP[6]	STOP[5]	STOP[4]	STOP[3]

STOP[<m>], bit [m+16], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of stopping trace.

STOP[<m>]	Meaning
0b0	The Single Address Comparator <m>, is not selected as a stop resource.
0b1	The Single Address Comparator <m>, is selected as a stop resource.

This bit is RES0 if $m \geq 2 \times$ [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

START[<m>], bit [m], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of starting trace.

START[<m>]	Meaning
0b0	The Single Address Comparator <m>, is not selected as a start resource.
0b1	The Single Address Comparator <m>, is selected as a start resource.

This bit is RES0 if $m \geq 2 \times$ [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

TRCVMIDCCTLRO, Virtual Context Identifier Comparator Control Register 0

The TRCVMIDCCTLRO characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the [TRCVMIDCVR<n>](#) registers, where n=0-3.

Configuration

External register TRCVMIDCCTLRO bits [31:0] are architecturally mapped to AArch64 System register [TRCVMIDCCTLRO\[31:0\]](#).

This register is present only when FEAT ETE is implemented, **FEAT TRC_EXT is implemented**, $\text{UInt}(\text{TRCIDR4.NUMVMIDC}) > 0x0$ and $\text{UInt}(\text{TRCIDR2.VMIDSIZE}) > 0$. Otherwise, direct accesses to TRCVMIDCCTLRO are RES0.

Attributes

TRCVMIDCCTLRO is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	
COMP3[7]	COMP3[6]	COMP3[5]	COMP3[4]	COMP3[3]	COMP3[2]	COMP3[1]	COMP3[0]	COMP2[7]	COMP2[6]	COMP2[5]	COMP2[4]

COMP3[<m>], bit [m+24], for m = 7 to 0
When $\text{UInt}(\text{TRCIDR4.NUMVMIDC}) > 3$:

TRCVMIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR3. Each bit in this field corresponds to a byte in TRCVMIDCVR3.

COMP3[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 2:

TRCVMIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR2. Each bit in this field corresponds to a byte in TRCVMIDCVR2.

COMP2[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 1:

TRCVMIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR1. Each bit in this field corresponds to a byte in TRCVMIDCVR1.

COMP1[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 0:

TRCVMIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR0. Each bit in this field corresponds to a byte in TRCVMIDCVR0.

COMP0[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if $m \geq \text{TRCIDR2.VMIDSIZE}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCTRL0

If software uses the [TRCVMIDCVR<n>](#) registers, where n=0-3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCVMIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCVMIDCVR<n>](#) is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVMIDCCTRL0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x688	TRCVMIDCCTLR0

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

htmldiff from-

(new)

The TRCVMIDCCTL1 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the [TRCVMIDCVR<n>](#) registers, where n=4-7.

Configuration

External register TRCVMIDCCTL1 bits [31:0] are architecturally mapped to AArch64 System register [TRCVMIDCCTL1\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented**, $\text{UInt}(\text{TRCIDR4.NUMVMIDC}) > 0x4$ and $\text{UInt}(\text{TRCIDR2.VMIDSIZE}) > 0$. Otherwise, direct accesses to TRCVMIDCCTLR1 are RES0.

Attributes

TRCVMIDCCTL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21
COMP7[7]	COMP7[6]	COMP7[5]	COMP7[4]	COMP7[3]	COMP7[2]	COMP7[1]	COMP7[0]	COMP6[7]	COMP6[6]	COMP6[5]

COMP7[<m>], bit [m+24], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 7:

TRCVMIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR7. Each bit in this field corresponds to a byte in TRCVMIDCVR7.

COMP7[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if $m \geq \text{TRCIDR2.VMIDSIZE}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 6:

TRCVMIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR6. Each bit in this field corresponds to a byte in TRCVMIDCVR6.

COMP6[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 5:

TRCVMIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.

COMP5[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 4:

TRCVMIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.

COMP4[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if $m \geq \text{TRCIDR2.VMIDSIZE}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCTRL1

If software uses the [TRCVMIDCVR<n>](#) registers, where n=4-7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCVMIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCVMIDCVR<n>](#) is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVMIDCTLR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x68C	TRCVMIDCCTLR1

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TRCVMIDCVR<n>, Virtual Context Identifier Comparator Value Register <n>, n = 0 - 7

The TRCVMIDCVR<n> characteristics are:

Purpose

Contains the Virtual Context Identifier Comparator value.

Configuration

External register TRCVMIDCVR<n> bits [63:0] are architecturally mapped to AArch64 System register [TRCVMIDCVR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented, **FEAT_TRC_EXT is implemented** and $UInt(TRCIDR4.NUMVMIDC) > n$. Otherwise, direct accesses to TRCVMIDCVR<n> are RES0.

Attributes

TRCVMIDCVR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																VALUE															
																VALUE															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

VALUE, bits [63:0]

Virtual context identifier value. The width of this field is indicated by [TRCIDR2.VMIDSIZE](#). Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier .

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVMIDCVR<n>

Must be programmed if any of the following are true:

- [TRCRSCTLR<a>](#).GROUP == 0b0111 and [TRCRSCTLR<a>](#).VMID[n] == 1.
- [TRCACATR<a>](#).CONTEXTTYPE == 0b10 or 0b11 and [TRCACATR<a>](#).CONTEXT == n.

TRCVMIDCVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x640 + (8 * n)	TRCVMIDCVR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered(), accesses to this register generate an error response.

- Otherwise, accesses to this register are **RW**.

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

PMU

The PMU characteristics are:

Configuration

[PMCCFILTR_ELO\[31:0\]](#) and [PMCCFILTR_ELO\[31:0\]](#) are mapped to each other.

When FEAT_PMUv3_EXT64 is implemented, [PMCCFILTR_ELO\[63:32\]](#) and [PMCCFILTR_ELO\[63:32\]](#) are mapped to each other.

[PMCCFILTR_ELO\[31:0\]](#) and [PMCCFILTR\[31:0\]](#) are mapped to each other.

[PMCCNTR_ELO\[63:0\]](#) and [PMCCNTR_ELO\[63:0\]](#) are mapped to each other.

[PMCCNTR_ELO\[63:0\]](#) and [PMCCNTR\[63:0\]](#) are mapped to each other.

When FEAT_PMUv3_SS is implemented, [PMCCNTSVR_EL1\[63:0\]](#) and [PMCCNTSVR_EL1\[63:0\]](#) are mapped to each other.

When FEAT_PMUv3_EXT32 is implemented, [PMCEID0\[31:0\]](#) and [PMCEID0_ELO\[31:0\]](#) are mapped to each other.

When FEAT_PMUv3_EXT32 is implemented, [PMCEID0\[31:0\]](#) and [PMCEID0\[31:0\]](#) are mapped to each other.

When FEAT_PMUv3_EXT32 is implemented, [PMCEID1\[31:0\]](#) and [PMCEID1_ELO\[31:0\]](#) are mapped to each other.

When FEAT_PMUv3_EXT32 is implemented, [PMCEID1\[31:0\]](#) and [PMCEID1\[31:0\]](#) are mapped to each other.

When FEAT_PMUv3_EXT32 is implemented, [PMCEID2\[31:0\]](#) and [PMCEID0_ELO\[63:32\]](#) are mapped to each other.

When FEAT_PMUv3_EXT32 is implemented, [PMCEID2\[31:0\]](#) and [PMCEID2\[31:0\]](#) are mapped to each other.

When FEAT_PMUv3_EXT32 is implemented, [PMCEID3\[31:0\]](#) and [PMCEID3\[31:0\]](#) are mapped to each other.

[PMCNTEN\[31:0\]](#) and [PMCNTENSET_ELO\[31:0\]](#) are mapped to each other.

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented, [PMCNTEN\[63:32\]](#) and [PMCNTENSET_ELO\[63:32\]](#) are mapped to each other.

[PMCNTEN\[31:0\]](#) and [PMCNTENSET\[31:0\]](#) are mapped to each other.

[PMCNTEN\[31:0\]](#) and [PMCNTENCLR_ELO\[31:0\]](#) are mapped to each other.

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented, [PMCNTEN\[63:32\]](#) and [PMCNTENCLR_ELO\[63:32\]](#) are mapped to each other.

[PMCNTEN\[31:0\]](#) and [PMCNTENCLR\[31:0\]](#) are mapped to each other.

[PMCNTENCLR_ELO\[31:0\]](#) and [PMCNTENCLR_ELO\[31:0\]](#) are mapped to each other.

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented, [PMCNTENCLR_ELO\[63:32\]](#) and [PMCNTENCLR_ELO\[63:32\]](#) are mapped to each other.

[PMCNTENCLR_ELO\[31:0\]](#) and [PMCNTENCLR\[31:0\]](#) are mapped to each other.

[PMCNTENCLR_ELO\[31:0\]](#) and [PMCNTENSET_ELO\[31:0\]](#) are mapped to each other.

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented, [PMCNTENCLR_ELO\[63:32\]](#) and [PMCNTENSET_ELO\[63:32\]](#) are mapped to each other.

[PMCNTENCLR_ELO\[31:0\]](#) and [PMCNTENSET\[31:0\]](#) are mapped to each other.

[PMCNTENSET_ELO\[31:0\]](#) and [PMCNTENSET_ELO\[31:0\]](#) are mapped to each other.

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented, [PMCNTENSET_EL0](#)[63:32] and [PMCNTENSET_EL0](#)[63:32] are mapped to each other.

[PMCNTENSET_EL0](#)[31:0] and [PMCNTENCLR_EL0](#)[31:0] are mapped to each other.

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented, [PMCNTENSET_EL0](#)[63:32] and [PMCNTENCLR_EL0](#)[63:32] are mapped to each other.

[PMCNTENSET_EL0](#)[31:0] and [PMCNTENCLR](#)[31:0] are mapped to each other.

[PMCNTENSET_EL0](#)[31:0] and [PMCNTENSET](#)[31:0] are mapped to each other.

[PMCR_EL0](#)[7:0] and [PMCR_EL0](#)[7:0] are mapped to each other.

[PMCR_EL0](#)[7:0] and [PMCR](#)[7:0] are mapped to each other.

[PMEVCNTR<n>_EL0](#)[31:0] and [PMEVCNTR<n>_EL0](#)[31:0] are mapped to each other.

When FEAT_PMUv3p5 is implemented, [PMEVCNTR<n>_EL0](#)[63:32] and [PMEVCNTR<n>_EL0](#)[63:32] are mapped to each other.

[PMEVCNTR<n>_EL0](#)[31:0] and [PMEVCNTR<n>](#)[31:0] are mapped to each other.

When FEAT_PMUv3_SS is implemented, [PMEVCNTSVR<n>_EL1](#)[63:0] and [PMEVCNTSVR<n>_EL1](#)[63:0] are mapped to each other.

[PMEVTPER<n>_EL0](#)[63:0] and [PMEVTPER<n>_EL0](#)[63:0] are mapped to each other.

[PMEVTPER<n>_EL0](#)[31:0] and [PMEVTPER<n>](#)[31:0] are mapped to each other.

When FEAT_PMUv3_ICNTR is implemented, [PMICFILTR_EL0](#)[63:0] and [PMICFILTR_EL0](#)[63:0] are mapped to each other.

When FEAT_PMUv3_ICNTR is implemented and FEAT_PMUv3_SS is implemented, [PMICNTSVR_EL1](#)[63:0] and [PMICNTSVR_EL1](#)[63:0] are mapped to each other.

When FEAT_PMUv3_ICNTR is implemented, [PMICNTR_EL0](#)[63:0] and [PMICNTR_EL0](#)[63:0] are mapped to each other.

[PMINTEN](#)[31:0] and [PMINTENSET_EL1](#)[31:0] are mapped to each other.

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented, [PMINTEN](#)[63:32] and [PMINTENSET_EL1](#)[63:32] are mapped to each other.

[PMINTEN](#)[31:0] and [PMINTENSET](#)[31:0] are mapped to each other.

[PMINTEN](#)[31:0] and [PMINTENCLR_EL1](#)[31:0] are mapped to each other.

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented, [PMINTEN](#)[63:32] and [PMINTENCLR_EL1](#)[63:32] are mapped to each other.

[PMINTEN](#)[31:0] and [PMINTENCLR](#)[31:0] are mapped to each other.

[PMINTENCLR_EL1](#)[31:0] and [PMINTENCLR_EL1](#)[31:0] are mapped to each other.

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented, [PMINTENCLR_EL1](#)[63:32] and [PMINTENCLR_EL1](#)[63:32] are mapped to each other.

[PMINTENCLR_EL1](#)[31:0] and [PMINTENCLR](#)[31:0] are mapped to each other.

[PMINTENCLR_EL1](#)[31:0] and [PMINTENSET_EL1](#)[31:0] are mapped to each other.

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented, [PMINTENCLR_EL1](#)[63:32] and [PMINTENSET_EL1](#)[63:32] are mapped to each other.

[PMINTENCLR_EL1](#)[31:0] and [PMINTENSET](#)[31:0] are mapped to each other.

[PMINTENSET_EL1](#)[31:0] and [PMINTENSET_EL1](#)[31:0] are mapped to each other.

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented, [PMINTENSET_EL1](#)[63:32] and [PMINTENSET_EL1](#)[63:32] are mapped to each other.

[PMINTENSET_EL1](#)[31:0] and [PMINTENSET](#)[31:0] are mapped to each other.

[PMINTENSET_EL1](#)[31:0] and [PMINTENCLR_EL1](#)[31:0] are mapped to each other.

When FEAT_PMuV3_EXT64 is implemented, or FEAT_PMuV3p9 is implemented or FEAT_PMuV3_ICNTR is implemented, [PMINTENSET_EL1](#)[63:32] and [PMINTENCLR_EL1](#)[63:32] are mapped to each other.

[PMINTENSET_EL1](#)[31:0] and [PMINTENCLR](#)[31:0] are mapped to each other.

[PMOVS](#)[31:0] and [PMOVSSET_EL0](#)[31:0] are mapped to each other.

When FEAT_PMuV3_EXT64 is implemented, or FEAT_PMuV3p9 is implemented or FEAT_PMuV3_ICNTR is implemented, [PMOVS](#)[63:32] and [PMOVSSET_EL0](#)[63:32] are mapped to each other.

[PMOVS](#)[31:0] and [PMOVSSET](#)[31:0] are mapped to each other.

[PMOVS](#)[31:0] and [PMOVSLR_EL0](#)[31:0] are mapped to each other.

When FEAT_PMuV3_EXT64 is implemented, or FEAT_PMuV3p9 is implemented or FEAT_PMuV3_ICNTR is implemented, [PMOVS](#)[63:32] and [PMOVSLR_EL0](#)[63:32] are mapped to each other.

[PMOVS](#)[31:0] and [PMOVSR](#)[31:0] are mapped to each other.

[PMOVSLR_EL0](#)[31:0] and [PMOVSLR_EL0](#)[31:0] are mapped to each other.

When FEAT_PMuV3_EXT64 is implemented, or FEAT_PMuV3p9 is implemented or FEAT_PMuV3_ICNTR is implemented, [PMOVSLR_EL0](#)[63:32] and [PMOVSLR_EL0](#)[63:32] are mapped to each other.

[PMOVSLR_EL0](#)[31:0] and [PMOVSR](#)[31:0] are mapped to each other.

[PMOVSLR_EL0](#)[31:0] and [PMOVSSET_EL0](#)[31:0] are mapped to each other.

When FEAT_PMuV3_EXT64 is implemented, or FEAT_PMuV3p9 is implemented or FEAT_PMuV3_ICNTR is implemented, [PMOVSLR_EL0](#)[63:32] and [PMOVSSET_EL0](#)[63:32] are mapped to each other.

[PMOVSLR_EL0](#)[31:0] and [PMOVSSET](#)[31:0] are mapped to each other.

[PMOVSSET_EL0](#)[31:0] and [PMOVSSET_EL0](#)[31:0] are mapped to each other.

When FEAT_PMuV3_EXT64 is implemented, or FEAT_PMuV3p9 is implemented or FEAT_PMuV3_ICNTR is implemented, [PMOVSSET_EL0](#)[63:32] and [PMOVSSET_EL0](#)[63:32] are mapped to each other.

[PMOVSSET_EL0](#)[31:0] and [PMOVSSET](#)[31:0] are mapped to each other.

[PMOVSSET_EL0](#)[31:0] and [PMOVSLR_EL0](#)[31:0] are mapped to each other.

When FEAT_PMuV3_EXT64 is implemented, or FEAT_PMuV3p9 is implemented or FEAT_PMuV3_ICNTR is implemented, [PMOVSSET_EL0](#)[63:32] and [PMOVSLR_EL0](#)[63:32] are mapped to each other.

[PMOVSSET_EL0](#)[31:0] and [PMOVSR](#)[31:0] are mapped to each other.

[PMSWINC_EL0](#)[31:0] and [PMSWINC_EL0](#)[31:0] are mapped to each other.

[PMSWINC_EL0](#)[31:0] and [PMSWINC](#)[31:0] are mapped to each other.

PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMAUTHSTATUS are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. Arm recommends that this register is implemented.

Attributes

PMAUTHSTATUS is a 32-bit register.

This register is part of the PMU block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				RTNID		RTID		RES0								RLNID		RLID		RES0				SNID		SID		NSNID		NSID	

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTNID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as [DBGAUTHSTATUS_EL1.RLNID](#).

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.

Bits [11:8]

Reserved, RES0.

SNID, bits [7:6]

Holds the same value as [DBGAUTHSTATUS_EL1.SNID](#).

SID, bits [5:4]

Secure invasive debug. Possible values of this field are:

SID	Meaning
0b00	Not implemented.

All other values are reserved.

NSNID, bits [3:2]

Holds the same value as [DBGAUTHSTATUS_EL1.NSNID](#).

NSID, bits [1:0]

Non-secure invasive debug. Possible values of this field are:

NSID	Meaning
0b00	Not implemented.

All other values are reserved.

Accessing PMAUTHSTATUS

PMAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFB8	PMAUTHSTATUS

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMAUTHSTATUS

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xFB8

PMAUTHSTATUS can be accessed through the PMU block as follows:

	Frame		Offset
	PMU		0xFB8

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 15:17:5708; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, `PMU.PMCCNTR_EL0`, increments. `PMCCNTR_EL0`, increments.

Configuration

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register `PMCCFILTR_EL0[31:0]`.

External register PMCCFILTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register `PMCCFILTR_EL0[63:32]` when FEAT_PMUv3_EXT64 is implemented.

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register `PMCCFILTR[31:0]`.

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are RES0.

PMCCFILTR_EL0 is in the Core power domain.

On a Warm or Cold reset, RW fields in this register reset to:

- Architecturally UNKNOWN values if the reset is to an Exception level that is using AArch64.
- 0 if the reset is to an Exception level that is using AArch32.

The register is not affected by an External debug reset.

Attributes

PMCCFILTR_EL0 is a `32-bit register`.

- 64-bit register when FEAT_PMUv3_EXT64 is implemented
- 32-bit register otherwise

This register is part of the `PMU` block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
P	U	NSK	NSU	NSH	M	RES0	SH	T	RLK	RLU	RLH	RES0																			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P	U	NSK	NSU	NSH	M	RES0	SH	RES0	RLK	RLU	RLH	RES0																			

Bits [63:32]

Reserved, RES0.

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMCCFILTR_EL0.RLK bit.

P	Meaning
0b0	Count cycles in EL1.
0b1	Do not count cycles in EL1.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMCCFILTR_EL0.RLU bit.

U	Meaning
0b0	Count cycles in EL0.
0b1	Do not count cycles in EL0.

NSK, bit [29]**When EL3 is implemented:**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

Otherwise:

Reserved, RES0.

NSU, bit [28]**When EL3 is implemented:**

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

Otherwise:

Reserved, RES0.

NSH, bit [27]**When EL2 is implemented:**

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMCCFILTR_EL0.RLH bit.

NSH	Meaning
0b0	Do not count cycles in EL2.
0b1	Count cycles in EL2.

Otherwise:

Reserved, RES0.

M, bit [26]**When EL3 is implemented:**

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

Note

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]**When FEAT_SEL2 is implemented and EL3 is implemented:**

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

Note

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

Otherwise:

Reserved, RES0.

T, bit [23]**When FEAT_TME is implemented:**

Transactional state filtering bit. Controls counting of Attributable events in Non-transactional state.

T	Meaning
0b0	This bit has no effect on the filtering of events.
0b1	Do not count Attributable events in Non-transactional state.

For each Unattributable event, it is IMPLEMENTATION DEFINED whether the filtering applies.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]

When FEAT_RME is implemented:

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Realm EL1 are counted.

Otherwise, cycles in Realm EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Realm EL0 are counted.

Otherwise, cycles in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]

When FEAT_RME is implemented:

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Realm EL2 are counted.

Otherwise, cycles in Realm EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCFILTR_EL0 can be accessed through the external debug interface:

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P	U	NS	NS	UN	SH	M	RES0	SH	T	RLK	RLU	RLH															RES0				
Component						Offset						Instance																			
PMU						0x47C						PMCCFILTR_EL0																			

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMCCFILTR_EL0.RLK bit.

P	Meaning
0b0	Count cycles in EL1.
0b1	Do not count cycles in EL1.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMCCFILTR_EL0.RLU bit.

U	Meaning
0b0	Count cycles in EL0.
0b1	Do not count cycles in EL0.

NSK, bit [29]**When EL3 is implemented:**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

Otherwise:

Reserved, RES0.

NSU, bit [28]**When EL3 is implemented:**

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

Otherwise:

Reserved, RES0.

NSH, bit [27]**When EL2 is implemented:**

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMCCFILTR_EL0.RLH bit.

NSH	Meaning
0b0	Do not count cycles in EL2.
0b1	Count cycles in EL2.

Otherwise:

Reserved, RES0.

M, bit [26]**When EL3 is implemented:**

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

Note

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]**When FEAT_SEL2 is implemented and EL3 is implemented:**

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

NoteThis field is not visible in the AArch32 [PMCCFILTR](#) System register.**Otherwise:**

Reserved, RES0.

T, bit [23]**When FEAT_TME is implemented:**

Transactional state filtering bit. Controls counting of Attributable events in Non-transactional state.

T	Meaning
0b0	This bit has no effect on the filtering of events.
0b1	Do not count Attributable events in Non-transactional state.

For each Unattributable event, it is IMPLEMENTATION DEFINED whether the filtering applies.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]**When FEAT_RME is implemented:**

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Realm EL1 are counted.

Otherwise, cycles in Realm EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]**When FEAT_RME is implemented:**

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Realm EL0 are counted.

Otherwise, cycles in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]**When FEAT_RME is implemented:**

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Realm EL2 are counted.

Otherwise, cycles in Realm EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings in the external debug interface:

When FEAT_PMUv3_EXT32 is implemented

BlockAccess at address 0x47C

PMCCFILTR_EL0 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x47C

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When FEAT_PMUv3_EXT64 is implemented

BlockAccess at address 0x4F8

PMCCFILTR_EL0 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x4F8

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

PMCCIDSR, CONTEXTIDR_ELx Sample Register

The PMCCIDSR characteristics are:

Purpose

Contains the sampled value of [CONTEXTIDR_EL1](#) and [CONTEXTIDR_EL2](#), captured on reading PMU.PMPCSR.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCCIDSR are RES0.

Note

If FEAT_PCSRv8p2 is not implemented, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

Attributes

PMCCIDSR is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CONTEXTIDR_EL2																															
CONTEXTIDR_EL1																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CONTEXTIDR_EL2, bits [63:32]

Context ID. The value of [CONTEXTIDR_EL2](#) that is associated with the most recent PMU.PMPCSR sample. When the most recent PMU.PMPCSR sample is generated:

- If the PE is not executing at EL3, EL2 is using AArch64, and EL2 is enabled in the current Security state, then this field is set to the Context ID sampled from [CONTEXTIDR_EL2](#).
- Otherwise, this field is set to an UNKNOWN value.

Because the value written to this field is an indirect read of [CONTEXTIDR_EL2](#), it is CONSTRAINED UNPREDICTABLE whether this field is set to the original or new value if PMU.PMPCSR samples:

- An instruction that writes to [CONTEXTIDR_EL2](#).
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CONTEXTIDR_EL1, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent PMU.PMPCSR sample. When the most recent PMU.PMPCSR sample is generated:

- If EL1 is using AArch64, then the Context ID is sampled from [CONTEXTIDR_EL1](#).
- If EL1 is using AArch32, then the Context ID is sampled from [CONTEXTIDR](#).
- If EL3 is implemented and is using AArch32, then [CONTEXTIDR](#) is a banked register and this register samples the current banked copy of [CONTEXTIDR](#) for the Security state that is associated with the most recent PMU.PMPCSR sample.

Because the value written to this register is an indirect read of CONTEXTIDR, it is **CONSTRAINED UNPREDICTABLE** whether this register is set to the original or new value if PMU.PMPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

Accessing PMCCIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register **UNKNOWN**, see 'Permitted behavior that might make the PC Sample-based profiling registers **UNKNOWN**'.

Accesses to this register use the following encodings in the external debug interface:

When FEAT_PMUv3_EXT64 is implemented

BlockAccess at address 0x228

PMCCIDSR can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x228

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. For more information, see 'Time as measured by the Performance Monitors cycle counter'.

[PMCCFILTER_EL0](#) [PMU.PMCCFILTER_EL0](#) determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register [PMCCNTR_EL0\[63:0\]](#).

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register [PMCCNTR\[63:0\]](#).

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are RES0.

PMCCNTR_EL0 is in the Core power domain.

Attributes

PMCCNTR_EL0 is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																CCNT															
																CCNT															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CCNT, bits [63:0]

Cycle count. Depending on the values of [PMU.PMCR_EL0.{LC,D}](#), the cycle count increments in one of the following ways: [PMCR_EL0.{LC,D}](#), the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMU.PMCR_EL0.C](#) sets this field to 0. [PMCR_EL0.C](#) sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCNTR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x0F8	PMCCNTR_EL0	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x0FC	PMCCNTR_EL0	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

Accessing PMCCNTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0x0F8

PMCCNTR_EL0 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x0F8

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

PMCCNTSVR_EL1, Performance Monitors Cycle Count Saved Value Register

The PMCCNTSVR_EL1 characteristics are:

Purpose

Captures the PMU Cycle counter, PMU.PMCCNTR_EL0.

Configuration

External register PMCCNTSVR_EL1 bits [63:0] are architecturally mapped to AArch64 System register [PMCCNTSVR_EL1\[63:0\]](#).

This register is present only when FEAT_PMUv3_SS is implemented. Otherwise, direct accesses to PMCCNTSVR_EL1 are RES0.

Attributes

PMCCNTSVR_EL1 is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																CCNT															
																CCNT															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CCNT, bits [63:0]

Sampled Cycle Count. The value of PMU.PMCCNTR_EL0 at the last Capture event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTSVR_EL1

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0x6F8

PMCCNTSVR_EL1 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x6F8

- When !AllowExternalPMSSAccess(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Note

This view of the register was previously called PMCEID0_EL0.

Configuration

External register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0_EL0\[31:0\]](#).

External register PMCEID0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID0\[31:0\]](#).

This register is present only when FEAT_PMUv3_EXT32 is implemented. Otherwise, direct accesses to PMCEID0 are RES0.

PMCEID0 is in the Core power domain.

Attributes

PMCEID0 is a 32-bit register.

This register is part of the [PMU](#) block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID7

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE20	PMCEID0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMCEID0

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xE20

PMCEID0 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xE20

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x020 to 0x03F.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Note

This view of the register was previously called PMCEID1_EL0.

Configuration

External register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID1_EL0\[31:0\]](#).

External register PMCEID1 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID1\[31:0\]](#).

This register is present only when FEAT_PMUv3_EXT32 is implemented. Otherwise, direct accesses to PMCEID1 are RES0.

PMCEID1 is in the Core power domain.

Attributes

PMCEID1 is a 32-bit register.

This register is part of the [PMU](#) block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID7

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event (0x0020 + n).

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID1

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE24	PMCEID1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMCEID1

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xE24

PMCEID1 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xE24

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

Purpose

Contains PMU-specific configuration data.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCFGR are RES0.

PMCFGR is in the Core power domain.

Attributes

PMCFGR is a: 32-bit register.

- 64-bit register when FEAT_PMUv3_EXT64 is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
NCG				RES0				SS	FZ	RES0	UEN	WT	NA	EX	CCD	CC	SIZE				N										
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NCG				RES0				FZ		RES0	UEN	WT	NA	EX	CCD	CC	SIZE				N										

This feature is not supported, so this field is RAZ.

Reads as 0b0000.

Access to this field is RO.

Bits [27:22]

BitsNCG, bits [63:31]:3228

Reserved, RES0.

NCG, bits [31:28]

When FEAT_PMUv3p9 is implemented:

Counter Groups. Defines the number of counter groups implemented, minus one.

Reads as 0b0001.

Access to this field is **RO**.

Otherwise:

Defines the number of counter groups implemented, minus one.

This field reads-as-zero.

Reads as 0b0000.

Access to this field is **RO**.

Bits [27:23]

Reserved, RES0.

SS, bit [22]

Snapshot supported.

SS	Meaning
0b0	Snapshot mechanism not supported. The locations 0x600-0x7FC and 0xE30-0xE3C are IMPLEMENTATION DEFINED.
0b1	Snapshot mechanism supported. PMSVR<n> and PMSSSCR are implemented.

FEAT_PMUv3_SS implements the functionality identified by the value 1.

If FEAT_PMUv3_SS is not implemented, a PMU might include an IMPLEMENTATION DEFINED snapshot mechanism, including one using the IMPLEMENTATION DEFINED registers 0x600-0x7FC and 0xE30-0xE3C.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

FZO, bit [21]

Freeze-on-overflow supported. Defined values are:

FZO	Meaning
0b0	Freeze-on-overflow mechanism is not supported. PMU.PMCR_EL0.FZO is PMCR_EL0.FZO is RES0.
0b1	Freeze-on-overflow mechanism is supported. PMU.PMCR_EL0.FZO is RW. PMCR_EL0.FZO is RW.

FEAT_PMUv3p7 implements the functionality added by the value 0b1.

From Armv8.7, if FEAT_PMUv3 is implemented, the only permitted value is 0b1.

Bit [20]

Reserved, RES0.

UEN, bit [19]

User-mode Enable Register supported. [PMUSERENR_EL0](#) is not visible in the external debug interface, so this bit is RAZ.

Reads as 0b0.

Access to this field is **RO**.

WT, bit [18]

This feature is not supported, so this bit is RAZ.

Reads as 0b0.

Access to this field is **RO**.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

Reads as 0b0.

Access to this field is **RO**.

EX, bit [16]

Export supported. Value is IMPLEMENTATION DEFINED.

EX	Meaning
0b0	PMCR_EL0PMU.PMCR_EL0.X.X is RES0.
0b1	PMCR_EL0PMU.PMCR_EL0.X.X is read/write.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CCD, bit [15]

Cycle counter has prescale.

This is RES1 if AArch32 is supported, and RAZ otherwise.

CCD	Meaning
0b0	PMCR_EL0PMU.PMCR_EL0.D.D is RES0.
0b1	PMCR_EL0PMU.PMCR_EL0.D.D is read/write.

CC, bit [14]

Dedicated cycle counter (counter 31) supported.

Reads as 0b1.

Access to this field is **RO**.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is **RO**.

N, bits [7:0]

Number of counters, minus implemented one, in addition to the cycle counter, PMCCNTR_EL0. The maximum number of event counters is 31.

N	Meaning
0x00	Only PMU.PMCCNTR_EL0 implemented.
0x01..0x20	PMU.PMCCNTR_EL0 implemented, PMCCNTR_EL0 Number plus this number of event counters implemented, are 1 to 33 implemented.

All other values are reserved.

The count includes the optional Instruction Counter, PMU.PMICNTR_EL0.

The count includes the Cycle Counter, PMU.PMCCNTR_EL0. For example, if N == 0x00, there is a single counter, PMU.PMCCNTR_EL0, and PMEVCNTR0_EL0 is not implemented.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMCFGR

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCFGR can be accessed through the external debug interface:

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
NCG				RES0				SSFZ				OZRES0				UEN				WTNA				EXCCDCC				SIZE				N			
Component												Offset												Instance											
PMU												0xE00												PMCFGR											

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

NCG, bits [31:28]

When FEAT_PMUv3p9 is implemented:

Counter Groups. Defines the number of counter groups implemented, minus one.

Reads as 0b0001.

Access to this field is **RO**.

Otherwise:

Defines the number of counter groups implemented, minus one.

This field reads-as-zero.

Reads as 0b0000.

Access to this field is **RO**.

Bits [27:23]

Reserved, RES0.

SS, bit [22]

Snapshot supported.

SS	Meaning
0b0	Snapshot mechanism not supported. The locations 0x600-0x7FC and 0xE30-0xE3C are IMPLEMENTATION DEFINED.
0b1	Snapshot mechanism supported. PMSVR<n> and PMSSSCR are implemented.

FEAT_PMUv3_SS implements the functionality identified by the value 1.

If FEAT_PMUv3_SS is not implemented, a PMU might include an IMPLEMENTATION DEFINED snapshot mechanism, including one using the IMPLEMENTATION DEFINED registers 0x600-0x7FC and 0xE30-0xE3C.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

FZO, bit [21]

Freeze-on-overflow supported. Defined values are:

FZO	Meaning
0b0	Freeze-on-overflow mechanism is not supported. PMU.PMCR_EL0.FZO is RES0.
0b1	Freeze-on-overflow mechanism is supported. PMU.PMCR_EL0.FZO is RW.

FEAT_PMUv3p7 implements the functionality added by the value 0b1.

From Armv8.7, if FEAT_PMUv3 is implemented, the only permitted value is 0b1.

Bit [20]

Reserved, RES0.

UEN, bit [19]

User-mode Enable Register supported. [PMUSERENR_EL0](#) is not visible in the external debug interface, so this bit is RAZ.

Reads as 0b0.

Access to this field is **RO**.

WT, bit [18]

This feature is not supported, so this bit is RAZ.

Reads as 0b0.

Access to this field is **RO**.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

Reads as 0b0.

Access to this field is **RO**.

EX, bit [16]

Export supported. Value is IMPLEMENTATION DEFINED.

EX	Meaning
0b0	PMU.PMCR_EL0.X is RES0.
0b1	PMU.PMCR_EL0.X is read/write.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CCD, bit [15]

Cycle counter has prescale.

This is RES1 if AArch32 is supported, and RAZ otherwise.

CCD	Meaning
0b0	PMU.PMCR_EL0.D is RES0.
0b1	PMU.PMCR_EL0.D is read/write.

CC, bit [14]

Dedicated cycle counter (counter 31) supported.

Reads as 0b1.

Access to this field is **RO**.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is **RO**.

N, bits [7:0]

Number of counters, minus one.

N	Meaning
0x00	Only PMU.PMCCNTR_EL0 implemented.
0x01..0x20	Number of counters implemented, 1 to 33.

All other values are reserved.

The count includes the optional Instruction Counter, PMU.PMICNTR_EL0.

The count includes the Cycle Counter, PMU.PMCCNTR_EL0. For example, if N == 0x00, there is a single counter, PMU.PMCCNTR_EL0, and PMEVCNTR0_EL0 is not implemented.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PMCGCR0, Counter Group Configuration Register 0

The PMCGCR0 characteristics are:

Purpose

Encodes the number of PMU.PMEVCNTR<n>_EL0 counters implemented.

Configuration

This register is present only when FEAT_PMUv3_ICNTR is implemented. Otherwise, direct accesses to PMCGCR0 are RES0.

PMCGCR0 is in the Core power domain.

Attributes

PMCGCR0 is a 32-bit register.

This register is part of the [PMU](#) block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																CG1NC								CG0NC							

Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Number of counters in group 1, which comprises the instruction counter [PMICNTR_EL0](#).

Reads as 0x01.

Access to this field is **RO**.

CG0NC, bits [7:0]

Number of counters in group 0, which comprises the event counters [PMEVCNTR<n>_EL0](#) and the cycle counter [PMCCNTR_EL0](#).

This field reads as [PMCFGR.N](#).

Accessing PMCGCR0

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xCE0

PMCGCR0 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xCE0

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus() or !AllowExternalPMUAccess(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

PMCID1SR, CONTEXTIDR_EL1 Sample Register

The PMCID1SR characteristics are:

Purpose

Contains the sampled value of [CONTEXTIDR_EL1](#), captured on reading [PMU.PMPCSR\[31:0\]](#). [PMPCSR\[31:0\]](#).

Configuration

This register is present only when FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMCID1SR are RES0.

If FEAT_PMUv3_EXT64 is implemented, the same content is present in the same location, and can be accessed using [PMCCIDSR\[31:0\]](#) or [PMCVIDSR\[31:0\]](#).

PMCID1SR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMCID1SR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

Attributes

PMCID1SR is a 32-bit register.

This register is part of the [PMU](#) block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CONTEXTIDR_EL1																															

CONTEXTIDR_EL1, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent [PMU.PMPCSR](#) sample. When the most recent [PMU.PMPCSR](#) sample is generated: [PMPCSR](#) sample. When the most recent [PMPCSR](#) sample is generated:

- If EL1 is using AArch64, then the Context ID is sampled from [CONTEXTIDR_EL1](#).
- If EL1 is using AArch32, then the Context ID is sampled from [CONTEXTIDR](#).
- If EL3 is implemented and is using AArch32, then [CONTEXTIDR](#) is a banked register and [this register](#) [PMCID1SR](#) samples the current banked copy of [CONTEXTIDR](#) for the Security state that is associated with the most recent [PMU.PMPCSR](#) sample. [PMPCSR](#) sample.

Because the value written to [this register](#) [PMCID1SR](#) is an indirect read of [CONTEXTIDR](#), it is CONSTRAINED UNPREDICTABLE whether [this](#) [PMCID1SR](#) register is set to the original or new value if [PMU.PMPCSR](#) samples: [PMPCSR](#) samples:

- An instruction that writes to [CONTEXTIDR](#).
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCID1SR

IMPLEMENTATION-DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMCID1SR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x208	PMCID1SR

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()` and `!OSLockStatus()`, accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Component	Offset	Instance
PMU	0x228	PMCID1SR

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()` and `!OSLockStatus()`, accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMCID1SR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0x208

PMCID1SR can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x208

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

BlockAccess at address 0x228

PMCID1SR can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x228

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

PMCID2SR, CONTEXTIDR_EL2 Sample Register

The PMCID2SR characteristics are:

Purpose

Contains the sampled value of [CONTEXTIDR_EL2](#), captured on reading [PMU.PMPCSR\[31:0\]](#).~~PMPCSR[31:0]~~.

Configuration

This [PMCID2SR](#) register is present in only the when Core FEAT_PMUv3_EXT32 power is implemented. Otherwise, direct accesses to PMCID2SR are ~~domain~~. RES0.

If FEAT_PMUv3_EXT64 is implemented, the same content is present in the same location, and can be accessed using [PMCCIDSR\[63:32\]](#).

~~This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMCID2SR are RES0.~~

[PMCIDR2SR](#) is in the Core power domain.

Note

If FEAT_PCSRv8p2 is not implemented, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

Attributes

PMCID2SR is a 32-bit register.

This register is part of the [PMU](#) block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CONTEXTIDR_EL2																															

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of [CONTEXTIDR_EL2](#) that is associated with the most recent [PMU.PMPCSR](#) sample. When the most recent [PMU.PMPCSR](#) sample is generated: ~~PMPCSR~~ sample. When the most recent ~~PMPCSR~~ sample is generated:

- If the PE is not executing at EL3, EL2 is using AArch64, and EL2 is enabled in the current Security state, then this field is set to the Context ID sampled from [CONTEXTIDR_EL2](#).
- Otherwise, this field is set to an UNKNOWN value.

Because the value written to this field [PMCID2SR](#) is an indirect read of [CONTEXTIDR_EL2](#), it is CONSTRAINED UNPREDICTABLE whether this [PMCID2SR](#) field is set to the original or new value if [PMU.PMPCSR](#) samples: ~~PMPCSR~~ samples:

- An instruction that writes to [CONTEXTIDR_EL2](#).
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Component	Offset	Instance
PMU	0x22C	PMCID2SR

- When `IsCorePowered()`, `!DoubleLockStatus()` and `!OSLockStatus()`, accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Frame	Offset
PMU	0x22C

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.

Reserved, RES0.

F0, bit [32]

When FEAT_PMUv3_ICNTR is implemented:

PMU.PMICNTR_EL0 counter enable. Enables the instruction counter.

F0	Meaning
0b0	PMU.PMICNTR_EL0 disabled.
0b1	PMU.PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [31]

PMU.PMCCNTR_EL0 enable. Enables the cycle counter register. Possible values are:

C	Meaning
0b0	PMU.PMCCNTR_EL0 is disabled.
0b1	PMU.PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter enable for PMU.PMEVCNTR<n>_EL0.

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	PMU.PMEVCNTR<n>_EL0 is disabled.
0b1	PMU.PMEVCNTR<n>_EL0 is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTEN

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xC10

PMCNTEN can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xC10

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Disables the Cycle Count Register, PMU.PMCCNTR_EL0, and any implemented event counters, and any implemented event counters. PMEVCNTR<n>_EL0, PMEVCNTR<n>, PMCCNTR_EL0. Reading this register shows which counters are enabled.

Configuration

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0].

External register PMCNTENCLR_EL0 bits [63:32] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[63:32] when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented.

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0].

External register PMCNTENCLR_EL0 bits [63:32] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[63:32] when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented.

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCNTENCLR_EL0 are RES0.

PMCNTENCLR_EL0 is in the Core power domain.

Attributes

PMCNTENCLR_EL0 is a: 32-bit register.

- 64-bit register when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented:

63	31	62	30	61	29	60	28	59	27	58	26	57	25	56	24	55	23	54	22	53	21	52	20	51	19	50	18	49	17	48	16	47	15	46	14	45	13	44	12	43	11	42	10	41	9	
RES0																																														
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9																								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9																								

Bits [63:33]

Reserved, RES0.

F0, bit [32]

When FEAT_PMUv3_ICNTR is implemented:

PMU.PMICNTR_EL0 disable. On writes, allows software to disable PMU.PMICNTR_EL0. On reads, returns the PMU.PMICNTR_EL0 enable status.

F0	Meaning
0b0	PMU.PMICNTR_EL0 disabled.
0b1	PMU.PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

C, bit [31]

PMCCNTR_EL0 PMU.PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, disables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for PMU.PMEVCNTR<n>_EL0. **PMEVCNTR<n>_EL0**.

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI. **PMCFGR.N** is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMU.PMEVCNTR<n>_ELO is disabled. When written, has no effect. PMEVCNTR<n>_ELO is disabled. When written, has no effect.
0b1	When read, means that PMU.PMEVCNTR<n>_ELO is enabled. When written, disables PMU.PMEVCNTR<n>_ELO. PMEVCNTR<n>_ELO is enabled. When written, disables PMEVCNTR<n>_ELO.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENCLR_ELO

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENCLR_ELO can be accessed through the external debug interface:

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
Component								Offset								Instance															
PMU								0xC20								PMCNTENCLR_ELO															

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

C, bit [31]

PMU.PMCCNTR_ELO disable bit. Disables the cycle counter register.

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, disables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for PMU.PMEVCNTR<n>_ELO.

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMU.PMEVCNTR<n>_ELO is disabled. When written, has no effect.
0b1	When read, means that PMU.PMEVCNTR<n>_ELO is enabled. When written, disables PMU.PMEVCNTR<n>_ELO.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENCLR_ELO

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings in the external debug interface:

When FEAT_PMUv3_EXT64 is implemented

BlockAccess at address 0xC20

PMCNTENCLR_ELO can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xC20

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When FEAT_PMUv3_EXT32 is implemented

BlockAccess at address 0xC20

PMCNTENCLR_ELO can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0xC20	31:0

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When (FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is implemented) or FEAT_PMUv3_ICNTR is implemented

BlockAccess at address 0xC24

PMCNTENCLR_ELO can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0xC24	63:32

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

Bits [63:33]

Reserved, RES0.

F0, bit [32]

When FEAT_PMUv3_ICNTR is implemented:

PMU.PMICNTR_EL0 enable. On writes, allows software to enable PMU.PMICNTR_EL0. On reads, returns the PMU.PMICNTR_EL0 enable status.

F0	Meaning
0b0	PMU.PMICNTR_EL0 disabled.
0b1	PMU.PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **W1S**.

Otherwise:

Reserved, RES0.

C, bit [31]

PMCCNTR_EL0 PMU.PMCCNTR_EL0 enable bit. Enables the cycle counter register. Possible values are:

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, enables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter enable bit for PMU.PMEVCNTR<n>_EL0. **PMEVCNTR<n>_EL0.**

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI. **PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.**

P<n>	Meaning
0b0	When read, means that PMU.PMEVCNTR<n>_EL0 is disabled. When written, has no effect. PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that PMU.PMEVCNTR<n>_EL0 event counter is enabled. When written, enables PMU.PMEVCNTR<n>_EL0. PMEVCNTR<n>_EL0 event counter is enabled. When written, enables PMEVCNTR<n>_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENSET_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENSET_EL0 can be accessed through the external debug interface:

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
Component								Offset								Instance															
PMU								0xC00								PMCNTENSET_EL0															

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

C, bit [31]

PMU.PMCCNTR_EL0 enable bit. Enables the cycle counter register.

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, enables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter enable bit for PMU.PMEVCNTR<n>_EL0.

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMU.PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that PMU.PMEVCNTR<n>_EL0 event counter is enabled. When written, enables PMU.PMEVCNTR<n>_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENSET_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings in the external debug interface:

When FEAT_PMUv3_EXT64 is implemented

BlockAccess at address 0xC00

PMCNTENSET_EL0 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xC00

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When FEAT_PMUv3_EXT32 is implemented

BlockAccess at address 0xC00

PMCNTENSET_EL0 can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0xC00	31:0

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When (FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is implemented) or FEAT_PMUv3_ICNTR is implemented

BlockAccess at address 0xC04

PMCNTENSET_EL0 can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0xC04	63:32

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch32 System register [PMCR\[7:0\]](#).

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch64 System register [PMCR_EL0\[7:0\]](#).

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch32 System register [PMCR\[7:0\]](#).

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCR_EL0 are RES0.

PMCR_EL0 is in the Core power domain.

This register is only partially mapped to the internal [PMCR](#) System register. An external agent must use other means to discover the information held in [PMCR\[31:11\]](#), such as accessing [PMU.PMCFGR](#) and the ID registers. [PMCFGR](#) and the ID registers.

Attributes

PMCR_EL0 is a [32-bit register](#).

- 64-bit register when FEAT_PMUv3_EXT64 is implemented
- 32-bit register otherwise

This register is part of the [PMU](#) block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented:

63	31	62	30	61	29	60	28	59	27	58	26	57	25	56	24	55	23	54	22	53	21	52	20	51	19	50	18	49	17	48	16	47	15	46	14	45	13	44	12	43	11	42	10	41
RAZ/WI																	RES0															RES0FZ					FZ					9		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9																						

Bits [63:33]

Reserved, RES0.

FZS, bit [32]

When FEAT_SPEv1p2 is implemented:

Freeze-on-SPE event. Stop counters when [PMBLIMITR_EL1](#).{PMFZ,E} == {1,1} and [PMBSR_EL1](#).S == 1.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.

- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2.HPMN](#).
- If EL2 is not implemented, PMN is [PMCR_EL0.N](#).

FZS	Meaning
0b0	Do not freeze on Statistical Profiling Buffer Management event.
0b1	Event counter PMEVCNTR<n>_EL0 does not count following a Statistical Profiling Buffer Management event if n is in the range of affected event counters.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported, this field resets to 0.
 - When the implementation only supports execution in AArch64 state, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR.HPMN](#).
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2.HPMN](#).
- If EL2 is not implemented, PMN is [PMCR_EL0.N](#).

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counter PMU.PMEVCNTR<n>_EL0 does not count when PMEVCNTR<n>_EL0 does not count when PMOVSCLR_EL0[(PMN-1):0] is nonzero and n is in the range of affected event counters.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and [PMU.PMCCNTR_EL0](#). [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMU.PMEVCNTR<n> EL0[31:0] . PMEVCNTR<n> EL0[31:0] .
0b1	Event counter overflow on increment that causes unsigned overflow of PMU.PMEVCNTR<n> EL0[63:0] . PMEVCNTR<n> EL0[63:0] .

If PMN is not 0, this bit affects the operation of event counters in the range [0 .. (PMN-1)].

The field does not affect the operation of other event counters and [PMU.PMCCNTR_EL0](#).[PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]

When AArch32 is supported:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMU.PMCCNTR_EL0[31:0] . PMCCNTR_EL0[31:0] .
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMU.PMCCNTR_EL0[63:0] . PMCCNTR_EL0[63:0] .

Arm deprecates use of [PMU.PMCR_EL0.LC = 0](#).[PMCR_EL0.LC = 0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]**When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):**

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

DP	Meaning
0b0	Cycle counting by PMU.PMCCNTR_EL0 is not affected by this mechanism. PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMU.PMCCNTR_EL0 is disabled in prohibited regions and when event counting is frozen. PMCCNTR_EL0 is disabled in prohibited regions and when event counting is frozen: <ul style="list-style-type: none"> If FEAT_PMUv3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD is 1, then cycle counting by PMU.PMCCNTR_EL0 is disabled at EL2. PMCCNTR_EL0 is disabled at EL2. If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMU.PMCCNTR_EL0 is disabled at EL3. PMCCNTR_EL0 is disabled at EL3. If FEAT_PMUv3p7 is implemented and event counting is frozen by PMCR_EL0.FZO, then cycle counting by PMU.PMCCNTR_EL0 is disabled. PMCCNTR_EL0 is disabled. If EL3 is implemented, MDCR_EL3.SPME is 0, and either FEAT_PMUv3p7 is not implemented or MDCR_EL3.MPMX is 0, then cycle counting by PMU.PMCCNTR_EL0 is disabled at EL3 and in Secure state. PMCCNTR_EL0 is disabled at EL3 and in Secure state. <p>If MDCR_EL2.HPMN is not 0, this is when event counting by event counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited or frozen.</p>

For more information, see 'Prohibiting event and cycle counting'.

The reset behavior of this field is:

- On a Warm reset:
 - When the implementation only supports execution in AArch32 state, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]**When the implementation includes a PMU event export bus:**

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

When AArch32 is supported:

Clock divider.

D	Meaning
0b0	When enabled, PMU.PMCCNTR_EL0 counts every clock cycle. PMCCNTR_EL0 counts every clock cycle.
0b1	When enabled, PMU.PMCCNTR_EL0 counts once every 64 clock cycles. PMCCNTR_EL0 counts once every 64 clock cycles.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
0b0	No action.
0b1	Reset PMU.PMCCNTR_EL0 to zero. PMCCNTR_EL0 to zero.

Note

Resetting PMU.PMCCNTR_EL0 does not change the cycle counter overflow bit. If PMCCNTR_EL0 does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

P	Meaning
0b0	No action.
0b1	Reset all event counters, not including PMU.PMCCNTR_EL0 , to zero. PMCCNTR_EL0 , to zero.

Note

Resetting the event counters does not change the event counter overflow bits. If FEAT_PMuV3p5 is implemented, the value of [MDCR_EL2.HLP](#), or PMCR_EL0.LP is ignored and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR.HPMN](#).
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2.HPMN](#).
- If EL2 is not implemented, PMN is PMCR_EL0.N.

E	Meaning
0b0	PMCCNTR_EL0 is disabled and event counters PMEVCNTR<n>_EL0 PMU.PMCCNTR_EL0 is disabled and event counters PMU.PMEVCNTR<n>_EL0, where n is in the range of affected event counters, are disabled.
0b1	PMCCNTR_EL0 and event counters PMEVCNTR<n>_EL0 , where n is in the range of affected event counters, are enabled by PMCNTESET_EL0 PMU.PMCCNTR_EL0 and event counters PMU.PMEVCNTR<n>_EL0, where n is in the range of affected event counters, are enabled by PMU.PMCNTESET_EL0.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMCR_EL0**Note**

[SoftwareLockStatus\(\)](#) depends on the type of access attempted and [AllowExternalPMUAccess\(\)](#) has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCR_EL0 can be accessed through the external debug interface:

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						
RAZ/WI																						RES0FZORES0LP LCDP X D C P E															
Component											Offset											Instance															
PMU											0xE04											PMCR_EL0															

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR.HPMN](#).
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2.HPMN](#).
- If EL2 is not implemented, PMN is PMCR_EL0.N.

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counter PMU.PMEVCNTR<n>_EL0 does not count when PMOVSCLR_EL0 [(PMN-1):0] is nonzero and n is in the range of affected event counters.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and PMU.PMCCNTR_EL0.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR.HPMN](#).
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2.HPMN](#).
- If EL2 is not implemented, PMN is PMCR_EL0.N.

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMU.PMEVCNTR<n>_EL0[31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMU.PMEVCNTR<n>_EL0[63:0].

If PMN is not 0, this bit affects the operation of event counters in the range [0 .. (PMN-1)].

The field does not affect the operation of other event counters and PMU.PMCCNTR_EL0.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]

When AArch32 is supported:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMU.PMCCNTR_EL0[31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMU.PMCCNTR_EL0[63:0].

Arm deprecates use of PMU.PMCR_EL0.LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

DP	Meaning
0b0	Cycle counting by PMU.PMCCNTR_EL0 is not affected by this mechanism.
0b1	<p>Cycle counting by PMU.PMCCNTR_EL0 is disabled in prohibited regions and when event counting is frozen:</p> <ul style="list-style-type: none"> If FEAT_PMUv3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD is 1, then cycle counting by PMU.PMCCNTR_EL0 is disabled at EL2. If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMU.PMCCNTR_EL0 is disabled at EL3. If FEAT_PMUv3p7 is implemented and event counting is frozen by PMCR_EL0.FZO, then cycle counting by PMU.PMCCNTR_EL0 is disabled. If EL3 is implemented, MDCR_EL3.SPME is 0, and either FEAT_PMUv3p7 is not implemented or MDCR_EL3.MPMX is 0, then cycle counting by PMU.PMCCNTR_EL0 is disabled at EL3 and in Secure state. <p>If MDCR_EL2.HPMN is not 0, this is when event counting by event counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited or frozen.</p>

For more information, see 'Prohibiting event and cycle counting'.

The reset behavior of this field is:

- On a Warm reset:
 - When the implementation only supports execution in AArch32 state, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]**When AArch32 is supported:**

Clock divider.

D	Meaning
0b0	When enabled, PMU.PMCCNTR_EL0 counts every clock cycle.
0b1	When enabled, PMU.PMCCNTR_EL0 counts once every 64 clock cycles.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
0b0	No action.
0b1	Reset PMU.PMCCNTR_EL0 to zero.

Note

Resetting PMU.PMCCNTR_EL0 does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

P	Meaning
0b0	No action.
0b1	Reset all event counters, not including PMU.PMCCNTR_EL0, to zero.

Note

Resetting the event counters does not change the event counter overflow bits. If FEAT_PMUv3p5 is implemented, the value of MDCR_EL2.HLP, or PMCR_EL0.LP is ignored and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR.HPMN](#).
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2.HPMN](#).
- If EL2 is not implemented, PMN is PMCR_EL0.N.

E	Meaning
0b0	PMU.PMCCNTR_EL0 is disabled and event counters PMU.PMEVCNTR<n>_EL0, where n is in the range of affected event counters, are disabled.
0b1	PMU.PMCCNTR_EL0 and event counters PMU.PMEVCNTR<n>_EL0, where n is in the range of affected event counters, are enabled by PMU.PMCNTENSET_EL0.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMCR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings in the external debug interface:

When FEAT_PMUv3_EXT32 is implemented

BlockAccess at address 0xE04

PMCR_EL0 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xE04

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When FEAT_PMUv3_EXT64 is implemented

BlockAccess at address 0xE10

PMCR_EL0 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xE10

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

PMDEVAFF, Performance Monitors Device Affinity register

The PMDEVAFF characteristics are:

Purpose

Copy of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

This register is present only when FEAT_PMUv3_EXT64 is implemented. Otherwise, direct accesses to PMDEVAFF are RES0.

Attributes

PMDEVAFF is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

This register is present only when FEAT_PMUv3_EXT32 is implemented. Otherwise, direct accesses to PMDEVAFF0 are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF0 is a 32-bit register.

This register is part of the [PMU](#) block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MPIDR_EL1lo																															

MPIDR_EL1lo, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing PMDEVAFF0

PMDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFA8	PMDEVAFF0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMDEVAFF0

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xFA8

PMDEVAFF0 can be accessed through the PMU block as follows:

	Frame		Offset
	PMU		0xFA8

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

This register is present only when FEAT_PMuV3_EXT32 is implemented. Otherwise, direct accesses to PMDEVAFF1 are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF1 is a 32-bit register.

This register is part of the [PMU](#) block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MPIDR_EL1hi																															

MPIDR_EL1hi, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing PMDEVAFF1

PMDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFAC	PMDEVAFF1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMDEVAFF1

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xFAC

PMDEVAFF1 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xFAC

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the Performance Monitor component.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMDEVARCH are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVARCH is a 32-bit register.

This register is part of the [PMU](#) block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION				ARCHVER				ARCHPART											

ARCHITECT, bits [31:21]

Defines the architecture of the component. For Performance Monitors, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is **RO**.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For Performance Monitors, the revision defined by Armv8 is 0x0.

All other values are reserved.

Reads as 0b0000.

Access to this field is **RO**.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0010	Performance Monitors Extension version 3, PMUv3.

All other values are reserved.

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHVER is PMDEVARCH.ARCHID[15:12].

Access to this field is **RO**.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning	Applies when
0xA16	Armv8-A PE performance monitors.	
0xA26	Armv8-A PE performance monitors, including the 64-bit programmers' model extension.	From Armv8.8

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHPART is PMDEVARCH.ARCHID[11:0].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMDEVARCH

PMDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFBC	PMDEVARCH

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMDEVARCH

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xFBC

PMDEVARCH can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xFBC

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5707; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

PMDEVID, Performance Monitors Device ID register

The PMDEVID characteristics are:

Purpose

Provides information about features of the Performance Monitors implementation.

Configuration

This register is present only when FEAT_PMUv3_EXT32 is implemented. Otherwise, direct accesses to PMDEVID are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required from Armv8.2 and in any implementation that includes FEAT_PCSRv8p2. Otherwise, its location is RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID.PCSample](#).

Attributes

PMDEVID is a 32-bit register.

This register is part of the [PMU](#) block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
												RES0														PMSS		PCSample		PCSample			

Bits [31:84]

Reserved, RES0.

PMSS, bits [7:4]

PMU Snapshot extension. Defined values are:

PMSS	Meaning
0b0000	PMU snapshot extension not implemented.
0b0001	PMU snapshot extension implemented.

All other values are reserved.

FEAT_PMUv3_SS implements the functionality identified by the value 0b0001.

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the Performance Monitors register space.
0b0001	PC Sample-based Profiling Extension is implemented in the Performance Monitors register space.
0b0010	As 0b0001, and adds support for PMPCSTL.

FEAT PCSRv8p2 implements the functionality identified by the value 0b0001.

FEAT PCSRv8p9 implements the functionality identified by the value 0b0010.

If FEAT_PCSRv8p2 is not implemented, then the only permitted value is 0b0000.

From Armv8.2, when FEAT PCSRv8p2 is implemented, the value 0b0000 is not permitted.

From Armv8.9, when FEAT PCSRv8p9 is implemented, the value 0b0001 is not permitted.

Accessing PMDEVID

PMDEVID can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFC8	PMDEVID

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMDEVID

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xFC8

PMDEVID can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xFC8

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

(old)

htmldiff from-

(new)

PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVTYPE is a 32-bit register.

This register is part of the [PMU](#) block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												SUB				MAJOR			

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as 0b0001.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type. Indicates this is a performance monitor component.

Reads as 0b0110.

Access to this field is **RO**.

Accessing PMDEVTYPE

PMDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

	PMU		0xFCC		PMDEVTYPE
--	-----	--	-------	--	-----------

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMDEVTYPE

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xFCC

PMDEVTYPE can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xFCC

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5707; 21c5a6dd0fdaf10a712e2f2d6ffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

(new)

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter **<n>**, which counts events, where **<n>** is 0 to 30.

Configuration

External register `PMEVCNTR<n>_EL0` bits [31:0] are architecturally mapped to AArch64 System register [PMEVCNTR<n>_EL0\[31:0\]](#).

External register `PMEVCNTR<n>_EL0` bits [63:32] are architecturally mapped to AArch64 System register `PMEVCNTR<n>_EL0[63:32]` when FEAT_PMUv3p5 is implemented.

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVCNTR<n>\[31:0\]](#).

This register is present only when FEAT_PMuV3_EXT is implemented. Otherwise, direct accesses to PMEVCNTR<n> EL0 are RES0.

PMEVCNTR<n>>_EL0 is in the Core power domain.

Attributes

PMEVCNTR<n>>_EL0 is a:

- 64-bit register when FEAT_PMUv3p5 is implemented
- 32-bit register otherwise

This register is part of the [PMU](#) block.

Field descriptions

When FEAT_PMUv3p5 is implemented:

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32

Event counter n

Event counter n

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If the highest implemented Exception level is using AArch32, the optional external interface to the performance monitors is implemented, and the [PMCR.LP](#) and [HDCR.HLP](#) bits are RAZ/WI, then locations in the external interface to the performance monitors that map to `PMEVCNTR<n> EL0[63:32]` return UNKNOWN values on reads.

If the implementation does not support AArch64, bits [63:32] of the event counters are not required to be implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>_EL0

External accesses to the performance monitors ignore the following controls:

- [PMUSERENR_EL0](#).
- If implemented, [MDCR_EL2](#).{TPM, TPMCR, HPMN}.
- [MDCR_EL3](#).TPM.

This means that all counters are accessible regardless of the current Exception level or privilege of the access.

If FEAT_PMuV3p5 is not implemented, when IsCorePowered(), DoubleLockStatus(), OSLockStatus() or !AllowExternalPMUAccess(), 32-bit accesses to 0x004+8×n have a CONSTRAINED UNPREDICTABLE behavior.

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVCNTR<n>_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x000 + (8 * n)	PMEVCNTR<n>_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

Accessing PMEVCNTR<n>_EL0

External accesses to the performance monitors ignore the following controls:

- [PMUSERENR_EL0](#).
- If implemented, [MDCR_EL2](#).{TPM, TPMCR, HPMN}.
- [MDCR_EL3](#).TPM.

This means that all counters are accessible regardless of the current Exception level or privilege of the access.

If FEAT_PMuV3p5 is not implemented, when IsCorePowered(), DoubleLockStatus(), OSLockStatus() or !AllowExternalPMUAccess(), 32-bit accesses to 0x004+8×n have a CONSTRAINED UNPREDICTABLE behavior.

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

BlockAccess at address $0x000 + (8 * n)$

Frame	Offset
PMU	0x000 + (8 * n)

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

PMEVCNTSVR<n>_EL1, Performance Monitors Event Count Saved Value Register <n>, n = 0 - 30

The PMEVCNTSVR<n>_EL1 characteristics are:

Purpose

Captures the PMU Event counter <n>, PMU.PMEVCNTR<n>_EL0.

Configuration

External register PMEVCNTSVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register [PMEVCNTSVR<n>_EL1\[63:0\]](#).

This register is present only when FEAT_PMUv3_SS is implemented. Otherwise, direct accesses to PMEVCNTSVR<n>_EL1 are RES0.

PMEVCNTSVR<n>_EL1 is in the Core power domain.

If event counter n is not implemented:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(), accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

Attributes

PMEVCNTSVR<n>_EL1 is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																EVCNT															
																EVCNT															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EVCNT, bits [63:0]

Sampled Event Count. The value of PMU.PMEVCNTR<n>_EL0 at the last Capture event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTSVR<n>_EL1

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address $0x600 + (8 * n)$

PMEVCNTSVR<n>_EL1 can be accessed through the PMU block as follows:

Frame	Offset
PMU	$0x600 + (8 * n)$

- When !AllowExternalPMSSAccess(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

PMEVTYPEPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter <n>, where <n> is 0 to 30.

Configuration

External register PMEVTYPER<n>_EL0 bits [63:0] are architecturally mapped to AArch64 System register [PMEVTYPER<n>_EL0\[63:0\]](#).

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVTYPER<n>\[31:0\]](#).

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are RES0.

PMEVTYPER<n>_EL0 is in the Core power domain.

If event counter n is not implemented:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(), accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

Attributes

PMEVTYPER<n>_EL0 is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60		59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

31	30	29	28		27		26		25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

TC, bits [63:61]

When FEAT_PMUv3_EDGEFEAT_PMUv3_TH is implemented and PMU.PMEVTYPER<n>_EL0.TE == 1:

Threshold Control. Defines the threshold function. In the description of this field, the value V is the value the event specified by PMEVTYPER<n>_EL0.evtCount would increment the counter by on a processor cycle if the threshold function is disabled. Comparisons treat V and this PMEVTYPER<n>_EL0.TH as unsigned integer values.

Defines the threshold function. In the description of this field:

- V_B is the value the event specified by PMU.PMEVTYPER<n>_EL0 would increment the counter by on a processor cycle if the threshold function is disabled.
- TH is the value of PMEVTYPER<n>.TH.

Comparisons treat V_B and TH as unsigned integer values.

TC	Meaning
0b110	Less-than. The counter increments by V on each processor cycle when V is less than $PMEVTYPER<n>_{EL0}.TH$.
0b111	Less-than, count. The counter increments by 1 on each processor cycle when V is less than $PMEVTYPER<n>_{EL0}.TH$.
0b0010b000	EqualNot-equal, to not-equal. The counter increments by 1V on each processor cycle when V is not equal to $PMEVTYPER<n>_{EL0}.TH$. If $PMEVTYPER<n>_{EL0}.TH$ is zero, the threshold function is disabled. B is not equal to TH and V_B was equal to TH on the previous processor cycle.
0b0100b001	EqualNot-equal, to/from count, not-equal. The counter increments by 1 on each processor cycle when either: V is not equal to $PMEVTYPER<n>_{EL0}.TH$. <ul style="list-style-type: none"> V_B is not equal to TH and V_B was equal to TH on the previous processor cycle. V_B is equal to TH and V_B was not equal to TH on the previous processor cycle.
0b0110b010	Not-equalEquals, to equal. The counter increments by 1V on each processor cycle when V is equal to $PMEVTYPER<n>_{EL0}.TH$. B is equal to TH and V_B was not equal to TH on the previous processor cycle.
0b1010b011	Less-thanEquals, to count, greater-than-or-equal. The counter increments by 1 on each processor cycle when V is equal to $PMEVTYPER<n>_{EL0}.TH$. B is greater than or equal to TH and V_B was less than TH on the previous processor cycle.
0b1100b100	Less-thanGreater-than-or-equal, to/from greater-than-or-equal. The counter increments by 1V on each processor cycle when either: V is $PMEVTYPER<n>_{EL0}.TH$ or more. <ul style="list-style-type: none"> V_B is greater than or equal to TH and V_B was less than TH on the previous processor cycle. V_B is less than TH and V_B was greater than or equal to TH on the previous processor cycle.
0b1110b101	Greater-than-or-equal, to count, less-than. The counter increments by 1 on each processor cycle when V is $PMEVTYPER<n>_{EL0}.TH$ or more. B is less than TH and V_B was greater than or equal to TH on the previous processor cycle.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

When ((FEAT_PMuV3_EDGE is implemented and $PMU.PMEVTYPER<n>_{EL0}.TE == 0$) or FEAT_PMuV3_EDGE is not implemented) and FEAT_PMuV3_TH is implemented:

Threshold Control.

Defines the threshold function. In the description of this field:

- V_B is the value the event specified by $PMU.PMEVTYPER<n>_{EL0}$ would increment the counter by on a processor cycle if the threshold function is disabled.
- TH is the value of $PMEVTYPER<n>_{EL0}.TH$.

Comparisons treat V_B and TH as unsigned integer values.

TC	Meaning
0b000	Not-equal. The counter increments by V_B on each processor cycle when V_B is not equal to TH. If TH is zero, the threshold function is disabled.
0b001	Not-equal, count. The counter increments by 1 on each processor cycle when V_B is not equal to TH.
0b010	Equals. The counter increments by V_B on each processor cycle when V_B is equal to TH.
0b011	Equals, count. The counter increments by 1 on each processor cycle when V_B is equal to TH.
0b100	Greater-than-or-equal. The counter increments by V_B on each processor cycle when V_B is greater than or equal to TH.
0b101	Greater-than-or-equal, count. The counter increments by 1 on each processor cycle when V_B is greater than or equal to TH.
0b110	Less-than. The counter increments by V_B on each processor cycle when V_B is less than TH.
0b111	Less-than, count. The counter increments by 1 on each processor cycle when V_B is less than TH.

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Threshold Control.

Defines the threshold function. In the description of this field:

- V_B is the value the event specified by PMU.PMEVTYPER<n>_EL0 would increment the counter by on a processor cycle if the threshold function is disabled.
- TH is the value of PMEVTYPER<n>.TH.

Comparisons treat V_B and TH as unsigned integer values.

TE, bit [60]

When FEAT_PMUv3_EDGE is implemented:

Threshold Edge. Enables the edge condition. When PMEVTYPER<n>.TE is 1, the event counter increments on cycles when the result of the threshold condition changes. See PMEVTYPER<n>.TC for more information.

TE	Meaning
0b0	Threshold edge condition disabled.
0b1	Threshold edge condition enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BitBits [5960:44]

Reserved, RES0.

SYNC, bit [58]**When FEAT_SEBEP is implemented:**

Synchronous Mode. Controls whether a PMU exception generated by the counter is synchronous or asynchronous.

SYNC	Meaning
0b0	Asynchronous PMU exception is enabled.
0b1	Synchronous PMU exception is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [57:44]

Reserved, RES0.

TH, bits [43:32]**When FEAT_PMUv3_TH is implemented:**

Threshold value. Provides the unsigned value for the threshold function defined by PMEVTYPER<n>_EL0.TC.

If PMEVTYPER<n>_EL0.TC is 0b000 and PMEVTYPER<n>_EL0.TH is zero, then the threshold function is disabled.

If `PMMIR_EL1.PMMIR.THWIDTH` is less than 12, then bits `PMEVTYPER<n>_EL0.TH[11:PMMIR_EL1.PMMIR.THWIDTH]` are RES0. This accounts for the behavior when writing a value greater-than-or-equal-to $2^{(PMMIR_EL1.THWIDTH - PMMIR.THWIDTH)}$.

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMEVTYPER<n>_EL0.RLK bit.

P	Meaning
0b0	Count events in EL1.
0b1	Do not count events in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMEVTYPER<n>_EL0.RLU bit.

U	Meaning
0b0	Count events in EL0.
0b1	Do not count events in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]**When EL3 is implemented:**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]**When EL3 is implemented:**

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]**When EL2 is implemented:**

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMEVTYPER<n>_EL0.RLH bit.

NSH	Meaning
0b0	Do not count events in EL2.
0b1	Count events in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in EL3 are counted.

Otherwise, events in EL3 are not counted.

Most applications can ignore this field and set its value to 0b0.

Note

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]

When (FEAT_MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

Note

- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]**When FEAT_SEL2 is implemented and EL3 is implemented:**

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

Note

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

T, bit [23]**When FEAT_TME is implemented:**

Transactional state filtering bit. Controls counting of Attributable events in Non-transactionalTransactional state.

T	Meaning
0b0	This bit has no effect on the filtering of events.
0b1	Do not count Attributable events in Non-transactionalTransactional state.

For each Unattributable event, it is IMPLEMENTATION DEFINED whether the filtering applies.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]**When FEAT_RME is implemented:**

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Realm EL1 are counted.

Otherwise, events in Realm EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]**When FEAT_RME is implemented:**

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Realm EL0 are counted.

Otherwise, events in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]**When FEAT_RME is implemented:**

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Realm EL2 are counted.

Otherwise, events in Realm EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]**When FEAT_PMUv3p1 is implemented:**

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter

PMU.PMEVCNTR<n>_EL0.PMEVCNTR<n>_EL0.

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.

Note

Arm recommends this behavior for all implementations of FEAT_PMUv3.

Otherwise, if PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>_EL0

If FEAT_PMUv3_TH or FEAT_PMUv3p8 is implemented, bits [63:32] of this interface are accessible at offset 0xA00 + (4*n). Otherwise accesses at this offset are IMPLEMENTATION DEFINED.

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVTYPER<n>_EL0 can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x400 + (4 * n)	PMEVTYPER<n>_EL0	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

Component	Offset	Instance	Range
-----------	--------	----------	-------

PMU	0xA00 + (4 * n)	PMEVTYPEPER<n>_EL0	63:32
-----	-----------------	--------------------	-------

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

Accessing PMEVTYPER<n>_EL0

If FEAT_PMUv3_TH is implemented, and at least one of FEAT_PMUv3_TH or FEAT_PMUv3p8 is implemented, bits [63:32] of this interface are accessible at offset 0xA00 + (4*n). Otherwise accesses at this offset are IMPLEMENTATION DEFINED.

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings in the external debug interface:

When FEAT_PMUv3_EXT32 is implemented

BlockAccess at address 0x400 + (4 * n)

PMEVTYPEPER<n>_EL0 can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0x400 + (4 * n)	31:0

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When FEAT_PMUv3_EXT64 is implemented

BlockAccess at address 0x400 + (8 * n)

PMEVTYPEPER<n>_EL0 can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0x400 + (8 * n)	63:0

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When FEAT_PMUv3_EXT32 is implemented

BlockAccess at address 0xA00 + (4 * n)

PMEVTYPEPER<n>_EL0 can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0xA00 + (4 * n)	63:32

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus() or !AllowExternalPMUAccess(), accesses to this register generate an error response.

- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

PMICFILTR_EL0, Performance Monitors Instruction Counter Filter Register

The PMICFILTR_EL0 characteristics are:

Purpose

Configures the Instruction Counter.

Configuration

External register PMICFILTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register [PMICFILTR_EL0\[63:0\]](#).

This register is present only when FEAT_PMUv3_ICNTR is implemented. Otherwise, direct accesses to PMICFILTR_EL0 are RES0.

PMICFILTR_EL0 is in the Core power domain.

Note

If FEAT_Debugv8p4 is implemented, the OPTIONAL Software Lock is not implemented.

Attributes

PMICFILTR_EL0 is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0					SYNC	RES0																									
P	U	NSK	NSU	NSH	M	RES0	SH	T	RLK	RLU	RLH	RES0				evtCount															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:59]

Reserved, RES0.

SYNC, bit [58]

When FEAT_SEBEP is implemented:

Synchronous mode. Controls whether a PMU exception generated by the counter is synchronous or asynchronous.

SYNC	Meaning
0b0	Asynchronous PMU exception is enabled.
0b1	Synchronous PMU exception is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [57:32]

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting instructions in EL1.

P	Meaning
0b0	This bit has no effect on filtering of instructions.
0b1	Instructions in EL1 are not counted.

If EL3 is implemented, then counting instructions in Non-secure EL1 is further controlled by PMICFILTR_EL0.NSK, and counting instructions in EL3 is further controlled by PMICFILTR_EL0.M.

If FEAT_RME is implemented, then counting instructions in Realm EL1 is further controlled by PMICFILTR_EL0.RLK.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting instructions in EL0.

U	Meaning
0b0	This bit has no effect on filtering of instructions.
0b1	Instructions in EL0 are not counted.

If EL3 is implemented, then PMICFILTR_EL0.NSU further controls filtering instructions in Non-secure EL0.

If FEAT_RME is implemented, then counting instructions in Realm EL1 is further controlled by PMICFILTR_EL0.RLU.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]**When EL3 is implemented:**

Non-secure EL1 filtering. Controls counting instructions in Non-secure EL1. If PMICFILTR_EL0.NSK is equal to PMICFILTR_EL0.P, then instructions in Non-secure EL1 are counted. Otherwise, instructions in Non-secure EL1 are not counted.

NSK	Meaning
0b0	If PMICFILTR_EL0.P == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.P == 1, then instructions in Non-secure EL1 are not counted.
0b1	If PMICFILTR_EL0.P == 0, then instructions in Non-secure EL1 are not counted. If PMICFILTR_EL0.P == 1, then this bit has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]**When EL3 is implemented:**

Non-secure EL0 filtering. Controls counting instructions in Non-secure EL0. If PMICFILTR_EL0.NSU is equal to PMICFILTR_EL0.U, then instructions in Non-secure EL0 are counted. Otherwise, instructions in Non-secure EL0 are not counted.

NSU	Meaning
0b0	If PMICFILTR_EL0.U == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.U == 1, then instructions in Non-secure EL0 are not counted.
0b1	If PMICFILTR_EL0.U == 0, then instructions in Non-secure EL0 are not counted. If PMICFILTR_EL0.U == 1, then this bit has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]**When EL2 is implemented:**

EL2 filtering. Controls counting instructions in EL2.

NSH	Meaning
0b0	Instructions in EL2 are not counted.
0b1	This bit has no effect on filtering of instructions.

If EL3 is implemented and FEAT_SEL2 is implemented, then counting instructions in Secure EL2 is further controlled by PMICFILTR_EL0.SH.

If FEAT_RME is implemented, then counting instructions in Realm EL2 is further controlled by PMICFILTR_EL0.RLH.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]**When EL3 is implemented:**

EL3 filtering. Controls counting instructions in EL3. If PMICFILTR_EL0.M is equal to PMICFILTR_EL0.P, then instructions in EL3 are counted. Otherwise, instructions in EL3 are not counted.

M	Meaning
0b0	If PMICFILTR_EL0.P == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.P == 1, then instructions in EL3 are not counted.
0b1	If PMICFILTR_EL0.P == 0, then instructions in EL3 are not counted. If PMICFILTR_EL0.P == 1, then this bit has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

When EL3 is implemented and FEAT_SEL2 is implemented:

Secure EL2 filtering. Controls counting instructions in Secure EL2. If PMICFILTR_EL0.SH is not equal to PMICFILTR_EL0.NSH, then instructions in Secure EL2 are counted. Otherwise, instructions in Secure EL2 are not counted.

SH	Meaning
0b0	If PMICFILTR_EL0.NSH == 0, then instructions in Secure EL2 are not counted. If PMICFILTR_EL0.NSH == 1, then this bit has no effect on filtering of instructions.
0b1	If PMICFILTR_EL0.NSH == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.NSH == 1, then instructions in Secure EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When !IsSecureEL2Enabled(), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

T, bit [23]

When FEAT_TME is implemented:

Non-transactional state filtering. Controls counting instructions in Non-transactional state.

T	Meaning
0b0	This bit has no effect on filtering of instructions.
0b1	Instructions in Non-transactional state are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]

When FEAT_RME is implemented:

Realm EL1 filtering. Controls counting instructions in Realm EL1. If PMICFILTR_EL0.RLK is equal to PMICFILTR_EL0.P, then instructions in Realm EL1 are counted. Otherwise, instructions in Realm EL1 are not counted.

RLK	Meaning
0b0	If PMICFILTR_EL0.P == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.P == 1, then instructions in Realm EL1 are not counted.
0b1	If PMICFILTR_EL0.P == 0, then instructions in Realm EL1 are not counted. If PMICFILTR_EL0.P == 1, then this bit has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 filtering. Controls counting instructions in Realm EL0. If PMICFILTR_EL0.RLU is equal to PMICFILTR_EL0.U, then instructions in Realm EL0 are counted. Otherwise, instructions in Realm EL0 are not counted.

RLU	Meaning
0b0	If PMICFILTR_EL0.U == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.U == 1, then instructions in Realm EL0 are not counted.
0b1	If PMICFILTR_EL0.U == 0, then instructions in Realm EL0 are not counted. If PMICFILTR_EL0.U == 1, then this bit has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]**When FEAT_RME is implemented:**

Realm EL2 filtering. Controls counting instructions in Realm EL2. If PMICFILTR_EL0.RLH is not equal to PMICFILTR_EL0.NSH, then instructions in Realm EL2 are counted. Otherwise, instructions in Realm EL2 are not counted.

RLH	Meaning
0b0	If PMICFILTR_EL0.NSH == 0, then instructions in Realm EL2 are not counted. If PMICFILTR_EL0.NSH == 1, then this bit has no effect on filtering of instructions.
0b1	If PMICFILTR_EL0.NSH == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.NSH == 1, then instructions in Realm EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count.

Reads as 0x0008.

Access to this field is **RO**.

Accessing PMICFILTR_EL0

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0x480

PMICFILTR_EL0 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x480

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus() or !AllowExternalPMUAccess(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

PMICNTR_EL0, Performance Monitors Instruction Counter Register

The PMICNTR_EL0 characteristics are:

Purpose

If event counting is not prohibited and the instruction counter is enabled, the counter increments for each architecturally-executed instruction, according to the configuration specified by PMU.PMICFILTR_EL0.

Configuration

External register PMICNTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register [PMICNTR_EL0\[63:0\]](#).

This register is present only when FEAT_PMUv3_ICNTR is implemented. Otherwise, direct accesses to PMICNTR_EL0 are RES0.

PMICNTR_EL0 is in the Core power domain.

Attributes

PMICNTR_EL0 is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

																ICNT															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ICNT, bits [63:0]

Instruction Counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMICNTR_EL0

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0x100

PMICNTR_EL0 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x100

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus() or !AllowExternalPMUAccess(), accesses to this register generate an error response.

- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

PMICNTSVR_EL1, Performance Monitors Instruction Count Saved Value Register

The PMICNTSVR_EL1 characteristics are:

Purpose

Captures the PMU Instruction counter, PMU.PMICNTR_EL0.

Configuration

External register PMICNTSVR_EL1 bits [63:0] are architecturally mapped to AArch64 System register [PMICNTSVR_EL1\[63:0\]](#).

This register is present only when FEAT_PMUv3_ICNTR is implemented and FEAT_PMUv3_SS is implemented. Otherwise, direct accesses to PMICNTSVR_EL1 are RES0.

Attributes

PMICNTSVR_EL1 is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																ICNT															
																ICNT

ICNT, bits [63:0]

Sampled Instruction Count. The value of PMU.PMICNTR_EL0 at the last Capture event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMICNTSVR_EL1

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0x700

PMICNTSVR_EL1 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x700

- When !AllowExternalPMSSAccess(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

PMIIDR, Performance Monitors Implementation Identification Register

The PMIIDR characteristics are:

Purpose

Provides discovery information about the Performance Monitor component.

Configuration

This register is present only when (FEAT_PMUv3_EXT32 is implemented and an implementation implements PMIIDR) or FEAT_PMUv3_EXT64 is implemented. Otherwise, direct accesses to PMIIDR are RES0.

Attributes

PMIIDR is a:

- 64-bit register when FEAT_PMUv3_EXT64 is implemented
- 32-bit register otherwise

This register is part of the [PMU](#) block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																			
ProductID																Variant				Revision				Implementer[10:7]				RES0		Implementer[6:0]					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:32]

Reserved, RES0.

ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

Matches the PMU.PMPIDR1.PART_1, PMU.PMPIDR0.PART_0 fields if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [19:16]

Component major revision.

Defines either a variant of the component defined by PMIIDR.ProductID, or the major revision of the component.

When defining a major revision, PMIIDR.Variant and PMIIDR.Revision together form the revision number of the component, with this field being the most significant part.

When a component is changed, PMIIDR.Variant or PMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If this field is increased, PMIIDR.Revision should be set to 0b0000.

Matches the PMU.PMPIDR2.REVISION field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Component minor revision.

PMIIDR.Variant and PMIIDR.Revision together form the revision number of the component, with this field being the least significant part.

When a component is changed, PMIIDR.Variant or PMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If PMIIDR.Variant field is increased, this field should be set to 0b0000, otherwise the value in this field should be increased.

Matches the PMU.PMPIDR3.REVAND field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:8, 6:0]

JEDEC-assigned JEP106 identification code of the designer of the component.

Bits [11:8] are the JEP106 bank identifier minus 1 and bits [6:0] are the JEP106 identification code for the designer of the component.

Note

For Arm Limited, the JEP106 bank is 5 and the JEP106 identification code is 0x3B, meaning PMIIDR[11:0] has the value 0x43B.

Bits [11:8] match the PMU.PMPIDR4.DES_2 field, if present.

Bits[6:0] match the {PMPIDR2.DES1, PMPIDR1.DES_0} fields if present.

This field has an IMPLEMENTATION DEFINED value.

The Implementer field is split as follows:

- Implementer[10:7] is PMIIDR[11:8].
- Implementer[6:0] is PMIIDR[6:0].

Access to this field is **RO**.

Bit [7]

Reserved, RES0.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID												Variant			Revision			Implementer[10:7]			RES0	Implementer[6:0]									

ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

Matches the PMU.PMPIDR1.PART_1, PMU.PMPIDR0.PART_0 fields if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [19:16]

Component major revision.

Defines either a variant of the component defined by PMIIDR.ProductID, or the major revision of the component.

When defining a major revision, PMIIDR.Variant and PMIIDR.Revision together form the revision number of the component, with this field being the most significant part.

When a component is changed, PMIIDR.Variant or PMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If this field is increased, PMIIDR.Revision should be set to 0b0000.

Matches the PMU.PMPIDR2.REVISION field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Component minor revision.

PMIIDR.Variant and PMIIDR.Revision together form the revision number of the component, with this field being the least significant part.

When a component is changed, PMIIDR.Variant or PMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If PMIIDR.Variant field is increased, this field should be set to 0b0000, otherwise the value in this field should be increased.

Matches the PMU.PMPIDR3.REVAND field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:8, 6:0]

JEDEC-assigned JEP106 identification code of the designer of the component.

Bits [11:8] are the JEP106 bank identifier minus 1 and bits [6:0] are the JEP106 identification code for the designer of the component.

Note

For Arm Limited, the JEP106 bank is 5 and the JEP106 identification code is 0x3B, meaning PMIIDR[11:0] has the value 0x43B.

Bits [11:8] match the PMU.PMPIDR4.DES_2 field, if present.

Bits[6:0] match the {PMPIDR2.DES1, PMPIDR1.DES_0} fields if present.

This field has an IMPLEMENTATION DEFINED value.

The Implementer field is split as follows:

- Implementer[10:7] is PMIIDR[11:8].
- Implementer[6:0] is PMIIDR[6:0].

Access to this field is **RO**.

Bit [7]

Reserved, RES0.

Accessing PMIIDR

Accesses to this register use the following encodings in the external debug interface:

When FEAT_PMUv3_EXT64 is implemented

BlockAccess at address 0xE08

PMIIDR can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xE08

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

PMINTEN, Performance Monitors Interrupt Enable register

The PMINTEN characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMU.PMCCNTR_EL0, and the event counters PMU.PMEVCNTR<n>_EL0.

Configuration

External register PMINTEN bits [31:0] are architecturally mapped to AArch64 System register [PMINTENSET_EL1\[31:0\]](#).

External register PMINTEN bits [63:32] are architecturally mapped to AArch64 System register [PMINTENSET_EL1\[63:32\]](#) when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented.

External register PMINTEN bits [31:0] are architecturally mapped to AArch32 System register [PMINTENSET\[31:0\]](#).

External register PMINTEN bits [31:0] are architecturally mapped to AArch64 System register [PMINTENCLR_EL1\[31:0\]](#).

External register PMINTEN bits [63:32] are architecturally mapped to AArch64 System register [PMINTENCLR_EL1\[63:32\]](#) when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented.

External register PMINTEN bits [31:0] are architecturally mapped to AArch32 System register [PMINTENCLR\[31:0\]](#).

This register is present only when FEAT_PMUv3_EXT64 is implemented. Otherwise, direct accesses to PMINTEN are RES0.

Attributes

PMINTEN is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bits [63:33]

Reserved, RES0.

F0, bit [32]

When FEAT_PMUv3_ICNTR is implemented:

Interrupt request on unsigned overflow of PMU.PMICNTR_EL0 enable.

F0	Meaning
0b0	Interrupt request on unsigned overflow of PMU.PMICNTR_ELO disabled.
0b1	Interrupt request on unsigned overflow of PMU.PMICNTR_ELO enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [31]

PMU.PMCCNTR_ELO unsigned overflow interrupt request enable bit. Possible values are:

C	Meaning
0b0	The cycle counter overflow interrupt request is disabled.
0b1	The cycle counter overflow interrupt request is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter unsigned overflow interrupt request enable bit for PMU.PMEVCNTR<n>_ELO.

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	The PMU.PMEVCNTR<n>_ELO event counter interrupt request is disabled.
0b1	The PMU.PMEVCNTR<n>_ELO event counter interrupt request is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTEN

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xC50

PMINTEN can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xC50

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMU.PMCCNTR_EL0](#), and the event counters [PMU.PMEVCNTR<n>_EL0](#). Reading the register shows which overflow interrupt requests are enabled. [PMCCNTR_EL0](#), and the event counters [PMEVCNTR<n>_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

Configuration

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [PMINTENCLR_EL1\[31:0\]](#).

External register PMINTENCLR_EL1 bits [63:32] are architecturally mapped to AArch64 System register [PMINTENCLR_EL1\[63:32\]](#) when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented.

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENCLR\[31:0\]](#).

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [PMINTENSET_EL1\[31:0\]](#).

External register PMINTENCLR_EL1 bits [63:32] are architecturally mapped to AArch64 System register [PMINTENSET_EL1\[63:32\]](#) when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented.

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENSET\[31:0\]](#).

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMINTENCLR_EL1 are RES0.

PMINTENCLR_EL1 is in the Core power domain.

Attributes

PMINTENCLR_EL1 is a: [32-bit register](#).

- 64-bit register when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented
- 32-bit register otherwise

This register is part of the [PMU](#) block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented:

63	31	16	23	06	12	96	02	85	92	75	82	65	72	55	62	45	52	35	42	25	32	15	22	05	12	95	02	84	91	74	81	64	71	54	61	44	51	34	41	24	31	14	21	04	11	9
RES0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9																								

Bits [63:33]

Reserved, RES0.

F0, bit [32]

When FEAT_PMUv3_ICNTR is implemented:

Interrupt request on unsigned overflow of PMU.PMICNTR_EL0 disable. On writes, allows software to disable the interrupt request on unsigned overflow of PMU.PMICNTR_EL0. On reads, returns the interrupt request on unsigned overflow of PMU.PMICNTR_EL0 enable status.

F0	Meaning
0b0	Interrupt request on unsigned overflow of PMU.PMICNTR_EL0 disabled.
0b1	Interrupt request on unsigned overflow of PMU.PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

C, bit [31]

~~PMCCNTR_EL0~~PMU.PMCCNTR_EL0 overflow interrupt request disable bit. ~~Possible values are:~~

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for PMU.PMEVCNTR<n>_EL0. ~~PMEVCNTR<n>_EL0.~~

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI. ~~PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.~~

P<n>	Meaning
0b0	When read, means that the PMU.PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect. PMMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the PMU.PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, disables the PMU.PMEVCNTR<n>_EL0 interrupt request. PMMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, disables the PMMEVCNTR<n>_EL0 interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENCLR_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENCLR_EL1 can be accessed through the external debug interface:

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
Component								Offset								Instance															
PMU								0xC60								PMINTENCLR_EL1															

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

C, bit [31]

PMU.PMCCNTR_EL0 overflow interrupt request disable bit.

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for PMU.PMEVCNTR<n>_EL0.

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that the PMU.PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the PMU.PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, disables the PMU.PMEVCNTR<n>_EL0 interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENCLR_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings in the external debug interface:

When FEAT_PMUv3_EXT64 is implemented

BlockAccess at address 0xC60

PMINTENCLR_EL1 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xC60

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When FEAT_PMUv3_EXT32 is implemented

BlockAccess at address 0xC60

PMINTENCLR_EL1 can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0xC60	31:0

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When (FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is implemented) or FEAT_PMUv3_ICNTR is implemented

BlockAccess at address 0xC64

PMINTENCLR_EL1 can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0xC64	63:32

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.

- Otherwise, accesses to this register generate an error response.

PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMU.PMCCNTR_EL0](#), and the event counters [PMU.PMEVCNTR<n>_EL0](#). Reading the register shows which overflow interrupt requests are enabled. [PMCCNTR_EL0](#), and the event counters [PMEVCNTR<n>_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

Configuration

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register [PMINTENSET_EL1\[31:0\]](#).

External register PMINTENSET_EL1 bits [63:32] are architecturally mapped to AArch64 System register [PMINTENSET_EL1\[63:32\]](#) when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented.

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENSETI\[31:0\]](#).

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register [PMINTENCLR_EL1\[31:0\]](#).

External register PMINTENSET_EL1 bits [63:32] are architecturally mapped to AArch64 System register [PMINTENCLR_EL1\[63:32\]](#) when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented.

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENCLR\[31:0\]](#).

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMINTENSET_EL1 are RES0.

PMINTENSET_EL1 is in the Core power domain.

Attributes

PMINTENSET_EL1 is a: [32-bit register](#).

- 64-bit register when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented
- 32-bit register otherwise

This register is part of the [PMU](#) block.

P<n>	Meaning
0b0	When read, means that the PMU.PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect. PMMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the PMU.PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, enables the PMU.PMEVCNTR<n>_EL0 interrupt request. PMMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, enables the PMMEVCNTR<n>_EL0 interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENSET_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENSET_EL1 can be accessed through the external debug interface:

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
Component								Offset								Instance															
PMU								0xC40								PMINTENSET_EL1															

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

C, bit [31]

PMU.PMCCNTR_EL0 overflow interrupt request enable bit.

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request enable bit for PMU.PMEVCNTR<n>_EL0.

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that the PMU.PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the PMU.PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, enables the PMU.PMEVCNTR<n>_EL0 interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENSET_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings in the external debug interface:

When FEAT_PMUv3_EXT64 is implemented

BlockAccess at address 0xC40

PMINTENSET_EL1 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xC40

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When FEAT_PMUv3_EXT32 is implemented

BlockAccess at address 0xC40

PMINTENSET_EL1 can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0xC40	31:0

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When (FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is implemented) or FEAT_PMUv3_ICNTR is implemented

BlockAccess at address 0xC44

PMINTENSET_EL1 can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0xC44	63:32

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.

- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5708; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

Purpose

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

Implementation of this register is OPTIONAL.

This register is present only when FEAT_PMUv3_EXT32 is implemented and an implementation implements PMITCTRL. Otherwise, direct accesses to PMITCTRL are RES0IMPLEMENTATION DEFINED. whether PMITCTRL is implemented in the Core power domain or in the Debug power domain.

Attributes

PMITCTRL is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The following resets apply:

- If the register is implemented in the Core power domain:
 - On a Cold reset, this field resets to 0.
 - On an External debug reset, the value of this field is unchanged.
 - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
 - On a Cold reset, the value of this field is unchanged.

PMITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xF00	PMITCTRL

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `SoftwareLockStatus()`, accesses to this register are **RO**.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `!SoftwareLockStatus()`, accesses to this register are **RW**.
- Otherwise, accesses to this register are **IMPDEF**.

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xF00

PMITCTRL can be accessed through the PMU block as follows:

	Frame		Offset
	PMU		0xF00

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register are **IMPDEF**.

3005/0907/2022 1517:5708; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

Purpose

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

This register is present only when FEAT_PMUv3_EXT32 is implemented. Otherwise, direct accesses to PMLAR are RES0.

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMU.PMLSR to check the current status of the lock. PMLSR to check the current status of the lock.

Attributes

PMLAR is a 32-bit register.

This register is part of the PMU block.

Field descriptions

When Software Lock is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																KEY															

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																RES0															

Otherwise

PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

Purpose

Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

This register is present only when FEAT_PMUv3_EXT32 is implemented. Otherwise, direct accesses to PMLSR are RES0.

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMU.PMLAR to set or clear the lock, and PMLSR to check the current status of the lock. PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes

PMLSR is a 32-bit register.

This register is part of the PMU block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																	nTT		SLK		SLI										

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required.

Reads as 0b0.

Access to this field is **RO**.

SLK, bit [1]

When Software Lock is implemented and FEAT_DoPD is not implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On an External debug reset, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Accessing PMLSR

PMLSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
PMU	0xFB4	PMLSR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMLSR

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xFB4

PMLSR can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xFB4

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5708; 21c5a6dd0fdaf10a712e2f2d6ffbbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are RES0.

PMMIR is in the Core power domain.

~~This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are RES0.~~

Attributes

PMMIR is a ~~32-bit register.~~

- 64-bit register when FEAT_PMUv3_EXT64 is implemented
- 32-bit register otherwise

This register is part of the [PMU](#) block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32																
RES0																																															
RES0								EDGE								THWIDTH								BUS_WIDTH								BUS_SLOTS								SLOTS							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
RES0								THWIDTH								BUS_WIDTH								BUS_SLOTS								SLOTS															

Access to this field is **RO**.

THWIDTH, bits [23:20]

PMEVTYPER<n>_ELO PMU.PMEVTYPER<n>_TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the **PMEVTYPER<n>_ELO** feature, and, if implemented, the size of the PMU.PMEVTYPER<n>_TH field.

THWIDTH	Meaning
0b0000	FEAT_PMUv3_TH is not implemented.
0b0001	1 bit. PMU.PMEVTYPER<n>_TH[11:1] are PMEVTYPER<n>_ELO .TH[11:1] are RES0.
0b0010	2 bits. PMU.PMEVTYPER<n>_TH[11:2] are PMEVTYPER<n>_ELO .TH[11:2] are RES0.
0b0011	3 bits. PMU.PMEVTYPER<n>_TH[11:3] are PMEVTYPER<n>_ELO .TH[11:3] are RES0.
0b0100	4 bits. PMU.PMEVTYPER<n>_TH[11:4] are PMEVTYPER<n>_ELO .TH[11:4] are RES0.
0b0101	5 bits. PMU.PMEVTYPER<n>_TH[11:5] are PMEVTYPER<n>_ELO .TH[11:5] are RES0.
0b0110	6 bits. PMU.PMEVTYPER<n>_TH[11:6] are PMEVTYPER<n>_ELO .TH[11:6] are RES0.
0b0111	7 bits. PMU.PMEVTYPER<n>_TH[11:7] are PMEVTYPER<n>_ELO .TH[11:7] are RES0.
0b1000	8 bits. PMU.PMEVTYPER<n>_TH[11:8] are PMEVTYPER<n>_ELO .TH[11:8] are RES0.
0b1001	9 bits. PMU.PMEVTYPER<n>_TH[11:9] are PMEVTYPER<n>_ELO .TH[11:9] are RES0.
0b1010	10 bits. PMU.PMEVTYPER<n>_TH[11:10] are PMEVTYPER<n>_ELO .TH[11:10] are RES0.
0b1011	11 bits. PMU.PMEVTYPER<n>_TH[11] is PMEVTYPER<n>_ELO .TH[11] is RES0.
0b1100	12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to **PMU.PMEVTYPER<n>_TH** is $2^{\text{PMEVTYPER<n>_ELO.TH}}$ minus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as $\text{Log}_2(\text{number of bytes})$, plus one.

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

If the bus count information is not available, this field will read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment **by** in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMMIR

If the Core power domain is off or in a low-power state, access on this interface returns an Error.

PMMIR can be accessed through the external debug interface:

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				EDGE			THWIDTH				BUS_WIDTH				BUS_SLOTS				SLOTS												
Component										Offset										Instance											
PMU										0xE40										PMMIR											

This interface is accessible as follows:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or !AllowExternalPMUAccess(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

Bits [31:28]

Reserved, RES0.

EDGE, bits [27:24]

PMU event edge detection. Indicates implementation of the FEAT_PMUv3_EDGE feature.

EDGE	Meaning
0b0000	FEAT_PMUv3_EDGE is not implemented.
0b0001	FEAT_PMUv3_EDGE is implemented.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

THWIDTH, bits [23:20]

PMU.PMEVTYPER<n>.TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the PMU.PMEVTYPER<n>.TH field.

THWIDTH	Meaning
0b0000	FEAT_PMUv3_TH is not implemented.
0b0001	1 bit. PMU.PMEVTYPER<n>.TH[11:1] are RES0.
0b0010	2 bits. PMU.PMEVTYPER<n>.TH[11:2] are RES0.
0b0011	3 bits. PMU.PMEVTYPER<n>.TH[11:3] are RES0.
0b0100	4 bits. PMU.PMEVTYPER<n>.TH[11:4] are RES0.
0b0101	5 bits. PMU.PMEVTYPER<n>.TH[11:5] are RES0.
0b0110	6 bits. PMU.PMEVTYPER<n>.TH[11:6] are RES0.
0b0111	7 bits. PMU.PMEVTYPER<n>.TH[11:7] are RES0.
0b1000	8 bits. PMU.PMEVTYPER<n>.TH[11:8] are RES0.
0b1001	9 bits. PMU.PMEVTYPER<n>.TH[11:9] are RES0.
0b1010	10 bits. PMU.PMEVTYPER<n>.TH[11:10] are RES0.
0b1011	11 bits. PMU.PMEVTYPER<n>.TH[11] is RES0.
0b1100	12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to PMU.PMEVTYPER<n>.TH is $2^{(\text{PMMIR.THWIDTH})}$ minus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as $\text{Log}_2(\text{number of bytes})$, plus one.

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

If the bus count information is not available, this field will read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMMIR

If the Core power domain is off or in a low-power state, access on this interface returns an Error.

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xE40

PMMIR can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xE40

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or !AllowExternalPMUAccess(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

3005/0907/2022 1517:5708; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

PMOVS, Performance Monitors Overflow Flag Status register

The PMOVS characteristics are:

Purpose

The unsigned overflow flags for the Cycle Count Register, PMU.PMCCNTR_EL0, and each of the implemented event counters [PMEVCNTR<n>](#).

Configuration

External register PMOVS bits [31:0] are architecturally mapped to AArch64 System register [PMOVSSET_EL0\[31:0\]](#).

External register PMOVS bits [63:32] are architecturally mapped to AArch64 System register [PMOVSSET_EL0\[63:32\]](#) when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented.

External register PMOVS bits [31:0] are architecturally mapped to AArch32 System register [PMOVSSET\[31:0\]](#).

External register PMOVS bits [31:0] are architecturally mapped to AArch64 System register [PMOVSCLR_EL0\[31:0\]](#).

External register PMOVS bits [63:32] are architecturally mapped to AArch64 System register [PMOVSCLR_EL0\[63:32\]](#) when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented.

External register PMOVS bits [31:0] are architecturally mapped to AArch32 System register [PMOVS\[31:0\]](#).

This register is present only when FEAT_PMUv3_EXT64 is implemented. Otherwise, direct accesses to PMOVS are RES0.

Attributes

PMOVS is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:33]

Reserved, RES0.

F0, bit [32] When FEAT_PMUv3_ICNTR is implemented:

PMU.PMICNTR_EL0 unsigned overflow flag.

F0	Meaning
0b0	PMU.PMICNTR_EL0 has not overflowed.
0b1	PMU.PMICNTR_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [31]

Cycle counter unsigned overflow flag.

C	Meaning
0b0	The cycle counter has not overflowed since this bit was last cleared.
0b1	The cycle counter has overflowed since this bit was last cleared.

PMU.PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMU.PMCCNTR_EL0[31:0] or unsigned overflow of PMU.PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter unsigned overflow bit for PMU.PMEVCNTR<n>_EL0.

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	PMU.PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared.
0b1	PMU.PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared.

If FEAT_PMUv3p5 is implemented, [MDCR_EL2.HLP](#) and PMU.PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMU.PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMU.PMEVCNTR<n>_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVS

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xC90

PMOVS can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xC90

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

no old file

htmldiff from-

(new)

The PMOVSLR_EL0 characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, `PMU.PMCCNTR_ELO`, and each of the implemented event counters, and each of the implemented event counters `PMEVCNTR<n>_ELO`, `PMEVCNTR<n>`, `PMCCNTR_ELO`. Writing to this register clears these bits.

Configuration

External register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMOVSLR_EL0\[31:0\]](#).

External register PMOVSLR_EL0 bits [63:32] are architecturally mapped to AArch64 System register PMOVSLR_EL0[63:32] when FEAT_PMuV3_EXT64 is implemented, or FEAT_PMuV3p9 is implemented or FEAT_PMuV3_ICNTR is implemented.

External register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSRL\[31:0\]](#).

External register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMOVSSET_EL0\[31:0\]](#).

External register PMOVSLR_EL0 bits [63:32] are architecturally mapped to AArch64 System register [PMOVSSET_EL0\[63:32\]](#) when FEAT_PMuV3_EXT64 is implemented, or FEAT_PMuV3p9 is implemented or FEAT_PMuV3_ICNTR is implemented.

External register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMOVSCLR_EL0 are RES0.

PMOVSLR EL0 is in the Core power domain.

Attributes

PMOVSLR_EL0 is a 32-bit register.

- 64-bit register when FEAT_PMuV3_EXT64 is implemented, or FEAT_PMuV3p9 is implemented or FEAT_PMuV3_ICNTR is implemented
- 32-bit register otherwise

This register is part of the [PMU](#) block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT PMUv3 ICNTR is implemented:

6331623061296028592758265725562455235422532152205119501849174816471546144513441243114210419																							
RES0																							
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	

Bits [63:33]

Reserved, RES0.

F0, bit [32]**When FEAT_PMUv3_ICNTR is implemented:**

Unsigned overflow flag for PMU.PMICNTR_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMU.PMICNTR_EL0 to 0. On reads, returns the unsigned overflow flag for PMU.PMICNTR_EL0.

F0	Meaning
0b0	PMU.PMICNTR_EL0 has not overflowed.
0b1	PMU.PMICNTR_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

C, bit [31]

Cycle counter overflow clear bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

PMCCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0. PMCCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMU.PMCCNTR_EL0[31:0] or unsigned overflow of PMU.PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for PMU.PMEVCNTR<n>_EL0. PMEVCNTR<n>_EL0.

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI. PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMU.PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect. PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMU.PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, clears the PMU.PMEVCNTR<n>_EL0 overflow bit to 0. PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR<n>_EL0 overflow bit to 0.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMU.PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMU.PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMU.PMEVCNTR<n>_EL0[63:0]. PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

- The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSLR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSLR_EL0 can be accessed through the external debug interface:

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
Component								Offset								Instance															
PMU								0xC80								PMOVSLR_EL0															

- This interface is accessible as follows:
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
 - When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
 - Otherwise, accesses to this register generate an error response.

C, bit [31]

Cycle counter overflow clear bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

PMU.PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMU.PMCCNTR_EL0[31:0] or unsigned overflow of PMU.PMCCNTR_EL0[63:0].

- The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for PMU.PMEVCNTR<n>_EL0.

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMU.PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMU.PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, clears the PMU.PMEVCNTR<n>_EL0 overflow bit to 0.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMU.PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMU.PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMU.PMEVCNTR<n>_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSLR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings in the external debug interface:

When FEAT_PMUv3_EXT64 is implemented

BlockAccess at address 0xC80

PMOVSLR_EL0 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xC80

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When FEAT_PMUv3_EXT32 is implemented

BlockAccess at address 0xC80

PMOVSLR_EL0 can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0xC80	31:0

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When (FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is implemented) or FEAT_PMUv3_ICNTR is implemented

BlockAccess at address 0xC84

PMOVSLR_EL0 can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0xC84	63:32

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

-------	----------------	-------

The PMOVSET_EL0 characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, `PMU.PMCCNTR_EL0`, and each of the implemented event counters `PMU.PMEVCNTR<n>_EL0`. `PMCCNTR_EL0`, and each of the implemented event counters `PMEVCNTR<n>_EL0`.

Configuration

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMOVSSET_EL0\[31:0\]](#).

External register PMOVSET_EL0 bits [63:32] are architecturally mapped to AArch64 System register [PMOVSET_EL0\[63:32\]](#) when FEAT_PMuV3_EXT64 is implemented, or FEAT_PMuV3p9 is implemented or FEAT_PMuV3_ICNTR is implemented.

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSSET\[31:0\]](#).

External register PMOVSSSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSLR_EL0[31:0].

External register PMOVSET_EL0 bits [63:32] are architecturally mapped to AArch64 System register [PMOVSLR_EL0\[63:32\]](#) when FEAT_PMuV3_EXT64 is implemented, or FEAT_PMuV3p9 is implemented or FEAT_PMuV3_ICNTR is implemented.

External register PMOVSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSr\[31:0\]](#).

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMOVSSET_EL0 are RES0.

PMOVSSET_EL0 is in the Core power domain.

Attributes

PMOVSSET_EL0 is a 32-bit register.

- 64-bit register when FEAT_PMuV3_EXT64 is implemented, or FEAT_PMuV3p9 is implemented or FEAT_PMuV3_ICNTR is implemented
- 32-bit register otherwise

This register is part of the [PMU](#) block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented or FEAT_PMUv3_ICNTR is implemented:

6331623061296028592758265725562455235422532152205119501849174816471546144513441243114210419																							
RES0																							
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	

Bits [63:33]

Reserved, RES0.

F0, bit [32]**When FEAT_PMUv3_ICNTR is implemented:**

Unsigned overflow flag for PMU.PMICNTR_EL0 set. On writes, allows software to set the unsigned overflow flag for PMU.PMICNTR_EL0 to 1. On reads, returns the unsigned overflow flag for PMU.PMICNTR_EL0.

F0	Meaning
0b0	PMU.PMICNTR_EL0 has not overflowed.
0b1	PMU.PMICNTR_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **W1S**.

Otherwise:

Reserved, RES0.

C, bit [31]

Cycle counter overflow set bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0. PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMU.PMCCNTR_EL0[31:0] or unsigned overflow of PMU.PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow set bit for PMU.PMEVCNTR<n>_EL0. PMEVCNTR<n>_EL0.

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI. PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMU.PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect. PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMU.PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, sets the PMU.PMEVCNTR<n>_EL0 overflow bit to 1. PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, sets the PMEVCNTR<n>_EL0 overflow bit to 1.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMU.PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMU.PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMU.PMEVCNTR<n>_EL0[63:0]. PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

- The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSSET_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSSET_EL0 can be accessed through the external debug interface:

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
Component								Offset								Instance															
PMU								0xCC0								PMOVSSET_EL0															

- This interface is accessible as follows:
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
 - When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
 - Otherwise, accesses to this register generate an error response.

C, bit [31]

Cycle counter overflow set bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

PMU.PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMU.PMCCNTR_EL0[31:0] or unsigned overflow of PMU.PMCCNTR_EL0[63:0].

- The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow set bit for PMU.PMEVCNTR<n>_EL0.

If PMU.PMCFGR.N is less than 31, bits [30:PMU.PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMU.PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMU.PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, sets the PMU.PMEVCNTR<n>_EL0 overflow bit to 1.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMU.PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMU.PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMU.PMEVCNTR<n>_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSSET_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings in the external debug interface:

When FEAT_PMUv3_EXT64 is implemented

BlockAccess at address 0xCC0

PMOVSSET_EL0 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xCC0

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When FEAT_PMUv3_EXT32 is implemented

BlockAccess at address 0xCC0

PMOVSSET_EL0 can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0xCC0	31:0

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

When (FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is implemented) or FEAT_PMUv3_ICNTR is implemented

BlockAccess at address 0xCC4

PMOVSSET_EL0 can be accessed through the PMU block as follows:

Frame	Offset	Range
PMU	0xCC4	63:32

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **RW**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5708; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

PMPCSCCTL, PC Sample-based Profiling Control Register

The PMPCSCCTL characteristics are:

Purpose

Controls the PC Sample-based Profiling feature.

Configuration

This register is present only when FEAT_PCSRv8p9 is implemented. Otherwise, direct accesses to PMPCSCCTL are RES0.

PMPCSCCTL is in the Core power domain.

Attributes

PMPCSCCTL is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:5]

Reserved, RES0.

SS, bit [4]

When FEAT_PMUv3_SS is implemented:

Sample on Snapshot.

Controls whether the following registers are sampled on a PMU snapshot Capture event:

PMU.PMCID1SR, PMU.PMCID2SR, and PMU.PMPCSR.

SS	Meaning
0b0	Sample on Read.
0b1	Sample on Snapshot.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [3:2]

Reserved, RES0.

IMP, bit [1]

Profiling enable implemented.

IMP	Meaning
0b0	PMPCSCTL.EN reads-as-zero and ignores writes.
0b1	PMPCSCTL.EN is a read-write control bit.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

EN, bit [0]**When PMU.PMPCSCTL.IMP == 1:**

PC Sample-based Profiling Enable.

EN	Meaning
0b0	PC Sample-based Profiling is suspended.
0b1	PC Sample-based Profiling is active.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

Accessing PMPCSCTL

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0x230

PMPCSCTL can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x230

- When DoubleLockStatus(), or !IsCorePowered() or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

PMPCSR, Program Counter Sample Register

The PMPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMPCSR are RES0.

PMPCSR is in the Core power domain.

~~This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMPCSR are RES0.~~

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID.PCSample](#).

Support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMCSR[31:0] followed by a 32-bit read of PMPCSR[63:32], returning the combined value. For example, if the PE is in Debug state then a 64-bit atomic read returns bits[31:0] == 0xFFFFFFFF and bits[63:32] UNKNOWN.

Attributes

PMPCSR is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NS	EL	T	NSE	RES0	PCSample[55:32]																											
PCSample[31:0]																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

NS, bit [63]

When FEAT_RME is implemented:

Together with the NSE field, indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Otherwise:

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

EL	Meaning
0b00	Sample is from EL0.
0b01	Sample is from EL1.
0b10	Sample is from EL2.
0b11	Sample is from EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

T, bit [60]**When FEAT_TME is implemented:**

Transactional state of the sample. Indicates the Transactional state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

T	Meaning
0b0	Sample is from Non-transactional state.
0b1	Sample is from Transactional state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSE, bit [59]**When FEAT_RME is implemented:**

Together with the NS field, indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

For a description of the values derived by evaluating NS and NSE together, see PMPCSR.NS.

Otherwise:

Reserved, RES0.

Bits [58:56]

Reserved, RES0.

PCSample[55:32], bits [55:32]

Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PCSample[31:0], bits [31:0]

Bits[31:0] of the sampled instruction address value.

PMPCSR[31:0] reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of PMPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

PMPCSR[31:0] reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of PMPCSR[31:0].

For the cases where a read of PMPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting PMPCSR[63:32], PMU.PMCID1SR, PMU.PMCID2SR, and PMU.PMVIDSR to ~~PMCID1SR, PMCID2SR, and PMVIDSR~~ to UNKNOWN values.

Otherwise, a read of PMPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to PMPCSR[63:32], PMU.PMCID1SR, PMU.PMCID2SR, and PMU.PMVIDSR. ~~The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}. PMCID1SR, PMCID2SR, and PMVIDSR. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.~~

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and PMPCSR[63:32], PMU.PMCID1SR, PMU.PMCID2SR, and PMU.PMVIDSR are unchanged. ~~PMCID1SR, PMCID2SR, and PMVIDSR are unchanged.~~

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Note

~~A 32-bit access to PMPCSR[63:32] does not update the PC sample registers. Only a 64-bit access to PMPCSR[63:0] or a 32-bit access to PMPCSR[31:0] updates the PC sample registers. This includes the value a subsequent 32-bit read of PMPCSR[63:32] will return.~~

PMPCSR can be accessed through the external debug interface:

Component	Offset	Instance	Range
-----------	--------	----------	-------

PMU	0x200	PMPCSR	31:0
-----	-------	--------	------

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x204	PMPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x220	PMPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x224	PMPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Note

A 32-bit access to PMPCSR[63:32] does not update the PC sample registers. Only a 64-bit access to PMPCSR[63:0] or a 32-bit access to PMPCSR[31:0] updates the PC sample registers. This includes the value a subsequent 32-bit read of PMPCSR[63:32] will return.

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0x200

PMPCSR can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x200

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

BlockAccess at address 0x220

PMPCSR can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x220

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5707; 21c5a6dd0fdaf10a712e2f2d6ffbbdd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

This Implementation register of isthis presentregister only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR0. Otherwise, direct accesses to PMPIDR0 are RES0OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR0 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PART_0							

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMPIDR0

PMPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE0	PMPIDR0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMPIDR0

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xFE0

PMPIDR0 can be accessed through the PMU block as follows:

	Frame		Offset
	PMU		0xFE0

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

3005/0907/2022 1517:5708; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

ThisImplementation registerof isthis presentregister only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR1. Otherwise, direct accesses to PMPIDR1 are RES0OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR1 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								DES_0				PART_1			

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

ThisImplementation registerof isthis presentregister only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR2. Otherwise, direct accesses to PMPIDR2 are RES0OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR2 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								REVISION			JEDEC		DES_1		

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as 0b1.

Access to this field is **RO**.

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMPIDR2

PMPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE8	PMPIDR2

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMPIDR2

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xFE8

PMPIDR2 can be accessed through the PMU block as follows:

	Frame		Offset
	PMU		0xFE8

- When FEAT_DoPD is not implemented or IsCorePowered(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

ThisImplementation registerof isthis presentregister only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR3. Otherwise, direct accesses to PMPIDR3 are RES0OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.
This register is required for CoreSight compliance.

Attributes

PMPIDR3 is a 32-bit register.
This register is part of the PMU block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								REVAND				CMOD			

Bits [31:8]
Reserved, RES0.

REVAND, bits [7:4]
Part minor revision. Parts using PMU.PMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.~~PMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.~~
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

CMOD, bits [3:0]
Customer modified. Indicates someone other than the Designer has modified the component.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

This **Implementation** register of **this** present register only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR4. Otherwise, direct accesses to PMPIDR4 are **RES0** **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR4 is a 32-bit register.

This register is part of the **PMU** block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0								
												RES0																SIZE								DES_2			

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PMSSCR_EL1, Performance Monitors Snapshot Status and Capture Register

The PMSSCR_EL1 characteristics are:

Purpose

Holds status information about the captured counters and provides a mechanism for software to initiate a sample.

Configuration

This register is present only when FEAT_PMUv3_SS is implemented. Otherwise, direct accesses to PMSSCR_EL1 are RES0.

Attributes

PMSSCR_EL1 is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																NC
																RES0																SS
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:33]

Reserved, RES0.

NC, bit [32]

No Capture. Indicates whether the PMU counters have been captured.

NC	Meaning
0b0	PMU counters captured.
0b1	PMU counters not captured.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Bits [31:1]

Reserved, RES0.

SS, bit [0]

Snapshot Capture and Status.

SS	Meaning
0b0	On a read: The Capture event has completed. On a write: Ignored.
0b1	On a read: The Capture event has not completed. On a write: Initiate a capture immediately.

It is CONSTRAINED UNPREDICTABLE whether a Capture event has completed if this field is modified when the Capture event is ongoing.

Note

If FEAT_Debugv8p4 is implemented, the OPTIONAL Software Lock is not implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **WO/RAZ**.

Accessing PMSSCR_EL1

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xE30

PMSSCR_EL1 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xE30

- When !AllowExternalPMSSAccess(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see 'SW_INCR'.

Configuration

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMSWINC_EL0\[31:0\]](#).

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSWINC\[31:0\]](#).

This register is present only when FEAT_PMUv3_EXT32 is implemented and an implementation implements PMSWINC_EL0. Otherwise, direct accesses to PMSWINC_EL0 are RES0.

PMSWINC_EL0 is in the Core power domain.

Implementation of this register is OPTIONAL.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

Attributes

PMSWINC_EL0 is a 32-bit register.

This register is part of the [PMU](#) block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bit [31]

Reserved, RES0.

P<n>, bit [n], for n = 30 to 0

Event counter software increment bit for [PMU.PMEVCNTR<n>_EL0](#). [PMEVCNTR<n>_EL0](#).

If [PMU.PMCFGR.N](#) is less than 31, bits [30:PMU.PMCFGR.N] are WI. [PMCFGR.N](#) is less than 31, bits [30:PMCFGR.N] are WI.

P<n>	Meaning
0b0	No action. The write to this bit is ignored.
0b1	It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter n.

Accessing PMSWINC_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMSWINC_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xCA0	PMSWINC_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **WO**.
- Otherwise, accesses to this register generate an error response.

Accessing PMSWINC_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0xCA0

PMSWINC_EL0 can be accessed through the PMU block as follows:

Frame	Offset
PMU	0xCA0

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus(), accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus(), accesses to this register are **WO**.
- Otherwise, accesses to this register generate an error response.

3095/0907/2022 1517:5708; 21c5a6dd0fdaf10a712e2f2d6ffbd6d66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

PMVCIDSR, CONTEXTIDR_EL1 and VMID Sample Register

The PMVCIDSR characteristics are:

Purpose

Contains the sampled CONTEXTIDR_EL1 and VMID values that are captured on reading PMU.PMPCSR.

Configuration

This register is present only when FEAT_PMUv3_EXT64 is implemented and FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMVCIDSR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

Attributes

PMVCIDSR is a 64-bit register.

This register is part of the [PMU](#) block.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																VMID[15:8]								VMID							
CONTEXTIDR_EL1																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented:

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [39:32]

VMID sample. The VMID associated with the most recent PMU.PMPCSR sample. When the most recent PMU.PMPCSR sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
 - EL2 is disabled in the current Security state.
 - The PE is executing at EL2.
 - EL2 is enabled in the current Security state, the PE is executing at EL0, EL2 is using AArch64, HCR_EL2.E2H == 1, and HCR_EL2.TGE == 1.
- Otherwise:
 - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or [VTCR_EL2.VS](#) is 1, this field is set to [VTTBR_EL2.VMID](#).
 - If EL2 is using AArch64, FEAT_VMID16 is implemented, and [VTCR_EL2.VS](#) is 0, PMVIDSR.VMID[7:0] is set to [VTTBR_EL2.VMID\[7:0\]](#) and PMVIDSR.VMID[15:8] is RES0.
 - If EL2 is using AArch32, this field is set to [VTTBR.VMID](#).

Because the value written to PMVIDSR is an indirect read of the VMID value, it is CONSTRAINED UNPREDICTABLE whether PMVIDSR is set to the original or new value if PMU.PMPCSR samples:

- An instruction that writes to the VMID value.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CONTEXTIDR_EL1, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent PMU.PMPCSR sample. When the most recent PMU.PMPCSR sample is generated:

- If EL1 is using AArch64, then the Context ID is sampled from [CONTEXTIDR_EL1](#).
- If EL1 is using AArch32, then the Context ID is sampled from [CONTEXTIDR](#).
- If EL3 is implemented and is using AArch32, then [CONTEXTIDR](#) is a banked register and this register samples the current banked copy of [CONTEXTIDR](#) for the Security state that is associated with the most recent PMU.PMPCSR sample.

Because the value written to this register is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether this register is set to the original or new value if PMU.PMPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMVCIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0x208

PMVCIDSR can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x208

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register generate an error response.

PMVIDSR, VMID Sample Register

The PMVIDSR characteristics are:

Purpose

Contains the sampled VMID value that is captured on reading [PMU.PMPCSR\[31:0\]](#). [PMPCSR\[31:0\]](#).

Configuration

This register is present only when FEAT_PMUv3_EXT32 is implemented, FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMVIDSR are RES0.

PMVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMVIDSR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID.PCSample](#).

Attributes

PMVIDSR is a 32-bit register.

This register is part of the [PMU](#) block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																VMID[15:8]								VMID							

Bits [31:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented:

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]

VMID sample. The VMID associated with the most recent PMU.PMPCSR sample. When the most recent PMU.PMPCSR sample was generated: PMPCSR sample. When the most recent PMPCSR sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
 - EL2 is disabled in the current Security state.
 - The PE is executing at EL2.
 - EL2 is enabled in the current Security state, the PE is executing at EL0, EL2 is using AArch64, HCR_EL2.E2H == 1, and HCR_EL2.TGE == 1.
- Otherwise:
 - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
 - If EL2 is using AArch64, FEAT_VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
 - If EL2 is using AArch32, this field is set to VTTBR.VMID.

Because the value written to PMVIDSR is an indirect read of the VMID value, it is CONSTRAINED UNPREDICTABLE whether PMVIDSR is set to the original or new value if PMU.PMPCSR samples: PMPCSR samples:

- An instruction that writes to the VMID value.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x20C	PMVIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register generate an error response.

Accessing PMVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Accesses to this register use the following encodings in the external debug interface:

BlockAccess at address 0x20C

PMVIDSR can be accessed through the PMU block as follows:

Frame	Offset
PMU	0x20C

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus(), accesses to this register are RO.
- Otherwise, accesses to this register generate an error response.
