PFAR_EL1, Physical Fault Address Register (EL1)

The PFAR_EL1 characteristics are:

Purpose

Records the faulting physical address for a synchronous External Abort, or SError exception taken to EL1.

Configuration

This register is present only when FEAT_PFAR is implemented. Otherwise, direct accesses to PFAR_EL1 are UNDEFINED.

Attributes

PFAR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NS	NSE	RESO										PA																			
PA																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NS, bit [63]

When FEAT_RME is implemented:

Together with the NSE field, reports the physical address space of the access that triggered the exception.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When EL3 is implemented:

Non-secure. Reports the physical address space of the access that triggered the exception.

NS	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSE, bit [62]**When FEAT_RME is implemented:**

Together with the NS field, reports the physical address space of the access that triggered the exception.

For a description of the values derived by evaluating NS and NSE together, see MFAR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [61:52]

Reserved, RES0.

PA, bits [51:0]

Physical Address.

For implementations with fewer than 52 physical address bits, the corresponding upper bits in this field are RES0.

When recording an address for a synchronous External Abort or SError exception, the recorded address can be any address within the same naturally-aligned fault granule as the faulting physical address, where the size of the fault granule is IMPLEMENTATION DEFINED, but must be no larger than:

- The size of the range of values permitted to be recorded in [FAR_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PFAR_EL1

PFAR_EL1 is not valid and reads UNKNOWN if [ESR_EL1](#).PFV is recorded as 0.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PFAR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0110	0b0000	0b101

```

PFAR_EL2, Physical Fault Address Register (EL2)

The PFAR_EL2 characteristics are:

Purpose

Records the faulting physical address for a synchronous External Abort, or SError exception taken to EL2.

Configuration

This register is present only when FEAT_PFAR is implemented. Otherwise, direct accesses to PFAR_EL2 are UNDEFINED.

Attributes

PFAR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NS	NSE	RESO										PA																			
PA																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NS, bit [63]

When FEAT_RME is implemented:

Together with the NSE field, reports the physical address space of the access that triggered the exception.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When EL3 is implemented:

Non-secure. Reports the physical address space of the access that triggered the exception.

NS	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSE, bit [62]**When FEAT_RME is implemented:**

Together with the NS field, reports the physical address space of the access that triggered the exception.

For a description of the values derived by evaluating NS and NSE together, see MFAR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [61:52]

Reserved, RES0.

PA, bits [51:0]

Physical Address.

For implementations with fewer than 52 physical address bits, the corresponding upper bits in this field are RES0.

When recording an address for a synchronous External Abort or SError exception, the recorded address can be any address within the same naturally-aligned fault granule as the faulting physical address, where the size of the fault granule is IMPLEMENTATION DEFINED, but must be no larger than:

- The size of the range of values permitted to be recorded in [FAR_EL2](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PFAR_EL2

When FEAT_VHE is implemented, and [HCR_EL2.E2H](#) is 1, without explicit synchronization, accesses from EL2 using the register name PFAR_EL2 or PFAR_EL1 are not guaranteed to be ordered with respect to accesses using the other register name.

PFAR_EL2 is not valid and reads UNKNOWN if [ESR_EL2.PFV](#) is recorded as 0.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PFAR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b101

```

PIR_EL1, Permission Indirection Register 1 (EL1)

The PIR_EL1 characteristics are:

Purpose

Stage 1 Permission Indirection Register for privileged access of the EL1&0 translation regime.

Configuration

This register is present only when FEAT_S1PIE is implemented. Otherwise, direct accesses to PIR_EL1 are UNDEFINED.

Attributes

PIR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Perm15	Perm14	Perm13	Perm12	Perm11	Perm10	Perm9	Perm8	Perm7	Perm6	Perm5	Perm4	Perm3	Perm2	Perm1	Perm0																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Perm<m>, bits [4m+3:4m], for m = 15 to 0

Represents Stage 1 Base Permissions.

Perm<m>	Meaning
0b0000	No access, Overlay applied.
0b0001	Read, Overlay applied.
0b0010	Execute, Overlay applied.
0b0011	Read and Execute, Overlay applied.
0b0100	Reserved - treated as No access, Overlay applied.
0b0101	Read and Write, Overlay applied.
0b0110	Read, Write and Execute, Overlay applied.
0b0111	Read, Write and Execute, Overlay applied.
0b1000	Read, Overlay not applied.
0b1001	Read, GCS Read and GCS Write, Overlay not applied.
0b1010	Read and Execute, Overlay not applied.
0b1011	Reserved - treated as No access, Overlay not applied.
0b1100	Read and Write, Overlay not applied.
0b1101	Reserved - treated as No access, Overlay not applied.
0b1110	Read, Write and Execute, Overlay not applied.
0b1111	Reserved - treated as No access, Overlay not applied.

This field is permitted to be cached in a TLB.

When Stage 1 Indirect Permission mechanism is disabled, this register is ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PIR_EL1

Accesses to this register use the following encodings in the System register encoding space:

PIR_EL2, Permission Indirection Register 2 (EL2)

The PIR_EL2 characteristics are:

Purpose

Stage 1 Permission Indirection Register for privileged access of the EL2 or EL2&0 translation regime.

Configuration

This register is present only when FEAT_S1PIE is implemented. Otherwise, direct accesses to PIR_EL2 are UNDEFINED.

Attributes

PIR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Perm15	Perm14	Perm13	Perm12	Perm11	Perm10	Perm9	Perm8	Perm7	Perm6	Perm5	Perm4	Perm3	Perm2	Perm1	Perm0																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Perm<m>, bits [4m+3:4m], for m = 15 to 0

Represents Stage 1 Base Permissions.

Perm<m>	Meaning
0b0000	No access, Overlay applied.
0b0001	Read, Overlay applied.
0b0010	Execute, Overlay applied.
0b0011	Read and Execute, Overlay applied.
0b0100	Reserved - treated as No access, Overlay applied.
0b0101	Read and Write, Overlay applied.
0b0110	Read, Write and Execute, Overlay applied.
0b0111	Read, Write and Execute, Overlay applied.
0b1000	Read, Overlay not applied.
0b1001	Read, GCS Read and GCS Write, Overlay not applied.
0b1010	Read and Execute, Overlay not applied.
0b1011	Reserved - treated as No access, Overlay not applied.
0b1100	Read and Write, Overlay not applied.
0b1101	Reserved - treated as No access, Overlay not applied.
0b1110	Read, Write and Execute, Overlay not applied.
0b1111	Reserved - treated as No access, Overlay not applied.

This field is permitted to be cached in a TLB.

When Stage 1 Indirect Permission mechanism is disabled, this register is ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PIR_EL2

When FEAT_VHE is implemented, and [HCR_EL2.E2H](#) is 1, without explicit synchronization, accesses from EL2 using the register name PIR_EL2 or [PIR_EL1](#) are not guaranteed to be ordered with respect to accesses using the other register name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PIR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0010	0b011

```

PIRE0_EL2, Permission Indirection Register 0 (EL2)

The PIRE0_EL2 characteristics are:

Purpose

Stage 1 Permission Indirection Register for unprivileged access of the EL2&0 translation regime.

Configuration

This register is present only when FEAT_S1PIE is implemented. Otherwise, direct accesses to PIRE0_EL2 are UNDEFINED.

Attributes

PIRE0_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Perm15				Perm14				Perm13				Perm12				Perm11				Perm10				Perm9				Perm8			
Perm7				Perm6				Perm5				Perm4				Perm3				Perm2				Perm1				Perm0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Perm<m>, bits [4m+3:4m], for m = 15 to 0

Represents Stage 1 Base Permissions.

Perm<m>	Meaning
0b0000	No access, Overlay applied.
0b0001	Read, Overlay applied.
0b0010	Execute, Overlay applied.
0b0011	Read and Execute, Overlay applied.
0b0100	Reserved - treated as No access, Overlay applied.
0b0101	Read and Write, Overlay applied.
0b0110	Read, Write and Execute, Overlay applied.
0b0111	Read, Write and Execute, Overlay applied.
0b1000	Read, Overlay not applied.
0b1001	Read, GCS Read and GCS Write, Overlay not applied.
0b1010	Read and Execute, Overlay not applied.
0b1011	Reserved - treated as No access, Overlay not applied.
0b1100	Read and Write, Overlay not applied.
0b1101	Reserved - treated as No access, Overlay not applied.
0b1110	Read, Write and Execute, Overlay not applied.
0b1111	Reserved - treated as No access, Overlay not applied.

This field is permitted to be cached in a TLB.

When Stage 1 Indirect Permission mechanism is disabled, this register is ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PIRE0_EL2

When FEAT_VHE is implemented, and [HCR_EL2.E2H](#) is 1, without explicit synchronization, accesses from EL2 using the register name PIRE0_EL2 or [PIRE0_EL1](#) are not guaranteed to be ordered with respect to accesses using the other register name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PIRE0_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0010	0b010

```

PMBIDR_EL1, Profiling Buffer ID Register

The PMBIDR_EL1 characteristics are:

Purpose

Provides information to software as to whether the buffer can be programmed at the current Exception level.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBIDR_EL1 are UNDEFINED.

Attributes

PMBIDR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
RES0												EA				RES0		F	P	Align											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:12]

Reserved, RES0.

EA, bits [11:8]

External Abort handling. Describes how the PE manages External aborts on writes made by the Statistical Profiling Unit to the Profiling Buffer.

EA	Meaning
0b0000	Not described.
0b0001	The PE ignores External aborts on writes made by the Statistical Profiling Unit.
0b0010	The External abort generates an SError interrupt at the PE.

All other values are reserved.

From Armv8.8, the value 0b0000 is not permitted.

PMBIDR_EL1.EA describes only External aborts generated by the write to memory. External aborts on a translation table walk made by the Statistical Profiling Unit generate Profiling Buffer management events reported as MMU faults using [PMBSR_EL1](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [7:6]

Reserved, RES0.

F, bit [5]

Flag updates. Describes how address translations performed by the Statistical Profiling Unit manage the Access flag and dirty state.

F	Meaning
0b0	Hardware management of the Access flag and dirty state for accesses made by the Statistical Profiling Unit is always disabled for all translation stages.
0b1	Hardware management of the Access flag and dirty state for accesses made by the Statistical Profiling Unit is controlled in the same way as explicit memory accesses in the Profiling Buffer owning translation regime.

Note

If hardware management of the Access flag is disabled for a stage of translation, an access to a Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor and might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

From Armv8.8, the value 0 is not permitted.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

P, bit [4]

Programming not allowed. When read at EL3, this field reads as zero. Otherwise, indicates that the Profiling Buffer is owned by a higher Exception level or another Security state. Defined values are:

P	Meaning
0b0	Programming is allowed.
0b1	Programming not allowed.

The value read from this field depends on the current Exception level and the Effective values of [MDCR_EL3.NSPB](#), [MDCR_EL3.NSPBE](#), and [MDCR_EL2.E2PB](#):

- If EL3 is implemented, and the owning Security state is Secure state, this field reads as one from:
 - Non-secure EL1 and Non-secure EL2.
 - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
 - If Secure EL2 is implemented and enabled, and [MDCR_EL2.E2PB](#) is 0b00, Secure EL1.
- If EL3 is implemented, and the owning Security state is Non-secure state, this field reads as one from:
 - Secure EL1.
 - If Secure EL2 is implemented, Secure EL2.
 - If EL2 is implemented and [MDCR_EL2.E2PB](#) is 0b00, Non-secure EL1.
 - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
- If FEAT_RME is implemented, and the owning Security state is Realm state, this field reads as one from:
 - Non-secure EL1 and Non-secure EL2.
 - Secure EL1 and Secure EL2.
 - If [MDCR_EL2.E2PB](#) is 0b00, Realm EL1.
- If EL3 is not implemented, EL2 is implemented, and [MDCR_EL2.E2PB](#) is 0b00, this field reads as one from EL1.
- Otherwise, this field reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for writes to [PMBPTR_EL1](#). Defined values are:

Align	Meaning
0b0000	Byte.
0b0001	Halfword.
0b0010	Word.
0b0011	Doubleword.
0b0100	16 bytes.
0b0101	32 bytes.
0b0110	64 bytes.
0b0111	128 bytes.
0b1000	256 bytes.
0b1001	512 bytes.
0b1010	1KB.
0b1011	2KB.

All other values are reserved.

For more information, see 'Restrictions on the current write pointer'.

If this field is non-zero, then every record is a multiple of this size.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMBIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBIDR EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1010	0b111

```

PMBLIMITR_EL1, Profiling Buffer Limit Address Register

The PMBLIMITR_EL1 characteristics are:

Purpose

Defines the upper limit for the profiling buffer, and enables the profiling buffer

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBLIMITR_EL1 are UNDEFINED.

Attributes

PMBLIMITR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
																LIMIT																					
LIMIT																RES0						PMFZ	RES0	FM	E												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

LIMIT, bits [63:12]

Limit address. PMBLIMITR_EL1.LIMIT:Zeros(12) is the address of the first byte in memory after the last byte in the profiling buffer. If the smallest implemented translation granule is not 4KB, then bits[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value, $\text{Log}_2(\text{smallest implemented translation granule})$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:6]

Reserved, RES0.

PMFZ, bit [5]

When FEAT_SPEv1p2 is implemented:

Freeze PMU on SPE event. Stop PMU event counters when [PMBSR_EL1.S](#) == 1.

PMFZ	Meaning
0b0	Do not freeze PMU event counters on Statistical Profiling Buffer Management event.
0b1	Freeze PMU event counters on Statistical Profiling Buffer Management event.

The PMU event counters affected by this control is controlled by [PMCR_ELO.FZS](#) and, if EL2 is implemented, [MDCR_EL2.HPMFZS](#). See the descriptions of these control bits for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

FM, bits [2:1]

Fill mode.

FM	Meaning	Applies when
0b00	Fill mode. Stop collection and raise maintenance interrupt on buffer fill.	
0b10	Discard mode. All output is discarded.	When FEAT_SPEv1p2 is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Profiling Buffer enable

E	Meaning
0b0	All output is discarded.
0b1	Profiling buffer enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMBLIMITR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBLIMITR_EL1

PMBPTR_EL1, Profiling Buffer Write Pointer Register

The PMBPTR_EL1 characteristics are:

Purpose

Defines the current write pointer for the profiling buffer.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBPTR_EL1 are UNDEFINED.

Attributes

PMBPTR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																PTR															
																PTR															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PTR, bits [63:0]

Current write address. Defines the virtual address of the next entry to be written to the buffer.

The architecture places restrictions on the values software can write to the pointer. For more information see 'Restrictions on the current write pointer'.

Note

As a result, an implementation might treat some of bits[M:0], where M is defined by [PMBIDR_EL1](#).Align, as RES0.

On a management interrupt, PMBPTR_EL1 is frozen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMBPTR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBPTR_EL1

op0	op1	CRn	CRm	op2

PMBSR_EL1, Profiling Buffer Status/syndrome Register

The PMBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software when the buffer is disabled because the management interrupt has been raised.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBSR_EL1 are UNDEFINED.

Attributes

PMBSR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																								AssuredOnly		Overlay		DirtyBit				RES0	
EC				RES0				DL		EA		S		COLL		MSS																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:40]32

Reserved, RES0.

AssuredOnly, bit [39]

When FEAT_THE is implemented:

AssuredOnly flag.

If a memory access generates a Stage 2 Data Abort, this field holds information about the fault.

AssuredOnly	Meaning
0b0	The Data Abort is not due to AssuredOnly.
0b1	The Data Abort is due to AssuredOnly.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [38]**When FEAT_S1POE is implemented or FEAT_S2POE is implemented:**

Overlay flag.

If a memory access generates a Data Abort for a Permission fault, this field holds information about the fault.

Overlay	Meaning
0b0	The Data Abort is due to Base Permissions.
0b1	The Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DirtyBit, bit [37]**When FEAT_S1PIE is implemented or FEAT_S2PIE is implemented:**

DirtyBit flag.

If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, this field holds information about the fault.

DirtyBit	Meaning
0b0	The Permission Fault is not due to nDirty State or Dirty State.
0b1	The Permission Fault is due to nDirty State or Dirty State.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [36:32]

Reserved, RES0.

EC, bits [31:26]

Event class. Top-level description of the cause of the buffer management event.

EC	Meaning	MSS	Applies when
0b000000	Other buffer management event. All buffer management events other than those described by other defined Event class codes.	MSS encoding for other buffer management events	
0b011110	Granule Protection Check fault, other than GPF, on write to Profiling Buffer.	MSS encoding for Granule Protection Check fault	When FEAT_RME is implemented
0b011111	Buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for a buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer	
0b100101	Stage 2 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer	

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:20]

Reserved, RES0.

DL, bit [19]

Partial record lost.

Following a buffer management event other than an asynchronous External abort, indicates whether the last record written to the Profiling Buffer is complete.

DL	Meaning
0b0	PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer.
0b1	Part of a record was lost because of a buffer management event or synchronous External abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse. All records prior to the last record have been written to the buffer.

When the buffer management event was because of an asynchronous External abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if the PE never sets this bit as a result of a buffer management event caused by an asynchronous External abort.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [18]

External abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Statistical Profiling Unit.

This bit is RES0 if the PE never sets this bit as the result of an External abort.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [17]

Service

S	Meaning
0b0	PMBIRQ is not asserted.
0b1	PMBIRQ is asserted. All profiling data has either been written to the buffer or discarded.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COLL, bit [16]

Collision detected.

COLL	Meaning
0b0	No collision events detected.
0b1	At least one collision event was recorded.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS, bits [15:0]

Management Event Specific Syndrome.

Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										FSC					

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented

0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

It is IMPLEMENTATION DEFINED whether each of the Access Flag fault, asynchronous External abort and synchronous External abort, Alignment fault, and TLB Conflict abort values can be generated by the PE. For more information see 'Faults and Watchpoints'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for other buffer management events

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										BSC					

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Buffer status code

BSC	Meaning
0b000000	Buffer not filled
0b000001	Buffer filled

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check fault

Bits [15:0]

Reserved, RES0.

MSS encoding for a buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMBSR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBSR_EL1

PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR_EL0](#), increments.

Configuration

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCCFILTR\[31:0\]](#).

AArch64 System register PMCCFILTR_EL0 bits [63:32] are architecturally mapped to External register [PMU.PMCCFILTR_EL0\[63:32\]](#) when FEAT_PMUv3_EXT64 is implemented.

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to External register [PMU.PMCCFILTR_EL0\[31:0\]](#)[PMCCFILTR_EL0\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are UNDEFINED.

Attributes

PMCCFILTR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
P	U	NSK	NSU	NSH	M	RES0	SH	T	RLK	RLU	RLH	RES0																			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMCCFILTR_EL0.RLK bit.

P	Meaning
0b0	Count cycles in EL1.
0b1	Do not count cycles in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMCCFILTR_EL0.RLU bit.

U	Meaning
0b0	Count cycles in EL0.
0b1	Do not count cycles in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]**When EL3 is implemented:**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]**When EL3 is implemented:**

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]**When EL2 is implemented:**

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMCCFILTR_EL0.RLH bit.

NSH	Meaning
0b0	Do not count cycles in EL2.
0b1	Count cycles in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

When FEAT_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

T, bit [23]

When FEAT_TME is implemented:

Transactional state filtering bit. Controls counting of Attributable events in Non-transactional state.

T	Meaning
0b0	This bit has no effect on the filtering of events.cycles.
0b1	Do not count Attributable eventscycles in Non-transactional state.

For each Unattributable event, it is IMPLEMENTATION DEFINED whether the filtering applies.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]

When FEAT_RME is implemented:

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Realm EL1 are counted.

Otherwise, cycles in Realm EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Realm EL0 are counted.

Otherwise, cycles in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]

When FEAT_RME is implemented:

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Realm EL2 are counted.

Otherwise, cycles in Realm EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

PMCCFILTR_EL0 can also be accessed by using [PMXEVTYPERS_EL0](#) with [PMSELR_EL0](#).SEL set to 0b11111.

PMCCNTR_EL0, Performance Monitors Cycle Count Register

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' for more information.

[PMCCFILTR_EL0](#) determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register [PMCCNTR\[63:0\]](#).

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to External register [PMU.PMCCNTR_EL0\[63:0\]](#)[PMCCNTR_EL0\[63:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are UNDEFINED.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																CCNT															
																CCNT

CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR_EL0](#).{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR_EL0](#).C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCCNTR_EL0

op0	op1	CRn	CRm	op2

PMCCNTSVR_EL1, Performance Monitors Cycle Count Saved Value Register

The PMCCNTSVR_EL1 characteristics are:

Purpose

Captures the PMU Cycle counter, [PMCCNTR_EL0](#).

Configuration

AArch64 System register PMCCNTSVR_EL1 bits [63:0] are architecturally mapped to External register [PMU.PMCCNTSVR_EL1\[63:0\]](#).

This register is present only when FEAT_PMUv3_SS is implemented. Otherwise, direct accesses to PMCCNTSVR_EL1 are UNDEFINED.

Attributes

PMCCNTSVR_EL1 is a 64-bit register.

Field descriptions

CCNT, bits [63:0]

Sampled Cycle Count. The value of [PMCCNTR_EL0](#) at the last Capture event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTSVR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCCNTSVR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b1110	0b1011	0b111

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    X[t, 64] = PMCCNTSVR_EL1;
elsif PSTATE.EL == EL2 then
    X[t, 64] = PMCCNTSVR_EL1;
elsif PSTATE.EL == EL3 then
    X[t, 64] = PMCCNTSVR_EL1;
```

PMCEID0_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0_EL0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

For more information about the Common events and the use of the PMCEID<n>_EL0 registers see 'The PMU event number space and common events'.

Configuration

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID0\[31:0\]](#).

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to AArch32 System register [PMCEID2\[31:0\]](#).

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to External register [PMU.PMCEID0\[31:0\]](#)[PMCEID0\[31:0\]](#).

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to External register [PMU.PMCEID2\[31:0\]](#)[PMCEID2\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0_EL0 are UNDEFINED.

Attributes

PMCEID0_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47
IDhi31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16	IDhi15
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15

IDhi<n>, bit [n+32], for n = 31 to 0

When FEAT_PMUv3p1 is implemented:

IDhi[n] corresponds to Common event (0x4000 + n).

For each bit:

IDhi<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Accessing PMCEID0_EL0

PMCEID1_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1_EL0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0020 to 0x003F and 0x4020 to 0x403F.

For more information about the Common events and the use of the PMCEID<n>_EL0 registers see 'The PMU event number space and common events'.

Configuration

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID1\[31:0\]](#).

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to AArch32 System register [PMCEID3\[31:0\]](#).

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to External register [PMU.PMCEID1\[31:0\]](#)[PMCEID1\[31:0\]](#).

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to External register [PMU.PMCEID3\[31:0\]](#)[PMCEID3\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1_EL0 are UNDEFINED.

Attributes

PMCEID1_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47
IDhi31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16	IDhi15
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15

IDhi<n>, bit [n+32], for n = 31 to 0

When FEAT_PMUv3p1 is implemented:

IDhi[n] corresponds to Common event (0x4020 + n).

For each bit:

IDhi<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event (0x0020 + n).

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Bits [63:[33](#)[32](#)]

Reserved, RES0.

F<m>, bit [m+32], for m = 0

When FEAT_PMUv3_ICNTR is implemented:

Fixed-function counter <m> disable. On writes, allows software to disable fixed-function counter <m>. On reads, returns the fixed-function counter <m> enable status.

F<m>	Meaning
0b0	Fixed-function counter <m> disabled.
0b1	Fixed-function counter <m> enabled.

PMCNTENCLR_EL0.F0 holds the enable status for [PMICNTR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

C, bit [31]

[PMCCNTR_EL0](#) disable bit. Disables the cycle counter register. Possible values are:

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, disables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN. Otherwise, N is the value in [PMCR_EL0](#).N.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 is enabled. When written, disables PMEVCNTR<n>_EL0 .

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

Purpose

Enables the Cycle Count Register, [PMCCNTR_EL0](#), and any implemented event counters [PMEVCNTR<n>_EL0](#). Reading this register shows which counters are enabled.

Configuration

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENSET\[31:0\]](#).

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to External register [PMU.PMCNTENSET_EL0\[31:0\]](#) [PMCNTENSET_EL0\[31:0\]](#).

AArch64 System register PMCNTENSET_EL0 bits [63:32] are architecturally mapped to External register [PMU.PMCNTENSET_EL0\[63:32\]](#) when FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET_EL0 are UNDEFINED.

Attributes

PMCNTENSET_EL0 is a 64-bit register.

Bits [63:**33**32]

Reserved, RES0.

F<m>, bit [m+32], for m = 0

When FEAT_PMUv3_ICNTR is implemented:

Fixed-function counter <m> enable. On writes, allows software to enable fixed-function counter <m>. On reads, returns the fixed-function counter <m> enable status.

F<m>	Meaning
0b0	Fixed-function counter <m> disabled.
0b1	Fixed-function counter <m> enabled.

PMCNTENSET_EL0.F0 holds the enable status for [PMICNTR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Access to this field is **WIS**.

Otherwise:

Reserved, RES0.

C, bit [31]

[PMCCNTR_EL0](#) enable bit. Enables the cycle counter register. Possible values are:

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, enables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter enable bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN. Otherwise, N is the value in [PMCR_EL0](#).N.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 event counter is enabled. When written, enables PMEVCNTR<n>_EL0 .

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCR\[31:0\]](#).

AArch64 System register PMCR_EL0 bits [7:0] are architecturally mapped to External register [PMU.PMCR_EL0\[7:0\]](#)~~PMCR_EL0[7:0]~~.

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR_EL0 are UNDEFINED.

Attributes

PMCR_EL0 is a 64-bit register.

Field descriptions

RES0																															FZS
IMP								IDCODE								N				RES0	FZ0	RES0	LP	LC	DP	X	D	C	P	E	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:33]

Reserved, RES0.

FZS, bit [32]

When FEAT_SPEv1p2 is implemented:

Freeze-on-SPE event. Stop counters when [PMBLIMITR_EL1](#).{PMFZ,E} == {1,1} and [PMBSR_EL1](#).S == 1.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

FZS	Meaning
0b0	Do not freeze on Statistical Profiling Buffer Management event.
0b1	Event counter PMEVCNTR<n>_EL0 does not count following a Statistical Profiling Buffer Management event if n is in the range of affected event counters.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported, this field resets to 0.
 - When the implementation only supports execution in AArch64 state, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMP, bits [31:24]

When FEAT_PMUv3p7 is not implemented:

Implementer code.

If this field is zero, then PMCR_EL0.IDCODE is RES0 and software must use [MIDR_EL1](#) to identify the PE.

Otherwise, this field and PMCR_EL0.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as [MIDR_EL1](#).Implementer.

Use of this field is deprecated.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

IDCODE, bits [23:16]

When PMCR_EL0.IMP != 0b00000000:

Identification code. Use of this field is deprecated.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of 0b000000-0b11111. If the value is 0b000000, then only [PMCCNTR_EL0](#) is implemented. If the value is 0b11111, then [PMCCNTR_EL0](#) and 31 event counters are implemented.

When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the value of [MDCR_EL2](#).HPMN.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counter PMEVCNTR<n>_EL0 does not count when PMOVSCLR_EL0 [(PMN-1):0] is nonzero and n is in the range of affected event counters.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [63:0].

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]

When AArch32 is supported:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0 [31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0 [63:0].

Arm deprecates use of [PMCR_EL0](#).LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is disabled in prohibited regions and when event counting is frozen: <ul style="list-style-type: none"> If FEAT_PMUv3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL2. If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL3. If FEAT_PMUv3p7 is implemented and event counting is frozen by PMCR_EL0.FZO, then cycle counting by PMCCNTR_EL0 is disabled. If EL3 is implemented, MDCR_EL3.SPME is 0, and either FEAT_PMUv3p7 is not implemented or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR_EL0 is disabled at EL3 and in Secure state. <p>If MDCR_EL2.HPMN is not 0, this is when event counting by event counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited or frozen.</p>

For more information, see 'Prohibiting event and cycle counting'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

When AArch32 is supported:

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR_EL0 counts every clock cycle.
0b1	When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR_EL0 to zero.

Note

Resetting [PMCCNTR_EL0](#) does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

P	Meaning
0b0	No action.
0b1	If n is in the range of affected event counters, resets each event counter PMEVCNTR<n>_EL0 to zero.

The effects of writing to this bit are:

- If EL2 is implemented and enabled in the current Security state, in EL0 and EL1, if PMN is not 0, a write of 1 to this bit resets event counters in the range [0 .. (PMN-1)].
- If EL2 is disabled in the current Security state, a write of 1 to this bit resets all the event counters.
- In EL2 and EL3, a write of 1 to this bit resets all the event counters.
- This field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

Note

Resetting the event counters does not change the event counter overflow bits. If FEAT_PMUv3p5 is implemented, the values of [MDCR_EL2](#).HLP and PMCR_EL0.LP are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.

If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.

If EL2 is not implemented, PMN is PMCR_EL0.N.

E	Meaning
0b0	PMCCNTR_EL0 is disabled and event counters PMEVCNTR<n>_EL0 , where n is in the range of affected event counters, are disabled.
0b1	PMCCNTR_EL0 and event counters PMEVCNTR<n>_EL0 , where n is in the range of affected event counters, are enabled by PMCNTENSET_EL0 .

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMCR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b000

PMECR_EL1, Performance Monitors Exception Control Register

The PMECR_EL1 characteristics are:

Purpose

Controls the behavior on overflow of the performance monitors.

Configuration

This register is present only when FEAT_PMuV3 is implemented and FEAT_EBEP is implemented. Otherwise, direct accesses to PMECR_EL1 are UNDEFINED.

Attributes

PMECR_EL1 is a 64-bit register.

Field descriptions

Bits [63:3]

Reserved, RES0.

KPME, bit [2]

Local (Kernel) PMU Exception Enable. Enables PMU exceptions taken to the current Exception level.

KPME	Meaning
0b0	PMU exceptions taken to the current Exception level are disabled.
0b1	PMU exceptions taken to the current Exception level are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMEE, bits [1:0]

Performance Monitors Exception Enable. Controls the generation of **PMUIRQ** signal and PMU exception at EL0 and EL1.

PMEE	Meaning
0b00	PMUIRQ signal is enabled, and PMU exception is disabled.
0b10	PMUIRQ signal is disabled, and PMU exception is disabled.
0b11	PMUIRQ signal is disabled, and PMU exception is enabled.

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- All of the following are true:
 - EL3 is implemented.
 - [MDCR_EL3](#).PMEE != 0b01.
- All of the following are true:
 - EL2 is implemented and enabled in the current Security State.
 - [MDCR_EL2](#).PMEE != 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMECR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMECR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1110	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    X[t, 64] = PMECR_EL1;
elsif PSTATE.EL == EL2 then
    X[t, 64] = PMECR_EL1;
elsif PSTATE.EL == EL3 then
    X[t, 64] = PMECR_EL1;
```

MSR PMECR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1110	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    PMECR_EL1 = X[t, 64];
elsif PSTATE.EL == EL2 then
    PMECR_EL1 = X[t, 64];
elsif PSTATE.EL == EL3 then
    PMECR_EL1 = X[t, 64];
```

(new)

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>_EL0

PMEVCNTR<n>_EL0 can also be accessed by using [PMXEVCNTR_EL0](#) with [PMSELR_EL0](#).SEL set to the value of <n>.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMEVCNTR<n>_EL0](#) is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of [PMEVCNTR<n>_EL0](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR_EL0](#).{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR_EL2](#).HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [MDCR_EL2](#).HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMEVCNTR<m>_EL0 ; Where m = 0-30

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b10:m[4:3]	m[2:0]

```

integer m = UInt(CRm<1:0>:op2<2:0>);

if m >= NUM_PMU_COUNTERS then
    if IsFeatureImplemented(FEAT_FGT) then
        UNDEFINED;
    else
        ConstrainUnpredictableProcedure(Unpredictable_PMUEVENTCOUNTER);
elsif PSTATE.EL == EL0 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TPM == '1' then
        UNDEFINED;
    elsif PMUSERENR_EL0.<ER,EN> == '00' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

PMEVCNTSVR<n>_EL1, Performance Monitors Event Count Saved Value Register <n>, n = 0 - 30

The PMEVCNTSVR<n>_EL1 characteristics are:

Purpose

Captures the PMU Event counter <n>, [PMEVCNTR<n>_EL0](#).

Configuration

This register is present only when FEAT_PMUv3_SS is implemented. Otherwise, direct accesses to PMEVCNTSVR<n>_EL1 are UNDEFINED.

Attributes

PMEVCNTSVR<n>_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

EVCNT, bits [63:0]

Sampled Event Count. The value of [PMEVCNTR<n>_EL0](#) at the last Capture event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTSVR<n>_EL1

If <n> is greater-than-or-equal-to the number of implemented event counters, then direct reads of PMEVCNTSVR<n>_EL1 are UNDEFINED.

Otherwise, direct reads of PMEVCNTSVR<n>_EL1 generate a Trap exception to EL2 when all of the following are true:

- <n> is greater-than-or-equal-to the number of snapshot registers accessible at the current Exception level.
- EL2 is implemented and enabled in the current Security state.
- The access is from EL1.

Note

If EL2 is implemented and enabled in the current Security state, [MDCR_EL2](#).HPMN identifies the number of accessible snapshot registers at EL1. Otherwise, the number of accessible snapshot registers is the number of implemented event counters. See [MDCR_EL2](#).HPMN for more details.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMEVCNTSVR<m>_EL1 ; Where m = 0-30

op0	op1	CRn	CRm	op2
0b10	0b000	0b1110	0b10:m[4:3]	m[2:0]

```
integer m = UInt(CRm<1:0>:op2<2:0>);
```

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    X[t, 64] = PMEVCNTSVR_EL1[m];
elsif PSTATE.EL == EL2 then
    X[t, 64] = PMEVCNTSVR_EL1[m];
elsif PSTATE.EL == EL3 then
    X[t, 64] = PMEVCNTSVR_EL1[m];
```

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVTYPER<n>\[31:0\]](#).

AArch64 System register PMEVTYPER<n>_EL0 bits [63:0] are architecturally mapped to External register [PMU.PMEVTYPER<n>_EL0\[63:0\]](#)[PMEVTYPER<n>_EL0\[63:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are UNDEFINED.

Attributes

PMEVTYPER<n>_EL0 is a 64-bit register.

Field descriptions

63	62	61	60		59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

TC, bits [63:61]

When (FEAT_PMUv3_EDGE is not implemented or PMEVTYPER<n>_EL0.TE == 0) and FEAT_PMUv3_TH is implemented:

Threshold Control. Defines the threshold function. In the description of this field, the value V is the value the event specified by PMEVTYPER<n>_EL0 would increment the counter by on a processor cycle if the threshold function is disabled. Comparisons treat V and PMEVTYPER<n>_EL0.TH as unsigned integer values.

Defines the threshold function. In the description of this field:

- V_B is the value the event specified by PMEVTYPER<n>_EL0 would increment the counter by on a processor cycle if the threshold function is disabled.
- TH is the value of PMEVTYPER<n>_EL0.TH.

Comparisons treat V_B and TH as unsigned integer values.

TC	Meaning
0b000	Not-equal. The counter increments by V on each processor cycle when V is not equal to PMEVTYPER<n>_EL0.TH. If PMEVTYPER<n>_EL0.TH is zero, the threshold function is disabled. B on each processor cycle when V _B is not equal to TH. If TH is zero, the threshold function is disabled.
0b001	Not-equal, count. The counter increments by 1 on each processor cycle when V is not equal to PMEVTYPER<n>_EL0.TH. B is not equal to TH.
0b010	Equals. The counter increments by V on each processor cycle when V is equal to PMEVTYPER<n>_EL0.TH. B on each processor cycle when V _B is equal to TH.
0b011	Equals, count. The counter increments by 1 on each processor cycle when V is equal to PMEVTYPER<n>_EL0.TH. B is equal to TH.
0b100	Greater-than-or-equal. The counter increments by V on each processor cycle when V is PMEVTYPER<n>_EL0.TH or more. B on each processor cycle when V _B is greater than or equal to TH.
0b101	Greater-than-or-equal, count. The counter increments by 1 on each processor cycle when V is PMEVTYPER<n>_EL0.TH or more. B is greater than or equal to TH.
0b110	Less-than. The counter increments by V on each processor cycle when V is less than PMEVTYPER<n>_EL0.TH. B on each processor cycle when V _B is less than TH.
0b111	Less-than, count. The counter increments by 1 on each processor cycle when V is less than PMEVTYPER<n>_EL0.TH. B is less than TH.

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

When FEAT_PMUv3_EDGE is implemented and PMEVTYPER<n>_EL0.TE == 1:

Threshold Control.

Defines the threshold function. In the description of this field:

- V_B is the value the event specified by PMEVTYPER<n>_EL0 would increment the counter by on a processor cycle if the threshold function is disabled.
- TH is the value of PMEVTYPER<n>_EL0.TH.

Comparisons treat V_B and TH as unsigned integer values.

TC	Meaning
0b001	Equal to not-equal. The counter increments by 1 on each processor cycle when V_B is not equal to TH and V_B was equal to TH on the previous processor cycle.
0b010	Equal to/from not-equal. The counter increments by 1 on each processor cycle when either: <ul style="list-style-type: none"> V_B is not equal to TH and V_B was equal to TH on the previous processor cycle. V_B is equal to TH and V_B was not equal to TH on the previous processor cycle.
0b011	Not-equal to equal. The counter increments by 1 on each processor cycle when V_B is equal to TH and V_B was not equal to TH on the previous processor cycle.
0b101	Less-than to greater-than-or-equal. The counter increments by 1 on each processor cycle when V_B is greater than or equal to TH and V_B was less than TH on the previous processor cycle.
0b110	Less-than to/from greater-than-or-equal. The counter increments by 1 on each processor cycle when either: <ul style="list-style-type: none"> V_B is greater than or equal to TH and V_B was less than TH on the previous processor cycle. V_B is less than TH and V_B was greater than or equal to TH on the previous processor cycle.
0b111	Greater-than-or-equal to less-than. The counter increments by 1 on each processor cycle when V_B is less than TH and V_B was greater than or equal to TH on the previous processor cycle.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Threshold Control.

Defines the threshold function. In the description of this field:

- V_B is the value the event specified by PMEVTYPER<n>_EL0 would increment the counter by on a processor cycle if the threshold function is disabled.
- TH is the value of PMEVTYPER<n>_EL0.TH.

Comparisons treat V_B and TH as unsigned integer values.

TE, bit [60]

When FEAT_PMUv3_EDGE is implemented:

Threshold Edge. Enables the edge condition. When PMEVTYPER<n>_EL0.TE is 1, the event counter increments on cycles when the result of the threshold condition changes. See PMEVTYPER<n>_EL0.TC for more information.

TE	Meaning
0b0	Threshold edge condition disabled.
0b1	Threshold edge condition enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BitBits [5960:44]

Reserved, RES0.

SYNC, bit [58]**When FEAT_SEBEP is implemented:**

Synchronous Mode. Controls whether a PMU exception generated by the counter is synchronous or asynchronous.

SYNC	Meaning
0b0	Asynchronous PMU exception is enabled.
0b1	Synchronous PMU exception is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [57:44]

Reserved, RES0.

TH, bits [43:32]**When FEAT_PMUv3_TH is implemented:**

Threshold value. Provides the unsigned value for the threshold function defined by PMEVTYPER<n>_EL0.TC.

If PMEVTYPER<n>_EL0.TC is 0b000 and PMEVTYPER<n>_EL0.TH is zero, then the threshold function is disabled.

If [PMMIR_EL1](#).THWIDTH is less than 12, then bits PMEVTYPER<n>_EL0.TH[11:[PMMIR_EL1](#).THWIDTH] are RES0. This accounts for the behavior when writing a value greater-than-or-equal-to $2^{(\text{PMMIR_EL1.THWIDTH})}$.

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMEVTYPER<n>_EL0.RLK bit.

P	Meaning
0b0	Count events in EL1.
0b1	Do not count events in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMEVTYPER<n>_EL0.RLU bit.

U	Meaning
0b0	Count events in EL0.
0b1	Do not count events in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]**When EL2 is implemented:**

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMEVTYPER<n>_EL0.RLH bit.

NSH	Meaning
0b0	Do not count events in EL2.
0b1	Count events in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]**When EL3 is implemented:**

EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in EL3 are counted.

Otherwise, events in EL3 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]**When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:**

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this field is RES0. See [ID_AA64DFR0_EL1](#).MTPMU.

This field is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and Disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]

When FEAT_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

T, bit [23]

When FEAT_TME is implemented:

Transactional state filtering bit. Controls counting of Attributable events in Non-transactional Transactional state.

T	Meaning
0b0	This bit has no effect on the filtering of events.
0b1	Do not count Attributable events in Non-transactional Transactional state.

For each Unattributable event, it is IMPLEMENTATION DEFINED whether the filtering applies.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]

When FEAT_RME is implemented:

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Realm EL1 are counted.

Otherwise, events in Realm EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]**When FEAT_RME is implemented:**

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Realm EL0 are counted.

Otherwise, events in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]**When FEAT_RME is implemented:**

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Realm EL2 are counted.

Otherwise, events in Realm EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]**When FEAT_PMUv3p1 is implemented:**

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter [PMEVCNTR<n>_EL0](#).

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.

Note

Arm recommends this behavior for all implementations of FEAT_PMUv3.

Otherwise, if PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>_EL0

PMEVTYPER<n>_EL0 can also be accessed by using [PMXEVTYPER_EL0](#) with [PMSELR_EL0](#).SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMEVTYPER<n>_EL0](#) is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of [PMEVTYPER<n>_EL0](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR_EL0](#).EN.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR_EL2](#).HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [MDCR_EL2](#).HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMEVTYPER<m>_EL0 ; Where m = 0-30

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b11:m[4:3]	m[2:0]

```

PMIAR_EL1, Performance Monitors Instruction Address Register

The PMIAR_EL1 characteristics are:

Purpose

Captures the address of the instruction generating a PMU exception.

Configuration

This register is present only when FEAT_SEBEP is implemented. Otherwise, direct accesses to PMIAR_EL1 are UNDEFINED.

Attributes

PMIAR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

PMICFILTR_EL0, Performance Monitors Instruction Counter Filter Register

The PMICFILTR_EL0 characteristics are:

Purpose

Configures the Instruction Counter.

Configuration

AArch64 System register PMICFILTR_EL0 bits [63:0] are architecturally mapped to External register [PMU.PMICFILTR_EL0\[63:0\]](#).

This register is present only when FEAT_PMUv3 is implemented and FEAT_PMUv3_ICNTR is implemented. Otherwise, direct accesses to PMICFILTR_EL0 are UNDEFINED.

Attributes

PMICFILTR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0					SYNC	RES0																									
P	U	NSK	NSU	NSH	M	RES0	SH	T	RLK	RLU	RLH	RES0				evtCount															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:59]

Reserved, RES0.

SYNC, bit [58]

When FEAT_SEBEP is implemented:

Synchronous mode. Controls whether a PMU exception generated by the counter is synchronous or asynchronous.

SYNC	Meaning
0b0	Asynchronous PMU exception is enabled.
0b1	Synchronous PMU exception is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [57:32]

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting instructions in EL1.

P	Meaning
0b0	This bit has no effect on filtering of instructions.
0b1	Instructions in EL1 are not counted.

If EL3 is implemented, then counting instructions in Non-secure EL1 is further controlled by PMICFILTR_EL0.NSK, and counting instructions in EL3 is further controlled by PMICFILTR_EL0.M.

If FEAT_RME is implemented, then counting instructions in Realm EL1 is further controlled by PMICFILTR_EL0.RLK.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting instructions in EL0.

U	Meaning
0b0	This bit has no effect on filtering of instructions.
0b1	Instructions in EL0 are not counted.

If EL3 is implemented, then PMICFILTR_EL0.NSU further controls filtering instructions in Non-secure EL0.

If FEAT_RME is implemented, then counting instructions in Realm EL1 is further controlled by PMICFILTR_EL0.RLU.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]**When EL3 is implemented:**

Non-secure EL1 filtering. Controls counting instructions in Non-secure EL1. If PMICFILTR_EL0.NSK is equal to PMICFILTR_EL0.P, then instructions in Non-secure EL1 are counted. Otherwise, instructions in Non-secure EL1 are not counted.

NSK	Meaning
0b0	If PMICFILTR_EL0.P == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.P == 1, then instructions in Non-secure EL1 are not counted.
0b1	If PMICFILTR_EL0.P == 0, then instructions in Non-secure EL1 are not counted. If PMICFILTR_EL0.P == 1, then this bit has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]**When EL3 is implemented:**

Non-secure EL0 filtering. Controls counting instructions in Non-secure EL0. If PMICFILTR_EL0.NSU is equal to PMICFILTR_EL0.U, then instructions in Non-secure EL0 are counted. Otherwise, instructions in Non-secure EL0 are not counted.

NSU	Meaning
0b0	If PMICFILTR_EL0.U == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.U == 1, then instructions in Non-secure EL0 are not counted.
0b1	If PMICFILTR_EL0.U == 0, then instructions in Non-secure EL0 are not counted. If PMICFILTR_EL0.U == 1, then this bit has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]**When EL2 is implemented:**

EL2 filtering. Controls counting instructions in EL2.

NSH	Meaning
0b0	Instructions in EL2 are not counted.
0b1	This bit has no effect on filtering of instructions.

If EL3 is implemented and FEAT_SEL2 is implemented, then counting instructions in Secure EL2 is further controlled by PMICFILTR_EL0.SH.

If FEAT_RME is implemented, then counting instructions in Realm EL2 is further controlled by PMICFILTR_EL0.RLH.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]**When EL3 is implemented:**

EL3 filtering. Controls counting instructions in EL3. If PMICFILTR_EL0.M is equal to PMICFILTR_EL0.P, then instructions in EL3 are counted. Otherwise, instructions in EL3 are not counted.

M	Meaning
0b0	If PMICFILTR_EL0.P == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.P == 1, then instructions in EL3 are not counted.
0b1	If PMICFILTR_EL0.P == 0, then instructions in EL3 are not counted. If PMICFILTR_EL0.P == 1, then this bit has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

When EL3 is implemented and FEAT_SEL2 is implemented:

Secure EL2 filtering. Controls counting instructions in Secure EL2. If PMICFILTR_EL0.SH is not equal to PMICFILTR_EL0.NSH, then instructions in Secure EL2 are counted. Otherwise, instructions in Secure EL2 are not counted.

SH	Meaning
0b0	If PMICFILTR_EL0.NSH == 0, then instructions in Secure EL2 are not counted. If PMICFILTR_EL0.NSH == 1, then this bit has no effect on filtering of instructions.
0b1	If PMICFILTR_EL0.NSH == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.NSH == 1, then instructions in Secure EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When !IsSecureEL2Enabled(), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

T, bit [23]

When FEAT_TME is implemented:

Non-transactional state filtering. Controls counting instructions in Non-transactional state.

T	Meaning
0b0	This bit has no effect on filtering of instructions.
0b1	Instructions in Non-transactional state are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]

When FEAT_RME is implemented:

Realm EL1 filtering. Controls counting instructions in Realm EL1. If PMICFILTR_EL0.RLK is equal to PMICFILTR_EL0.P, then instructions in Realm EL1 are counted. Otherwise, instructions in Realm EL1 are not counted.

RLK	Meaning
0b0	If PMICFILTR_EL0.P == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.P == 1, then instructions in Realm EL1 are not counted.
0b1	If PMICFILTR_EL0.P == 0, then instructions in Realm EL1 are not counted. If PMICFILTR_EL0.P == 1, then this bit has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 filtering. Controls counting instructions in Realm EL0. If PMICFILTR_EL0.RLU is equal to PMICFILTR_EL0.U, then instructions in Realm EL0 are counted. Otherwise, instructions in Realm EL0 are not counted.

RLU	Meaning
0b0	If PMICFILTR_EL0.U == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.U == 1, then instructions in Realm EL0 are not counted.
0b1	If PMICFILTR_EL0.U == 0, then instructions in Realm EL0 are not counted. If PMICFILTR_EL0.U == 1, then this bit has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]**When FEAT_RME is implemented:**

Realm EL2 filtering. Controls counting instructions in Realm EL2. If PMICFILTR_EL0.RLH is not equal to PMICFILTR_EL0.NSH, then instructions in Realm EL2 are counted. Otherwise, instructions in Realm EL2 are not counted.

RLH	Meaning
0b0	If PMICFILTR_EL0.NSH == 0, then instructions in Realm EL2 are not counted. If PMICFILTR_EL0.NSH == 1, then this bit has no effect on filtering of instructions.
0b1	If PMICFILTR_EL0.NSH == 0, then this bit has no effect on filtering of instructions. If PMICFILTR_EL0.NSH == 1, then instructions in Realm EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count.

Reads as 0x0008.

Access to this field is **RO**.

Accessing PMICFILTR_EL0

PMICFILTR_EL0 reads-as-zero and ignores writes if all of the following are true:

- PSTATE.EL == EL0.
- [PMUSERENR_EL0](#).{UEN,EN} == {1,0}.
- [PMUACR_EL1](#).F0 == 0.

PMICFILTR_EL0 ignores writes if all of the following are true:

- PSTATE.EL == EL0.
- [PMUSERENR_EL0](#).{UEN,IR,EN} == {1,1,0}.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMICFILTR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b0110	0b000

PMICNTR_EL0, Performance Monitors Instruction Counter Register

The PMICNTR_EL0 characteristics are:

Purpose

If event counting is not prohibited and the instruction counter is enabled, the counter increments for each architecturally-executed instruction, according to the configuration specified by [PMICFILTR_EL0](#).

Configuration

AArch64 System register PMICNTR_EL0 bits [63:0] are architecturally mapped to External register [PMU.PMICNTR_EL0\[63:0\]](#).

This register is present only when FEAT_PMUv3_ICNTR is implemented. Otherwise, direct accesses to PMICNTR_EL0 are UNDEFINED.

Attributes

PMICNTR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:[33](#)[32](#)]

Reserved, RES0.

F<m>, bit [m+32], for m = 0

When FEAT_PMUv3_ICNTR is implemented:

Interrupt request or PMU exception on unsigned overflow of fixed-function counter <m> disable. On writes, allows software to disable the interrupt request or PMU exception on unsigned overflow of fixed-function counter <m>. On reads, returns the interrupt request or PMU exception on unsigned overflow of fixed-function counter <m> enable status.

F<m>	Meaning
0b0	Interrupt request or PMU exception on unsigned overflow of fixed-function counter <m> disabled.
0b1	Interrupt request or PMU exception on unsigned overflow of fixed-function counter <m> enabled.

PMINTENCLR_EL1.F0 holds the enable status for [PMICNTR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

C, bit [31]

[PMCCNTR_EL0](#) overflow interrupt request disable bit. Possible values are:

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in [MDCR_EL2](#).HPMN. Otherwise, N is the value in [PMCR_EL0](#).N.

P<n>	Meaning
0b0	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR<n>_EL0 interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMMIR_EL1, Performance Monitors Machine Identification Register

The PMMIR_EL1 characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation to software.

Configuration

This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR_EL1 are UNDEFINED.

Attributes

PMMIR_EL1 is a 64-bit register.

Field descriptions

Bits [63:2824]

Reserved, RES0.

EDGE, bits [27:24]

PMU event edge detection. Indicates implementation of the FEAT_PMUv3_EDGE feature.

EDGE	Meaning
0b0000	FEAT_PMUv3_EDGE is not implemented.
0b0001	FEAT_PMUv3_EDGE is implemented.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

THWIDTH, bits [23:20]

PMEVTYPEPER<n>_ELO.TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the PMEVTYPEPER<n>_ELO.TH field.

THWIDTH	Meaning
0b0000	FEAT_PMUv3_TH is not implemented.
0b0001	1 bit. PMEVTYPER<n>_EL0.TH[11:1] are RES0.
0b0010	2 bits. PMEVTYPER<n>_EL0.TH[11:2] are RES0.
0b0011	3 bits. PMEVTYPER<n>_EL0.TH[11:3] are RES0.
0b0100	4 bits. PMEVTYPER<n>_EL0.TH[11:4] are RES0.
0b0101	5 bits. PMEVTYPER<n>_EL0.TH[11:5] are RES0.
0b0110	6 bits. PMEVTYPER<n>_EL0.TH[11:6] are RES0.
0b0111	7 bits. PMEVTYPER<n>_EL0.TH[11:7] are RES0.
0b1000	8 bits. PMEVTYPER<n>_EL0.TH[11:8] are RES0.
0b1001	9 bits. PMEVTYPER<n>_EL0.TH[11:9] are RES0.
0b1010	10 bits. PMEVTYPER<n>_EL0.TH[11:10] are RES0.
0b1011	11 bits. PMEVTYPER<n>_EL0.TH[11] is RES0.
0b1100	12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to [PMEVTYPER<n>_EL0.TH](#) is $2^{(\text{PMMIR_EL1.THWIDTH})}$ minus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as $\text{Log}_2(\text{number of bytes})$, plus one.

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

If the bus count information is not available, this field will read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMMIR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMMIR_EL1

op0	op1	CRn	CRm	op2

PMOVSLR_EL0, Performance Monitors Overflow Flag Status Clear Register

The PMOVSLR_EL0 characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>_EL0](#). Writing to this register clears these bits.

Configuration

AArch64 System register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSRI31:0](#).

AArch64 System register PMOVSLR_EL0 bits [31:0] are architecturally mapped to External register [PMU.PMOVSLR_EL0\[31:0\]](#)[PMOVSLR_EL0\[31:0\]](#).

AArch64 System register PMOVSLR_EL0 bits [63:32] are architecturally mapped to External register [PMU.PMOVSLR_EL0\[63:32\]](#) when FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSLR_EL0 are UNDEFINED.

Attributes

PMOVSLR_EL0 is a 64-bit register.

Field descriptions

Bits [63:**33**32]

Reserved, RES0.

F<m>, bit [m+32], for m = 0
When FEAT_PMUv3_ICNTR is implemented:

Unsigned overflow flag for fixed-function counter <m> clear. On writes, allows software to clear the unsigned overflow flag for fixed-function counter <m> to 0. On reads, returns the unsigned overflow flag for fixed-function counter <m> overflow status.

F<m>	Meaning
0b0	Fixed-function counter <m> has not overflowed.
0b1	Fixed-function counter <m> has overflowed.

PMOVSLR_EL0.F0 holds the overflow status for [PMICNTR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

C, bit [31]

Cycle counter overflow clear bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN. Otherwise, N is the value in [PMCR_EL0](#).N.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR<n>_EL0 overflow bit to 0.

If FEAT_PMuV3p5 is implemented, [MDCR_EL2](#).HLP and [PMCR_EL0](#).LP control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>_EL0](#)[31:0] or unsigned overflow of [PMEVCNTR<n>_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>_EL0](#).

Configuration

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSSETI\[31:0\]](#).

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to External register [PMU.PMOVSSET_EL0\[31:0\]](#)[PMOVSSET_EL0\[31:0\]](#).

AArch64 System register PMOVSSET_EL0 bits [63:32] are architecturally mapped to External register [PMU.PMOVSSET_EL0\[63:32\]](#) when FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET_EL0 are UNDEFINED.

Attributes

PMOVSSET_EL0 is a 64-bit register.

Field descriptions

Bits [63:**33****32**]

Reserved, RES0.

F<m>, bit [m+32], for m = 0
When FEAT_PMUv3_ICNTR is implemented:

Unsigned overflow flag for fixed-function counter <m> set. On writes, allows software to set the unsigned overflow flag for fixed-function counter <m> to 1. On reads, returns the unsigned overflow flag for fixed-function counter <m> overflow status.

F<m>	Meaning
0b0	Fixed-function counter <m> has not overflowed.
0b1	Fixed-function counter <m> has overflowed.

PMOVSSET_EL0.F0 holds the overflow status for [PMICNTR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Access to this field is **W1S**.

Otherwise:

Reserved, RES0.

C, bit [31]

Cycle counter overflow set bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow set bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN. Otherwise, N is the value in [PMCR_EL0](#).N.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, sets the PMEVCNTR<n>_EL0 overflow bit to 1.

If FEAT_PMuV3p5 is implemented, [MDCR_EL2](#).HLP and [PMCR_EL0](#).LP control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>_EL0](#)[31:0] or unsigned overflow of [PMEVCNTR<n>_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSSET_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMOVSSET_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1110	0b011

```

if PSTATE.EL == EL0 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TPM == '1' then
        UNDEFINED;
    elsif PMUSERENR_EL0.EN == '0' then

PMSCR_EL1, Statistical Profiling Control Register (EL1)

The PMSCR_EL1 characteristics are:

Purpose

Provides EL1 controls for Statistical Profiling.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSCR_EL1 are UNDEFINED.

Attributes

PMSCR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																								PCT	TS	PA	CX	RES0	E1SPE	E0SPE	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:8]

Reserved, RES0.

PCT, bits [7:6]

When EL2 is implemented:

Physical Timestamp. If timestamp sampling is enabled and the Profiling Buffer is owned by EL1, requests which timestamp counter value is collected.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.

PCT	Meaning	Applies when
0b00	Virtual timestamp. The collected timestamp is the physical counter minus the value of CNTVOFF_EL2 .	
0b01	Physical timestamp. The collected timestamp is the physical counter.	
0b11	Guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2 : <ul style="list-style-type: none"> SCR_EL3.ECVEN == 0. CNTHCTL_EL2.ECV == 0. 	When FEAT_ECV is implemented

If EL2 is enabled in the current Security state, then the value of [PMSCR_EL2.PCT](#) might override or modify the meaning of this field.

This field is ignored by the PE when the Profiling Buffer owning Exception level is EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Physical Timestamp. Reserved. This field reads as 0b01 and ignores writes. Software should treat this field as UNK/SBZP.

When EL2 is not implemented, the Effective values of [CNTVOFF_EL2](#) and [CNTPOFF_EL2](#) are zero, meaning the virtual counter and physical counter have the same value.

TS, bit [5]

Timestamp enable.

TS	Meaning
0b0	Timestamp sampling disabled.
0b1	Timestamp sampling enabled.

This bit is ignored by the PE if EL2 is implemented and the Profiling Buffer is owned by EL2. For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address sample enable.

PA	Meaning
0b0	Physical addresses are not collected.
0b1	Physical addresses are collected.

If EL2 is implemented:

- If the Profiling Buffer is owned by EL1, this bit is combined with [PMSCR_EL2.PA](#) to determine which address is collected. For more information, see 'Controlling the data that is collected'.
- If the Profiling Buffer is owned by EL2, this bit is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CX, bit [3]

[CONTEXTIDR_EL1](#) sample enable.

CX	Meaning
0b0	CONTEXTIDR_EL1 is not collected.
0b1	CONTEXTIDR_EL1 is collected.

If EL2 is implemented and enabled in the current Security state when an operation is sampled:

- If the PE is at EL2, this bit is ignored by the PE.
- If [HCR_EL2.TGE](#) == 1, this bit is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E1SPE, bit [1]

EL1 Statistical Profiling Enable.

E1SPE	Meaning
0b0	Sampling disabled at EL1.
0b1	Sampling enabled at EL1.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when [HCR_EL2.TGE](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E0SPE, bit [0]

EL0 Statistical Profiling Enable. Controls sampling at EL0 when [HCR_EL2.TGE](#) == 0 or if EL2 is disabled or not implemented.

E0SPE	Meaning
0b0	Sampling disabled at EL0.
0b1	Sampling enabled at EL0.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when [HCR_EL2.TGE](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSCR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1001	0b000

Bits [63:8]

Reserved, RES0.

PCT, bits [7:6]

Physical Timestamp. If timestamp sampling is enabled, determines which counter is collected. The behavior depends on the Profiling Buffer owning Exception level.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.

PCT	Meaning	Applies when
0b00	<p>Virtual timestamp. The collected timestamp is the physical counter minus a virtual offset. If any of the following are true, the virtual offset is zero, otherwise the virtual offset is the value of CNTVOFF_EL2:</p> <ul style="list-style-type: none"> The sampled operation executed at EL2 and HCR_EL2.E2H == 1. The sampled operation executed at EL0 and HCR_EL2.{E2H,TGE} == {1,1}. 	
	<p>Note If the Profiling Buffer owning Exception level is EL1, the virtual offset is always CNTVOFF_EL2.</p>	
0b01	<p>If the Profiling Buffer owning Exception level is EL1, then the timestamp value is selected by PMSCR_EL1.PCT. Otherwise, physical timestamp. The collected timestamp is the physical counter.</p>	
0b11	<p>If the Profiling Buffer owning Exception level is EL1 and PMSCR_EL1.PCT == 0b00, then guest virtual timestamp. The collected timestamp is the physical counter minus the value of CNTVOFF_EL2. Otherwise, guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2:</p> <ul style="list-style-type: none"> SCR_EL3.ECVEn == 0. CNTHCTL_EL2.ECV == 0. 	When FEAT_ECV is implemented

All other values are reserved.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 0b01, other than for a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TS, bit [5]

Timestamp Enable.

TS	Meaning
0b0	Timestamp sampling disabled.
0b1	Timestamp sampling enabled.

This bit is ignored by the PE when any of the following are true:

- The Profiling Buffer owning Exception level is EL1.
- In Secure state, and either FEAT_SEL2 is not implemented or Secure EL2 is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address Sample Enable.

PA	Meaning
0b0	Physical addresses are not collected.
0b1	Physical addresses are collected.

If the Profiling Buffer owning Exception level is EL1, and EL2 is enabled in the current Security state, this bit is combined with [PMSCR_EL1.PA](#) to determine which address is collected.

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit and behaves as if this bit is set to 1, other than for a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CX, bit [3]

[CONTEXTIDR_EL2](#) Sample Enable.

CX	Meaning
0b0	CONTEXTIDR_EL2 is not collected.
0b1	CONTEXTIDR_EL2 is collected.

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E2SPE, bit [1]

EL2 Statistical Profiling Enable.

E2SPE	Meaning
0b0	Sampling disabled at EL2.
0b1	Sampling enabled at EL2.

This bit is RES0 if [MDCR_EL2.E2PB](#) != 0b00.

If EL2 is disabled in the current Security state, this bit is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E0HSPE, bit [0]

EL0 Statistical Profiling Enable.

E0HSPE	Meaning
0b0	Sampling disabled at EL0.
0b1	Sampling enabled at EL0.

If [MDCR_EL2.E2PB](#) != 0b00, this bit is RES0.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when [HCR_EL2.TGE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMSDSFR_EL1, Sampling Data Source Filter Register

The PMSDSFR_EL1 characteristics are:

Purpose

Controls sample filtering by Data Source.

Configuration

This register is present only when FEAT_SPE_FDS is implemented. Otherwise, direct accesses to PMSDSFR_EL1 are UNDEFINED.

Attributes

PMSDSFR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35
S63	S62	S61	S60	S59	S58	S57	S56	S55	S54	S53	S52	S51	S50	S49	S48	S47	S46	S45	S44	S43	S42	S41	S40	S39	S38	S37	S36	S35

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3

S<m>, bit [m], for m = 63 to 0
When filtering on Data Source <m> is supported:

S[<m>] is the Data Source filter for IMPLEMENTATION DEFINED Data Source <m>.

S<m>	Meaning
0b0	If PMSFCR_EL1 .FDS is 1, do not record load operations that have bits [5:0] of the Data Source packet set to <m>.
0b1	Load operations with Data Source <m> are unaffected by PMSFCR_EL1 .FDS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Accessing PMSDSFR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSDSFR_EL1

op0	op1	CRn	CRm	op2

PMSELR_EL0, Performance Monitors Event Counter Selection Register

The PMSELR_EL0 characteristics are:

Purpose

Selects the current event counter [PMEVCNTR<n>_EL0](#) or the cycle counter, CCNT.

PMSELR_EL0 is used in conjunction with [PMXEVTYPER_EL0](#) to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with [PMXVCNTR_EL0](#), to determine the value of a selected event counter.

Configuration

AArch64 System register PMSELR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSELR\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSELR_EL0 are UNDEFINED.

Attributes

PMSELR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SEL																															

Bits [63:5]

Reserved, RES0.

SEL, bits [4:0]

Selects event counter, [PMEVCNTR<n>_EL0](#), where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to [PMXEVTYPER_EL0](#) or [PMXVCNTR_EL0](#) occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR_EL0.SEL is 0b11111, it selects the cycle counter and:

- A read of the [PMXEVTYPER_EL0](#) returns the value of [PMCCFILTR_EL0](#).
- A write of the [PMXEVTYPER_EL0](#) writes to [PMCCFILTR_EL0](#).
- A read or write of [PMXVCNTR_EL0](#) has CONSTRAINED UNPREDICTABLE effects. For more information, see [PMXVCNTR_EL0](#).

For more information about the results of accesses to the event counters, see [PMXEVTYPER_EL0](#) and [PMXVCNTR_EL0](#).

For more information about the number of counters accessible at each Exception level, see [MDCR_EL2](#).HPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSELR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSELR_EL0

PMSEVFR_EL1, Sampling Event Filter Register

The PMSEVFR_EL1 characteristics are:

Purpose

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if PMSEVFR_EL1.E[3] and PMSEVFR_EL1.E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 (TLB walk) set to 1 are recorded.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSEVFR_EL1 are UNDEFINED.

Attributes

PMSEVFR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49						
E[63]	E[62]	E[61]	E[60]	E[59]	E[58]	E[57]	E[56]	E[55]	E[54]	E[53]	E[52]	E[51]	E[50]	E[49]						
E[31]	E[30]	E[29]	E[28]	E[27]	E[26]	E[25]	E[24]	E[23] RAZ/WI	E[22]	E[18]	E[21]	E[17]	E[20]	E[16]	E[19]	E[15]	E[18]	E[14]	E[17]	E[13]
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11

E[<x>], bit [x], for x = 63 to 48, 31 to 24, 15 to 12

E[<x>] is the event filter for event <x>. If event <x> is not implemented, or filtering on event <x> is not supported, the corresponding bit is RAZ/WI.

E[<x>]	Meaning
0b0	Event <x> is ignored.
0b1	Do not record samples that have event <x> == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:32]

Reserved, RAZ/WI.

E[23], Bits bit [23:19]
When FEAT_SPEv1p4 is implemented and event 23 is implemented:

Data snooped.

E[23]	Meaning
0b0	Data snooped event is ignored.
0b1	Do not record samples that have the Data snooped event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[22], bit [22]

When FEAT_SPEv1p4 is implemented and event 22 is implemented:

Recently fetched.

E[22]	Meaning
0b0	Recently fetched event is ignored.
0b1	Do not record samples that have the Recently fetched event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[21], bit [21]

When FEAT_SPEv1p4 is implemented and event 21 is implemented:

Cache data modified.

E[21]	Meaning
0b0	Cache data modified event is ignored.
0b1	Do not record samples that have the Cache data modified event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[20], bit [20]

When FEAT_SPEv1p4 is implemented and event 20 is implemented:

Level 2 data cache miss.

E[20]	Meaning
0b0	Level 2 data cache miss event is ignored.
0b1	Do not record samples that have the Level 2 data cache miss event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[19], bit [19]

When FEAT_SPEv1p4 is implemented and event 19 is implemented:

Level 2 data cache access.

E[19]	Meaning
0b0	Level 2 data cache access event is ignored.
0b1	Do not record samples that have the Level 2 data cache access event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[18], bit [18]

When FEAT_SPEv1p1 is implemented and FEAT_SVE is implemented:

Empty predicate.

E[18]	Meaning
0b0	Empty predicate event is ignored.
0b1	Do not record samples that have the Empty predicate event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]

When FEAT_SPEv1p1 is implemented and FEAT_SVE is implemented:

Partial predicate.

E[17]	Meaning
0b0	Partial predicate event is ignored.
0b1	Do not record samples that have the Partial predicate event == 0.

This bit is ignored by the PE when [PMSFCR_EL1](#).FE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[16], bit [16]

When FEAT_TME is implemented:

Transactional

E[16]	Meaning
0b0	Transactional event is ignored.
0b1	Do not record samples that have the Transactional event == 0.

This bit is ignored by the PE when [PMSFCR_EL1](#).FE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[11], bit [11]

When FEAT_SPEv1p1 is implemented:

Alignment.

E[11]	Meaning
0b0	Alignment event is ignored.
0b1	Do not record samples that have the Alignment event == 0.

This bit is ignored by the PE when [PMSFCR_EL1](#).FE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[10], Bits bit [10:8]

When (FEAT_SPEv1p4 is implemented or filtering on event 10 is optionally supported) and event 10 is implemented:

Remote access.

E[10]	Meaning
0b0	Remote access event is ignored.
0b1	Do not record samples that have the Remote access event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[9], bit [9]

When (FEAT_SPEv1p4 is implemented or filtering on event 9 is optionally supported) and event 9 is implemented:

Last Level cache miss.

E[9]	Meaning
0b0	Last Level cache miss event is ignored.
0b1	Do not record samples that have the Last Level cache miss event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[8], bit [8]

When (FEAT_SPEv1p4 is implemented or filtering on event 8 is optionally supported) and event 8 is implemented:

Last Level cache access.

E[8]	Meaning
0b0	Last Level cache access event is ignored.
0b1	Do not record samples that have the Last Level cache access event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[7], bit [7]

Mispredicted.

E[7]	Meaning
0b0	Mispredicted event is ignored.
0b1	Do not record samples that have the Mispredicted event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[6], bit [6]**When FEAT_SPEv1p2 is implemented:**

Not taken.

E[6]	Meaning
0b0	Not taken event is ignored.
0b1	Do not record samples that have the Not taken event == 0.

This field is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[5], bit [5]

TLB walk.

E[5]	Meaning
0b0	TLB walk event is ignored.
0b1	Do not record samples that have the TLB walk event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[4], bit [4]**When FEAT_SPEv1p4 is implemented or filtering on event 4 is optionally supported:**

TLB access.

E[4]	Meaning
0b0	TLB access event is ignored.
0b1	Do not record samples that have the TLB access event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[3], bit [3]

Level 1 data or unified cache refill.

E[3]	Meaning
0b0	Level 1 data or unified cache refill event is ignored.
0b1	Do not record samples that have the Level 1 data or unified cache refill event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[2], bit [2]**When FEAT_SPEv1p4 is implemented or filtering on event 2 is optionally supported:**

Level 1 data cache access.

E[2]	Meaning
0b0	Level 1 data cache access event is ignored.
0b1	Do not record samples that have the Level 1 data cache access event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[1], bit [1]**When the PE supports sampling of speculative instructions:**

Architecturally executed.

When the PE supports sampling of speculative instructions:

E[1]	Meaning
0b0	Architecturally executed event is ignored.
0b1	Do not record samples that have the Architecturally executed event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, UNKNOWN.

Bit [0]

Reserved, RAZ/WI.

Accessing PMSEVFR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSEVFR_EL1

PMSFCR_EL1, Sampling Filter Control Register

The PMSFCR_EL1 characteristics are:

Purpose

Controls sample filtering. The filter is the logical AND of the FL, FT and FE bits. For example, if FE == 1 and FT == 1 only samples including the selected operation types and the selected events will be recorded

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSFCR_EL1 are UNDEFINED.

Attributes

PMSFCR_EL1 is a 64-bit register.

Field descriptions

Bits [63:19]

Reserved, RES0.

ST, bit [18]

Store filter enable

ST	Meaning
0b0	Do not record store operations
0b1	Record all store operations, including vector stores and all atomic operations

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LD, bit [17]

Load filter enable

LD	Meaning
0b0	Do not record load operations
0b1	Record all load operations, including vector loads and atomic operations that return data

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

B, bit [16]

Branch filter enable

B	Meaning
0b0	Do not record branch and exception return operations
0b1	Record all branch and exception return operations

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:54]

Reserved, RES0.

FDS, bit [4]**When FEAT_SPE_FDS is implemented:**

Filter by Data Source.

FDS	Meaning
0b0	Data Source filtering disabled.
0b1	Data Source filtering enabled. Samples of load instructions reporting a Data Source selected by PMSDSFR_EL1 will not be recorded.

If PMSFCR_EL1.FDS == 1 and PMSDSFR_EL1 is zero, then no load operations with a Data Source will be recorded.

Load operations without a Data Source and other sampled operations are unaffected by this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnE, bit [3]**When FEAT_SPEv1p2 is implemented:**

Filter by event, inverted.

FnE	Meaning
0b0	Inverted event filtering disabled.
0b1	Inverted event filtering enabled. Samples including the events selected by PMSNEVFR_EL1 will not be recorded.

If any of the following are true, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FnE == 0:

- PMSFCR_EL1.FnE == 1 and PMSNEVFR_EL1 is zero.
- PMSFCR_EL1.FnE == 1, PMSFCR_EL1.FE == 1, and there exists a value x such that PMSEVFR_EL1.E[x] == 1 and PMSNEVFR_EL1.E[x] == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FL, bit [2]

Filter by latency

FL	Meaning
0b0	Latency filtering disabled
0b1	Latency filtering enabled. Samples with a total latency less than PMSLATFR_EL1.MINLAT will not be recorded

If this field is set to 1 and PMSLATFR_EL1.MINLAT is set to zero, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FL is set to 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FT, bit [1]

Filter by operation type. The filter is the logical OR of the ST, LD and B bits. For example, if LD and ST are both set, both load and store operations are recorded

FT	Meaning
0b0	Type filtering disabled
0b1	Type filtering enabled. Samples not one of the selected operation types will not be recorded

If this field is set to 1 and the PMSFCR_EL1.{ST, LD, B} bits are all set to zero, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FT is set to 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FE, bit [0]

Filter by event.

FE	Meaning
0b0	Event filtering disabled.
0b1	Event filtering enabled. Samples not including the events selected by PMSEVER_EL1 will not be recorded.

If any of the following are true, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FE == 0:

- PMSFCR_EL1.FE == 1 and [PMSEVER_EL1](#) is zero.
- FEAT_SPEv1p2 is implemented, PMSFCR_EL1.FnE == 1, PMSFCR_EL1.FE == 1, and there exists a value x such that [PMSEVER_EL1](#).E[x] == 1 and [PMSNEVER_EL1](#).E[x] == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSFCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSFCR_EL1

PMSICR_EL1, Sampling Interval Counter Register

The PMSICR_EL1 characteristics are:

Purpose

Software must write zero to PMSICR_EL1 before enabling sample profiling for a sampling session. Software must then treat PMSICR_EL1 as an opaque, 64-bit, read/write register used for context switches only.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSICR_EL1 are UNDEFINED.

The value of PMSICR_EL1 does not change whilst profiling is disabled.

Attributes

PMSICR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ECOUNT								RES0																							
COUNT																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECOUNT, bits [63:56]

When PMSIDR_EL1.ERnd == 1:

Secondary sample interval counter.

This field provides the secondary counter used after the primary counter reaches zero. Whilst the secondary counter is nonzero and profiling is enabled, the secondary counter decrements by 1 for each member of the sample population. The primary counter also continues to decrement since it is also nonzero. When the secondary counter reaches zero, a member of the sampling population is selected for sampling.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [55:32]

Reserved, RES0.

COUNT, bits [31:0]

Primary sample interval counter

Provides the primary counter used for sampling.

The primary counter is reloaded when the value of this register is zero and the PE moves from a state or Exception level where profiling is disabled to a state or Exception level where profiling is enabled

Whilst the primary counter is nonzero and sampling is enabled, the primary counter decrements by 1 for each member of the sample population

When the counter reaches zero, the behavior depends on the values of PMSIDR_EL1.ERnd and PMSIRR_EL1.RND

- If [PMSIRR_EL1](#).RND == 0 or PMSIDR_EL1.ERnd == 0:
 - A member of the sampling population is selected for sampling
 - The primary counter is reloaded
- If [PMSIRR_EL1](#).RND == 1 and [PMSIDR_EL1](#).ERnd == 1:
 - The secondary counter is set to a random or pseudorandom value in the range 0x00 to 0xFF
 - The primary counter is reloaded

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSICR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSICR_EL1

Bits [63:25]

Reserved, RES0.

PBT, bit [24]

Previous branch target Address packet. Defined values are:

PBT	Meaning
0b0	Previous branch target Address packet not supported.
0b1	Previous branch target Address packet support implemented.

FEAT_SPEv1p2 adds the OPTIONAL functionality identified by the value 1.

Format, bits [23:20]
From Armv8.7:

Defines the format of the sample records. Defined values are:

Format	Meaning
0b0000	Format 0.

All other values are reserved.

Otherwise:

Reserved, RAZ.

CountSize, bits [19:16]

Defines the size of the counters.

CountSize	Meaning	Applies when
0b0010	12-bit saturating counters.	
0b0011	16-bit saturating counters.	From Armv8.8

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

MaxSize, bits [15:12]

Defines the largest size for a single record, rounded up to a power-of-two. If this is the same as the minimum alignment ([PMBIDR_EL1.Align](#)), then each record is exactly this size. Defined values are:

MaxSize	Meaning
0b0100	16 bytes.
0b0101	32 bytes.
0b0110	64 bytes.
0b0111	128 bytes.
0b1000	256 bytes.
0b1001	512 bytes.
0b1010	1KB.
0b1011	2KB.

All other values are reserved.

The values 0b0100 and 0b0101 are not permitted for an implementation.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Interval, bits [11:8]

Recommended minimum sampling interval. This provides guidance from the implementer to the smallest minimum sampling interval, N. Defined values are:

Interval	Meaning
0b0000	256.
0b0010	512.
0b0011	768.
0b0100	1,024.
0b0101	1,536.
0b0110	2,048.
0b0111	3,072.
0b1000	4,096.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

FDS, bitBit [7]

Filter by data source. Defined values are:

Reserved, RES0.

FDS	Meaning
0b0	PMSDSFR_EL1 is not implemented and PMSFCR_EL1.FDS is RES0.
0b1	PMSDSFR_EL1 and PMSFCR_EL1.FDS are implemented.

[FEAT_SPE_FDS](#) adds the functionality identified by the value 1.

FnE, bit [6]

Filtering by events, inverted. Defined values are:

FnE	Meaning
0b0	PMSNEVER_EL1 is not implemented and PMSFCR_EL1.FnE is RES0.
0b1	PMSNEVER_EL1 and PMSFCR_EL1.FnE are implemented.

[FEAT_SPEv1p2](#) adds the functionality identified by the value 1.

ERnd, bit [5]

Defines how the random number generator is used in determining the interval between samples, when enabled by [PMSIRR_EL1.RND](#). Defined values are:

ERnd	Meaning
0b0	The random number is added at the start of the interval, and the sample is taken and a new interval started when the combined interval expires.
0b1	The random number is added and the new interval started after the interval programmed in PMSIRR_EL1.INTERVAL expires, and the sample is taken when the random interval expires.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

LDS, bit [4]

Data source indicator for sampled load instructions. Defined values are:

LDS	Meaning
0b0	Loaded data source not implemented.
0b1	Loaded data source implemented.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

ArchInst, bit [3]

Architectural instruction profiling. Defined values are:

ArchInst	Meaning
0b0	Micro-op sampling implemented.
0b1	Architecture instruction sampling implemented.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

FL, bit [2]

Filtering by latency. This bit is RAO.

FT, bit [1]

Filtering by operation type. This bit is RAO.

FE, bit [0]

Filtering by events. This bit is RAO.

Accessing PMSIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1001	0b111

```

PMSIRR_EL1, Sampling Interval Reload Register

The PMSIRR_EL1 characteristics are:

Purpose

Defines the interval between samples.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSIRR_EL1 are UNDEFINED.

Attributes

PMSIRR_EL1 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

INTERVAL, bits [31:8]

Bits [31:8] of the PMSICR_EL1 interval counter reload value. Software must set this to a non-zero value. If software sets this to zero, an UNKNOWN sampling interval is used. Software should set this to a value greater than the minimum indicated by PMSIDR_EL1.Interval.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:1]

Reserved, RES0.

RND, bit [0]

Controls randomization of the sampling interval.

RND	Meaning
0b0	Disable randomization of sampling interval.
0b1	Add (pseudo-)random jitter to sampling interval.

The random number generator is not architected.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSIRR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSIRR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1001	0b011

PMSLATFR_EL1, Sampling Latency Filter Register

The PMSLATFR_EL1 characteristics are:

Purpose

Controls sample filtering by latency

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSLATFR_EL1 are UNDEFINED.

Attributes

PMSLATFR_EL1 is a 64-bit register.

Field descriptions

Bits [63:16]

Reserved, RES0.

MINLAT, bits [15:0]

Minimum latency. When [PMSFCR_EL1](#).FL is 1, defines the minimum total latency for filtered operations. Samples with a total latency less than PMSLATFR_EL1.MINLAT are not recorded.

If [PMSIDR_EL1](#).CountSize is 0b0010, PMSLATFR_EL1.MINLAT[15:12] is RES0.

This field is ignored by the PE when [PMSFCR_EL1](#).FL == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSLATFR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSLATFR_EL1

PMSNEVFR_EL1, Sampling Inverted Event Filter Register

The PMSNEVFR_EL1 characteristics are:

Purpose

Controls sample filtering by events. The overall inverted filter is the logical OR of these filters. For example, if PMSNEVFR_EL1.E[3] and PMSNEVFR_EL1.E[5] are both set to 1, samples that have either event 3 (Level 1 unified or data cache refill) or event 5 (TLB walk) set to 1 are not recorded.

Configuration

This register is present only when FEAT_SPEv1p2 is implemented. Otherwise, direct accesses to PMSNEVFR_EL1 are UNDEFINED.

Attributes

PMSNEVFR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49
E[63]	E[62]	E[61]	E[60]	E[59]	E[58]	E[57]	E[56]	E[55]	E[54]	E[53]	E[52]	E[51]	E[50]	E[49]
E[31]	E[30]	E[29]	E[28]	E[27]	E[26]	E[25]	E[24]	E[23]	E[22]	E[21]	E[20]	E[19]	E[18]	E[17]
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17

E[<x>], bit [x], for x = 63 to 48, 31 to 24, 15 to 12

E[<x>] is the event filter for IMPLEMENTATION DEFINED event <x>.

E[<x>]	Meaning
0b0	Event <x> is ignored.
0b1	Do not record samples that have event <x> == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This bit is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When event <x> is not implemented, or filtering on event <x> is not supported, access to this field is **RAZ/WI**.

Bits [47:32]

Reserved, RAZ/WI.

E[23], Bits bit [23:19]**When FEAT_SPEv1p4 is implemented and event 23 is implemented:**

Data not snooped.

E[23]	Meaning
0b0	Data snooped event is ignored.
0b1	Do not record samples that have the Data snooped event == 1.

This bit is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[22], bit [22]**When FEAT_SPEv1p4 is implemented and event 22 is implemented:**

Not recently fetched.

E[22]	Meaning
0b0	Recently fetched event is ignored.
0b1	Do not record samples that have the Recently fetched event == 1.

This bit is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[21], bit [21]**When FEAT_SPEv1p4 is implemented and event 21 is implemented:**

Cache data not modified.

E[21]	Meaning
0b0	Cache data modified event is ignored.
0b1	Do not record samples that have the Cache data modified event == 1.

This bit is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[20], bit [20]**When FEAT_SPEv1p4 is implemented and event 20 is implemented:**

Level 2 data cache hit.

E[20]	Meaning
0b0	Level 2 data cache miss event is ignored.
0b1	Do not record samples that have the Level 2 data cache miss event == 1.

This bit is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[19], bit [19]**When FEAT_SPEv1p4 is implemented and event 19 is implemented:**

No level 2 data cache access.

E[19]	Meaning
0b0	Level 2 data cache access event is ignored.
0b1	Do not record samples that have the Level 2 data cache access event == 1.

This bit is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[18], bit [18]**When FEAT_SVE is implemented and FEAT_SPEv1p1 is implemented:**

Not empty predicate.

E[18]	Meaning
0b0	Empty predicate event is ignored.
0b1	Do not record samples that have the Empty predicate event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]**When FEAT_SVE is implemented and FEAT_SPEv1p1 is implemented:**

Not partial predicate.

E[17]	Meaning
0b0	Partial predicate event is ignored.
0b1	Do not record samples that have the Partial predicate event == 1.

This field is ignored by the PE when [PMSFCR_EL1](#).FnE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[16], bit [16]**When FEAT_TME is implemented:**

Not transactional.

E[16]	Meaning
0b0	Transactional event is ignored.
0b1	Do not record samples that have the Transactional event == 1.

This field is ignored by the PE when [PMSFCR_EL1](#).FnE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[11], bit [11]**When FEAT_SPEv1p1 is implemented:**

Aligned.

E[11]	Meaning
0b0	Misalignment event is ignored.
0b1	Do not record samples that have the Misalignment event == 1.

This field is ignored by the PE when [PMSFCR_EL1](#).FnE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[10], Bits bit [10:8]

When (FEAT_SPEv1p4 is implemented or filtering on event 10 is optionally supported) and event 10 is implemented:

No remote access.

E[10]	Meaning
0b0	Remote access event is ignored.
0b1	Do not record samples that have the Remote access event == 1.

This bit is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[9], bit [9]

When (FEAT_SPEv1p4 is implemented or filtering on event 9 is optionally supported) and event 9 is implemented:

Last Level cache hit.

E[9]	Meaning
0b0	Last Level cache miss event is ignored.
0b1	Do not record samples that have the Last Level cache miss event == 1.

This bit is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[8], bit [8]

When (FEAT_SPEv1p4 is implemented or filtering on event 8 is optionally supported) and event 8 is implemented:

No Last Level cache access.

E[8]	Meaning
0b0	Last Level cache access event is ignored.
0b1	Do not record samples that have the Last Level cache access event == 1.

This bit is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[7], bit [7]

Correctly predicted.

E[7]	Meaning
0b0	Mispredicted event is ignored.
0b1	Do not record samples that have the Mispredicted event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[6], bit [6]

Taken.

E[6]	Meaning
0b0	Not taken event is ignored.
0b1	Do not record samples that have the Not taken event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[5], bit [5]

TLB hit.

E[5]	Meaning
0b0	TLB walk event is ignored.
0b1	Do not record samples that have the TLB walk event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[4], bit [4]**When FEAT_SPEv1p4 is implemented or filtering on event 4 is optionally supported:**

No TLB access.

E[4]	Meaning
0b0	TLB access event is ignored.
0b1	Do not record samples that have the TLB access event == 1.

This bit is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[3], bit [3]

Level 1 data or unified cache hit.

E[3]	Meaning
0b0	Level 1 data or unified cache refill event is ignored.
0b1	Do not record samples that have the Level 1 data or unified cache refill event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[2], bit [2]**When FEAT_SPEv1p4 is implemented or filtering on event 2 is optionally supported:**

No Level 1 data cache access.

E[2]	Meaning
0b0	Level 1 data cache access event is ignored.
0b1	Do not record samples that have the Level 1 data cache access event == 1.

This bit is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[1], bit [1]**When the PE supports sampling of speculative instructions:**

Speculative.

E[1]	Meaning
0b0	Architecturally executed event is ignored.
0b1	Do not record samples that have the Architecturally executed event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bit [0]

Reserved, RAZ/WI.

PMSSCR_EL1, Performance Monitors Snapshot Status and Capture Register

The PMSSCR_EL1 characteristics are:

Purpose

Holds status information about the captured counters and provides a mechanism for software to initiate a sample.

Configuration

AArch64 System register PMSSCR_EL1 bits [63:0] are architecturally mapped to External register [PMU.PMSSCR_EL1\[63:0\]](#).

This register is present only when FEAT_PMUv3_SS is implemented. Otherwise, direct accesses to PMSSCR_EL1 are UNDEFINED.

Attributes

PMSSCR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																NC															
RES0																SS															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:33]

Reserved, RES0.

NC, bit [32]

No Capture. Indicates whether the PMU counters have been captured.

NC	Meaning
0b0	PMU counters captured.
0b1	PMU counters not captured.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Bits [31:1]

Reserved, RES0.

SS, bit [0]

Snapshot Capture and Status.

SS	Meaning
0b0	On a read: The Capture event has completed. On a write: Ignored.
0b1	On a read: The Capture event has not completed. On a write: Initiate a capture immediately.

It is CONSTRAINED UNPREDICTABLE whether a Capture event has completed if this field is modified when the Capture event is ongoing.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMSSCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSSCR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1101	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    X[t, 64] = PMSSCR_EL1;
elsif PSTATE.EL == EL2 then
    X[t, 64] = PMSSCR_EL1;
elsif PSTATE.EL == EL3 then
    X[t, 64] = PMSSCR_EL1;
```

MSR PMSSCR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1101	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    PMSSCR_EL1 = X[t, 64];
elsif PSTATE.EL == EL2 then
    PMSSCR_EL1 = X[t, 64];
elsif PSTATE.EL == EL3 then
    PMSSCR_EL1 = X[t, 64];
```

PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see 'SW_INCR'.

Configuration

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSWINC\[31:0\]](#).

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to External register [PMU.PMSWINC_EL0\[31:0\]](#)[PMSWINC_EL0\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC_EL0 are UNDEFINED.

Attributes

PMSWINC_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:31]

Reserved, RES0.

P<n>, bit [n], for n = 30 to 0

Event counter software increment bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN. Otherwise, N is the value in [PMCR_EL0](#).N.

P<n>	Meaning
0b0	No action. The write to this bit is ignored.
0b1	If PMEVCNTR<n>_EL0 is enabled and configured to count the software increment event, increments PMEVCNTR<n>_EL0 by 1. If PMEVCNTR<n>_EL0 is disabled, or not configured to count the software increment event, the write to this bit is ignored.

Accessing PMSWINC_EL0

PMUACR_EL1, Performance Monitors User Access Control Register

The PMUACR_EL1 characteristics are:

Purpose

Enables or disables EL0 access to specific Performance Monitors.

Configuration

This register is present only when FEAT_PMUv3p9 is implemented. Otherwise, direct accesses to PMUACR_EL1 are UNDEFINED.

Attributes

PMUACR_EL1 is a 64-bit register.

Bits [63:33]

Reserved, RES0.

F<m>, bit [m+32], for m = 0

When FEAT_PMUv3_ICNTR is implemented:

EL0 access to fixed-function counter <m> enable.

F<m>	Meaning
0b0	EL0 access to fixed-function counter <m> disabled when PMUSERENR_EL0 .{UEN,EN} == {1,0}.
0b1	EL0 access to fixed-function counter <m> enabled when PMUSERENR_EL0 .{UEN,EN} == {1,0}.

This bit is ignored by the PE when any of the following are true:

- All of the following are true:
 - EL2 is disabled in the current Security state, EL2 is using AArch32, or [HCR_EL2](#).{E2H,TGE} != {1,1}.
 - EL1 is using AArch32.
- [PMUSERENR_EL0](#).{UEN,EN} != {1,0}.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- Access is **RAZ/WI** if all of the following are true:

- EL2Enabled()
- EL3 is not implemented or SCR_EL3.FGTEn2 == 1
- HDFGRTR2_EL2.nPMICFILTR_ELO == 0
- PSTATE.EL == EL1
- HCR_EL2.E2H != 1
- HCR_EL2.TGE != 1
- Access is **RAZ/WI** if all of the following are true:
 - EL3 is implemented
 - MDCR_EL3.EnPM2 == 0
 - PSTATE.EL IN {EL2, EL1}
- Access is **RO** if all of the following are true:
 - EL2Enabled()
 - EL3 is not implemented or SCR_EL3.FGTEn2 == 1
 - HDFGWTR2_EL2.nPMICFILTR_ELO == 0
 - PSTATE.EL == EL1
 - HCR_EL2.E2H != 1
 - HCR_EL2.TGE != 1
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

C, bit [31]

EL0 access to [PMCCNTR_ELO](#) enable.

C	Meaning
0b0	EL0 access to PMCCNTR_ELO disabled when PMUSERENR_ELO .{UEN,EN} == {1,0}.
0b1	EL0 access to PMCCNTR_ELO enabled when PMUSERENR_ELO .{UEN,EN} == {1,0}.

This field is ignored by the PE when any of the following are true:

- All of the following are true:
 - EL2 is disabled in the current Security state, EL2 is using AArch32, or [HCR_EL2](#).{E2H,TGE} != {1,1}.
 - EL1 is using AArch32.
- [PMUSERENR_ELO](#).{UEN,EN} != {1,0}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<m>, bit [m], for m = 30 to 0

EL0 access to [PMEVCNTR<m>_ELO](#) enable.

P<m>	Meaning
0b0	EL0 access to PMEVCNTR<m>_ELO disabled when PMUSERENR_ELO .{UEN,EN} == {1,0}.
0b1	EL0 access to PMEVCNTR<m>_ELO enabled when PMUSERENR_ELO .{UEN,EN} == {1,0}.

This bit is ignored by the PE when any of the following are true:

- All of the following are true:
 - EL2 is disabled in the current Security state, EL2 is using AArch32, or [HCR_EL2](#).{E2H,TGE} != {1,1}.
 - EL1 is using AArch32.
- [PMUSERENR_ELO](#).{UEN,EN} != {1,0}.

Accessing this bit has the following behavior:

- This bit reads-as-zero and ignores writes if any of the following are true:

- All of the following are true:
 - EL2 is implemented and enabled in the current Security state.
 - $m \geq \text{UInt}(\text{MDCR_EL2.HPMN})$.
 - Accessed at EL1.
- $m \geq \text{UInt}(\text{PMCR_EL0.N})$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMUACR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMUACR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1110	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    X[t, 64] = PMUACR_EL1;
elsif PSTATE.EL == EL2 then
    X[t, 64] = PMUACR_EL1;
elsif PSTATE.EL == EL3 then
    X[t, 64] = PMUACR_EL1;
```

MSR PMUACR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1110	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    PMUACR_EL1 = X[t, 64];
elsif PSTATE.EL == EL2 then
    PMUACR_EL1 = X[t, 64];
elsif PSTATE.EL == EL3 then
    PMUACR_EL1 = X[t, 64];
```

The PMUSERENR EL0 characteristics are:

Purpose

Enables or disables EL0 access to the Performance Monitors.

Configuration

AArch64 System register PMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMUSERENR\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR_EL0 are UNDEFINED.

Attributes

PMUSERENR_EL0 is a 64-bit register.

Field descriptions

Bits [63:74]

Reserved, RES0.

TIDER, bit [63]

When FEAT PMUv3p9 is implemented:

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped accesses are reported using EC syndrome value 0x03.

TrapEventIDcounter registers. Read Traps EL0 read access to common event identification counters registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.

TIDELR	Meaning
0b0	EL0 using AArch32: EL0 reads of the PMXVCNTR and PMEVCNTR<n> , and EL0 read/write accesses to the PMSELR , are trapped if PMUSERENR_EL0.EN is also 0. Accesses EL0 to using PMCEID<n>_EL0 AArch64: and EL0 PMCEID<n> reads are of not trapped by this mechanism. the PMXVCNTR_EL0 and PMEVCNTR<n>_EL0 , and EL0 read/write accesses to the PMSELR_EL0 , are trapped if PMUSERENR_EL0.EN is also 0.
0b1	<ul style="list-style-type: none"> RO access to PMXVCNTR_EL0 and PMEVCNTR<n>_EL0 at EL0. RW access to PMSELR_EL0 at EL0. RW access to PMSELR at EL0. EL0 Overrides read PMUSERENR_EL0.EN accesses to PMCEID<n>_EL0 and PMCEID<n> are trapped. enables:

In AArch64 state, the register accesses affected by this control are:

- MRS reads of [PMCEID0_EL0](#) and [PMCEID1_EL0](#).

In AArch32 state, the register accesses affected by this control are:

- MRC reads of [PMCEID0](#), [PMCEID1](#), [PMCEID2](#), and [PMCEID3](#).

When trapped, reads generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, and:

- AArch64 MRS reads are reported using EC syndrome value 0x18.
- AArch32 MRC reads are reported using EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

CR, bit [2]

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped MRC accesses are reported using EC syndrome value 0x03, trapped MRRC accesses are reported using EC syndrome value 0x04.

CR	Meaning
0b0	EL0 using AArch64: EL0 read accesses to the PMCCNTR_EL0 are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 read accesses to the PMCCNTR are trapped if PMUSERENR_EL0.EN is also 0.
0b1	Overrides PMUSERENR_EL0.EN and enables access to: <ul style="list-style-type: none"> PMCCNTR_EL0 at EL0. PMCCNTR at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Reserved, RES0.

Cycle counter Read. Traps EL0 access to cycle counter reads to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1.

IRSW, bit [51]

When FEAT_PMuV3_ICNTR is implemented:

Instruction Traps counter Software Read Increment enable. writes to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1.

When PMUSERENR_EL0.UEN is 0, PMUSERENR_EL0.IR enables EL0 reads of the instruction counter.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

When PMUSERENR_EL0.UEN is 1, EL0 reads of the instruction counter and EL0 writes to PMZR_EL0 are enabled by PMUSERENR_EL0.UEN, unless trapped by another control, and PMUSERENR_EL0.IR controls the behavior of EL0 writes to the instruction counter and PMZR_EL0.

In AArch32 state, trapped accesses are reported using EC syndrome value 0x03.

IRSW	Meaning
0b0	When EL0 PMUSERENR_EL0.UEN using == 0 AArch64: EL0 reads/writes to the instruction counter are disabled. PMSWINC_EL0 are trapped if PMUSERENR_EL0.EN is also 0. When EL0 PMUSERENR_EL0.UEN using == 1 AArch32: Permitted EL0 writes are to not affected by this mechanism. the PMSWINC are trapped if PMUSERENR_EL0.EN is also 0.
0b1	When Overrides PMUSERENR_EL0.UEN PMUSERENR_EL0.EN == and 0: enables EL0 access reads of the instruction counter are enabled, unless trapped by another control. to: <ul style="list-style-type: none"> PMSWINC_EL0 at EL0. PMSWINC at EL0. When PMUSERENR_EL0.UEN == 1: Permitted EL0 writes to the instruction counter and PMZR_EL0.F0 are ignored.

In AArch64 state, the register accesses affected by this control are:

- When PMUSERENR_EL0.UEN is 0, MRS reads of PMICNTR_EL0.
- When PMUSERENR_EL0.UEN is 1, MSR writes to PMZR_EL0 and PMICNTR_EL0.

When disabled, reads generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, reported using EC syndrome value 0x18.

Ignored writes are not trapped and do not generate an exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEN, bit [4]

When FEAT_PMUv3p9 is implemented:

User Enable, with access controlled by PMUACR_EL1. Enables EL0 read/write access to PMU registers, other than PMCR_EL0. Software can restrict permitted accesses using PMUSERENR_EL0.{IR,ER,CR} and PMUACR_EL1.

UEN	Meaning
0b0	EL0 accesses to PMU registers are trapped, unless enabled by PMUSERENR_EL0.{IR,ER,CR,EN}.
0b1	EL0 accesses to PMU registers are enabled, unless trapped by another control. A permitted access might be restricted by PMUSERENR_EL0.{IR,ER,CR} and PMUACR_EL1.

In AArch64 state, the register accesses affected by this control are:

- MRS or MSR accesses to the following registers:
 - PMCCFILTR_EL0, PMCCNTR_EL0, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMOVSLR_EL0, PMOVSSSET_EL0, PMSELR_EL0, PMXEVCNTR_EL0, and PMXEVTYPER_EL0.
 - If FEAT_PMUv3 ICNTR is implemented, PMICFILTR_EL0 and PMICNTR_EL0.
- MRS reads of PMCEID0_EL0 and PMCEID1_EL0.

- MSR writes to [PMSWINC_EL0](#) and [PMZR_EL0](#).

In AArch32 state, the register accesses affected by this control are:

- MRC or MCR accesses to [PMCCFILTER](#), [PMCCNTR](#), [PMCNTENCLR](#), [PMCNTENSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMOVSr](#), [PMOVSSET](#), [PMSELR](#), [PMXEVCNTR](#), and [PMXEVTYPER](#).
- MRC reads of [PMCEID0](#), [PMCEID1](#), [PMCEID2](#), and [PMCEID3](#).
- MCR writes to [PMSWINC](#).
- MRRC or MCRR accesses to [PMCCNTR](#).

When trapped, reads and writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, and:

- AArch64 MRS and MSR accesses are reported using EC syndrome value 0x18.
- AArch32 MRC and MCR accesses are reported using EC syndrome value 0x03.
- AArch32 MRRC and MCRR accesses are reported using EC syndrome value 0x04.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ER, bit [3]

When FEAT_PMuV3p9 is implemented:

Event counters Read enable.

When [PMUSERENR_EL0.UEN,EN](#) is {0,0}, [PMUSERENR_EL0.ER](#) enables EL0 reads of the event counters and EL0 reads and writes of the select register.

When [PMUSERENR_EL0.UEN,EN](#) is {1,0}, EL0 reads of the event counters and EL0 writes to [PMZR_EL0](#) are enabled by [PMUSERENR_EL0.UEN](#), unless trapped by another control, and [PMUSERENR_EL0.ER](#) controls the behavior of EL0 writes to the event counters and [PMZR_EL0](#).

ER	Meaning
0b0	When PMUSERENR_EL0.UEN == 0: EL0 reads of the event counters and EL0 reads and writes of the select register are disabled, unless enabled by PMUSERENR_EL0.EN . When PMUSERENR_EL0.UEN == 1: Permitted EL0 writes are not affected by this mechanism.
0b1	When PMUSERENR_EL0.UEN == 0: EL0 reads of the event counters and EL0 reads and writes of the select register are enabled, unless trapped by another control. When PMUSERENR_EL0.UEN == 1: Permitted EL0 writes to the event counters and PMZR_EL0.P[30:0] are ignored, unless enabled by PMUSERENR_EL0.EN .

In AArch64 state, the register accesses affected by this control are:

- When [PMUSERENR_EL0.UEN,EN](#) is {0,0}:
 - MRS reads of [PMEVCNTR<n>_EL0](#) and [PMXEVCNTR_EL0](#).
 - MRS and MSR accesses to [PMSELR_EL0](#).
- When [PMUSERENR_EL0.UEN,EN](#) is {1,0}, MSR writes to [PMZR_EL0](#), [PMEVCNTR<n>_EL0](#) and [PMXEVCNTR_EL0](#).

In AArch32 state, the register accesses affected by this control are:

- When [PMUSERENR_EL0.UEN,EN](#) is {0,0}:
 - MRC reads of [PMEVCNTR<n>](#) and [PMXEVCNTR](#).
 - MRC and MCR accesses to [PMSELR](#).
- When [PMUSERENR_EL0.UEN,EN](#) is {1,0}, MCR writes to [PMEVCNTR<n>](#) and [PMXEVCNTR](#).

When disabled, reads and writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, and:

- AArch64 MRS and MSR accesses are reported using EC syndrome value 0x18.
- AArch32 MRC and MCR accesses are reported using EC syndrome value 0x03.

Ignored writes are not trapped and do not generate an exception.

This field is ignored by the PE when `PMUSERENR_EL0.EN == 1`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Event counters Read enable.

When `PMUSERENR_EL0.EN` is 0, `PMUSERENR_EL0.ER` enables EL0 reads of the event counters and EL0 reads and writes of the select register.

ER	Meaning
0b0	EL0 reads of the event counters and EL0 reads and writes of the select register are disabled, unless enabled by <code>PMUSERENR_EL0.EN</code> .
0b1	EL0 reads of the event counters and EL0 reads and writes of the select register are enabled, unless trapped by another control.

In AArch64 state, the register accesses affected by this control are:

- MRS reads of `PMEVCNTR<n>_EL0` and `PMXVCNTR_EL0`.
- MRS and MSR accesses to `PMSELR_EL0`.

In AArch32 state, the register accesses affected by this control are:

- MRC reads of `PMEVCNTR<n>` and `PMXVCNTR`.
- MRC and MCR accesses to `PMSELR`.

When disabled, reads and writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and `HCR_EL2.TGE` is 1, and:

- AArch64 MRS and MSR accesses are reported using EC syndrome value 0x18.
- AArch32 MRC and MCR accesses are reported using EC syndrome value 0x03.

This field is ignored by the PE when `PMUSERENR_EL0.EN == 1`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CR, bit [2]

When FEAT_PMuV3p9 is implemented:

Cycle counter Read enable.

When `PMUSERENR_EL0.{UEN,EN}` is {0,0}, `PMUSERENR_EL0.CR` enables EL0 reads of the cycle counter.

When `PMUSERENR_EL0.{UEN,EN}` is {1,0}, EL0 reads of the cycle counter and EL0 writes to `PMZR_EL0` are enabled by `PMUSERENR_EL0.UEN`, unless trapped by another control, and `PMUSERENR_EL0.CR` controls the behavior of EL0 writes to the cycle counter and `PMZR_EL0`.

CR	Meaning
0b0	When PMUSERENR_EL0.UEN == 0: EL0 reads of the cycle counter are disabled, unless enabled by PMUSERENR_EL0.EN. When PMUSERENR_EL0.UEN == 1: Permitted EL0 writes are not affected by this mechanism.
0b1	When PMUSERENR_EL0.UEN == 0: EL0 reads of the cycle counter are enabled, unless trapped by another control. When PMUSERENR_EL0.UEN == 1: Permitted EL0 writes to the cycle counter and PMZR_EL0.C are ignored, unless enabled by PMUSERENR_EL0.EN.

In AArch64 state, the register accesses affected by this control are:

- When PMUSERENR_EL0.{UEN,EN} is {0,0}, MRS reads of PMCCNTR_EL0.
- When PMUSERENR_EL0.{UEN,EN} is {1,0}, MSR writes to PMZR_EL0 and PMCCNTR_EL0.

In AArch32 state, the register accesses affected by this control are:

- When PMUSERENR_EL0.{UEN,EN} is {0,0}:
 - MRC reads of PMCCNTR.
 - MRRC reads of PMCCNTR.
- When PMUSERENR_EL0.{UEN,EN} is {1,0}:
 - MCR writes to PMCCNTR.
 - MCRR writes to PMCCNTR.

When disabled, reads generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MRS reads are reported using EC syndrome value 0x18.
- AArch32 MRC reads are reported using EC syndrome value 0x03.
- AArch32 MRRC reads are reported using EC syndrome value 0x04.

Ignored writes are not trapped and do not generate an exception.

This field is ignored by the PE when PMUSERENR_EL0.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Cycle counter Read enable.

When PMUSERENR_EL0.EN is 0, PMUSERENR_EL0.CR enables EL0 reads of the cycle counter.

CR	Meaning
0b0	EL0 reads of the cycle counter are disabled, unless enabled by PMUSERENR_EL0.EN.
0b1	EL0 reads of the cycle counter are enabled, unless trapped by another control.

In AArch64 state, the register accesses affected by this control are:

- MRS reads of PMCCNTR_EL0.

In AArch32 state, the register accesses affected by this control are:

- MRC reads of PMCCNTR.
- MRRC reads of PMCCNTR.

When disabled, reads generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MRS reads are reported using EC syndrome value 0x18.
- AArch32 MRC reads are reported using EC syndrome value 0x03.
- AArch32 MRRC reads are reported using EC syndrome value 0x04.

This field is ignored by the PE when PMUSERENR_EL0.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SW, bit [1]

When FEAT_PMuV3p9 is implemented:

Software increment register Write enable.

When PMUSERENR_EL0.UEN is 0, PMUSERENR_EL0.SW enables EL0 writes to the Software increment register.

When PMUSERENR_EL0.UEN is 1, EL0 writes to the Software increment register are enabled by PMUSERENR_EL0.UEN, unless trapped by another control, and PMUSERENR_EL0.SW controls the behavior of EL0 writes to the Software increment register.

SW	Meaning
0b0	When PMUSERENR_EL0.UEN == 0: EL0 writes to the Software increment register are disabled, unless enabled by PMUSERENR_EL0.EN. When PMUSERENR_EL0.UEN == 1: Permitted EL0 writes are not affected by this mechanism.
0b1	When PMUSERENR_EL0.UEN == 0: EL0 writes to the Software increment register are enabled, unless trapped by another control. When PMUSERENR_EL0.UEN == 1: Permitted EL0 writes to the Software increment register ignore the value of PMUACR_EL1.

In AArch64 state, the register accesses affected by this control are:

- MSR writes to PMSWINC_EL0.

In AArch32 state, the register accesses affected by this control are:

- MCR writes to PMSWINC.

When disabled, writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MSR writes are reported using EC syndrome value 0x18.
- AArch32 MCR writes are reported using EC syndrome value 0x03.

This field is ignored by the PE when PMUSERENR_EL0.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Software increment register Write enable.

When PMUSERENR_EL0.EN is 0, PMUSERENR_EL0.SW enables EL0 writes to the Software increment register.

SW	Meaning
0b0	EL0 writes to the Software increment register are disabled, unless enabled by PMUSERENR_EL0.EN.
0b1	EL0 writes to the Software increment register are enabled, unless trapped by another control.

In AArch64 state, the register accesses affected by this control are:

- MSR writes to PMSWINC_EL0.

In AArch32 state, the register accesses affected by this control are:

- MCR writes to PMSWINC.

When disabled, writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, and:

- AArch64 MSR writes are reported using EC syndrome value 0x18.
- AArch32 MCR writes are reported using EC syndrome value 0x03.

This field is ignored by the PE when `PMUSERENR_EL0.EN == 1`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

- In AArch64 state, MRS or MSR accesses to the following registers are reported using EC syndrome value 0x18:
 - [PMCR_EL0](#), [PMOVSCLR_EL0](#), [PMSELR_EL0](#), [PMCEID0_EL0](#), [PMCEID1_EL0](#), [PMCCNTR_EL0](#), [PMXEVTYPER_EL0](#), [PMXVCNTR_EL0](#), [PMCNTENSET_EL0](#), [PMCNTENCLR_EL0](#), [PMOVSSET_EL0](#), [PMEVCNTR<n>_EL0](#), [PMEVTYPER<n>_EL0](#), [PMCCFILTR_EL0](#), [PMSWINC_EL0](#).
 - If FEAT_PMUv3p4 is implemented, [PMMIR_EL1](#).
- In AArch32 state, MRC or MCR accesses to the following registers are reported using EC syndrome value 0x03:
 - [PMCR](#), [PMOVS](#), [PMSEL](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXVCNTR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVSSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#), [PMSWINC](#).
 - If FEAT_PMUv3p4 is implemented, [PMMIR](#).
 - If FEAT_PMUv3p1 is implemented, in AArch32 state, [PMCEID2](#), and [PMCEID3](#).
- In AArch32 state, MRRC or MCRR accesses to [PMCCNTR](#) are reported using EC syndrome value 0x04.

Enable. Traps Enables EL0 read/write accesses access to PMU the Performance Monitor registers to EL1, other or than to EL2 when it is implemented and enabled for the instruction current counter. Security state and [HCR_EL2.TGE](#) is 1, from both Execution states as follows:

EN	Meaning
0b0	While at EL0, accesses to PMU the specified registers at EL0 are trapped, unless enabled overridden by one of <code>PMUSERENR_EL0.{UEN, ER, CR, SW}</code> .
0b1	EL0 While accesses at to EL0, PMU software registers can are access enabled, all unless of trapped the by specified another control registers.

In AArch64 state, the register accesses affected by this control are:

- MRS or MSR accesses to [PMCCFILTR_EL0](#), [PMCCNTR_EL0](#), [PMCNTENCLR_EL0](#), [PMCNTENSET_EL0](#), [PMCR_EL0](#), [PMEVCNTR<n>_EL0](#), [PMEVTYPER<n>_EL0](#), [PMOVSCLR_EL0](#), [PMOVSSET_EL0](#), [PMSELR_EL0](#), [PMXVCNTR_EL0](#), and [PMXEVTYPER_EL0](#).
- MRS reads of [PMCEID0_EL0](#) and [PMCEID1_EL0](#).
- MSR writes to the following registers:
 - [PMSWINC_EL0](#).
 - If FEAT_PMUv3p9 is implemented, [PMZR_EL0](#).

Note

When FEAT_PMUv3_ICNTR is implemented, this field does not affect MRS and MSR accesses to [PMICNTR_EL0](#) and [PMICFILTR_EL0](#).

In AArch32 state, the register accesses affected by this control are:

- MRC or MCR accesses to [PMCCFILTR](#), [PMCCNTR](#), [PMCNTENCLR](#), [PMCNTENSET](#), [PMCR](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMOVS](#), [PMOVSSET](#), [PMSEL](#), [PMXVCNTR](#), and [PMXEVTYPER](#).
- MRC reads of the following registers:

- [PMCEID0](#) and [PMCEID1](#).
- If FEAT_PMUv3p1 is implemented, [PMCEID2](#) and [PMCEID3](#).
- MCR writes to [PMSWINC](#).
- MRRC or MCRR accesses to [PMCCNTR](#).

When trapped, reads and writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, and:

- AArch64 MRS and MSR accesses are reported using EC syndrome value 0x18.
- AArch32 MRC and MCR accesses are reported using EC syndrome value 0x03.
- AArch32 MRRC and MCRR accesses are reported using EC syndrome value 0x04.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMUSERENR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMUSERENR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1110	0b000

```

if PSTATE.EL == EL0 then

PMXEVCNTR_EL0, Performance Monitors Selected Event Count Register

The PMXEVCNTR_EL0 characteristics are:

Purpose

Reads or writes the value of the selected event counter, [PMEVCNTR<n>_EL0](#). [PMSELR_EL0](#).SEL determines which event counter is selected.

Configuration

AArch64 System register PMXEVCNTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVCNTR\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR_EL0 are UNDEFINED.

Attributes

PMXEVCNTR_EL0 is a 64-bit register.

Field descriptions

When FEAT_PMUv3p5 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
PMEVCNTR<n>																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PMEVCNTR<n>																															

PMEVCNTR<n>, bits [63:0]

Value of the selected event counter, [PMEVCNTR<n>_EL0](#), where n is the value stored in [PMSELR_EL0](#).SEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
PMEVCNTR<n>																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, [PMEVCNTR<n>_EL0](#), where n is the value stored in [PMSELR_EL0](#).SEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVCNTR_EL0

If FEAT_FGT is implemented and [PMSELR_EL0.SEL](#) is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMXEVCNTR_EL0](#) is as follows:

- If [PMSELR_EL0.SEL](#) selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and [PMSELR_EL0.SEL](#) is greater than or equal to the number of accessible event counters, then reads and writes of [PMXEVCNTR_EL0](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if [PMSELR_EL0.SEL](#) has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and [PMSELR_EL0.SEL](#) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR_EL0](#).{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR_EL2](#).HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [MDCR_EL2](#).HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMXEVCNTR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1101	0b010

PMXEVTYPER_ELO, Performance Monitors Selected Event Type Register

The PMXEVTYPER_ELO characteristics are:

Purpose

When [PMSELR_ELO](#).SEL selects an event counter, this accesses a [PMEVTYPER<n>_ELO](#) register. When [PMSELR_ELO](#).SEL selects the cycle counter, this accesses [PMCCFILTR_ELO](#).

Configuration

AArch64 System register PMXEVTYPER_ELO bits [31:0] are architecturally mapped to AArch32 System register [PMXEVTYPER\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER_ELO are UNDEFINED.

Attributes

PMXEVTYPER_ELO is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Event type register or PMCCFILTR_ELO																															
Event type register or PMCCFILTR_ELO																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

When [PMSELR_ELO](#).SEL == 31, this register accesses [PMCCFILTR_ELO](#).

Otherwise, this register accesses [PMEVTYPER<n>_ELO](#) where n is the value in [PMSELR_ELO](#).SEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVTYPER_ELO

If FEAT_FGT is implemented, and [PMSELR_ELO](#).SEL is not 31 and is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMXEVTYPER_ELO](#) is as follows:

- If [PMSELR_ELO](#).SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented, and [PMSELR_ELO](#).SEL is not 31 and is greater than or equal to the number of accessible event counters, then reads and writes of [PMXEVTYPER_ELO](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if [PMSELR_ELO](#).SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.

- Accesses to the register behave as if [PMSELR_EL0.SEL](#) is 31.
- If EL2 is implemented and enabled in the current Security state, [PMSELR_EL0](#) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR_EL0.EN](#).

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR_EL2.HPMN](#) identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [MDCR_EL2.HPMN](#).

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMXEVTYPER_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1101	0b001

```

PMZR_EL0, Performance Monitors Zero with Mask

The PMZR_EL0 characteristics are:

Purpose

Zero the set of counters specified by the mask written to PMZR_EL0.

Configuration

This register is present only when FEAT_PMUv3p9 is implemented. Otherwise, direct accesses to PMZR_EL0 are UNDEFINED.

Attributes

PMZR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:33]

Reserved, RES0.

F<m>, bit [m+32], for m = 0
When FEAT_PMUv3_ICNTR is implemented:

Zero fixed-function instruction counter.

F<m>	Meaning
0b0	Do not set fixed-function counter <m> to zero.
0b1	Set fixed-function counter <m> to zero.

Writing 1 to PMZR_EL0.F[0] zeros the instruction counter, [PMICNTR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

C, bit [31]

Zero [PMCCNTR_EL0](#).

C	Meaning
0b0	Do not set Cycle counter to zero.
0b1	Set Cycle counter to zero.

Access to this field is **W1C**.

P<m>, bit [m], for m = 30 to 0

Zero [PMEVCNTR<n>_EL0](#).

P<m>	Meaning
0b0	Do not set Event counter <m> to zero.
0b1	Set Event counter <m> to zero.

Access to this field is **W1C**.

Accessing PMZR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MSR PMZR_EL0, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1101	0b100

```

POR_EL0, Permission Overlay Register 0 (EL0)

The POR_EL0 characteristics are:

Purpose

Stage 1 Permission Overlay Register for unprivileged access of EL1&0 or EL2&0 translation regime.

Configuration

This register is present only when FEAT_S1POE is implemented. Otherwise, direct accesses to POR_EL0 are UNDEFINED.

Attributes

POR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Perm15	Perm14	Perm13	Perm12	Perm11	Perm10	Perm9	Perm8	Perm7	Perm6	Perm5	Perm4	Perm3	Perm2	Perm1	Perm0																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Perm<m>, bits [4m+3:4m], for m = 15 to 0

Perm Represents Stage 1 Overlay Permissions.

Perm<m>	Meaning
0b0000	No access.
0b0001	Read.
0b0010	Execute.
0b0011	Read, Execute.
0b0100	Write.
0b0101	Write, Read.
0b0110	Write, Execute.
0b0111	Read, Write, Execute.
0b1xxx	Reserved - treated as No access

When VMSAv9-128 is not in use, fields Perm[8] to Perm[15] are not used.

This field is not permitted to be cached in a TLB.

When Stage 1 Overlay mechanism is disabled, contents of this register is ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing POR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, POR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1010	0b0010	0b100

POR_EL1, Permission Overlay Register 1 (EL1)

The POR_EL1 characteristics are:

Purpose

Stage 1 Permission Overlay Register for privileged access of the EL1&0 translation regime.

Configuration

This register is present only when FEAT_S1POE is implemented. Otherwise, direct accesses to POR_EL1 are UNDEFINED.

Attributes

POR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Perm15	Perm14	Perm13	Perm12	Perm11	Perm10	Perm9	Perm8	Perm7	Perm6	Perm5	Perm4	Perm3	Perm2	Perm1	Perm0

Perm<m>, bits [4m+3:4m], for m = 15 to 0

Perm Represents Stage 1 Overlay Permissions.

Perm<m>	Meaning
0b0000	No access.
0b0001	Read.
0b0010	Execute.
0b0011	Read, Execute.
0b0100	Write.
0b0101	Write, Read.
0b0110	Write, Execute.
0b0111	Read, Write, Execute.
0b1xxx	Reserved - treated as No access

When VMSAv9-128 is not in use, fields Perm[8] to Perm[15] are not used.

This field is not permitted to be cached in a TLB.

When Stage 1 Overlay mechanism is disabled, this register is ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing POR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, POR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0010	0b100

Perm<m>, bits [4m+3:4m], for m = 15 to 0

Perm Represents Stage 1 Overlay Permissions.

Perm<m>	Meaning
0b0000	No access.
0b0001	Read.
0b0010	Execute.
0b0011	Read, Execute.
0b0100	Write.
0b0101	Write, Read.
0b0110	Write, Execute.
0b0111	Read, Write, Execute.
0b1xxx	Reserved - treated as No access

When VMSAv9-128 is not in use, fields Perm[8] to Perm[15] are not used.

This field is not permitted to be cached in a TLB.

When Stage 1 Overlay mechanism is disabled, this register is ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing POR_EL2

When FEAT_VHE is implemented, and [HCR_EL2.E2H](#) is 1, without explicit synchronization, accesses from EL2 using the register name POR_EL2 or [POR_EL1](#) are not guaranteed to be ordered with respect to accesses using the other register name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, POR_EL2

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Perm<m>, bits [4m+3:4m], for m = 15 to 0

Perm Represents Stage 1 Overlay Permissions.

Perm<m>	Meaning
0b0000	No access.
0b0001	Read.
0b0010	Execute.
0b0011	Read, Execute.
0b0100	Write.
0b0101	Write, Read.
0b0110	Write, Execute.
0b0111	Read, Write, Execute.
0b1xxx	Reserved - treated as No access

When VMSAv9-128 is not in use, fields Perm[8] to Perm[15] are not used.

This field is not permitted to be cached in a TLB.

When Stage 1 Overlay mechanism is disabled, this register is ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing POR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, POR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = POR_EL3;

```

MSR POR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    POR_EL3 = X[t, 64];

```

RCWMASK_EL1, Read Check Write Instruction Mask (EL1)

The RCWMASK_EL1 characteristics are:

Purpose

Contains the mask used by RCW instructions.

Configuration

This register is present only when FEAT_THE is implemented. Otherwise, direct accesses to RCWMASK_EL1 are UNDEFINED.

RCWMASK_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

Attributes

RCWMASK_EL1 is a:

- 128-bit register when FEAT_D128 is implemented
- 64-bit register otherwise

Field descriptions

When FEAT_D128 is implemented:

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98

	Mask[25:16]																												

Mask, bits [127, 124:121, 118:115, 113, 111:109, 100:91, 16:1]

Mask used to decide which bit-fields are writable to the 128-bit Descriptor by RCW or RCWS Instructions.

The Mask field is split as follows:

- Mask[38] is RCWMASK_EL1[127].
- Mask[37:34] is RCWMASK_EL1[124:121].
- Mask[33:30] is RCWMASK_EL1[118:115].
- Mask[29] is RCWMASK_EL1[113].
- Mask[28:26] is RCWMASK_EL1[111:109].
- Mask[25:16] is RCWMASK_EL1[100:91].
- Mask[15:0] is RCWMASK_EL1[16:1].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

REVIDR_EL1, Revision ID Register

The REVIDR_EL1 characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configuration

AArch64 System register REVIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [REVIDR\[31:0\]](#).

If REVIDR_EL1 has the same value as [MIDR_EL1](#), then its contents have no significance.

Attributes

REVIDR_EL1 is a 64-bit register.

Field descriptions

RGSR_EL1, Random Allocation Tag Seed Register.

The RGSR_EL1 characteristics are:

Purpose

Random Allocation Tag Seed Register.

Configuration

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to RGSR_EL1 are UNDEFINED.

When [GCR_EL1.RRND](#)==0b1, updates to RGSR_EL1 are implementation-specific.

When [GCR_EL1.RRND](#)==0b0, direct and indirect reads and writes to the register appear to occur in program order relative to other instructions, without the need for any explicit synchronization.

Attributes

RGSR_EL1 is a 64-bit register.

Field descriptions

When GCR_EL1.RRND == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
RES0								SEED														RES0				TAG					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:24]

Reserved, RES0.

SEED, bits [23:8]

Seed register used for generating values returned by RandomAllocationTag().

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

TAG, bits [3:0]

Tag generated by the most recent IRG instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Bits [63:56]

Reserved, RES0.

SEED, bits [55:8]

IMPLEMENTATION DEFINED.

Note

Software is recommended to avoid writing SEED[15:0] with a value of zero, unless this has been generated by the PE in response to an earlier value with SEED being nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

TAG, bits [3:0]

Tag generated by the most recent IRG instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RGSR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RGSR_EL1

SYS S1_<op1>_<Cn>_<Cm>_<op2>, SYSL S1_<op1>_<Cn>_<Cm>_<op2>, SYSP S1_<op1>_<Cn>_<Cm>_<op2>, IMPLEMENTATION DEFINED maintenance instructions

The SYS S1_<op1>_<Cn>_<Cm>_<op2>, SYSL S1_<op1>_<Cn>_<Cm>_<op2>, SYSP S1_<op1>_<Cn>_<Cm>_<op2> characteristics are:

Purpose

This area of the System instruction encoding space is reserved for IMPLEMENTATION DEFINED System instructions.

Configuration

There are no configuration notes.

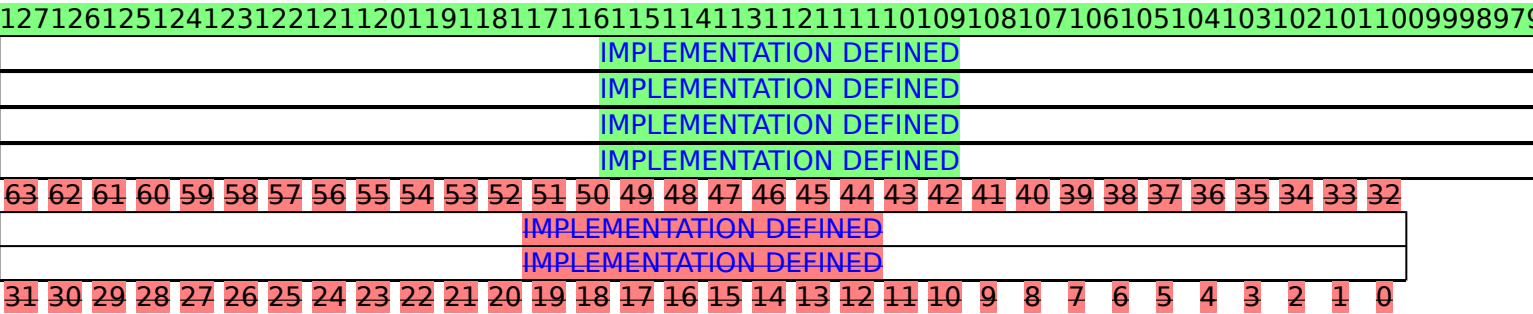

Attributes

SYS S1_<op1>_<Cn>_<Cm>_<op2>, SYSL S1_<op1>_<Cn>_<Cm>_<op2>, SYSP S1_<op1>_<Cn>_<Cm>_<op2> is a: 64-bit System instruction.

- 128-bit System instruction when FEAT_SYSINSTR128 is implemented
- 64-bit System instruction otherwise

Field descriptions

When FEAT_SYSINSTR128 is implemented:

IMPLEMENTATION DEFINED, bits [127:0]

IMPLEMENTATION DEFINED.

Otherwise:

SYS S1_<op1>_<Cn>_<Cm>_<op2>, SYSL S1_<op1>_<Cn>_<Cm>_<op2>, SYSP S1_<op1>_<Cn>_<Cm>_<op2>, IMPLEMENTATION DEFINED maintenance instructions

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Executing the SYS S1_<op1>_<Cn>_<Cm>_<op2>, SYSL S1_<op1>_<Cn>_<Cm>_<op2>, SYSP S1_<op1>_<Cn>_<Cm>_<op2> instruction

S2PIR_EL2, Stage 2 Permission Indirection Register (EL2)

The S2PIR_EL2 characteristics are:

Purpose

Stage 2 Permission Indirection Register for EL1&0 translation regime.

Configuration

This register is present only when FEAT_S2PIE is implemented. Otherwise, direct accesses to S2PIR_EL2 are UNDEFINED.

Attributes

S2PIR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

S3_<op1>_<Cn>_<Cm>_<op2>, IMPLEMENTATION DEFINED registers

The S3_<op1>_<Cn>_<Cm>_<op2> characteristics are:

Purpose

This area of the instruction set space is reserved for IMPLEMENTATION DEFINED registers.

Configuration

Each register in this configuration space is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

Attributes

- S3_<op1>_<Cn>_<Cm>_<op2> is a:
- 128-bit register when FEAT_SYSREG128 is implemented
 - 64-bit register otherwise

Field descriptions

When FEAT_SYSREG128 is implemented:

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97

SCR_EL3, Secure Configuration Register

The SCR_EL3 characteristics are:

Purpose

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is Secure, Non-secure, or Realm.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, SError interrupts, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCR_EL3 are UNDEFINED.

Attributes

SCR_EL3 is a 64-bit register.

Field descriptions

Bit [63]

Reserved, RES0.

NSE, bit [62] When FEAT_RME is implemented:

This field, evaluated with SCR_EL3.NS, selects the Security state of EL2 and lower Exception levels.

For a description of the values derived by evaluating NS and NSE together, see SCR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [61:6049]

Reserved, RES0.

FGTEn2, bit [59]**When FEAT_FGT2 is implemented:**

Fine-Grained Traps Enable 2.

When EL2 is implemented, enables the traps to EL2 controlled by [HDFGRTR2_EL2](#), [HDFGWTR2_EL2](#), [HFGITR2_EL2](#), [HFGRTR2_EL2](#), and [HFGWTR2_EL2](#), and controls access to those registers.

FGTEn2	Meaning
0b0	EL2 accesses to the specified registers are trapped to EL3. The values in these registers are treated as 0.
0b1	EL2 accesses to the specified registers are not trapped to EL3 by this mechanism.

Traps caused by accesses to the fine-grained trap registers are reported using an [ESR_ELx](#).EC value of 0x18 and its associated ISS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [58:56]

Reserved, RES0.

EnIDCP128, bit [55]**When FEAT_SYSREG128 is implemented:**

Enables access to IMPLEMENTATION DEFINED 128-bit System registers.

EnIDCP128	Meaning
0b0	Accesses at EL2, EL1, EL0 to IMPLEMENTATION DEFINED 128-bit System registers are trapped to EL3 using an ESR_EL3 .EC value of 0x14, unless the access generates a higher priority exception. Disables the functionality of the 128-bit IMPLEMENTATION DEFINED System registers that are accessible at EL3.
0b1	No accesses are trapped by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [54]

Reserved, RES0.

PFAREn, bit [53]**When FEAT_PFAR is implemented:**

Enable access to Physical Fault Address Registers. When disabled, accesses to Physical Fault Address Registers generate a trap to EL3.

PFAREn	Meaning
0b0	The following instructions at EL2 and EL1 are trapped to EL3: AArch64: MRS and MSR accesses to PFAR_EL1 , PFAR_EL2 , and PFAR_EL12 , reported with EC syndrome value 0x18.
0b1	Accesses of Physical Fault Address Registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWERR, bit [52]**When FEAT_RASv2 is implemented:**

Trap writes of error record registers. Enables a trap to EL3 on writes of error record registers.

TWERR	Meaning
0b0	Writes of error record registers are not trapped by this mechanism.
0b1	The following instructions at EL2 and EL1 are trapped to EL3: AArch64: MSR accesses to ERRSELR_EL1 , ERXADDR_EL1 , ERXCTLR_EL1 , ERXMISC0_EL1 , ERXMISC1_EL1 , ERXMISC2_EL1 , ERXMISC3_EL1 , and ERXSTATUS_EL1 , reported with EC syndrome value 0x18. AArch32: MCR accesses to ERRSELR , ERXADDR , ERXADDR2 , ERXCTLR , ERXCTLR2 , ERXMISC0 , ERXMISC1 , ERXMISC2 , ERXMISC3 , ERXMISC4 , ERXMISC5 , ERXMISC6 , ERXMISC7 , and ERXSTATUS , reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [51]

Reserved, RES0.

ERR2En, bit [50]**When FEAT_RASv2 is implemented:**

Enable access to additional error record registers. When disabled, accesses to additional error record registers generate a trap to EL3.

Traps MRS accesses to the following instructions at EL2 and EL1 to EL3, reported with the EC syndrome value 0x18:

- [ERXGSR_EL1](#).

ERR2En	Meaning
0b0	The specified instructions at EL2 and EL1 are trapped to EL3:
0b1	Accesses of additional error record registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MECEn, bit [49]

When FEAT_MEC is implemented:

Enables access to the following EL2 MECID registers, from EL2:

- [MECID_P0_EL2](#).
- [MECID_A0_EL2](#)
- [MECID_P1_EL2](#)
- [MECID_A1_EL2](#)
- [VMECID_P_EL2](#)
- [VMECID_A_EL2](#)

Accesses to these registers are trapped and reported using an ESR_EL3.EC value of 0x18.

MECEn	Meaning
0b0	Accesses from EL2 to a listed MECID register are trapped to EL3. The value of a listed EL2 MECID register is treated as 0 for all purposes other than direct reads or writes to the register from EL3.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GPF, bit [48]

When FEAT_RME is implemented:

Controls the reporting of Granule protection faults at EL0, EL1 and EL2.

GPF	Meaning
0b0	This control does not cause exceptions to be routed from EL0, EL1 or EL2 to EL3.
0b1	GPFs at EL0, EL1 and EL2 are routed to EL3 and reported as Granule Protection Check exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D128En, Bits bit [47:42]
When FEAT_D128 is implemented:

128-bit System Register trap control. Enables access to 128-bit System Registers via MRRS, MSRR instructions.

- MRRS and MSRR accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x14:
 - TTBR0_EL1.
 - TTBR1_EL1.
 - RCWMASK_EL1, RCWSMASK_EL1.
 - PAR_EL1.
- MRRS and MSRR accesses from EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x14:
 - TTBR1_EL2 and accesses using the register name TTBR1_EL12.
 - TTBR0_EL2 and accesses using the register name TTBR0_EL12.
 - VTTBR_EL2.

D128En	Meaning
0b0	EL1 and EL2 accesses to the specified registers are disabled, and trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIEEn, bit [46]
When FEAT_AIE is implemented:

MAIR2_ELx, AMAIR2_ELx Register access trap control.

- Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x18:
 - AMAIR2_EL1.
 - MAIR2_EL1.
- Accesses from EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x18:
 - AMAIR2_EL2 and accesses using the register name AMAIR2_EL12.

- [MAIR2_EL2](#) and accesses using the register name MAIR2_EL12.

AIEn	Meaning
0b0	EL1 and EL2 accesses to the specified registers are disabled, and trapped to EL3. The values in these registers are treated as 0.
0b1	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIEn, bit [45]

When FEAT_S1PIE is implemented, or FEAT_S2PIE is implemented, or FEAT_S1POE is implemented or FEAT_S2POE is implemented:

Permission Indirection, Overlay Register access trap control. Enables access to Permission Indirection and Overlay registers.

- Accesses from EL0, EL1 and EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x18:
 - [POR_EL0](#).
- Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x18:
 - [PIRE0_EL1](#).
 - [PIR_EL1](#).
 - [POR_EL1](#).
 - [S2POR_EL1](#).
- Accesses from EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x18:
 - [PIRE0_EL2](#) and accesses using the register name PIRE0_EL12.
 - [PIR_EL2](#) and accesses using the register name PIR_EL12.
 - [POR_EL2](#) and accesses using the register name POR_EL12.
 - [S2PIR_EL2](#).

PIEn	Meaning
0b0	EL0, EL1 and EL2 accesses to the specified registers are disabled, and trapped to EL3. The values in these registers are treated as 0.
0b1	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCTLR2En, bit [44]**When FEAT_SCTLR2 is implemented:**SCTLR2_ELx register trap control. Enables access to [SCTLR2_EL1](#) and [SCTLR2_EL2](#) registers.

SCTLR2En	Meaning
0b0	EL1 and EL2 accesses to SCTLR2_EL1 and SCTLR2_EL2 registers are disabled, and trapped to EL3. The values in these registers are treated as 0.
0b1	This control does not cause any instructions to be trapped.

Traps are reported using an [ESR_EL3](#).EC value of 0x18.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCR2En, bit [43]**When FEAT_TCR2 is implemented:**TCR2_ELx register trap control. Enables access to [TCR2_EL1](#) and [TCR2_EL2](#) registers.

TCR2En	Meaning
0b0	EL1 and EL2 accesses to TCR2_EL1 and TCR2_EL2 registers are disabled, and trapped to EL3. The values in these registers are treated as 0.
0b1	This control does not cause any instructions to be trapped.

Traps are reported using an [ESR_EL3](#).EC value of 0x18.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RCWMASKEn, bit [42]**When FEAT_THE is implemented:**RCW and RCWS Mask register trap control. Enables access to [RCWMASK_EL1](#), [RCWSMASK_EL1](#).

RCWMASKE _n	Meaning
0b0	EL1 and EL2 accesses to RCWMASK_EL1 and RCWSMASK_EL1 registers are disabled, and trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

Traps for MRS, MSR access are reported using an [ESR_EL3.EC](#) value of 0x18.

Traps for MRRS, MSRR access are reported using an [ESR_EL3.EC](#) value of 0x14.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnTP2, bit [41]

When FEAT_SME is implemented:

Traps instructions executed at EL2, EL1, and EL0 that access [TPIDR2_EL0](#) to EL3. The exception is reported using [ESR_ELx.EC](#) value 0x18.

EnTP2	Meaning
0b0	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRNDR, bit [40]

When FEAT_RNG_TRAP is implemented:

Controls trapping of reads of [RNDR](#) and [RNDRRS](#). The exception is reported using [ESR_ELx.EC](#) value 0x18.

TRNDR	Meaning
0b0	This control does not cause RNDR and RNDRRS to be trapped. When FEAT_RNG is implemented: <ul style="list-style-type: none"> ID_AA64ISAR0_EL1.RNDR returns the value 0b0001. When FEAT_RNG is not implemented: <ul style="list-style-type: none"> ID_AA64ISAR0_EL1.RNDR returns the value 0b0000. MRS reads of RNDR and RNDRRS are UNDEFINED.
0b1	ID_AA64ISAR0_EL1 .RNDR returns the value 0b0001. Any attempt to read RNDR or RNDRRS is trapped to EL3.

When FEAT_RNG is not implemented, Arm recommends that SCR_EL3.TRNDR is initialized before entering Exception levels below EL3 and not subsequently changed.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [39]

Reserved, RES0.

HXEn, bit [38]**When FEAT_HCX is implemented:**

Enables access to the [HCRX_EL2](#) register at EL2 from EL3.

HXEn	Meaning
0b0	Accesses at EL2 to HCRX_EL2 are trapped to EL3. Indirect reads of HCRX_EL2 return 0.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ADEn, bit [37]**When FEAT_LS64_ACCDATA is implemented:**

Enables access to the [ACCDATA_EL1](#) register at EL1 and EL2.

ADEn	Meaning
0b0	Accesses to ACCDATA_EL1 at EL1 and EL2 are trapped to EL3, unless the accesses are trapped to EL2 by the EL2 fine-grained trap.
0b1	This control does not cause accesses to ACCDATA_EL1 to be trapped.

If the [HFGWTR_EL2](#).nACCDATA_EL1 or [HFGTR_EL2](#).nACCDATA_EL1 traps are enabled, they take priority over this trap.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [36]**When FEAT_LS64_ACCDATA is implemented:**

Traps execution of an ST64BV0 instruction at EL0, EL1, or EL2 to EL3.

EnAS0	Meaning
0b0	EL0 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL1 by SCTLR_EL1.EnAS0 , or to EL2 by either HCRX_EL2.EnAS0 or SCTLR_EL2.EnAS0 . EL1 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL2 by HCRX_EL2.EnAS0 . EL2 execution of an ST64BV0 instruction is trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [35]

When FEAT_AMUv1p1 is implemented:

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Accesses to AMEVCNTVOFF0<n>_EL2 and AMEVCNTVOFF1<n>_EL2 at EL2 are trapped to EL3. Indirect reads of the virtual offset registers are zero.
0b1	Accesses to AMEVCNTVOFF0<n>_EL2 and AMEVCNTVOFF1<n>_EL2 are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [34]

When FEAT_TME is implemented:

Enables access to the TSTART, TCOMMIT, TTEST and TCANCEL instructions at EL0, EL1 and EL2.

TME	Meaning
0b0	EL0, EL1 and EL2 accesses to TSTART, TCOMMIT, TTEST and TCANCEL instructions are UNDEFINED.
0b1	This control does not cause any instruction to be UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [33:30]**When FEAT_TWED is implemented:**

TWE Delay. A 4-bit unsigned number that, when SCR_EL3.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCR_EL3.TWE as $2^{(\text{TWEDEL} + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [29]**When FEAT_TWED is implemented:**

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCR_EL3.TWE.

Traps are reported using an ESR_ELx.EC value of 0x01.

TWEDEn	Meaning
0b0	The delay for taking the trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking the trap is at least the number of cycles defined in SCR_EL3.TWEDEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECVEn, bit [28]**When FEAT_ECV is implemented:**

ECV Enable. Enables access to the [CNTPOFF_EL2](#) register.

ECVEn	Meaning
0b0	EL2 accesses to CNTPOFF_EL2 are trapped to EL3, and the value of CNTPOFF_EL2 is treated as 0 for all purposes other than direct reads or writes to the register from EL3.
0b1	EL2 accesses to CNTPOFF_EL2 are not trapped to EL3 by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTEn, bit [27]**When FEAT_FGT is implemented:**

Fine-Grained Traps Enable. When EL2 is implemented, enables the traps to EL2 controlled by [HAFGRTR_EL2](#), [HDFGRTR_EL2](#), [HDFGWTR_EL2](#), [HFGTRTR_EL2](#), [HFGITR_EL2](#), and [HFGWTR_EL2](#), and controls access to those registers.

Note

If EL2 is not implemented but EL3 is implemented, FEAT_FGT implements the [MDCR_EL3](#).TDC traps.

FGTEn	Meaning
0b0	EL2 accesses to HAFGRTR_EL2 , HDFGRTR_EL2 , HDFGWTR_EL2 , HFGTRTR_EL2 , HFGITR_EL2 and HFGWTR_EL2 registers are trapped to EL3, and the traps to EL2 controlled by those registers are disabled.
0b1	EL2 accesses to HAFGRTR_EL2 , HDFGRTR_EL2 , HDFGWTR_EL2 , HFGTRTR_EL2 , HFGITR_EL2 and HFGWTR_EL2 registers are not trapped to EL3 by this mechanism.

Traps caused by accesses to the fine-grained trap registers are reported using an ESR_ELx.EC value of 0x18 and its associated ISS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [26]**When FEAT_MTE2 is implemented:**

Allocation Tag Access. Controls access to Allocation Tags, System registers for Memory tagging, and prevention of Tag checking, at EL2, EL1 and EL0.

ATA	Meaning
0b0	Access to Allocation Tags is prevented at EL2, EL1, and EL0. Accesses at EL1 and EL2 to GCR_EL1 , RGSr_EL1 , TFSR_EL1 , TFSR_EL2 or TFSRE0_EL1 that are not UNDEFINED or trapped to a lower Exception level are trapped to EL3. Accesses at EL2 using MRS or MSR with the register name TFSR_EL12 that are not UNDEFINED are trapped to EL3. Memory accesses at EL2, EL1, and EL0 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL2, EL1, and EL0. This control does not prevent Tag checking at EL2, EL1, and EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [25]**When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:**

Enables ~~Enable~~ access to the [SCXTNUM_EL2](#), [SCXTNUM_EL1](#), and [SCXTNUM_EL0](#) registers.

EnSCXT	Meaning
0b0	Accesses at EL0, EL1 and EL2 to SCXTNUM_EL0 , SCXTNUM_EL1 , or SCXTNUM_EL2 registers are trapped to EL3 if they are not trapped by a higher priority exception, and the values of these registers are treated as 0.
0b1	This control does not cause any accesses to be trapped, or register values to be treated as 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:22]

Reserved, RES0.

FIEN, bit [21]**When FEAT_RASv1p1 is implemented:**

Fault Injection enable. Trap accesses to the registers [ERXPFPCDN_EL1](#), [ERXPFPCCTL_EL1](#), and [ERXPFPCGF_EL1](#) from EL1 and EL2 to EL3, reported using an ESR_ELx.EC value of 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.
0b1	This control does not cause any instructions to be trapped.

If EL3 is not implemented, the Effective value of SCR_EL3.FIEN is 0b1.

If [ERRIDR_EL1](#).NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [20]**When FEAT_DoubleFault is implemented:**

Non-maskable External Aborts. Controls whether PSTATE.A masks SError exceptions at EL3. When [SCR_EL3.EA](#) == 1, controls whether PSTATE.A masks SError interrupts at EL3.

NMEA	Meaning
0b0	Error exceptions are not taken at EL3 if PSTATE.A == 1. If SCR_EL3.EA == 1, asserted SError interrupts are not taken at EL3 if PSTATE.A == 1.
0b1	Error exceptions are taken at EL3 regardless of the value of PSTATE.A. If SCR_EL3.EA == 1, asserted SError interrupts are taken at EL3 regardless of the value of PSTATE.A.

This When field SCR_EL3.EA is == ignored by the PE and treated as zero when all of the following are true 0:

- This field is ignored and its Effective value is 0.
- SCR_EL3.EA Asserted == SError 0. interrupts are not taken at EL3 regardless of the value of PSTATE.A and this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EASE, bit [19]

When FEAT_DoubleFault is implemented:

External aborts to SError interrupt vector.

EASE	Meaning
0b0	Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from VBAR_EL3.
0b1	Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError interrupt vector offset from VBAR_EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EEL2, bit [18]

When FEAT_SEL2 is implemented:

Secure EL2 Enable.

EEL2	Meaning
0b0	All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by FEAT_SEL2 are UNDEFINED, and those timers are disabled.
0b1	All behaviors associated with Secure EL2 are enabled.

When the value of this bit is 1, then:

- When SCR_EL3.NS == 0, the SCR_EL3.RW bit is treated as 1 for all purposes other than reading or writing the register.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2, using the EC value of ESR_EL2.EC == 0x3 :
 - A read or write of the SCR.

- A read or write of the [NSACR](#).
 - A read or write of the [MVBAR](#).
 - A read or write of the [SDCR](#).
 - Execution of an `ATS12NSO**` instruction.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using the EC value of [ESR_EL2](#).EC == 0x0 :
 - Execution of an SRS instruction that uses `R13_mon`.
 - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access [SPSR_mon](#), `R13_mon`, or `R14_mon`.

Note

If the Effective value of `SCR_EL3.EEL2` is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.

A Secure only implementation that does not implement EL3 but implements EL2, behaves as if `SCR_EL3.EEL2` == 1.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [17]
When FEAT_SEL2 is implemented and FEAT_PAuth is implemented:

Controls the use of the following instructions related to Pointer Authentication. Traps are reported using an `ESR_ELx.EC` value of 0x09:

- PACGA, which is always enabled.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAZ when:
 - In EL0, when [HCR_EL2.TGE](#) == 0 or [HCR_EL2.E2H](#) == 0, and the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In EL0, when [HCR_EL2.TGE](#) == 1 and [HCR_EL2.E2H](#) == 1, and the associated [SCTLR_EL2.En<N><M>](#) == 1.
 - In EL1, when the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In EL2, when the associated [SCTLR_EL2.En<N><M>](#) == 1.

API	Meaning
0b0	The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2 .API bit.
0b1	This control does not cause any instructions to be trapped.

An instruction is trapped only if Pointer Authentication is enabled for that instruction, for more information, see '[PACSystem generation register and control verification of keys pointer authentication](#)'.

Note

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SEL2 is not implemented and FEAT_PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- PACGA.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZ, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAB when:
 - In Non-secure EL0, when [HCR_EL2.TGE](#) == 0 or [HCR_EL2.E2H](#) == 0, and the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In Non-secure EL0, when [HCR_EL2.TGE](#) == 1 and [HCR_EL2.E2H](#) == 1, and the associated [SCTLR_EL2.En<N><M>](#) == 1.
 - In Secure EL0, when the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In Secure or Non-secure EL1, when the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In EL2, when the associated [SCTLR_EL2.En<N><M>](#) == 1.

API	Meaning
0b0	The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.API bit.
0b1	This control does not cause any instructions to be trapped.

Note

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [16]

When FEAT_PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers, using an ESR_ELx.EC value of 0x18, from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the [HCR_EL2.APK](#) bit or other traps:

- [APIAKeyLo_EL1](#), [APIAKeyHi_EL1](#), [APIBKeyLo_EL1](#), [APIBKeyHi_EL1](#).
- [APDAKeyLo_EL1](#), [APDAKeyHi_EL1](#), [APDBKeyLo_EL1](#), [APDBKeyHi_EL1](#).
- [APGAKeyLo_EL1](#), and [APGAKeyHi_EL1](#).

APK	Meaning
0b0	Access to the registers holding "key" values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps.
0b1	This control does not cause any instructions to be trapped.

For more information, see '[PACSystem generation register and control verification of keys pointer authentication](#)'.

Note

If FEAT_PAAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [15]

When FEAT_RAS is implemented:

Trap Error record accesses. Accesses to the RAS ERR* and RAS ERX* registers from EL1 and EL2 to EL3 are trapped as follows:

- Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x18:
 - [ERRIDR_EL1](#), [ERRSELR_EL1](#), [ERXADDR_EL1](#), [ERXCTLR_EL1](#), [ERXFR_EL1](#), [ERXMISC0_EL1](#), [ERXMISC1_EL1](#), and [ERXSTATUS_EL1](#).
- If FEAT_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch64 to [ERXMISC2_EL1](#), and [ERXMISC3_EL1](#), are trapped and reported using an ESR_ELx.EC value of 0x18.
- Accesses from EL1 and EL2 using AArch32, to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
 - [ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#).
- If FEAT_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch32 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
 - [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

TERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [14]

When FEAT_LOR is implemented:

Trap LOR registers. Traps accesses to the [LORSA_EL1](#), [LOREA_EL1](#), [LORN_EL1](#), [LORC_EL1](#), and [LORID_EL1](#) registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

TLOR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped HCR_EL2.TLOR .

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [13]

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from any Security state and both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE , HCR.TWE , SCTLR_EL1.nTWE , SCTLR_EL2.nTWE , or HCR_EL2.TWE .

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TWI, bit [12]

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from any Security state and both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI , HCR.TWI , SCTLR_EL1.nTWI , SCTLR_EL2.nTWI , or HCR_EL2.TWI .

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the

WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ST, bit [11]

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

ST	Meaning
0b0	Secure EL1 using AArch64 accesses to the CNTPS_TVAL_EL1 , CNTPS_CTL_EL1 , and CNTPS_CVAL_EL1 are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was 0b1.
0b1	This control does not cause any instructions to be trapped.

Note

Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3. These registers are not accessible at EL0.

When FEAT_RME is implemented and Secure state is not implemented, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RW, bit [10]

When EL1 is capable of using AArch32 or EL2 is capable of using AArch32:

Execution state control for lower Exception levels.

RW	Meaning
0b0	Lower levels are all AArch32.
0b1	The next lower level is AArch64. If EL2 is present: <ul style="list-style-type: none"> • EL2 is AArch64. • EL2 controls EL1 and EL0 behaviors. If EL2 is not present: <ul style="list-style-type: none"> • EL1 is AArch64. • EL0 is determined by the Execution state described in the current process state when executing at EL0.

If AArch32 state is supported by the implementation at EL1, SCR_EL3.NS == 1 and AArch32 state is not supported by the implementation at EL2, the Effective value of this bit is 1.

If AArch32 state is supported by the implementation at EL1, FEAT_SEL2 is implemented and SCR_EL3.{EEL2, NS} == {1, 0}, the Effective value of this bit is 1.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

SIF, bit [9]

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction execution from memory marked in the first stage of translation as being Non-secure.

SIF	Meaning
0b0	Secure state instruction execution from memory marked in the first stage of translation as being Non-secure is permitted.
0b1	Secure state instruction execution from memory marked in the first stage of translation as being Non-secure is not permitted.

When FEAT_RME is implemented and Secure state is not implemented, this bit is RES0.

When FEAT_PAN3 is implemented, it is IMPLEMENTATION DEFINED whether SCR_EL3.SIF is also used to determine instruction access permission for the purpose of PAN.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states, reported using an ESR_ELx.EC value of 0x00.

HCE	Meaning
0b0	HVC instructions are UNDEFINED.
0b1	HVC instructions are enabled at EL3, EL2, and EL1.

Note

HVC instructions are always UNDEFINED at EL0 and, if Secure EL2 is disabled, at Secure EL1. Any resulting exception is taken from the current Exception level to the current Exception level.

If EL2 is not implemented, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SMD, bit [7]

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from any Security state and both Execution states, reported using an ESR_ELx.EC value of 0x00.

SMD	Meaning
0b0	SMC instructions are enabled at EL3, EL2 and EL1.
0b1	SMC instructions are UNDEFINED.

Note

SMC instructions are always UNDEFINED at EL0. Any resulting exception is taken from the current Exception level to the current Exception level.

If [HCR_EL2.TSC](#) or [HCR.TSC](#) traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

EA, bit [3]

External Abort and SError interrupt routing.

EA	Meaning
0b0	When executing at Exception levels below EL3, External aborts and SError interrupts are not taken to EL3. In addition, when executing at EL3: <ul style="list-style-type: none"> • SError interrupts are not taken. • External aborts are taken to EL3.
0b1	When executing at any Exception level, External aborts and SError interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIQ, bit [2]

Physical FIQ Routing.

FIQ	Meaning
0b0	When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3. When executing at EL3, physical FIQ interrupts are not taken.
0b1	When executing at any Exception level, physical FIQ interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRQ, bit [1]

Physical IRQ Routing.

IRQ	Meaning
0b0	When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3. When executing at EL3, physical IRQ interrupts are not taken.
0b1	When executing at any Exception level, physical IRQ interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [0]**When FEAT_RME is implemented:**

Non-secure bit. This field is used in combination with SCR_EL3.NSE to select the Security state of EL2 and lower Exception levels.

NSE	NS	Meaning
0b0	0b0	Secure.
0b0	0b1	Non-secure.
0b1	0b0	Reserved.
0b1	0b1	Realm.

When Secure state is not implemented, SCR_EL3.NS is RES1 and its effective value is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure bit.

NS	Meaning
0b0	Indicates that EL0 and EL1 are in Secure state. When FEAT_SEL2 is implemented and SCR_EL3.EEL2 == 1, then EL2 is using AArch64 and in Secure state.
0b1	Indicates that Exception levels lower than EL3 are in Non-secure state, so memory accesses from those Exception levels cannot access Secure memory.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = SCR_EL3;

```

MSR SCR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SCR_EL3 = X[t, 64];
```

3005/0907/2022 1517:5808; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

SCTLR2_EL1, System Control Register (EL1)

The SCTLR2_EL1 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL1 and EL0.

Configuration

This register is present only when FEAT_SCTLR2 is implemented. Otherwise, direct accesses to SCTLR2_EL1 are UNDEFINED.

Attributes

SCTLR2_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39		38		37		36		35		34	33	32	
RES0																																					
RES0																										EnIDCP128				RES0		EnANERR		EnADERR		RES0	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7		6		5		4		3		2	1	0	

Bits [63:7]

Reserved, RES0.

EnIDCP128, bit [6]

When FEAT_SYSREG128 is implemented:

Enables access to IMPLEMENTATION DEFINED 128-bit System registers.

EnIDCP128	Meaning
0b0	Accesses at EL0 to IMPLEMENTATION DEFINED 128-bit System registers are trapped to EL1 using an ESR_EL1.EC value of 0x14, unless the access generates a higher priority exception. Disables the functionality of the 128-bit IMPLEMENTATION DEFINED System registers that are accessible at EL1.
0b1	No accesses are trapped by this control.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

EnANERR, bit [4]**When FEAT_ANERR is implemented:**

Enable Asynchronous Normal Read Error.

EnANERR	Meaning
0b0	External abort on Normal memory reads generate synchronous Data Abort exceptions in the EL1&0 translation regime.
0b1	External abort on Normal memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL1&0 translation regime.

It is implementation-specific whether this field applies to memory reads generated by each of the following:

- FP&SIMD register loads.
- SVE register loads.
- SME register loads.
- LD<op>, SWP and CAS{P} Atomic instructions that return a value to the PE.
- ST64BV{0} instructions that return a value to the PE.
- RCW instructions that return a value to the PE.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Normal memory read in every case.

Setting this field to 0 might have a performance impact for Normal memory reads.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
 - EL2 is implemented and enabled in the current Security state.
 - The Effective value of [HCRX_EL2](#).SCTLR2En is 0.
- All of the following are true:
 - EL2 is implemented and enabled in the current Security state.
 - The Effective value of [HCRX_EL2](#).EnSNERR is 1.
- [SCR_EL3](#).SCTLR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnADERR, bit [3]**When FEAT_ADERR is implemented:**

Enable Asynchronous Device Read Error.

EnADERR	Meaning
0b0	External abort on Device memory reads generate synchronous Data Abort exceptions in the EL1&0 translation regime.
0b1	External abort on Device memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL1&0 translation regime.

It is implementation-specific whether this field applies to memory reads generated by each of the following:

- FP&SIMD register loads.

- SVE register loads.
- SME register loads.
- LD<op>, SWP and CAS{P} Atomic instructions that return a value to the PE.
- ST64BV{0} instructions that return a value to the PE.
- RCW instructions that return a value to the PE.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Device memory read in every case.

Setting this field to 0 might have a performance impact for Device memory reads.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
 - EL2 is implemented and enabled in the current Security state.
 - The Effective value of [HCRX_EL2](#).SCTLR2En is 0.
- All of the following are true:
 - EL2 is implemented and enabled in the current Security state.
 - The Effective value of [HCRX_EL2](#).EnSDERR is 1.
- [SCR_EL3](#).SCTLR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [2:0]

SCTLR2_EL2, System Control Register (EL2)

The SCTLR2_EL2 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL2.

When FEAT_VHE is implemented and the value of [HCR_EL2](#).{E2H,TGE} is {1,1}, these controls also apply to execution at EL0.

Configuration

This register is present only when FEAT_SCTLR2 is implemented. Otherwise, direct accesses to SCTLR2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLR2_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

RES0																															

Bits [63:7]

Reserved, RES0.

EnIDCP128, bit [6]

When FEAT_SYSREG128 is implemented and HCR_EL2.[E2H,TGE] != 0b11:

Enables access to IMPLEMENTATION DEFINED 128-bit System registers.

EnIDCP128	Meaning
0b0	Accesses at EL0 to IMPLEMENTATION DEFINED 128-bit System registers are trapped to EL2 using an ESR_EL2.EC value of 0x14, unless the access generates a higher priority exception. Disables the functionality of the 128-bit IMPLEMENTATION DEFINED System registers that are accessible at EL2.
0b1	No accesses are trapped by this control.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

EnANERR, bit [4]**When FEAT_ANERR is implemented:**

Enable Asynchronous Normal Read Error.

EnANERR	Meaning
0b0	External abort on Normal memory reads generate synchronous Data Abort exceptions in the EL2 and EL2&0 translation regimes.
0b1	External abort on Normal memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL2 and EL2&0 translation regimes.

It is implementation-specific whether this field applies to memory reads generated by each of the following:

- FP&SIMD register loads.
- SVE register loads.
- SME register loads.
- LD<op>, SWP and CAS{P} Atomic instructions that return a value to the PE.
- ST64BV{0} instructions that return a value to the PE.
- RCW instructions that return a value to the PE.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Normal memory read in every case.

Setting this field to 0 might have a performance impact for Normal memory reads.

This field is ignored by the PE and treated as zero when [SCR_EL3.SCTLR2En](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnADERR, bit [3]**When FEAT_ADERR is implemented:**

Enable Asynchronous Device Read Error.

EnADERR	Meaning
0b0	External abort on Device memory reads generate synchronous Data Abort exceptions in the EL2 and EL2&0 translation regimes.
0b1	External abort on Device memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL2 and EL2&0 translation regimes.

It is implementation-specific whether this field applies to memory reads generated by each of the following:

- FP&SIMD register loads.
- SVE register loads.
- SME register loads.

- LD<op>, SWP and CAS{P} Atomic instructions that return a value to the PE.
- ST64BV{0} instructions that return a value to the PE.
- RCW instructions that return a value to the PE.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Device memory read in every case.

Setting this field to 0 might have a performance impact for Device memory reads.

This field is ignored by the PE and treated as zero when [SCR_EL3](#).SCTLR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

MECRL, bit [1]

When FEAT_MEC is implemented:

Enables MEC for the Realm physical address space at EL2.

MECRL	Meaning
0b0	MEC is not enabled for the Realm physical address space at EL2.
0b1	MEC is enabled for the Realm physical address space at EL2.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [0]

Reserved, RES0.

Accessing SCTLR2_EL2

When FEAT_VHE is implemented, and [HCR_EL2](#).E2H is 1, without explicit synchronization, accesses from EL2 using the register name SCTLR2_EL2 or SCTLR2_EL1 are not guaranteed to be ordered with respect to accesses using the other register name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR2_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0000	0b011

RES0																															

Bits [63:5]

Reserved, RES0.

EnANERR, bit [4]

When FEAT_ANERR is implemented:

Enable Asynchronous Normal Read Error.

EnANERR	Meaning
0b0	External abort on Normal memory reads generate synchronous Data Abort exceptions in the EL3 translation regime.
0b1	External abort on Normal memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL3 translation regime.

It is implementation-specific whether this field applies to memory reads generated by each of the following:

- FP&SIMD register loads.
- SVE register loads.
- SME register loads.
- LD<op>, SWP and CAS{P} Atomic instructions that return a value to the PE.
- ST64BV{0} instructions that return a value to the PE.
- RCW instructions that return a value to the PE.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Normal memory read in every case.

Setting this field to 0 might have a performance impact for Normal memory reads.

This field is ignored by the PE and treated as zero when [SCR_EL3](#).SCTLR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnADERR, bit [3]

When FEAT_ADERR is implemented:

Enable Asynchronous Device Read Error.

EnADERR	Meaning
0b0	External abort on Device memory reads generate synchronous Data Abort exceptions in the EL3 translation regime.
0b1	External abort on Device memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL3 translation regime.

It is implementation-specific whether this field applies to memory reads generated by each of the following:

- FP&SIMD register loads.
- SVE register loads.
- SME register loads.
- LD<op>, SWP and CAS{P} Atomic instructions that return a value to the PE.
- ST64BV{0} instructions that return a value to the PE.
- RCW instructions that return a value to the PE.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Device memory read in every case.

Setting this field to 0 might have a performance impact for Device memory reads.

This field is ignored by the PE and treated as zero when [SCR_EL3.SCTLR2En](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

MECRL, bit [1]

When FEAT_MEC is implemented:

Enables MEC for the Realm physical address space at EL3.

MECRL	Meaning
0b0	MEC is not enabled for the Realm physical address space at EL3.
0b1	MEC is enabled for the Realm physical address space at EL3.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [0]

Reserved, RES0.

Accessing SCTLR2_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR2_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0000	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = SCTLR2_EL3;
```

MSR SCTLR2_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0000	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SCTLR2_EL3 = X[t, 64];
```

SCTLR_EL1, System Control Register (EL1)

The SCTLR_EL1 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL1 and EL0.

Configuration

AArch64 System register SCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [SCTLR\[31:0\]](#).

Attributes

SCTLR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53
TIDCP	SPINTMASK	NMI	EnTP2	TCSORES0	TCSO0EPAN	EPAN	EnALS	EnALS	EnAS0	EnAS0
EnIA	EnIB	LSMAOE	nTLSMD	EnDA	UCI	EE	E0E	SPAN	EIS	IESB
31	30	29	28	27	26	25	24	23	22	21

TIDCP, bit [63]
When FEAT_TIDCP1 is implemented:

Trap IMPLEMENTATION DEFINED functionality. When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps EL0 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL1.

TIDCP	Meaning
0b0	No instructions accessing the System register or System instruction spaces are trapped by this mechanism.
0b1	Instructions accessing the following System register or System instruction spaces are trapped to EL1 by this mechanism: <ul style="list-style-type: none">In AArch64 state, EL0 access to the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome 0x18:<ul style="list-style-type: none">IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}.IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name.In AArch32 state, EL0 MCR and MRC access to the following encodings are trapped and reported using EC syndrome 0x03:<ul style="list-style-type: none">All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}.All coproc==p15, CRn==c10, opc1 =={0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}.All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPINTMASK, bit [62]

When FEAT_NMI is implemented:

SP Interrupt Mask enable. When SCTLR_EL1.NMI is 1, controls whether PSTATE.SP acts as an interrupt mask, and controls the value of PSTATE.ALLINT on taking an exception to EL1.

SPINTMASK	Meaning
0b0	Does not cause PSTATE.SP to mask interrupts. PSTATE.ALLINT is set to 1 on taking an exception to EL1.
0b1	When PSTATE.SP is 1 and execution is at EL1, an IRQ or FIQ interrupt that is targeted to EL1 is masked regardless of any denotation of Superpriority. PSTATE.ALLINT is set to 0 on taking an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]

When FEAT_NMI is implemented:

Non-maskable Interrupt enable.

NMI	Meaning
0b0	This control does not affect interrupt masking behavior.
0b1	This control enables all of the following: <ul style="list-style-type: none"> The use of the PSTATE.ALLINT interrupt mask. IRQ and FIQ interrupts to have Superpriority as an additional attribute. PSTATE.SP to be used as an interrupt mask.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to 0.

Otherwise:

Reserved, RES0.

EnTP2, bit [60]**When FEAT_SME is implemented:**

Traps instructions executed at EL0 that access [TPIDR2_EL0](#) to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1. The exception is reported using ESR_ELx.EC value 0x18.

EnTP2	Meaning
0b0	This control causes execution of these instructions at EL0 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

If FEAT_VHE is implemented, EL2 is implemented and enabled in the current Security state, and [HCR_EL2.{E2H, TGE}](#) == {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, ~~in a system where the PE resets into EL1~~, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO, Bits bit [59:58]**When FEAT_MTE_STORE_ONLY is implemented:**

Tag Checking Store Only.

TCSO	Meaning
0b0	This field has no effect on Tag checking.
0b1	Load instructions executed in EL1 are Tag Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO0, bit [58]**When FEAT_MTE_STORE_ONLY is implemented:**

When [HCR_EL2.{E2H, TGE}](#) != {1, 1}, Tag Checking Store Only in EL0.

TCSO0	Meaning
0b0	This field has no effect on Tag checking.
0b1	Load instructions executed in EL0 are Tag Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EPAN, bit [57]**When FEAT_PAN3 is implemented:**

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL1 data access to a page with stage 1 EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

EPAN	Meaning
0b0	No additional Permission faults are generated by this mechanism.
0b1	An EL1 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]**When FEAT_LS64 is implemented:**

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 to EL1.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]**When FEAT_LS64_ACCDATA is implemented:**

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV0 instruction at EL0 to EL1.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, ~~in a system where the PE resets into EL1~~, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [54]

When FEAT_LS64_V is implemented:

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV instruction at EL0 to EL1.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

The reset behavior of this field is:

- On a Warm reset, ~~in a system where the PE resets into EL1~~, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [53]

When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL1.

TME	Meaning
0b0	Any attempt to execute a TSTART instruction at EL1 is trapped to EL1, unless HCR_EL2 .TME or SCR_EL3 .TME causes TSTART instructions to be UNDEFINED at EL1.
0b1	This control does not cause any TSTART instruction to be trapped.

The reset behavior of this field is:

- On a Warm reset, ~~in a system where the PE resets into EL1~~, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME0, bit [52]

When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL0.

TME0	Meaning
0b0	Any attempt to execute a TSTART instruction at EL0 is trapped to EL1, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL0.
0b1	This control does not cause any TSTART instruction to be trapped.

If FEAT_VHE is implemented, EL2 is implemented and enabled in the current Security state, and [HCR_EL2.{E2H, TGE}](#) == {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT, bit [51]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL1.

TMT	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL1, the transaction fails with a TRIVIAL failure cause.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT0, bit [50]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL0.

TMT0	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause.

If FEAT_VHE is implemented, EL2 is implemented and enabled in the current Security state, and [HCR_EL2.{E2H, TGE}](#) == {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [49:46]**When FEAT_TWED is implemented:**

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL1.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCTLR_EL1.nTWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, ~~in a system where the PE resets into EL1~~, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]**When FEAT_TWED is implemented:**

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCTLR_EL1.nTWE.

TWEDEn	Meaning
0b0	The delay for taking the trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking the trap is at least the number of cycles defined in SCTLR_EL1.TWEDEL.

The reset behavior of this field is:

- On a Warm reset, ~~in a system where the PE resets into EL1~~, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]**When FEAT_SSBS is implemented:**

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL1.
0b1	PSTATE.SSBS is set to 1 on an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]**When FEAT_MTE2 is implemented:**

Allocation Tag Access in EL1.

When [SCR_EL3.ATA](#) == 1 and [HCR_EL2.ATA](#) == 1, controls access to Allocation Tags and Tag Check operations in EL1.

ATA	Meaning
0b0	Access to Allocation Tags is prevented at EL1. Memory accesses at EL1 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL1. Tag Checked memory accesses at EL1 are subject to a Tag Check operation. The Tag Check operation depends on the type of tag at the memory being accessed: <ul style="list-style-type: none"> For Allocation Tagged memory, an Allocation Tag Check operation. If FEAT_MTE_CANONICAL_TAGS is implemented, for Canonically Tagged memory, a Canonical Tag Check operation.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL0.

When [SCR_EL3.ATA](#) == 1, [HCR_EL2.ATA](#) == 1, and [HCR_EL2.{E2H, TGE}](#) != {1, 1}, controls access to Allocation Tags and Tag Check operations in EL0.

ATA0	Meaning
0b0	Access to Allocation Tags is prevented at EL0. Memory accesses at EL0 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL0. Tag Checked memory accesses at EL0 are subject to a Tag Check operation. The Tag Check operation depends on the type of tag at the memory being accessed: <ul style="list-style-type: none"> For Allocation Tagged memory, an Allocation Tag Check operation. If FEAT_MTE_CANONICAL_TAGS is implemented, for Canonically Tagged memory, a Canonical Tag Check operation.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]**When FEAT_MTE2 is implemented:**

Tag Check Fault in EL1. Controls the effect of Tag Check Faults due to Loads and Stores in EL1.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	When FEAT_MTE3 is implemented
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]**When FEAT_MTE2 is implemented:**

Tag Check Fault in EL0. When [HCR_EL2](#).{E2H,TGE} != {1,1}, controls the effect of Tag Check Faults due to Loads and Stores in EL0.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

Note

Software may change this control bit on a context switch.

TCF0	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	When FEAT_MTE3 is implemented
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]**When FEAT_MTE2 is implemented:**

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL1, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into [TFSRE0_EL1](#) and [TFSR_EL1](#) registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL1.
0b1	Tag Check Faults are synchronized on entry to EL1.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT1, bit [36]**When FEAT_BT1 is implemented:**

PAC Branch Type compatibility at EL1.

BT1	Meaning
0b0	When the PE is executing at EL1, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL1, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]**When FEAT_BT1 is implemented:**

PAC Branch Type compatibility at EL0.

BT0	Meaning
0b0	When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

When the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, the value of SCTLR_EL1.BT0 has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [34]

Reserved, RES0.

MSCEn, bit [33]**When FEAT_MOPS is implemented and (HCR_EL2.E2H == 0 or HCR_EL2.TGE == 0):**

Memory Copy and Memory Set instructions Enable. Enables execution of the Memory Copy and Memory Set instructions at EL0.

MSCEn	Meaning
0b0	Execution of the Memory Copy and Memory Set instructions is UNDEFINED at EL0.
0b1	This control does not cause any instructions to be UNDEFINED.

When FEAT_MOPS is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, [in a system where the PE resets into EL1](#), this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [32]**When FEAT_CMOW is implemented:**

Controls cache maintenance instruction permission for the following instructions executed at EL0.

- [IC IVAU](#), [DC CIVAC](#), [DC CIGDVAC](#) and [DC CIGVAC](#).

CMOW	Meaning
0b0	These instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, do not generate a stage 1 permission fault.
0b1	If enabled as a result of SCTLR_EL1 .UCI==1, these instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, generate a stage 1 permission fault.

When AArch64.HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

For this control, stage 1 has write permission if all of the following apply:

- AP[2] is 0 or DBM is 1 in the stage 1 descriptor.
- Where APTTable is in use, APTTable[1] is 0 for all levels of the translation table.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, [in a system where the PE resets into EL1](#), this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIA, bit [31]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]**When FEAT_LSMAOC is implemented:**

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]**When FEAT_LSMAOC is implemented:**

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]**When FEAT_PAAuth is implemented:**

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Traps EL0 execution of cache maintenance instructions, to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

This applies to [DC CVAU](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#), and [IC IVAU](#).

If FEAT_DPB2 is implemented, this trap also applies to [DC CVADP](#).

If FEAT_MTE is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#), and [DC CGDVAP](#).

If FEAT_DPB2 and FEAT_MTE are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

UCI	Meaning
0b0	Execution of the specified instructions at EL0 using AArch64 is trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

EE, bit [25]

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.
0b1	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

EOE, bit [24]

Endianness of data accesses at EL0.

EOE	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0, then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0, then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

SPAN, bit [23]

When FEAT_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 on taking an exception to EL1.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EIS, bit [22]**When FEAT_ExS is implemented:**

Exception Entry is Context Synchronizing.

EIS	Meaning
0b0	The taking of an exception to EL1 is not a context synchronizing event.
0b1	The taking of an exception to EL1 is a context synchronizing event.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EIS is set to 0b0:

- Indirect writes to [ESR_EL1](#), [FAR_EL1](#), [SPSR_EL1](#), [ELR_EL1](#) are synchronized on exception entry to EL1, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EIS:

- Changes to the PSTATE information on entry to EL1.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, ~~in a system where the PE resets into EL1~~, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]**When FEAT_IESB is implemented:**

Implicit Error Synchronization event enable. Possible values are:

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: <ul style="list-style-type: none"> • At each exception taken to EL1. • Before the operational pseudocode of each ERET instruction executed at EL1.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL1 and before each DRPS instruction executed at EL1, in addition to the other cases where it is added.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap EL0 Access to the [SCXTNUM_EL0](#) register, when EL0 is using AArch64.

TSCXT	Meaning
0b0	EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.
0b1	EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2 .TGE is 1. The value of SCXTNUM_EL0 is treated as 0.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL1&0 translation regime is forced to XN for accesses from software executing at EL1 or EL0.

This bit applies only when SCTLR_EL1.M bit is set.

The WXN bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2](#).TGE is 1, from both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2](#).TGE is 1, from both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

UCT, bit [15]

Traps EL0 accesses to the [CTR_EL0](#) to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2](#).TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

UCT	Meaning
0b0	Accesses to the CTR_EL0 from EL0 using AArch64 are trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, [in a system where the PE resets into EL1](#), this field resets to an architecturally UNKNOWN value.

DZE, bit [14]

Traps EL0 execution of [DC ZVA](#) instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2](#).TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

If FEAT_MTE is implemented, this trap also applies to [DC GVA](#) and [DC GZVA](#).

DZE	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped. Reading DCZID_EL0 .DZP from EL0 returns 1, indicating that the instructions this trap applies to are not supported.
0b1	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, [in a system where the PE resets into EL1](#), this field resets to an architecturally UNKNOWN value.

EnDB, bit [13]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, [in a system where the PE resets into EL1](#), this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Stage 1 instruction access Cacheability control, for accesses at EL0 and EL1:

I	Meaning
0b0	All instruction access to Stage 1 Normal memory from EL0 and EL1 are Stage 1 Non-cacheable. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Stage 1 Cacheability of instruction access to Stage 1 Normal memory from EL0 and EL1. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

When the value of the [HCR_EL2.DC](#) bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR_EL1.I bit.

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

EOS, bit [11]**When FEAT_ExS is implemented:**

Exception Exit is Context Synchronizing.

EOS	Meaning
0b0	An exception return from EL1 is not a context synchronizing event
0b1	An exception return from EL1 is a context synchronizing event

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1,1}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EOS:

- The indirect write of the PSTATE and PC values from [SPSR_EL1](#) and [ELR_EL1](#) on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]**When FEAT_SPECRES is implemented:**

Enable EL0 ~~access~~Access to the following **System** instructions:

- **CFPRCTX, DVPRCTX and CPPRCTX** ~~AArch32 CFPRCTX, DVPRCTX and CPPRCTX~~ instructions.
- ~~If AArch64 FEAT_SPECRES2 CFP is RCTX, implemented, DVP RCT and CPP RCTX instructions. COSPRCTX.~~
- **CFP RCTX, DVP RCTX and CPP RCTX** instructions.
- **If FEAT_SPECRES2 is implemented, COSP RCTX.**

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.
0b1	EL0 access to these instructions is enabled.

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, ~~in a system where the PE resets into EL1,~~ this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UMA, bit [9]

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.{D, A, I, F} masks to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

UMA	Meaning
0b0	Any attempt at EL0 using AArch64 to execute an MRS, MSR(REGISTER), or MSR(IMMEDIATE) instruction that accesses the DAIF is trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, ~~in a system where the PE resets into EL1,~~ this field resets to an architecturally UNKNOWN value.

SED, bit [8]**When EL0 is capable of using AArch32:**

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL0 using AArch32.
0b1	SETEND instructions are UNDEFINED at EL0 using AArch32 and any attempt at EL0 to access a SETEND instruction generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, reported using an ESR_ELx.EC value of 0x00.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

ITD, bit [7]

When EL0 is capable of using AArch32:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL0 using AArch32.
0b1	Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED and generates an exception, reported using an ESR_ELx.EC value of 0x00, to EL1 or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1: <ul style="list-style-type: none"> All encodings of the IT instruction with hw1[3:0] != 1000. All encodings of the subsequent instruction with the following values for hw1: <ul style="list-style-type: none"> 0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'. 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm] 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. <p>These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.</p> <p>It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:</p> <ul style="list-style-type: none"> A 16-bit instruction, that can only be followed by another 16-bit instruction. The first half of a 32-bit instruction. <p>This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.</p> <p>An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</p>

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information, see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR_EL1 then it must also be implemented in the [SCTLR_EL2](#), [HSCTLR](#), and [SCTLR](#).

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

Otherwise:

Reserved, RES1.

nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.

The following instructions generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for access:

- LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH.
- STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH.

The following instructions generate an Alignment fault if all bytes being accessed for a single register are not within a single 16-byte quantity, aligned to 16 bytes for access:

- LDIAPP, LDAPR, STILP, and STLR.
- If Advanced SIMD and floating-point instructions are implemented, LDDAPUR, LDAP1, STLUR, and STL1.

nAA	Meaning
0b0	Unaligned accesses by the specified instructions generate an Alignment fault.
0b1	This control does not generate Alignment faults.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, **in a system where the PE resets into EL1**, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]

When EL0 is capable of using AArch32:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

CP15BEN	Meaning
0b0	EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is UNDEFINED and generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The exception is reported using an ESR_ELx.EC value of 0x00.
0b1	EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR_EL1 then it must also be implemented in the [SCTLR_EL2](#), [HSCTLR](#), and [SCTLR](#).

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, [in a system where the PE resets into EL1](#), this field resets to an architecturally UNKNOWN value.

When an implementation does not implement CP15BEN, access to this field is **RAO/WI**.

Otherwise:

Reserved, RES0.

SA0, bit [4]

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, [in a system where the PE resets into EL1](#), this field resets to an architecturally UNKNOWN value.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, [in a system where the PE resets into EL1](#), this field resets to an architecturally UNKNOWN value.

C, bit [2]

Stage 1 Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Stage 1 Normal memory from EL0 and EL1, and all Normal memory accesses from unified cache to the EL1&0 Stage 1 translation tables, are treated as Stage 1 Non-cacheable.
0b1	This control has no effect on the Stage 1 Cacheability of: <ul style="list-style-type: none"> Data access to Normal memory from EL0 and EL1. Normal memory accesses to the EL1&0 Stage 1 translation tables.

When the **Effective** value of the [HCR_EL2.DC](#) bit in the current Security state is 1, the PE ignores [SCTLR_EL1.C.SCTLR.C](#). This means that **Non-secure** EL0 and **Non-secure** EL1 data accesses to Normal memory are Cacheable.

When FEAT_VHE is implemented, and the **Effective** value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0.

A	Meaning
0b0	Alignment fault checking disabled when executing at EL1 or EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL1 or EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

If FEAT_MOPS is implemented, SETG* instructions have an alignment check regardless of the value of the A bit.

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL1&0 stage 1 address translation.

M	Meaning
0b0	EL1&0 stage 1 address translation disabled. See the SCTLR_EL1.I field for the behavior of instruction accesses to Normal memory.
0b1	EL1&0 stage 1 address translation enabled.

If the **Effective** value of **HCR_EL2**.{DC, TGE} **in the current Security state** is not {0, 0} then **in Non-secure state** the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of the field.

When FEAT_VHE is implemented, and the **Effective** value of **HCR_EL2**.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- **On a Warm reset:**
 - **When EL2 is not implemented and EL3 is not implemented, this field resets to 0.**
 - **Otherwise, this field resets to an architecturally UNKNOWN value.**
- **On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.**

Accessing SCTLR_EL1

When **HCR_EL2**.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SCTLR_EL1 or SCTLR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b000

```

SCTLR_EL2, System Control Register (EL2)

The SCTLR_EL2 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL2.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, these controls apply also to execution at EL0.

Configuration

AArch64 System register SCTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HSCTLR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53

31	30	29	28	27	26	25	24	23	22	21

TIDCP, bit [63]
When FEAT_TIDCP1 is implemented and HCR_EL2.E2H == 1:

Trap IMPLEMENTATION DEFINED functionality. Traps EL0 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2.

TIDCP	Meaning
0b0	No instructions accessing the System register or System instruction spaces are trapped by this mechanism.
0b1	<p>If HCR_EL2.TGE==0, no instructions accessing the System register or System instruction spaces are trapped by this mechanism.</p> <p>If HCR_EL2.TGE==1, instructions accessing the following System register or System instruction spaces are trapped to EL2 by this mechanism:</p> <ul style="list-style-type: none"> In AArch64 state, EL0 access to the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome 0x18: <ul style="list-style-type: none"> IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}. IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name. In AArch32 state, EL0 MCR and MRC access to the following encodings are trapped and reported using EC syndrome 0x03: <ul style="list-style-type: none"> All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}. All coproc==p15, CRn==c10, opc1 == {0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}. All coproc==p15, CRn==c11, opc1 == {0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPINTMASK, bit [62]

When FEAT_NMI is implemented:

SP Interrupt Mask enable. When SCTLR_EL2.NMI is 1, controls whether PSTATE.SP acts as an interrupt mask, and controls the value of PSTATE.ALLINT on taking an exception to EL2.

SPINTMASK	Meaning
0b0	Does not cause PSTATE.SP to mask interrupts. PSTATE.ALLINT is set to 1 on taking an exception to EL2.
0b1	When PSTATE.SP is 1 and execution is at EL2, an IRQ or FIQ interrupt that is targeted to EL2 is masked regardless of any denotation of Superpriority. PSTATE.ALLINT is set to 0 on taking an exception to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]**When FEAT_NMI is implemented:**

Non-maskable Interrupt enable.

NMI	Meaning
0b0	This control does not affect interrupt masking behavior.
0b1	This control enables all of the following: <ul style="list-style-type: none"> The use of the PSTATE.ALLINT interrupt mask. IRQ and FIQ interrupts to have Superpriority as an additional attribute. PSTATE.SP to be used as an interrupt mask.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

EnTP2, bit [60]**When FEAT_SME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Traps instructions executed at EL0 that access [TPIDR2_EL0](#) to EL2 when EL2 is implemented and enabled for the current Security state. The exception is reported using ESR_ELx.EC value 0x18.

EnTP2	Meaning
0b0	This control causes execution of these instructions at EL0 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_SME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

TCSO, Bits bit [59:58]**When FEAT_MTE_STORE_ONLY is implemented:**

Tag Checking Store Only.

TCSO	Meaning
0b0	This field has no effect on Tag checking.
0b1	Load instructions executed in EL2 are Tag Unchecked.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO0, bit [58]

When FEAT_MTE_STORE_ONLY is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Tag Checking Store Only in EL0.

TCSO0	Meaning
0b0	This field has no effect on Tag checking.
0b1	Load instructions executed in EL0 are Tag Unchecked.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EPAN, bit [57]

When FEAT_PAN3 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL2 data access to a page with EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

EPAN	Meaning
0b0	No additional Permission faults are generated by this mechanism.
0b1	An EL2 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_PAN3 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

EnALS, bit [56]

When FEAT_LS64 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of an LD64B or ST64B instruction at EL0 to EL2.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]

When FEAT_LS64_ACCDATA is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of an ST64BV0 instruction at EL0 to EL2.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64_ACCDATA is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

EnASR, bit [54]

When FEAT_LS64_V is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of an ST64BV instruction at EL0 to EL2.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64_V is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

TME, bit [53]

When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL2.

TME	Meaning
0b0	Any attempt to execute a TSTART instruction at EL2 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL2.
0b1	This control does not cause any TSTART instruction to be trapped.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME0, bit [52]

When FEAT_TME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Enables the Transactional Memory Extension at EL0.

TME0	Meaning
0b0	Any attempt to execute a TSTART instruction at EL0 is trapped to EL2, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL0.
0b1	This control does not cause any TSTART instruction to be trapped.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_TME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

TMT, bit [51]**When FEAT_TME is implemented:**

Forces a trivial implementation of the Transactional Memory Extension at EL2.

TMT	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL2, the transaction fails with a TRIVIAL failure cause.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT0, bit [50]**When FEAT_TME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Forces a trivial implementation of the Transactional Memory Extension at EL0.

TMT0	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_TME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

TWEDEL, bits [49:46]**When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR_EL2.nTWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

TWEDn, bit [45]

When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR_EL2.nTWE.

TWEDn	Meaning
0b0	The delay for taking a WFE trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL2.TWEDEL.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL2.
0b1	PSTATE.SSBS is set to 1 on an exception to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL2.

When [SCR_EL3.ATA](#) is 1, controls access to Allocation Tags and Tag Check operations in EL2.

ATA	Meaning
0b0	Access to Allocation Tags is prevented at EL2. Memory accesses at EL2 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL2. Tag Checked memory accesses at EL2 are subject to a Tag Check operation. The Tag Check operation depends on the type of tag at the memory being accessed: <ul style="list-style-type: none"> For Allocation Tagged memory, an Allocation Tag Check operation. If FEAT_MTE_CANONICAL_TAGS is implemented, for Canonically Tagged memory, a Canonical Tag Check operation.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]

When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Allocation Tag Access in EL0.

When [SCR_EL3.ATA](#) is 1, controls access to Allocation Tags and Tag Check operations in EL0.

ATA0	Meaning
0b0	Access to Allocation Tags is prevented at EL0. Memory accesses at EL0 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL0. Tag Checked memory accesses at EL0 are subject to a Tag Check operation. The Tag Check operation depends on the type of tag at the memory being accessed: <ul style="list-style-type: none"> For Allocation Tagged memory, an Allocation Tag Check operation. If FEAT_MTE_CANONICAL_TAGS is implemented, for Canonically Tagged memory, a Canonical Tag Check operation.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]**When FEAT_MTE2 is implemented:**

Tag Check Fault in EL2. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]**When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Tag Check Fault in EL0. Controls the effect of Tag Check Faults due to Loads and Stores in EL0.

TCF0	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]**When FEAT_MTE2 is implemented:**

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL2, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into [TFSRE0_EL1](#), [TFSR_EL1](#) and [TFSR_EL2](#) registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL2.
0b1	Tag Check Faults are synchronized on entry to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]**When FEAT_BTI is implemented:**

PAC Branch Type compatibility at EL2.

When [HCR_EL2](#).{E2H, TGE} == {1, 1}, this bit is named BT1.

BT	Meaning
0b0	When the PE is executing at EL2, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]**When FEAT_BTI is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

PAC Branch Type compatibility at EL0.

BT0	Meaning
0b0	When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_BTI is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

Bit [34]

Reserved, RES0.

MSCEn, bit [33]

When FEAT_MOPS is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Memory Copy and Memory Set instructions Enable. Enables execution of the Memory Copy and Memory Set instructions at EL0.

MSCEn	Meaning
0b0	Execution of the Memory Copy and Memory Set instructions is UNDEFINED at EL0.
0b1	This control does not cause any instructions to be UNDEFINED.

When FEAT_MOPS is implemented and [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_MOPS is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

CMOW, bit [32]

When FEAT_CMOW is implemented and HCR_EL2.E2H == 1:

Controls cache maintenance instruction permission for the following instructions executed at EL0.

- [IC IVAU](#), [DC CIVAC](#), [DC CIGDVAC](#) and [DC CIGVAC](#).

CMOW	Meaning
0b0	These instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, do not generate a stage 1 permission fault.
0b1	If enabled as a result of SCTLR_EL2.UCI =1, these instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, generate a stage 1 permission fault.

When [HCR_EL2.TGE](#) is 0, this bit has no effect on execution at EL0.

For this control, stage 1 has write permission if all of the following apply:

- AP[2] is 0 or DBM is 1 in the stage 1 descriptor.
- Where APTable is in use, APTable[1] is 0 for all levels of the translation table.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]**When FEAT_PAAuth is implemented:**

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]**When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]**When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES1.

EnDA, bit [27]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]**When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Traps execution of cache maintenance instructions at EL0 to EL2, from AArch64 state only. This applies to [DC CVAU](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#), and [IC IVAU](#).

If FEAT_DPB2 is implemented, this trap also applies to [DC CVADP](#).

If FEAT_MTE is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#), and [DC CGDVAP](#).

If FEAT_DPB2 and FEAT_MTE are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

UCI	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are little-endian.
0b1	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]**When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Endianness of data accesses at EL0.

E0E	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0, then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0, then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

SPAN, bit [23]**When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Set Privileged Access Never, on taking an exception to EL2.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 on taking an exception to EL2.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES1.

EIS, bit [22]**When FEAT_ExS is implemented:**

Exception entry is a context synchronization event.

EIS	Meaning
0b0	The taking of an exception to EL2 is not a context synchronization event.
0b1	The taking of an exception to EL2 is a context synchronization event.

If SCTLR_EL2.EIS is set to 0b0:

- Indirect writes to [ESR_EL2](#), [FAR_EL2](#), [SPSR_EL2](#), [ELR_EL2](#), and [HPFAR_EL2](#) are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]**When FEAT_IESB is implemented:**

Implicit Error Synchronization event enable.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: <ul style="list-style-type: none"> • At each exception taken to EL2. • Before the operational pseudocode of each ERET instruction executed at EL2.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented), HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

TSCXT	Meaning
0b0	EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.
0b1	EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL2, and the SCXTNUM_EL0 value is treated as 0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_CSV2_2 is not implemented, FEAT_CSV2_1p2 is not implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES1.

When (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented), HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of WFE instructions at EL0 to EL2, from both Execution states.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES1.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of WFI instructions at EL0 to EL2, from both Execution states.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES1.

UCT, bit [15]**When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Traps EL0 accesses to the [CTR_ELO](#) to EL2, from AArch64 state only.

UCT	Meaning
0b0	Accesses to the CTR_ELO from EL0 using AArch64 are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

DZE, bit [14]**When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Traps execution of [DC ZVA](#) instructions at EL0 to EL2, from AArch64 state only.

If FEAT_MTE is implemented, this trap also applies to [DC GVA](#) and [DC GZVA](#).

DZE	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading DCZID_ELO .DZP from EL0 returns 1, indicating that the instructions that this trap applies to are not supported.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

EnDB, bit [13]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2 and, when EL2 is enabled in the current Security state and [HCR_EL2](#).{E2H,TGE} == {1,1}, EL0.

I	Meaning
0b0	All instruction accesses to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. When EL2 is enabled in the current Security state and HCR_EL2 .{E2H, TGE} == {1, 1}, all instruction accesses to Normal memory from EL0 are Non-cacheable for all levels of instruction and unified cache. If SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and, when EL2 is enabled in the current Security state and HCR_EL2 .{E2H, TGE} == {1, 1}, instruction access to Normal memory from EL0. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL3 translation regime.

When EL2 is disabled in the current Security state or [HCR_EL2](#).{E2H,TGE} != {1,1}, this bit has no effect on the EL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

EOS, bit [11]

When FEAT_ExS is implemented:

Exception exit is a context synchronization event.

EOS	Meaning
0b0	An exception return from EL2 is not a context synchronization event.
0b1	An exception return from EL2 is a context synchronization event.

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from [SPSR_EL2](#) and [ELR_EL2](#) on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]

When FEAT_SPECRES is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Enable EL0 ~~access~~Access to the following ~~System~~ instructions:

- ~~CFPRCTX, DVPRCTX and CPPRCTX~~ ~~AArch32 CFPRCTX, DVPRCTX and CPPRCTX~~ instructions.
- ~~If AArch64 FEAT_SPECRES2 is implemented, DVP RCT and CPP RCTX instructions.~~
~~COSPRCTX.~~
- ~~CFP RCTX, DVP RCTX and CPP RCTX~~ instructions.
- ~~If FEAT_SPECRES2 is implemented, COSP RCTX.~~

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1.
0b1	EL0 access to these instructions is enabled.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_SPECRES is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL0 using AArch32.
0b1	SETEND instructions are UNDEFINED at EL0 using AArch32.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES1.

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

ITD, bit [7]

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL0 using AArch32.
0b1	<p>Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:</p> <ul style="list-style-type: none"> All encodings of the IT instruction with hw1[3:0] != 1000. All encodings of the subsequent instruction with the following values for hw1: <ul style="list-style-type: none"> 0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'. 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm] 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn. <p>These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.</p> <p>It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:</p> <ul style="list-style-type: none"> A 16-bit instruction, that can only be followed by another 16-bit instruction. The first half of a 32-bit instruction. <p>This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.</p> <p>An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</p>

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR_EL2 then it must also be implemented in the [SCTLR_EL1](#), [HSCTLR](#), and [SCTLR](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES1.

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES0.

nAA, bit [6]**When FEAT_LSE2 is implemented:**

Non-aligned access. This bit controls generation of Alignment faults under certain conditions at EL2, and, when EL2 is enabled in the current Security state and [HCR_EL2](#).{E2H, TGE} == {1, 1}, EL0.

The following instructions generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for access:

- LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH.
- STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH

The following instructions generate an Alignment fault if all bytes being accessed for a single register are not within a single 16-byte quantity, aligned to 16 bytes for access:

- LDIAPP, LDAPR, STILP, and STLR.
- If Advanced SIMD and floating-point instructions are implemented, LDDAPUR, LDAP1, STLUR, and STL1.

nAA	Meaning
0b0	Unaligned accesses by the specified instructions generate an Alignment fault.
0b1	Unaligned accesses by the specified instructions do not generate an Alignment fault.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]**When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

CP15BEN	Meaning
0b0	EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is UNDEFINED.
0b1	EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR_EL2 then it must also be implemented in the [SCTLR_EL1](#), [HSCTLR](#), and [SCTLR](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES0.

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 0:

IGNORED.

Otherwise:

Reserved, RES1.

SA0, bit [4]**When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Data access Cacheability control, for accesses at EL2 and, when EL2 is enabled in the current Security state and [HCR_EL2](#).{E2H, TGE} == {1, 1}, EL0

C	Meaning
0b0	<p>The following are Non-cacheable for all levels of data and unified cache:</p> <ul style="list-style-type: none"> • Data accesses to Normal memory from EL2. • When HCR_EL2.{E2H, TGE} != {1, 1}, Normal memory accesses to the EL2 translation tables. • When EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}: <ul style="list-style-type: none"> ◦ Data accesses to Normal memory from EL0. ◦ Normal memory accesses to the EL2&0 translation tables.
0b1	<p>This control has no effect on the Cacheability of:</p> <ul style="list-style-type: none"> • Data access to Normal memory from EL2. • When HCR_EL2.{E2H, TGE} != {1, 1}, Normal memory accesses to the EL2 translation tables. • When EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}: <ul style="list-style-type: none"> ◦ Data accesses to Normal memory from EL0. ◦ Normal memory accesses to the EL2&0 translation tables.

This bit has no effect on the EL3 translation regime.

When EL2 is disabled in the current Security state or [HCR_EL2](#).{E2H, TGE} != {1, 1}, this bit has no effect on the EL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and, when EL2 is enabled in the current Security state and [HCR_EL2](#).{E2H, TGE} == {1, 1}, EL0.

A	Meaning
0b0	Alignment fault checking disabled when executing at EL2. When EL2 is enabled in the current Security state and HCR_EL2 .{E2H, TGE} == {1, 1}, alignment fault checking disabled when executing at EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL2. When EL2 is enabled in the current Security state and HCR_EL2 .{E2H, TGE} == {1, 1}, alignment fault checking enabled when executing at EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

If FEAT_MOPS is implemented, SETG* instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 or EL2&0 stage 1 address translation.

M	Meaning
0b0	When HCR_EL2 .{E2H, TGE} != {1, 1}, EL2 stage 1 address translation disabled. When HCR_EL2 .{E2H, TGE} == {1, 1}, EL2&0 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.
0b1	When HCR_EL2 .{E2H, TGE} != {1, 1}, EL2 stage 1 address translation enabled. When HCR_EL2 .{E2H, TGE} == {1, 1}, EL2&0 stage 1 address translation enabled.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing SCTLR_EL2

When [HCR_EL2](#).E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCTLR_EL2 or SCTLR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then

SCTLR_EL3, System Control Register (EL3)

The SCTLR_EL3 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCTLR_EL3 are UNDEFINED.

Attributes

SCTLR_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44
RES0	SPINTMASK	NMI	RES0	TCSOTME	RES0				TME	TMT	RES0	TMT	DSSBS	RES0				ATA	DSSBS
EnIA	EnIB	RES1	EnDA	RES0	EE	RES0	RES1	EIS	IESB	RES0	WXN	RES1	RES0	RES1	RES0	EnDB			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12

Bit [63]

Reserved, RES0.

SPINTMASK, bit [62] When FEAT_NMI is implemented:

SP Interrupt Mask enable. When SCTLR_EL3.NMI is 1, controls whether PSTATE.SP acts as an interrupt mask, and controls the value of PSTATE.ALLINT on taking an exception to EL3.

SPINTMASK	Meaning
0b0	Does not cause PSTATE.SP to mask interrupts. PSTATE.ALLINT is set to 1 on taking an exception to EL3.
0b1	When PSTATE.SP is 1 and execution is at EL3, an IRQ or FIQ interrupt that is targeted to EL3 is masked regardless of any denotion of Superpriority. PSTATE.ALLINT is set to 0 on taking an exception to EL3.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]**When FEAT_NMI is implemented:**

Non-maskable Interrupt enable.

NMI	Meaning
0b0	This control does not affect interrupt masking behavior.
0b1	This control enables all of the following: <ul style="list-style-type: none"> The use of the PSTATE.ALLINT interrupt mask. IRQ and FIQ interrupts to have Superpriority as an additional attribute. PSTATE.SP to be used as an interrupt mask.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

BitBits [60:54]

Reserved, RES0.

TCSO, bit [59]**When FEAT_MTE_STORE_ONLY is implemented:**

Tag Checking Store Only.

TCSO	Meaning
0b0	This field has no effect on Tag checking.
0b1	Load instructions executed in EL3 are Tag Unchecked.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [58:54]

Reserved, RES0.

TME, bit [53]**When FEAT_TME is implemented:**

Enables the Transactional Memory Extension at EL3.

TME	Meaning
0b0	Any attempt to execute a TSTART instruction at EL3 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL3.
0b1	This control does not cause any TSTART instruction to be trapped.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [52]

Reserved, RES0.

TMT, bit [51]**When FEAT_TME is implemented:**

Forces a trivial implementation of the Transactional Memory Extension at EL3.

TMT	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL3, the transaction fails with a TRIVIAL failure cause.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [50:45]

Reserved, RES0.

DSSBS, bit [44]**When FEAT_SSBS is implemented:**

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL3.
0b1	PSTATE.SSBS is set to 1 on an exception to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]**When FEAT_MTE2 is implemented:**

Allocation Tag Access in EL3.

Controls access to Allocation Tags and Tag Check operations in EL3.

ATA	Meaning
0b0	Access to Allocation Tags is prevented at EL3. Memory accesses at EL3 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL3. Tag Checked memory accesses at EL3 are subject to a Tag Check operation. The Tag Check operation depends on the type of tag at the memory being accessed: <ul style="list-style-type: none"> For Allocation Tagged memory, an Allocation Tag Check operation. If FEAT_MTE_CANONICAL_TAGS is implemented, for Canonically Tagged memory, a Canonical Tag Check operation.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:

Tag Check Fault in EL3. Controls the effect of Tag Check Faults due to Loads and Stores in EL3.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

ITFSB, bit [37]**When FEAT_MTE2 is implemented:**

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL3, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into [TFSRE0_EL1](#) and TFSR_ELx registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL3.
0b1	Tag Check Faults are synchronized on entry to EL3.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]**When FEAT_BTI is implemented:**

PAC Branch Type compatibility at EL3.

BT	Meaning
0b0	When the PE is executing at EL3, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL3, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:32]

Reserved, RES0.

EnIA, bit [31]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

For more information, see 'System register control of pointer authentication'.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When FEAT_PAAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

For more information, see 'System register control of pointer authentication'.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

When FEAT_PAAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL3 translation regime.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

For more information, see 'System register control of pointer authentication'.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian.
0b1	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bit [23]

Reserved, RES1.

EIS, bit [22]

When FEAT_ExS is implemented:

Exception Entry is Context Synchronizing.

EIS	Meaning
0b0	The taking of an exception to EL3 is not a context synchronizing event.
0b1	The taking of an exception to EL3 is a context synchronizing event.

If SCTLR_EL3.EIS is set to 0b0:

- Indirect writes to [ESR_EL3](#), [FAR_EL3](#), [SPSR_EL3](#), [ELR_EL3](#) are synchronized on exception entry to EL3, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EIS:

- Changes to the PSTATE information on entry to EL3.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Debug state exit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When FEAT_IESB is implemented:

Implicit Error Synchronization event enable.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: <ul style="list-style-type: none"> • At each exception taken to EL3. • Before the operational pseudocode of each ERET instruction executed at EL3.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field and, if implemented, [SCR_EL3.NMEA](#). If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.

When FEAT_DoubleFault is implemented, the PE is in Non-debug state, and the Effective value of [SCR_EL3.NMEA](#) is 1, this field is ignored and its Effective value is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.

This bit applies only when SCTLR_EL3.M bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:14]

Reserved, RES0.

EnDB, bit [13]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL3 translation regime.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

For more information, see 'System register control of pointer authentication'.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

I	Meaning
0b0	All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL3. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

EOS, bit [11]**When FEAT_ExS is implemented:**

Exception Exit is Context Synchronizing.

EOS	Meaning
0b0	An exception return from EL3 is not a context synchronizing event
0b1	An exception return from EL3 is a context synchronizing event

If SCTLR_EL3.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EOS:

- The indirect write of the PSTATE and PC values from [SPSR_EL3](#) and [ELR_EL3](#) on exception return is synchronized.
- If the PE enters Debug state before the first instruction after an Exception return from EL3 to Non-secure state, any pending Halting debug event completes execution.
- The GIC behavior that allocates interrupts to FIQ or IRQ changes simultaneously with leaving the EL3 Exception level.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [10:7]

Reserved, RES0.

nAA, bit [6]**When FEAT_LSE2 is implemented:**

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions. The following instructions generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for access:

- LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH.
- STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH

The following instructions generate an Alignment fault if all bytes being accessed for a single register are not within a single 16-byte quantity, aligned to 16 bytes for access:

- LDIAPP, LDAPR, STILP, and STLR.
- If Advanced SIMD and floating-point instructions are implemented, LDDAPUR, LDAP1, STLUR, and STL1.

nAA	Meaning
0b0	Unaligned accesses by the specified instructions generate an Alignment fault.
0b1	Unaligned accesses by the specified instructions do not generate an Alignment fault.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	This control has no effect on the Cacheability of: <ul style="list-style-type: none"> Data access to Normal memory from EL3. Normal memory accesses to the EL3 translation tables.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

A	Meaning
0b0	Alignment fault checking disabled when executing at EL3. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL3. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

If FEAT_MOPS is implemented, SETG* instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL3 stage 1 address translation disabled. See the SCTLR_EL3.I field for the behavior of instruction accesses to Normal memory.
0b1	EL3 stage 1 address translation enabled.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Accessing SCTLR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL3

SCXTNUM_EL0, EL0 Read/Write Software Context Number

The SCXTNUM_EL0 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL0 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configuration

This register is present only when FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented. Otherwise, direct accesses to SCXTNUM_EL0 are UNDEFINED.

Attributes

SCXTNUM_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

SCXTNUM_EL1, EL1 Read/Write Software Context Number

The SCXTNUM_EL1 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL1 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configuration

This register is present only when FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented. Otherwise, direct accesses to SCXTNUM_EL1 are UNDEFINED.

Attributes

SCXTNUM_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

SCXTNUM_EL2, EL2 Read/Write Software Context Number

The SCXTNUM_EL2 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL2 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configuration

This register is present only when FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented. Otherwise, direct accesses to SCXTNUM_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SCXTNUM_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:0]

Software Context Number. A number to identify the context within the EL2 exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCXTNUM_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic SCXTNUM_EL2 or SCXTNUM_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCXTNUM_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1101	0b0000	0b111

Otherwise:

Reserved, RES0.

EZT0, Bits bit [30:9]
When FEAT_SME2 is implemented:

Traps execution at EL1 and EL0 of the LDR, LUT12, LUT14, MOVT, STR, and ZERO instructions that access the ZT0 register to EL1, or to EL2 when EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE is 1.

The exception is reported using ESR_EL1.EC or ESR_EL2.EC value 0x1D, with an ISS code of 0x0000004, at a lower priority than a trap due to PSTATE.SM or PSTATE.ZA.

EZT0	Meaning
0b0	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b1	This control does not cause execution of any instruction to be trapped.

Changes to this field only affect whether instructions that access ZT0 are trapped. They do not affect the contents of ZT0, which remain valid so long as PSTATE.ZA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Streaming SVE vector length (SVL) at EL1 of (LEN+1)*128 bits. This field also defines the Effective Streaming SVE vector length at EL0 when EL2 is not implemented, or EL2 is not enabled in the current Security state, or HCR_EL2.{E2H,TGE} is not {1,1}.

The Streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support any subset of the architecturally permitted lengths.

When the PE is in Streaming SVE mode, the Effective SVE vector length (VL) is equal to SVL.

When FEAT_SVE is implemented, and the PE is not in Streaming SVE mode, VL is equal to the Effective Non-streaming SVE vector length. See ZCR_EL1.

For all purposes other than returning the result of a direct read of SMCR_EL1, the PE selects the Effective Streaming SVE vector length by performing checks in the following order:

- If the requested length is less than the minimum implemented Streaming SVE vector length, then the Effective length is the minimum implemented Streaming SVE vector length.
- If EL2 is implemented and enabled in the current Security state, and the requested length is greater than the Effective length at EL2, then the Effective length at EL2 is used.

3. If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.
4. Otherwise, the Effective length is the highest supported Streaming SVE vector length that is less than or equal to the requested length.

An indirect read of SMCR_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMCR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic SMCR_EL1 or SMCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMCR_EL1

Otherwise:

Reserved, RES0.

EZT0, Bits bit [30:9]
When FEAT_SME2 is implemented:

Traps execution at EL2, EL1, and EL0 of the LDR, LUTi2, LUTi4, MOVt, STR, and ZERO instructions that access the ZT0 register to EL2, when EL2 is enabled in the current Security state.

The exception is reported using [ESR_EL2](#).EC value 0x1D, with an ISS code of 0x0000004, at a lower priority than a trap due to PSTATE.SM or PSTATE.ZA.

EZT0	Meaning
0b0	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b1	This control does not cause execution of any instruction to be trapped.

Changes to this field only affect whether instructions that access ZT0 are trapped. They do not affect the contents of ZT0, which remain valid so long as PSTATE.ZA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Streaming SVE vector length (SVL) at EL2 of (LEN+1)*128 bits. This field also defines the Effective Streaming SVE vector length at EL0 when EL2 is implemented and enabled in the current Security state, and HCR_EL2.{E2H,TGE} is {1,1}.

The Streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support any subset of the architecturally permitted lengths.

When the PE is in Streaming SVE mode, the Effective SVE vector length (VL) is equal to SVL.

When FEAT_SVE is implemented, and the PE is not in Streaming SVE mode, VL is equal to the Effective Non-streaming SVE vector length. See [ZCR_EL2](#).

For all purposes other than returning the result of a direct read of SMCR_EL2, the PE selects the Effective Streaming SVE vector length by performing checks in the following order:

- If the requested length is less than the minimum implemented Streaming SVE vector length, then the Effective length is the minimum implemented Streaming SVE vector length.
- If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.

- Otherwise, the Effective length is the highest supported Streaming SVE vector length that is less than or equal to the requested length.

An indirect read of SMCR_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMCR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic SMCR_EL2 or SMCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMCR_EL2

op0	op1	CRn	CRm	op2

The SMCR_EL3 characteristics are:

Purpose

This register controls aspects of Streaming SVE that are visible at all Exception levels.

Configuration

This register is present only when FEAT_SME is implemented and EL3 is implemented. Otherwise, direct accesses to SMCR_EL3 are UNDEFINED.

This register has no effect if the PE is not in Streaming SVE mode.

Attributes

SMCR_EL3 is a 64-bit register.

Field descriptions

**Bits [63:32]**

Reserved, RES0.

FA64, bit [31]

When FEAT_SME_FA64 is implemented:

Controls whether execution of an A64 instruction is considered legal when the PE is in Streaming SVE mode.

FA64	Meaning
0b0	This control does not cause any instruction to be treated as legal in Streaming SVE mode.
0b1	This control causes all implemented A64 instructions to be treated as legal in Streaming SVE mode at EL3.

Arm recommends that portable SME software should not rely on this optional feature, and that operating systems should provide a means to test for compliance with this recommendation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EZT0, Bits bit [30:9]
When FEAT_SME2 is implemented:

Traps execution at all Exception levels of the LDR, LUTi2, LUTi4, MOVt, STR, and ZERO instructions that access the ZT0 register to EL3.

The exception is reported using [ESR_EL3](#).EC value 0x1D, with an ISS code of 0x0000004, at a lower priority than a trap due to PSTATE.SM or PSTATE.ZA.

EZT0	Meaning
0b0	This control causes execution of these instructions at all Exception levels to be trapped.
0b1	This control does not cause execution of any instruction to be trapped.

Changes to this field only affect whether instructions that access ZT0 are trapped. They do not affect the contents of ZT0, which remain valid so long as PSTATE.ZA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Streaming SVE vector length (SVL) at EL3 of (LEN+1)*128 bits.

The Streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support any subset of the architecturally permitted lengths.

When the PE is in Streaming SVE mode, the Effective SVE vector length (VL) is equal to SVL.

When FEAT_SVE is implemented, and the PE is not in Streaming SVE mode, VL is equal to the Effective Non-streaming SVE vector length. See [ZCR_EL3](#).

For all purposes other than returning the result of a direct read of SMCR_EL3, the PE selects the Effective Streaming SVE vector length by performing checks in the following order:

- If the requested length is less than the minimum implemented Streaming SVE vector length, then the Effective length is the minimum implemented Streaming SVE vector length.
- Otherwise, the Effective length is the highest supported Streaming SVE vector length that is less than or equal to the requested length.

An indirect read of SMCR_EL3.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SMPRI_EL1, Streaming Mode Priority Register

The SMPRI_EL1 characteristics are:

Purpose

Configures the streaming execution priority for instructions executed on a shared Streaming Mode Compute Unit (SMCU) when the PE is in Streaming SVE mode at any Exception Level.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMPRI_EL1 are UNDEFINED.

When [SMIDR_EL1](#).SMPS is '0', this register is RES0.

Attributes

SMPRI_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
																RES0																					
																RES0														Priority							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

Bits [63:4]

Reserved, RES0.

Priority, bits [3:0]

Streaming execution priority value.

Either this value is used directly, or it is mapped into an effective priority value using [SMPRMAP_EL2](#).

This value is used directly when any of the following are true:

- The current Exception level is EL3 or EL2.
- The current Exception level is EL1 or EL0, if EL2 is implemented and enabled in the current Security state and [HCRX_EL2](#).SMPME is '0'.
- The current Exception level is EL1 or EL0, if EL2 is either not implemented or not enabled in the current Security state.

The precise meaning and behavior of each streaming execution priority value is IMPLEMENTATION DEFINED.

In an implementation that shares execution resources between PEs, higher priority values are allocated more processing resource than other PEs configured with lower priority values in the same Priority domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SPMACCESSR_EL1, System Performance Monitors Access Register (EL1)

The SPMACCESSR_EL1 characteristics are:

Purpose

Controls access to System PMUs from EL0.

Configuration

This register is present only when FEAT_SPMU is implemented. Otherwise, direct accesses to SPMACCESSR_EL1 are UNDEFINED.

Attributes

SPMACCESSR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

P<m>, bits [2m+1:2m], for m = 31 to 0

System PMU <m> access. Controls access to System PMU <m>.

P<m>	Meaning
0b00	MRS read and MSR write System register accesses to System PMU <m> at EL0 are trapped to EL1, unless the instruction generates a higher priority exception.
0b01	MSR write System register accesses to System PMU <m> at EL0 are trapped to EL1, unless the instruction generates a higher priority exception.
0b11	This control does not cause any instructions to be trapped.

All other values are reserved.

The registers trapped by this control are:

AArch64: [SPMCNTENCLR_EL0](#), [SPMCNTENSET_EL0](#), [SPMCR_EL0](#), [SPMEVCNTR<n>_EL0](#), [SPMEVFILT2R<n>_EL0](#), [SPMEVFILTR<n>_EL0](#), [SPMEVTYPER<n>_EL0](#), [SPMOVSLR_EL0](#), and [SPMOVSSET_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPMACCESSR_EL1

Accesses to this register use the following encodings in the System register encoding space:

SPMACCESSR_EL2, System Performance Monitors Access Register (EL2)

The SPMACCESSR_EL2 characteristics are:

Purpose

Controls access to System PMUs from EL1 and EL0.

Configuration

This register is present only when FEAT_SPMU is implemented. Otherwise, direct accesses to SPMACCESSR_EL2 are UNDEFINED.

Attributes

SPMACCESSR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16																
P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

P<m>, bits [2m+1:2m], for m = 31 to 0

System PMU <m> access. Controls access to System PMU <m>.

P<m>	Meaning
0b00	MRS read and MSR write System register accesses to System PMU <m> at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.
0b01	MSR write System register accesses to System PMU <m> at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.
0b11	This control does not cause any instructions to be trapped.

All other values are reserved.

The registers trapped by this control are:

AArch64: [SPMCFGR_EL1](#), [SPMCGCR<n>_EL1](#), [SPMCNTENCLR_EL0](#), [SPMCNTENSET_EL0](#), [SPMCR_EL0](#), [SPMDEVAFF_EL1](#), [SPMDEVARCH_EL1](#), [SPMEVCNTR<n>_EL0](#), [SPMEVFILT2R<n>_EL0](#), [SPMEVFILTR<n>_EL0](#), [SPMEVTYPER<n>_EL0](#), [SPMIIDR_EL1](#), [SPMINTENCLR_EL1](#), [SPMINTENSET_EL1](#), [SPMOVSCCLR_EL0](#), [SPMOVSSSET_EL0](#), and [SPMSCR_EL1](#).

This field is ignored by the PE when EL2 is not implemented or disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPMACCESSR_EL2

When FEAT_VHE is implemented, and [HCR_EL2.E2H](#) is 1, without explicit synchronization, accesses from EL2 using the register name SPMACCESSR_EL2 or SPMACCESSR_EL1 are not guaranteed to be ordered with respect to accesses using the other register name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMACCESSR_EL2

op0	op1	CRn	CRm	op2
0b10	0b100	0b1001	0b1101	0b011

SPMCFGR_EL1, System Performance Monitors Configuration Register

The SPMCFGR_EL1 characteristics are:

Purpose

Describes the System Performance Monitor.

Configuration

This register is present only when FEAT_SPMU is implemented. Otherwise, direct accesses to SPMCFGR_EL1 are UNDEFINED.

Attributes

SPMCFGR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32																																
RES0																																																															
NCG				RES0				HDBG				TRO				SS				FZO				MSI				RAO				RES0				NA				EX				RAZ				SIZE								N							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																																

Bits [63:32]

Reserved, RES0.

NCG, bits [31:28]

Counter Groups.

Defines the number of counter groups implemented, minus one.

If this field is zero, then one counter group is implemented and [SPMCGCR<n>_EL1](#) read-as-zero.

Otherwise, for each counter group <m>, SPMCGCR<m DIV 8>_EL1.N<m MOD 8> defines the number of counters in the group.

Locating the first counter in each group depends on the number of implemented groups. Each counter group starts with counter:

- SPMEVTYPEPER<m×32>_EL0, meaning there are at most 32 counters per group, if there are 2 counter groups.
- SPMEVTYPEPER<m×16>_EL0, meaning there are at most 16 counters per group, if there are 3 or 4 counter groups.
- SPMEVTYPEPER<m×8>_EL0, meaning there are at most 8 counters per group, if there are between 5 and 8 counter groups.
- SPMEVTYPEPER<m×4>_EL0, meaning there are at most 4 counters per group, if there are more than 8 counter groups.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

TRO, bit [23]

Trace output supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SS, bit [22]

Snapshot supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

FZO, bit [21]

Freeze-on-overflow supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

MSI, bit [20]

Message-signaled interrupts supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [19]

Reserved, RAO.

Bit [18]

Reserved, RES0.

NA, bit [17]

No write access when running. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

EX, bit [16]

Export supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [15:14]

Reserved, RAZ.

SIZE, bits [13:8]

Counter size. The size of the largest implemented counter.

SIZE	Meaning
0b000111	8-bit counters.
0b001001	10-bit counters.
0b001011	12-bit counters.
0b001111	16-bit counters.
0b010011	20-bit counters.
0b010111	24-bit counters.
0b011111	32-bit counters.
0b100011	36-bit counters.
0b100111	40-bit counters.
0b101011	44-bit counters.
0b101111	48-bit counters.
0b110011	52-bit counters.
0b110111	56-bit counters.
0b111111	64-bit counters.

All other values are reserved.

Not all counters must be this size. For example, an implementation might include a mix of 32-bit and 64-bit counters.

N, bits [7:0]

Number of event counters.

Accessing SPMCFGR_EL1

To access SPMCFGR_EL1 for System PMU <s>, set [SPMSELR_EL0](#).SYSPMUSEL to s.

SPMCFGR_EL1 reads-as-zero if the System PMU selected by [SPMSELR_EL0](#).SYSPMUSEL is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMCFGR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b1001	0b1101	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    X[t, 64] = SPMCFGR_EL1[UInt(SPMSELR_EL0.SYSPMUSEL)];
elsif PSTATE.EL == EL2 then
    X[t, 64] = SPMCFGR_EL1[UInt(SPMSELR_EL0.SYSPMUSEL)];
elsif PSTATE.EL == EL3 then
    X[t, 64] = SPMCFGR_EL1[UInt(SPMSELR_EL0.SYSPMUSEL)];

```

N<m>, bits [8m+7:8m], for m = 7 to 0

Number of counters in group $n \times 8 + m$.

The maximum size of each counter group depends on the number of implemented groups and the largest implemented counter size. For more information, see [SPMCFGR_EL1.NCG](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPMCGCR<n>_EL1

To access SPMCGCR<n>_EL1 for System PMU <s>, set [SPMSELR_EL0.SYSPMUSEL](#) to s.

SPMCGCR<n>_EL1 reads-as-zero if any of the following are true:

- The System PMU selected by [SPMSELR_EL0.SYSPMUSEL](#) is not implemented.
- [SPMCFGR_EL1.NCG](#) is zero.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMCGCR<n>_EL1 ; Where n = 0-1

op0	op1	CRn	CRm	op2
0b10	0b000	0b1001	0b1101	0b00:n[0]

```
integer n = UInt(op2<0>);  
  
if PSTATE.EL == EL0 then  
    UNDEFINED;  
elsif PSTATE.EL == EL1 then  
    X[t, 64] = SPMCGCR_EL1[UInt(SPMSELR_EL0.SYSPMUSEL)];  
elsif PSTATE.EL == EL2 then  
    X[t, 64] = SPMCGCR_EL1[UInt(SPMSELR_EL0.SYSPMUSEL)];  
elsif PSTATE.EL == EL3 then  
    X[t, 64] = SPMCGCR_EL1[UInt(SPMSELR_EL0.SYSPMUSEL)];
```

SPMCR_EL0, System Performance Monitor Control Register

The SPMCR_EL0 characteristics are:

Purpose

Main control register for the System Performance Monitors.

Configuration

This register is present only when FEAT_SPMU is implemented. Otherwise, direct accesses to SPMCR_EL0 are UNDEFINED.

Attributes

SPMCR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
																RES0																	
RES0												TRO				HDBG				FZONA				RES0				EX		RES0		P	E
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:12]

Reserved, RES0.

TRO, bit [11]

When SPMCFGR_EL1.TRO == 1:

Trace enable. For more information on this field, see 'CoreSight PMU Architecture'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When PSTATE.EL == EL0, access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

HDBG, bit [10]

When SPMCFGR_EL1.HDBG == 1:

Halt-on-debug. For more information on this field, see 'CoreSight PMU Architecture'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When PSTATE.EL == EL0, access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

FZO, bit [9]

When SPMCFGR_EL1.FZO == 1:

Freeze-on-overflow. For more information on this field, see 'CoreSight PMU Architecture'.

Note that, if implemented by a System PMU, then freeze-on-overflow affects only the counters of that System PMU, not other System PMUs nor the PE PMU.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NA, bit [8]

When SPMCFGR_EL1.NA == 1:

Not accessible. For more information on this field, see 'CoreSight PMU Architecture'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [7:5]

Reserved, RES0.

EX, bit [4]

When SPMCFGR_EL1.EX == 1:

Export enable. For more information on this field, see 'CoreSight PMU Architecture'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [3:2]

Reserved, RES0.

P, bit [1]

Event counter reset.

P	Meaning
0b0	Write is ignored.
0b1	Reset all event counters to zero. If the cycle counter is implemented, the cycle counter is not reset.

Note

Resetting the event counters does not affect any overflow flags.

Access to this field is **WO/RAZ**.

E, bit [0]

Count enable. This bit controls the System Performance Monitor.

E	Meaning
0b0	Monitor is disabled.
0b1	Monitor is enabled.

Performance monitor overflow IRQs are only signaled when this bit is set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing SPMCR_EL0

To access SPMCR_EL0 for System PMU <s>, set [SPMSELR_EL0](#).SYSPMUSEL to s.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMCR_EL0

op0	op1	CRn	CRm	op2
0b10	0b011	0b1001	0b1100	0b000

```

if PSTATE.EL == EL0 then
    X[t, 64] = SPMCR_EL0[UInt(SPMSELR_EL0.SYSPMUSEL)];
elsif PSTATE.EL == EL1 then
    X[t, 64] = SPMCR_EL0[UInt(SPMSELR_EL0.SYSPMUSEL)];
elsif PSTATE.EL == EL2 then
    X[t, 64] = SPMCR_EL0[UInt(SPMSELR_EL0.SYSPMUSEL)];
elsif PSTATE.EL == EL3 then
    X[t, 64] = SPMCR_EL0[UInt(SPMSELR_EL0.SYSPMUSEL)];

```

MSR SPMCR_EL0, <Xt>

op0	op1	CRn	CRm	op2
0b10	0b011	0b1001	0b1100	0b000

```

if PSTATE.EL == EL0 then
    SPMCR_EL0[UInt(SPMSELR_EL0.SYSPMUSEL)] = X[t, 64];
elsif PSTATE.EL == EL1 then
    SPMCR_EL0[UInt(SPMSELR_EL0.SYSPMUSEL)] = X[t, 64];
elsif PSTATE.EL == EL2 then
    SPMCR_EL0[UInt(SPMSELR_EL0.SYSPMUSEL)] = X[t, 64];
elsif PSTATE.EL == EL3 then
    SPMCR_EL0[UInt(SPMSELR_EL0.SYSPMUSEL)] = X[t, 64];

```

SPMDEVAFF_EL1, System Performance Monitors Device Affinity Register

The SPMDEVAFF_EL1 characteristics are:

Purpose

For additional information, see the CoreSight Architecture Specification.

For a System PMU that has affinity with a single PE or a group of PEs, SPMDEVAFF_EL1 is a copy of [MPIDR_EL1](#) or part of [MPIDR_EL1](#):

- If the System PMU has affinity with a single PE, the affinity level is 0, then SPMDEVAFF_EL1 reads the same value as [MPIDR_EL1](#), and SPMDEVAFF_EL1.FOV reads-as-one to indicate affinity level 0.
- If the System PMU has affinity with a group of PEs, the affinity level is 1, 2, or 3, then parts of SPMDEVAFF_EL1 reads the same value as parts of [MPIDR_EL1](#), and the rest of SPMDEVAFF_EL1 indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1 then all of the following are true:

- All the PEs in the group have the same values in [MPIDR_EL1](#).{Aff3,Aff2}, and these values are equal to SPMDEVAFF_EL1.{Aff3,Aff2}.
- SPMDEVAFF_EL1.Aff1 is nonzero and not 0x80, and SPMDEVAFF_EL1.{Aff0,FOV} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the System PMU has affinity with is indicated by the least-significant set bit in SPMDEVAFF_EL1.Aff1. In this example, if SPMDEVAFF_EL1.Aff1[2:0] is 0b100, then the System PMU has affinity with the up-to 8 PEs that have [MPIDR_EL1](#).Aff1[7:3] == SPMDEVAFF_EL1.Aff1[7:3].

Depending on the IMPLEMENTATION DEFINED nature of the system, it might be possible that SPMDEVAFF_EL1 is read before system firmware has configured the System PMU and/or the PE or group of PEs that the System PMU has affinity with. When this is the case, SPMDEVAFF_EL1 reads as zero.

Configuration

This register is present only when FEAT_SPMU is implemented. Otherwise, direct accesses to SPMDEVAFF_EL1 are UNDEFINED.

Attributes

SPMDEVAFF_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																								Aff3

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

PE affinity level 3. The [MPIDR_EL1](#).Aff3 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

F0V, bit [31]

Indicates that the SPMDEVAFF_EL1.Aff0 field is valid.

F0V	Meaning
0b0	SPMDEVAFF_EL1.Aff0 is not valid, and the PE affinity is above level 0 or a subset of level 0.
0b1	SPMDEVAFF_EL1.Aff0 is valid, and the PE affinity is at level 0.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

U, bit [30]

When SPMDEVAFF_EL1.F0V == 1:

Uniprocessor. The [MPIDR_EL1](#).U field, viewed from the highest Exception level of the associated PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, UNKNOWN.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

When SPMDEVAFF_EL1.F0V == 1:

Multithreaded. The [MPIDR_EL1](#).MT field, viewed from the highest Exception level of the associated PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, UNKNOWN.

Aff2, bits [23:16]

When affine with a PE or PEs at affinity level 2 or below:

PE affinity level 2. The [MPIDR_EL1](#).Aff2 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

When affine with a sub-set of PEs at affinity level 2:

PE affinity level 2. Defines part of the [MPIDR_EL1](#).Aff2 field, viewed from the highest Exception level of the associated PEs.

Aff2	Meaning
0bxxxxxxx1	SPMDEVAFF_EL1.Aff2[7:1] is the value of MPIDR_EL1 .Aff2[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	SPMDEVAFF_EL1.Aff2[7:2] is the value of MPIDR_EL1 .Aff2[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	SPMDEVAFF_EL1.Aff2[7:3] is the value of MPIDR_EL1 .Aff2[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	SPMDEVAFF_EL1.Aff2[7:4] is the value of MPIDR_EL1 .Aff2[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	SPMDEVAFF_EL1.Aff2[7:5] is the value of MPIDR_EL1 .Aff2[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	SPMDEVAFF_EL1.Aff2[7:6] is the value of MPIDR_EL1 .Aff2[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	SPMDEVAFF_EL1.Aff2[7] is the value of MPIDR_EL1 .Aff2[7], viewed from the highest Exception level of the associated PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

PE affinity level NOT DEFINED. Indicates whether the PE affinity is at level 3.

Aff2	Meaning
0x80	PE affinity is at level 3.

All other values are reserved.

Access to this field is **RO**.

Aff1, bits [15:8]**When affine with a PE or PEs at affinity level 1 or below:**

PE affinity level 1. The [MPIDR_EL1](#).Aff1 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

When affine with a sub-set of PEs at affinity level 1:

PE affinity level 1. Defines part of the [MPIDR_EL1](#).Aff1 field, viewed from the highest Exception level of the associated PEs.

Aff1	Meaning
0bxxxxxxx1	SPMDEVAFF_EL1.Aff1[7:1] is the value of MPIDR_EL1 .Aff1[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	SPMDEVAFF_EL1.Aff1[7:2] is the value of MPIDR_EL1 .Aff1[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	SPMDEVAFF_EL1.Aff1[7:3] is the value of MPIDR_EL1 .Aff1[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	SPMDEVAFF_EL1.Aff1[7:4] is the value of MPIDR_EL1 .Aff1[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	SPMDEVAFF_EL1.Aff1[7:5] is the value of MPIDR_EL1 .Aff1[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	SPMDEVAFF_EL1.Aff1[7:6] is the value of MPIDR_EL1 .Aff1[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	SPMDEVAFF_EL1.Aff1[7] is the value of MPIDR_EL1 .Aff1[7], viewed from the highest Exception level of the associated PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

PE affinity level 1. Indicates whether the PE affinity is at level 2.

Aff1	Meaning
0x00	PE affinity is above level 2 or a subset of level 2.
0x80	PE affinity is at level 2.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Aff0, bits [7:0]

When affine with a PE at affinity level 0:

PE affinity level 0. The [MPIDR_EL1](#).Aff0 field, viewed from the highest Exception level of the associated PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

When affine with a sub-set of PEs at affinity level 0:

PE affinity level 0. Defines part of the [MPIDR_EL1](#).Aff0 field, viewed from the highest Exception level of the associated PEs.

Aff0	Meaning
0bxxxxxxx1	SPMDEVAFF_EL1.Aff0[7:1] is the value of MPIDR_EL1 .Aff0[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	SPMDEVAFF_EL1.Aff0[7:2] is the value of MPIDR_EL1 .Aff0[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	SPMDEVAFF_EL1.Aff0[7:3] is the value of MPIDR_EL1 .Aff0[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	SPMDEVAFF_EL1.Aff0[7:4] is the value of MPIDR_EL1 .Aff0[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	SPMDEVAFF_EL1.Aff0[7:5] is the value of MPIDR_EL1 .Aff0[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	SPMDEVAFF_EL1.Aff0[7:6] is the value of MPIDR_EL1 .Aff0[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	SPMDEVAFF_EL1.Aff0[7] is the value of MPIDR_EL1 .Aff0[7], viewed from the highest Exception level of the associated PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

PE affinity level 0. Indicates whether the PE affinity is at level 1.

Aff0	Meaning
0x00	PE affinity is above level 1 or a subset of level 1.
0x80	PE affinity is at level 1.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing SPMDEVAFF_EL1

Reads of SPMDEVAFF_EL1 are not affected by the value of [VMPIDR_EL2](#) at any Exception level.

If the System PMU has affinity only with this PE, then it is IMPLEMENTATION DEFINED whether SPMDEVAFF_EL1 reads-as-zero or reads the same value as [MPIDR_EL1](#).

To access SPMDEVAFF_EL1 for System PMU <s>, set [SPMSELR_EL0](#).SYSPMUSEL to s.

SPMDEVAFF_EL1 reads-as-zero if the System PMU selected by [SPMSELR_EL0](#).SYSPMUSEL is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMDEVAFF_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b1001	0b1101	0b110

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    X[t, 64] = SPMDEVAFF_EL1;
elsif PSTATE.EL == EL2 then
    X[t, 64] = SPMDEVAFF_EL1;
elsif PSTATE.EL == EL3 then
    X[t, 64] = SPMDEVAFF_EL1;
```

SPMDEVARCH_EL1, System Performance Monitors Device Architecture Register

The SPMDEVARCH_EL1 characteristics are:

Purpose

Provides discovery information for the component.

Configuration

This register is present only when FEAT_SPMU is implemented. Otherwise, direct accesses to SPMDEVARCH_EL1 are UNDEFINED.

Attributes

SPMDEVARCH_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
ARCHITECT											PRESENT	REVISION				ARCHVER				ARCHPART											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PRESENT, bit [20]

DEVARCH present. Defines that SPMDEVARCH_EL1 register is present.

PRESENT	Meaning
0b0	Device Architecture information not present.
0b1	Device Architecture information present.

This bit reads as 1.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

SPMDEVARCH_EL1.ARCHVER and SPMDEVARCH_EL1.ARCHPART are also defined as a single field, SPMDEVARCH_EL1.ARCHID, so that SPMDEVARCH_EL1.ARCHVER is SPMDEVARCH_EL1.ARCHID[15:12].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

SPMDEVARCH_EL1.ARCHVER and SPMDEVARCH_EL1.ARCHPART are also defined as a single field, SPMDEVARCH_EL1.ARCHID, so that SPMDEVARCH_EL1.ARCHPART is SPMDEVARCH_EL1.ARCHID[11:0].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing SPMDEVARCH_EL1

To access SPMDEVARCH_EL1 for System PMU <s>, set [SPMSELR_EL0](#).SYSPMUSEL to s.

SPMDEVARCH_EL1 reads-as-zero if the System PMU selected by [SPMSELR_EL0](#).SYSPMUSEL is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMDEVARCH_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b1001	0b1101	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    X[t, 64] = SPMDEVARCH_EL1[UInt(SPMSELR_EL0.SYSPMUSEL)];
elsif PSTATE.EL == EL2 then
    X[t, 64] = SPMDEVARCH_EL1[UInt(SPMSELR_EL0.SYSPMUSEL)];
elsif PSTATE.EL == EL3 then
    X[t, 64] = SPMDEVARCH_EL1[UInt(SPMSELR_EL0.SYSPMUSEL)];

```

SPMEVCNTR<n>_EL0, System Performance Monitors Event Count Register, n = 0 - 63

The SPMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 15.

Configuration

This register is present only when FEAT_SPMU is implemented. Otherwise, direct accesses to SPMEVCNTR<n>_EL0 are UNDEFINED.

Attributes

SPMEVCNTR<n>_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

CNTR																															

CNTR, bits [63:0]

Event counter n.

The number of implemented bits for SPMEVCNTR<n>_EL0 is IMPLEMENTATION DEFINED. Unimplemented bits are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPMEVCNTR<n>_EL0

To access SPMEVCNTR<n>_EL0 for System PMU <s>, set [SPMSELR_EL0](#).SYSPMUSEL to s and [SPMSELR_EL0](#).BANK to n[5:4].

SPMEVCNTR<n>_EL0 reads-as-zero and ignores writes if event counter <n> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMEVCNTR<m>_EL0 ; Where m = 0-15

op0	op1	CRn	CRm	op2

SPMEVTYPEPER<n>_EL0, System Performance Monitors Event Type Register, n = 0 - 63

The SPMEVTYPEPER<n>_EL0 characteristics are:

Purpose

Configures which event increments the event counter [SPMEVCNTR<n>_EL0](#), or to read the current configuration.

The contents of this register are IMPLEMENTATION DEFINED. An Event Type Select Register typically contains:

- A field defining the event that the counter is responsive to, in the least-significant bits.
- Controls for per-counter filtering, such as by mode or state.
- Additional controls, such as for a per-counter state machine.

Additional controls might also be provided in the [SPMEVFILTR<n>_EL0](#) and [SPMEVFILT2R<n>_EL0](#) registers.

Configuration

This register is present only when FEAT_SPMU is implemented. Otherwise, direct accesses to SPMEVTYPEPER<n>_EL0 are UNDEFINED.

Attributes

SPMEVTYPEPER<n>_EL0 is a 64-bit register.

Field descriptions

SPMIIDR_EL1, Implementation Identification Register

The SPMIIDR_EL1 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

This register is present only when FEAT_SPMU is implemented. Otherwise, direct accesses to SPMIIDR_EL1 are UNDEFINED.

Attributes

SPMIIDR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																			
ProductID																Variant				Revision				Implementer[10:7]				RES0		Implementer[6:0]					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:32]

Reserved, RES0.

ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [19:16]

Component major revision.

Defines either a variant of the component defined by SPMIIDR_EL1.ProductID, or the major revision of the component.

When defining a major revision, SPMIIDR_EL1.Variant and SPMIIDR_EL1.Revision together form the revision number of the component, with SPMIIDR_EL1.Variant being the most significant part and SPMIIDR_EL1.Revision the least significant part. When a component is changed, SPMIIDR_EL1.Variant or SPMIIDR_EL1.Revision is increased to ensure that software can differentiate the different revisions of the component. If SPMIIDR_EL1.Variant is increased then SPMIIDR_EL1.Revision should be set to 0b0000.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Component minor revision.

When a component is changed:

- If SPMIIDR_EL1.Variant and SPMIIDR_EL1.Revision together form the revision number of the component then:
 - SPMIIDR_EL1.Variant or SPMIIDR_EL1.Revision is increased to ensure that software can differentiate the different revisions of the component.
 - If Variant is increased then Revision should be set to 0b0000.
- Otherwise, SPMIIDR_EL1.Revision is increased to ensure that software can differentiate the different revisions of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:8, 6:0]

JEDEC-assigned JEP106 identification code of the designer of the component.

SPMIIDR_EL1[11:8] is the JEP106 bank identifier minus 1 and SPMIIDR_EL1[6:0] is the JEP106 identification code for the designer of the component. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For example, for a component designed by Arm Limited, the JEP106 bank is 5, and the JEP106 identification code is 0x3B, meaning SPMIIDR_EL1[11:0] has the value 0x43B.

Zero is not a valid JEP106 identification code, meaning a value of zero for SPMIIDR_EL1 indicates this register is not implemented.

This field has an IMPLEMENTATION DEFINED value.

The Implementer field is split as follows:

- Implementer[10:7] is SPMIIDR_EL1[11:8].
- Implementer[6:0] is SPMIIDR_EL1[6:0].

Access to this field is **RO**.

Bit [7]

Reserved, RES0.

Accessing SPMIIDR_EL1

To access SPMIIDR_EL1 for System PMU <s>, set [SPMSELR_EL0](#).SYSPMUSEL to s.

SPMIIDR_EL1 reads-as-zero if the System PMU selected by [SPMSELR_EL0](#).SYSPMUSEL is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMIIDR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b1001	0b1101	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    X[t, 64] = SPMIIDR_EL1[UInt(SPMSELR_EL0.SYSPMUSEL)];
elsif PSTATE.EL == EL2 then
    X[t, 64] = SPMIIDR_EL1[UInt(SPMSELR_EL0.SYSPMUSEL)];
elsif PSTATE.EL == EL3 then
    X[t, 64] = SPMIIDR_EL1[UInt(SPMSELR_EL0.SYSPMUSEL)];
```

SPMINTENCLR_EL1, System Performance Monitors Interrupt Enable Clear Register

The SPMINTENCLR_EL1 characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from implemented event counters.

Configuration

This register is present only when FEAT_SPMU is implemented. Otherwise, direct accesses to SPMINTENCLR_EL1 are UNDEFINED.

Attributes

SPMINTENCLR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34
P63	P62	P61	P60	P59	P58	P57	P56	P55	P54	P53	P52	P51	P50	P49	P48	P47	P46	P45	P44	P43	P42	P41	P40	P39	P38	P37	P36	P35	P34

IMPLEMENTATION DEFINED, bits [63:32]

IMPLEMENTATION DEFINED observation controls. Additional IMPLEMENTATION DEFINED bits to control certain types of filter or events.

IMPL, bit [31]

Indicates SPMROOTCR_EL3 is present.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

Bits [30:4]

Reserved, RES0.

NAO, bit [3]

When the System PMU can count or monitor non-attributable events:

Non-attributable Observation. Controls whether events or monitorable characteristics not attributable with any source can be monitored.

NAO	Meaning
0b0	Events not attributable with any event source are not counted.
0b1	Counting non-attributable events is not prevented by this bit.

When both SPMROOTCR_EL3 and [SPMSCR_EL1](#) are implemented, non-attributable events are counted only if both SPMROOTCR_EL3.NAO is 1 and [SPMSCR_EL1](#).{NAO, SO} is nonzero.

SPMROOTCR_EL3.NAO has the opposite reset polarity to [SPMSCR_EL1](#).NAO.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

RLO, bit [1]

Realm Observation. Controls whether events or monitorable characteristics attributable to a Realm event source can be monitored.

RLO	Meaning
0b0	Events attributable to a Realm event source are not counted.
0b1	Events attributable to a Realm event source are counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

RTO, bit [0]

Root Observation. Controls whether events or monitorable characteristics attributable to a Root event source can be monitored.

RTO	Meaning
0b0	Events attributable to a Root event source are not counted.
0b1	Events attributable to a Root event source are counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing SPMROOTCR_EL3

To access SPMROOTCR_EL3 for System PMU <s>, set [SPMSELR_EL0](#).SYSPMUSEL to s.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMROOTCR_EL3

op0	op1	CRn	CRm	op2
0b10	0b110	0b1001	0b1110	0b111

SPMSCR_EL1, System Performance Monitors Secure Control Register

The SPMSCR_EL1 characteristics are:

Purpose

Controls observability of Secure events by the System Performance Monitor, and optionally controls Secure attributes for message signaled interrupts and Non-secure access to the performance monitor registers.

Configuration

This register is present only when FEAT_SPMU is implemented. Otherwise, direct accesses to SPMSCR_EL1 are UNDEFINED.

Attributes

SPMSCR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
IMPL	RES0																										NAO	RES0	SC		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IMPLEMENTATION DEFINED, bits [63:32]

IMPLEMENTATION DEFINED observation controls. Additional IMPLEMENTATION DEFINED bits to control certain types of filter or events.

IMPL, bit [31]

Indicates SPMSCR_EL1 is present.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

Bits [30:5]

Reserved, RES0.

NAO, bit [4]

When the System PMU can count or monitor non-attributable events:

Non-attributable Observation. Controls whether events or monitorable characteristics not attributable with any source can be monitored.

NAO	Meaning
0b0	Events not attributable with any event source are not counted, unless overridden by SPMSCR_EL1.SO.
0b1	Counting non-attributable events is not prevented by this bit.

When both [SPMROOTCR_EL3](#) and SPMSCR_EL1 are implemented, non-attributable events are counted only if both [SPMROOTCR_EL3](#).NAO is 1 and SPMSCR_EL1.{NAO, SO} is nonzero.

SPMSCR_EL1.NAO has the opposite reset polarity to [SPMROOTCR_EL3](#).NAO.

This bit is optional if Root and Realm states are not implemented. When this bit is not implemented, the PMU behaves as if SPMSCR_EL1.NAO is 0, and whether events or monitorable characteristics not attributable with any source can be monitored is controlled by SPMSCR_EL1.SO.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [3:1]

Reserved, RES0.

SO, bit [0]

Secure Observation. Controls whether events or monitorable characteristics attributable to a Secure event source can be monitored.

SO	Meaning
0b0	Events attributable to a Secure event source are not counted.
0b1	Events attributable to a Secure event source are counted.

Also controls whether events or monitorable characteristics not attributable with any source can be monitored. See SPMSCR_EL1.NAO.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing SPMSCR_EL1

To access SPMSCR_EL1 for System PMU <s>, set [SPMSELR_EL0](#).SYSPMUSEL to s.

SPMSCR_EL1 is UNDEFINED if accessed in Non-secure or Realm state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMSCR_EL1

op0	op1	CRn	CRm	op2

SPMSELR_EL0, System Performance Monitors Select Register

The SPMSELR_EL0 characteristics are:

Purpose

Selects the System PMU and event counter registers to access.

Configuration

This register is present only when FEAT_SPMU is implemented. Otherwise, direct accesses to SPMSELR_EL0 are UNDEFINED.

Attributes

SPMSELR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																RES0								SYSPMUSEL				RES0		BANK	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:10]

Reserved, RES0.

SYSPMUSEL, bits [9:4]

System PMU Select. Selects a System PMU <s> to access.

Values 0x20 to 0x3F are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:2]

Reserved, RES0.

BANK, bits [1:0]

System PMU bank access control. Selects a bank of 16 System PMU event counters and related controls to access.

BANK	Meaning
0b00	Select event counters 0 to 15.
0b01	Select event counters 16 to 31.
0b10	Select event counters 32 to 47.
0b11	Select event counters 48 to 63.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPMSELR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMSELR_EL0

op0	op1	CRn	CRm	op2
0b10	0b011	0b1001	0b1100	0b101

```
if PSTATE.EL == EL0 then
    X[t, 64] = SPMSELR_EL0;
elsif PSTATE.EL == EL1 then
    X[t, 64] = SPMSELR_EL0;
elsif PSTATE.EL == EL2 then
    X[t, 64] = SPMSELR_EL0;
elsif PSTATE.EL == EL3 then
    X[t, 64] = SPMSELR_EL0;
```

MSR SPMSELR_EL0, <Xt>

op0	op1	CRn	CRm	op2
0b10	0b011	0b1001	0b1100	0b101

```
if PSTATE.EL == EL0 then
    SPMSELR_EL0 = X[t, 64];
elsif PSTATE.EL == EL1 then
    SPMSELR_EL0 = X[t, 64];
elsif PSTATE.EL == EL2 then
    SPMSELR_EL0 = X[t, 64];
elsif PSTATE.EL == EL3 then
    SPMSELR_EL0 = X[t, 64];
```

SPSR_EL1, Saved Program Status Register (EL1)

The SPSR_EL1 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL1.

Configuration

AArch64 System register SPSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [SPSR_svc\[31:0\]](#).

Attributes

SPSR_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported and exception taken from AArch32 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]	DIT	SSBS	PAN	SS	IL	GE	IT[7:2]	E	A	I	F	T	M[4]	M[3:0]												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL1, and copied to PSTATE.Q on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL1, and copied to PSTATE.IT on executing an exception return operation in EL1.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL1[26:25].
- IT[7:2] is SPSR_EL1[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL1, and copied to PSTATE.GE on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL1, and copied to PSTATE.E on executing an exception return operation in EL1.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL1, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL1, and copied to PSTATE.T on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL1 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

M[4]	Meaning
0b1	AArch32 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL1, and copied to PSTATE.M[3:0] on executing an exception return operation in EL1.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0111	Abort.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
PENDPM																															
N	Z	C	V	RES0	TCODIT	UAO	PAN	SS	IL	RES0				ALLINT	SSBS	BTYPE	D	A	I	F	RES0	M[4]	M[3:0]

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:34:32]

Reserved, RES0.

PPEND, bit [33]

When FEAT_SEBEP is implemented:

PMU exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL1, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PM, bit [32]

When FEAT_EBEP is implemented:

PMU exception mask bit. Set to the value of PSTATE.PM on taking an exception to EL1, and copied to PSTATE.PM on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL1, and copied to PSTATE.TCO on executing an exception return operation in EL1.

When FEAT_MTE2 is not implemented, it is CONSTRAINED UNPREDICTABLE whether this field is RES0 or behaves as if **FEAT_MTE2** ~~FEAT_MTE~~ is implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]**When FEAT_UAO is implemented:**

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL1, and copied to PSTATE.UAO on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

ALLINT, bit [13]**When FEAT_NMI is implemented:**

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on taking an exception to EL1, and copied to PSTATE.ALLINT on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]**When FEAT_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]**When FEAT_BTI is implemented:**

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL1, and copied to PSTATE.BTYPE on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL1, and copied to PSTATE.D on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL1 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

M[4]	Meaning
0b0	AArch64 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2]: On an exception to EL1:
 - If the Effective value of [HCR_EL2](#).{NV, NV1} != {1,0} or the exception is not taken from EL1, then M[3:2] is set to the value of PSTATE.EL on taking an exception to EL1.
 - If the Effective value of [HCR_EL2](#).{NV, NV1} == {1,0} and the exception is not taken from EL1, then M[3:2] is set to 0b10.
 - M[3:2] is copied to PSTATE.EL on executing a legal exception return operation in EL1.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL1 and copied to PSTATE.SP on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL1

When [HCR_EL2](#).E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SPSR_EL1 or SPSR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_EL1

op0	op1	CRn	CRm	op2
------------	------------	------------	------------	------------

0b11	0b000	0b0100	0b0000	0b000

SPSR_EL2, Saved Program Status Register (EL2)

The SPSR_EL2 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL2.

Configuration

AArch64 System register SPSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [SPSR_hyp\[31:0\]](#).

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SPSR_EL2 is a 64-bit register.

Field descriptions

When AArch32 is supported and exception taken from AArch32 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]	DI	SSBS	PAN	SS	IL	GE				IT[7:2]				E	A	I	F	T	M[4]				M[3:0]			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL2, and copied to PSTATE.Q on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL2, and copied to PSTATE.IT on executing an exception return operation in EL2.

SPSR_EL2.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL2[26:25].
- IT[7:2] is SPSR_EL2[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]**When FEAT_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL2, and copied to PSTATE.GE on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL2, and copied to PSTATE.E on executing an exception return operation in EL2.

If the implementation does not support big-endian operation, SPSR_EL2.E is RES0. If the implementation does not support little-endian operation, SPSR_EL2.E is RES1. On executing an exception return operation in EL2, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL2.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL2.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL2, and copied to PSTATE.T on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL2 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

M[4]	Meaning
0b1	AArch32 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL2, and copied to PSTATE.M[3:0] on executing an exception return operation in EL2.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:34:32]

Reserved, RES0.

PPEND, bit [33]

When FEAT_SEBEP is implemented:

PMU exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL2, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PM, bit [32]

When FEAT_EBEP is implemented:

PMU exception mask bit. Set to the value of PSTATE.PM on taking an exception to EL2, and copied to PSTATE.PM on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]**When FEAT_MTE is implemented:**

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL2, and copied to PSTATE.TCO on executing an exception return operation in EL2.

When FEAT_MTE2 is not implemented, it is CONSTRAINED UNPREDICTABLE whether this field is RES0 or behaves as if FEAT_MTE2 is implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]**When FEAT_UAO is implemented:**

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL2, and copied to PSTATE.UAO on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

ALLINT, bit [13]**When FEAT_NMI is implemented:**

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on taking an exception to EL2, and copied to PSTATE.ALLINT on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]**When FEAT_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]**When FEAT_BTI is implemented:**

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL2, and copied to PSTATE.BTYPE on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL2, and copied to PSTATE.D on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL2 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

M[4]	Meaning
0b0	AArch64 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.
0b1000	EL2t.
0b1001	EL2h.

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL2 and copied to PSTATE.EL on executing an exception return operation in EL2.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL2 and copied to PSTATE.SP on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic SPSR_EL2 or SPSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0000	0b000

```

SPSR_EL3, Saved Program Status Register (EL3)

The SPSR_EL3 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to SPSR_EL3 are UNDEFINED.

Attributes

SPSR_EL3 is a 64-bit register.

Field descriptions

When AArch32 is supported and exception taken from AArch32 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]	DIT	SSBS	PAN	SS	IL	GE	IT[7:2]	E	A	I	F	T	M[4]	M[3:0]												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL3 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL3, and copied to PSTATE.Q on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL3, and copied to PSTATE.IT on executing an exception return operation in EL3.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL3[26:25].
- IT[7:2] is SPSR_EL3[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL3, and copied to PSTATE.GE on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL3, and copied to PSTATE.E on executing an exception return operation in EL3.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL3, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL3, and copied to PSTATE.T on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL3 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

M[4]	Meaning
0b1	AArch32 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL3, and copied to PSTATE.M[3:0] on executing an exception return operation in EL3.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0110	Monitor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32					
RES0																															PPENDPM					
N	Z	C	V	RES0	TCODIT	UAO	PAN	SS	IL	RES0				ALLINT	SSBS	BTYPE	D	A	I	F	RES0	M[4]	M[3:0]

An exception return from EL3 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:34:32]

Reserved, RES0.

PPEND, bit [33]

When FEAT_SEBEP is implemented:

PMU exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL3, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PM, bit [32]

When FEAT_EBEP is implemented:

PMU exception mask bit. Set to the value of PSTATE.PM on taking an exception to EL3, and copied to PSTATE.PM on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]**When FEAT_MTE is implemented:**

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL3, and copied to PSTATE.TCO on executing an exception return operation in EL3.

When FEAT_MTE2 is not implemented, it is CONSTRAINED UNPREDICTABLE whether this field is RES0 or behaves as if FEAT_MTE2FEAT_MTE is implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]**When FEAT_UAO is implemented:**

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL3, and copied to PSTATE.UAO on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

ALLINT, bit [13]**When FEAT_NMI is implemented:**

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on taking an exception to EL3, and copied to PSTATE.ALLINT on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]**When FEAT_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]**When FEAT_BTI is implemented:**

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL3, and copied to PSTATE.BTYPE on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL3, and copied to PSTATE.D on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL3 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

M[4]	Meaning
0b0	AArch64 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.
0b1000	EL2t.
0b1001	EL2h.
0b1100	EL3t.
0b1101	EL3h.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL3 and copied to PSTATE.EL on executing an exception return operation in EL3.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL3 and copied to PSTATE.SP on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0100	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = SPSR_EL3;
```

MSR SPSR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0100	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SPSR_EL3 = X[t, 64];
```

SVCR, Streaming Vector Control Register

The SVCR characteristics are:

Purpose

Controls Streaming SVE mode and SME behavior.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SVCR are UNDEFINED.

Attributes

SVCR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																														ZA	SM

Bits [63:2]

Reserved, RES0.

ZA, bit [1]

Enables SME ZA storage. If FEAT_SME2 is implemented, also enables SME2 ZT0 storage.

When this storage is disabled, execution of an instruction which can access it is trapped. The exception is reported using an ESR_ELx.{EC, SMTC} value of {0x1D, 0x3}.

The possible values of this bit are:

ZA	Meaning
0b0	SME ZA storage and, if implemented, ZT0 storage are invalid and not accessible. This control causes execution at any Exception level of instructions that can access this storage to be trapped.
0b1	SME ZA storage and, if implemented, ZT0 storage are valid and accessible. This control does not cause execution of any instructions to be trapped.

When a write to SVCR.ZA changes the value of PSTATE.ZA from 0 to 1, all implemented bits of the storage following are set to zero. applies:

- When changed from 0 to 1, all implemented bits of the storage are set to zero.
- When changed from 1 to 0, there is no observable change to the storage.

Changes to this field do not have an affect on the SVE vector and predicate registers and FPSR.

Changes to this field do not have an effect on the SVE vector and predicate registers and FPSR.

A direct or indirect read of ZA appears to occur in program order relative to a direct write of SVCR, and to MSR SVCRZA and MSR SVCRSMZA instructions, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SM, bit [0]

Enables Streaming SVE mode.

When the PE is in Streaming SVE mode, the Streaming SVE vector length (SVL) applies to SVE instructions, and execution at any Exception level of an instruction which is illegal in that mode is trapped. The exception is reported using an ESR_ELx.{EC, SMTC} value of {0x1D, 0x1}.

When the PE is not in Streaming SVE mode, the SVE vector length (VL) applies to SVE instructions, and execution at any Exception level of an instruction which is only legal in that mode is trapped. The exception is reported using an ESR_ELx.{EC, SMTC} value of {0x1D, 0x2}.

The possible values of this bit are:

SM	Meaning
0b0	The PE is not in Streaming SVE mode.
0b1	The PE is in Streaming SVE mode.

When a write to SVCR.SM changes the value of PSTATE.SM, the following applies:

- When changed from 0 to 1, an entry to Streaming SVE mode is performed.
- When changed from 1 to 0, an exit from Streaming SVE mode is performed.
- All implemented bits of the SVE registers Z0-Z31, P0-P15, and FFR in the new mode are set to zero.
- [FPSR](#) in the new mode is set to 0x0000_0000_0800_009f, in which all cumulative status bits are set to 1.

Changes to this field do not have an affect on SME ZA **storage or, if implemented, ZT0** storage.

A direct or indirect read of SM appears to occur in program order relative to a direct write of SVCR, and to MSR SVCRSM and MSR SVCRSMZA instructions, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing SVCR

SVCR is read/write and can be accessed from any Exception level.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SVCR

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b010

TCO, Tag Check Override

The TCO characteristics are:

Purpose

When FEAT_MTE is implemented, this register allows tag checks to be disabled globally.

When FEAT_MTE2 is not implemented, it is CONstrained UNpredictable whether this register is RES0 or behaves as if FEAT_MTE2FEAT_MTE is implemented.

Configuration

This register is present only when FEAT_MTE is implemented. Otherwise, direct accesses to TCO are UNDEFINED.

Attributes

TCO is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

TCR2_EL1, Extended Translation Control Register (EL1)

The TCR2_EL1 characteristics are:

Purpose

The control register for stage 1 of the EL1&0 translation regime.

Configuration

This register is present only when FEAT_TCR2 is implemented. Otherwise, direct accesses to TCR2_EL1 are UNDEFINED.

Attributes

TCR2_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																DisCH1	DisCH0	RES0	HAFT	PTTWI	RES0	D128	AIE	POE	E0	POE	PIE	PnCH			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Unless stated otherwise, all the bits in [TCR2_EL1](#), when they have the value 1, are permitted to be cached in a TLB.

Bits [63:16]

Reserved, RES0.

DisCH1, bit [15]

When FEAT_D128 is implemented and TCR2_EL1.D128 == 1:

Disable Contiguous Hint for Start Table for VARange 1.

DisCH1	Meaning
0b0	Contiguous Hint of Block or Page descriptors of the Start Table for VARange 1 are not affected by this field.
0b1	Contiguous Hint of Block or Page descriptors of the Start Table for VARange 1 are disabled.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH0, bit [14]**When FEAT_D128 is implemented and TCR2_EL1.D128 == 1:**

Disable Contiguous Hint for Start Table for VARange 0.

DisCH0	Meaning
0b0	Contiguous Hint of Block or Page descriptors of the Start Table for VARange 0 are not affected by this field.
0b1	Contiguous Hint of Block or Page descriptors of the Start Table for VARange 0 are disabled.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [13:12]

Reserved, RES0.

HAFT, bit [11]**When FEAT_HAFT is implemented:**

Hardware managed Access Flag for Tables.

Enables the Hardware managed Access Flag for Tables.

HAFT	Meaning
0b0	Hardware managed Access Flag for Tables is disabled.
0b1	Hardware managed Access Flag for Tables is enabled.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]**When FEAT_THE is implemented:**

Permit Translation table walk Incoherence.

Permits RCWS instructions to have Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS at EL1&0 do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS at EL1&0 have the Reduced Coherence property if HCRX_EL2 .PTTWI is 1.

This bit is permitted to be built as a read-only bit with a fixed value of 0.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [9:6]

Reserved, RES0.

D128, bit [5]

When FEAT_D128 is implemented:

Enable 128-bit Page Table Descriptors.

Enables VMSAv9-128 translation system for the Stage 1 EL1&0 Translation Process.

D128	Meaning
0b0	Translation system follows VMSA-64 translation process.
0b1	Translation system follows VMSAv9-128 translation process.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIE, bit [4]

When FEAT_AIE is implemented:

Enable Attribute Indexing Extension. Control for Attribute Indexing Extension for Stage 1 EL1&0 Translation Process.

AIE	Meaning
0b0	Attribute Indexing Extension Disabled.
0b1	Attribute Indexing Extension Enabled.

This field is RES1 when [TCR2_EL1.D128](#) is set.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [3]**When FEAT_S1POE is implemented:**

POE. Controls setting of permission overlay for EL1 accesses in stage 1 of the EL1&0 translation regime.

POE	Meaning
0b0	Permission overlay disabled for EL1 access in stage 1 of EL1&0 translation regime.
0b1	Permission overlay enabled for EL1 access in stage 1 of EL1&0 translation regime.

This bit is not permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0POE, bit [2]**When FEAT_S1POE is implemented:**

E0POE. controls setting of permission overlay in stage 1 of the EL1 translation regime.

E0POE	Meaning
0b0	Permission overlay disabled for EL0 access in stage 1 of EL1&0 translation regime.
0b1	Permission overlay enabled for EL0 access in stage 1 of EL1&0 translation regime.

This bit is not permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIE, bit [1]**When FEAT_S1PIE is implemented:**

Select Permission Model. Controls setting of indirect permission model in Stage 1 EL1 Translation Process.

PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

This field is RES1 when [TCR2_EL1.D128](#) is set.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [0]**When FEAT_TTE is implemented:**

Protected attribute enable. Indicates use of bit[52] of the stage 1 translation table entry.

PnCH	Meaning
0b0	Bit[52] of each stage 1 translation table entry does not indicate protected attribute.
0b1	Bit[52] of each stage 1 translation table entry indicates protected attribute.

This field is RES0 when [TCR2_EL1.D128](#) is set.

The reset behavior of this field is:

- On a Warm reset:
 - When EL2 is not implemented and EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCR2_EL2, Extended Translation Control Register (EL2)

The TCR2_EL2 characteristics are:

Purpose

The control register for stage 1 of the EL2&0 translation regime.

Configuration

This register is present only when FEAT_TCR2 is implemented. Otherwise, direct accesses to TCR2_EL2 are UNDEFINED.

Attributes

TCR2_EL2 is a 64-bit register.

Field descriptions

When HCR_EL2.E2H == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
																RES0																			
RES0														AMEC1		AMEC0		HAFT		PTTWI		RES0		D128		AIE		POE		RES0		PIE		PnCH	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Unless stated otherwise, all the bits in [TCR2_EL2](#), when they have the value 1, are permitted to be cached in a TLB.

Bits [63:14]

Reserved, RES0.

AMEC1, bit [13]

When FEAT_MEC is implemented and FEAT_VHE is implemented:

This field controls the enabling of the Alternate MECID translations for the EL2&0 TTBR1 translation regime.

TCR2_EL2.AMEC1 is provided to enable the safe update of [TTBR_EL2](#) and [MECID_A_EL2](#), by disabling access and speculation to AMEC == 1 Block or Page descriptors during the update.

AMEC1	Meaning
0b0	Use of a Block or Page descriptor containing AMEC == 1 generates a Translation fault.
0b1	Accesses translated by a Block or Page descriptor containing AMEC == 1 are associated with the MECID configured in MECID_A1_EL2 .

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When IsCurrentSecurityState(SS_Secure), access to this field is **RES0**.
- When IsCurrentSecurityState(SS_NonSecure), access to this field is **RES0**.
- When SCTLR2_EL2.MECRL != 0, access to this field is **RES1**.

Otherwise:

Reserved, RES0.

AMEC0, bit [12]**When FEAT_MEC is implemented:**

This field controls the enabling of the Alternate MECID translations for the EL2 and EL2&0 TTBR0 translation regimes.

TCR2_EL2.AMEC0 is provided to enable the safe update of [TTBR_EL2](#) and [MECID_A_EL2](#), by disabling access and speculation to AMEC=1 Block or Page descriptors during the update.

AMEC0	Meaning
0b0	Use of a Block or Page descriptor containing AMEC == 1 generates a Translation fault.
0b1	Accesses translated by a Block or Page descriptor containing AMEC == 1 are associated with the MECID configured in MECID_A0_EL2 .

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When IsCurrentSecurityState(SS_Secure), access to this field is **RES0**.
- When IsCurrentSecurityState(SS_NonSecure), access to this field is **RES0**.
- When SCTLR2_EL2.MECRL != 0, access to this field is **RES1**.

Otherwise:

Reserved, RES0.

HAFT, bit [11]**When FEAT_HAFT is implemented:**

Hardware managed Access Flag for Tables.

Enables the Hardware managed Access Flag for Tables.

HAFT	Meaning
0b0	Hardware managed Access Flag for Tables is disabled.
0b1	Hardware managed Access Flag for Tables is enabled.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]**When FEAT_THE is implemented:**

Permit Translation table walk Incoherence.

Permits RCWS instructions to have Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS at EL2 or EL2&0 do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS at EL2 or EL2&0 have the Reduced Coherence property.

This bit is permitted to be built as a read-only bit with a fixed value of 0.

This field is ignored by the PE and treated as zero when [SCR_EL3.TCR2En](#) == 0.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [9:6]

Reserved, RES0.

D128, bit [5]**When FEAT_D128 is implemented:**

Enable 128-bit Page Table Descriptors.

Enables VMSAv9-128 translation system for the Stage 1 EL2 Translation Process.

D128	Meaning
0b0	Translation system follows VMSA-64 translation process.
0b1	Translation system follows VMSAv9-128 translation process.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIE, bit [4]**When FEAT_AIE is implemented:**

Enable Attribute Indexing Extension. Control for Attribute Indexing Extension for Stage 1 EL2 Translation Process.

AIE	Meaning
0b0	Attribute Indexing Extension Disabled.
0b1	Attribute Indexing Extension Enabled.

This field is RES1 when TCR2_EL2.D128 is set.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [3]

When FEAT_S1POE is implemented:

POE. Controls setting of permission overlay for EL2 accesses in stage 1 of the EL2 translation regime.

POE	Meaning
0b0	Permission overlay disabled for EL2 access in stage 1 of EL2 translation regime.
0b1	Permission overlay enabled for EL2 access in stage 1 of EL2 translation regime.

This bit is not permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

PIE, bit [1]

When FEAT_S1PIE is implemented:

Select Permission Model. Controls setting of indirect permission model in Stage 1 EL2 Translation Process.

PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

This field is RES1 when TCR2_EL2.D128 is set.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [0]**When FEAT_THE is implemented:**

Protected attribute enable. Indicates use of bit[52] of the stage 1 translation table entry.

PnCH	Meaning
0b0	Bit[52] of each stage 1 translation table entry does not indicate protected attribute.
0b1	Bit[52] of each stage 1 translation table entry indicates protected attribute.

This field is RES0 when TCR2_EL2.D128 is set.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When HCR_EL2.E2H == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
RES0																DisCH1	DisCH0	RES0	AMEC0	HAFT	PTTW	SKL1	SKL0	D128	AIE	POE	E0	POE	PIE	PnCH	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Unless stated otherwise, all the bits in [TCR2_EL2](#), when they have the value 1, are permitted to be cached in a TLB.

Bits [63:16]

Reserved, RES0.

DisCH1, bit [15]**When FEAT_D128 is implemented and TCR2_EL2.D128 == 1:**

Disable Contiguous Hint for Start Table for VARange 1.

DisCH1	Meaning
0b0	Contiguous Hint of Block or Page descriptors of the Start Table for VARange 1 are not affected by this field.
0b1	Contiguous Hint of Block or Page descriptors of the Start Table for VARange 1 are disabled.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH0, bit [14]**When FEAT_D128 is implemented and TCR2_EL2.D128 == 1:**

Disable Contiguous Hint for Start Table for VARange 0.

DisCH0	Meaning
0b0	Contiguous Hint of Block or Page descriptors of the Start Table for VARange 0 are not affected by this field.
0b1	Contiguous Hint of Block or Page descriptors of the Start Table for VARange 0 are disabled.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [13]

Reserved, RES0.

AMEC0, bit [12]**When FEAT_MEC is implemented:**

This field controls the enabling of the Alternate MECID translations for the EL2 and EL2&0 TTBR0 translation regimes.

TCR2_EL2.AMEC0 is provided to enable the safe update of [TTBR_EL2](#) and [MECID_A_EL2](#), by disabling access and speculation to AMEC=1 Block or Page descriptors during the update.

AMEC0	Meaning
0b0	Use of a Block or Page descriptor containing AMEC == 1 generates a Translation fault.
0b1	Accesses translated by a Block or Page descriptor containing AMEC == 1 are associated with the MECID configured in MECID_A0_EL2 .

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When IsCurrentSecurityState(SS_Secure), access to this field is **RES0**.
- When IsCurrentSecurityState(SS_NonSecure), access to this field is **RES0**.
- When SCTLR2_EL2.MECRL != 0, access to this field is **RES1**.

Otherwise:

Reserved, RES0.

HAFT, bit [11]**When FEAT_HAFT is implemented:**

Hardware managed Access Flag for Tables.

Enables the Hardware managed Access Flag for Tables.

HAFT	Meaning
0b0	Hardware managed Access Flag for Tables is disabled.
0b1	Hardware managed Access Flag for Tables is enabled.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]

When FEAT_THE is implemented:

Permit Translation table walk Incoherence.

Permits RCWS instructions to have Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS have the Reduced Coherence property.

This bit is permitted to be built as a read-only bit with a fixed value of 0.

This field is ignored by the PE and treated as zero when [SCR_EL3.TCR2En](#) == 0.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SKL1, bits [9:8]

When FEAT_D128 is implemented:

Skip Level associated with translation table walks using [TTBR1_EL2](#).

This determines the number of levels to be skipped in the regular start level of the Stage 1 EL2&0 translation table walks using [TTBR1_EL2](#).

SKL1	Meaning
0b00	Skip 0 level in the regular start level.
0b01	Skip 1 level in the regular start level.
0b10	Skip 2 levels in the regular start level.
0b11	Skip 3 levels in the regular start level.

This field is IGNORED when [TCR2_EL2.D128](#) is 0.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.

- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SKL0, bits [7:6]**When FEAT_D128 is implemented:**

Skip Level associated with translation table walks using [TTBR0_EL2](#).

This determines the number of levels to be skipped in the regular start level of the Stage 1 EL2&0 translation table walks using [TTBR0_EL2](#).

SKL0	Meaning
0b00	Skip 0 level in the regular start level.
0b01	Skip 1 level in the regular start level.
0b10	Skip 2 levels in the regular start level.
0b11	Skip 3 levels in the regular start level.

This field is IGNORED when [TCR2_EL2.D128](#) is 0.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D128, bit [5]**When FEAT_D128 is implemented:**

Enable 128-bit Page Table Descriptors.

Enables VMSAv9-128 translation system for the Stage 1 EL2&0 Translation Process.

D128	Meaning
0b0	Translation system follows VMSA-64 translation process.
0b1	Translation system follows VMSAv9-128 translation process.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIE, bit [4]**When FEAT_AIE is implemented:**

Enable Attribute Indexing Extension. Control for Attribute Indexing Extension for Stage 1 EL2&0 Translation Process.

AIE	Meaning
0b0	Attribute Indexing Extension Disabled.
0b1	Attribute Indexing Extension Enabled.

This field is RES1 when [TCR2_EL2.D128](#) is set.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [3]

When FEAT_S1POE is implemented:

POE. Controls setting of permission overlay for EL2 accesses in stage 1 of the EL2&0 translation regime.

POE	Meaning
0b0	Permission overlay disabled for EL2 access in stage 1 of EL2&0 translation regime.
0b1	Permission overlay enabled for EL2 access in stage 1 of EL2&0 translation regime.

This bit is not permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0POE, bit [2]

When FEAT_S1POE is implemented:

E0POE. controls setting of permission overlay in stage 1 of the EL2 translation regime.

E0POE	Meaning
0b0	Permission overlay disabled for EL0 access in stage 1 of EL2&0 translation regime.
0b1	Permission overlay enabled for EL0 access in stage 1 of EL2&0 translation regime.

This bit is not permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIE, bit [1]**When FEAT_S1PIE is implemented:**

Select Permission Model. Controls setting of indirect permission model in Stage 1 EL2 Translation Process.

PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

This field is RES1 when [TCR2_EL2](#).D128 is set.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [0]**When FEAT_THE is implemented:**

Protected attribute enable. Indicates use of bit[52] of the stage 1 translation table entry.

PnCH	Meaning
0b0	Bit[52] of each stage 1 translation table entry does not indicate protected attribute.
0b1	Bit[52] of each stage 1 translation table entry indicate protected attribute.

This field is RES1 when [TCR2_EL2](#).D128 is set.

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TCR2_EL2

When FEAT_VHE is implemented, and [HCR_EL2](#).E2H is 1, without explicit synchronization, accesses from EL2 using the register name TCR2_EL2 or TCR2_EL1 are not guaranteed to be ordered with respect to accesses using the other register name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR2_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0000	0b011

The TCR EL1 characteristics are:

Purpose

The control register for stage 1 of the EL1&0 translation regime.

Configuration

AArch64 System register TCR EL1 bits [31:0] are architecturally mapped to AArch32 System register [TTBCR\[31:0\]](#).

AArch64 System register TCR EL1 bits [63:32] are architecturally mapped to AArch32 System register [TTBCR2\[31:0\]](#).

Attributes

TCR EL1 is a 64-bit register.

Field descriptions

Any of the bits in TCR_EL1, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

Bits [63:6260]

Reserved, RES0.

MTX1, bit [61]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and tag checking when EL0 and EL1 are using AArch64 where the data address would be translated by tables pointed to by [TTBR1_EL1](#).

This control has an effect regardless of whether stage 1 of the EL1&0 translation regime is enabled or not.

MTX1	Meaning
0b0	This control has no effect on the PE.
0b1	<p>Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply:</p> <ul style="list-style-type: none"> Bits[59:56] are treated as 0b1111 when checking if the address is out of range. If FEAT_PAAuth is implemented, bits[59:56] are not part of the PAC field. A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTX0, bit [60]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and tag checking when EL0 and EL1 are using AArch64 where the data address would be translated by tables pointed to by TTBR0_EL1.

This control has an effect regardless of whether stage 1 of the EL1&0 translation regime is enabled or not.

MTX0	Meaning
0b0	This control has no effect on the PE.
0b1	Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: <ul style="list-style-type: none">Bits[59:56] are treated as 0b0000 when checking if the address is out of range.If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field.A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [59]

When FEAT_LPA2 is implemented:

This field affects whether a 52-bit output address addressing can when be using described 4KB by and the 16KB translation tables granules in stage 1 of the 4KB EL1&0 or 16KB translation granules regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in Table descriptors are ignored by hardware.</p> <p>The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p>
0b1	<p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of Translation table descriptors hold output address[51:50].</p> <p>The shareability information of Block and Page descriptors for cacheable locations is determined by:</p> <ul style="list-style-type: none"> • TCR_EL1.SH0 if the VA is translated using tables pointed to by TTBR0_EL1. • TCR_EL1.SH1 if the VA is translated using tables pointed to by TTBR1_EL1. <p>The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of TTBR0_EL1 or TTBR1_EL1 are used to hold bits[51:48] of the output address in all cases.</p> <hr/> <p>Note</p> <p>As FEAT_LVA must be implemented if TCR_EL1.DS == 1, the minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12, as determined by that extension.</p> <hr/> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p> <hr/> <p>Note</p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p>

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA1, bit [58]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if [HCR_EL2](#).{E2H,TGE}!={1,1}, when address[59:55] = 0b11111.

TCMA1	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1	All accesses at EL1 and EL0 are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if [HCR_EL2](#).{E2H,TGE}!={1,1}, when address[59:55] = 0b00000.

TCMA0	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1	All accesses at EL1 and EL0 are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD1, bit [56]

When FEAT_EOPD is implemented:

Faulting control for Unprivileged access to any address translated by [TTBR1_EL1](#).

EOPD1	Meaning
0b0	Unprivileged access to any address translated by TTBR1_EL1 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR1_EL1 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD0, bit [55]**When FEAT_EOPD is implemented:**

Faulting control for Unprivileged access to any address translated by [TTBR0_EL1](#).

EOPD0	Meaning
0b0	Unprivileged access to any address translated by TTBR0_EL1 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR0_EL1 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]**When FEAT_SVE is implemented or FEAT_TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR1_EL1](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR1_EL1](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

NFD1	Meaning
0b0	Does not disable stage 1 translation table walks using TTBR1_EL1 .
0b1	A TLB miss on a virtual address that is translated using TTBR1_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]**When FEAT_SVE is implemented or FEAT_TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR0_EL1](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR0_EL1](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

NFD0	Meaning
0b0	Does not disable stage 1 translation table walks using TTBR0_EL1 .
0b1	A TLB miss on a virtual address that is translated using TTBR0_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]**When FEAT_PAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

TBID1	Meaning
0b0	TCR_EL1.TBI1 applies to Instruction and Data accesses.
0b1	TCR_EL1.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR1_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]**When FEAT_PAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

TBID0	Meaning
0b0	TCR_EL1.TBI0 applies to Instruction and Data accesses.
0b1	TCR_EL1.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

HWU162	Meaning
0b0	For translations using TTBR1_EL1 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [49]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

HWU161	Meaning
0b0	For translations using TTBR1_EL1 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [48]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

HWU160	Meaning
0b0	For translations using TTBR1_EL1 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [47]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

HWU159	Meaning
0b0	For translations using TTBR1_EL1 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU062	Meaning
0b0	For translations using TTBR0_EL1 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU061	Meaning
0b0	For translations using TTBR0_EL1 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [44]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU060	Meaning
0b0	For translations using TTBR0_EL1 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [43]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU059	Meaning
0b0	For translations using TTBR0_EL1 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]**When FEAT_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR1_EL1](#).

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL1](#).

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL0 and EL1.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the [TTBR1_EL1](#) region, or ignored and used for tagged addresses.

TBI1	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR1_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAAuth is implemented and TCR_EL1.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TBI0, bit [37]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL1](#) region, or ignored and used for tagged addresses.

TBI0	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAAuth is implemented and TCR_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

ASID Size.

AS	Meaning
0b0	8 bit - the upper 8 bits of TTBR0_EL1 and TTBR1_EL1 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
0b1	16 bit - the upper 16 bits of TTBR0_EL1 and TTBR1_EL1 are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

IPS	Meaning	Applies when
0b000	32 bits, 4GB.	
0b001	36 bits, 64GB.	
0b010	40 bits, 1TB.	
0b011	42 bits, 4TB.	
0b100	44 bits, 16TB.	
0b101	48 bits, 256TB.	
0b110	52 bits, 4PB.	
0b111	56 bits, 64PB.	When FEAT_D128 is implemented

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

If in an implementation that supports 52-bit PAs, if the value of this field is not ID_AA64MMFR0_EL1.PARange is 0b0110, and the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL1 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the TTBR1_EL1.

TG1	Meaning
0b01	16KB.
0b10	4KB.
0b11	64KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1_EL1.

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1_EL1](#).

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1_EL1](#).

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1_EL1](#). The encoding of this bit is:

EPD1	Meaning
0b0	Perform translation table walks using TTBR1_EL1 .
0b1	A TLB miss on an address that is translated using TTBR1_EL1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether [TTBR0_EL1](#) or [TTBR1_EL1](#) defines the ASID. The encoding of this bit is:

A1	Meaning
0b0	TTBR0_EL1 .ASID defines the ASID.
0b1	TTBR1_EL1 .ASID defines the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

The size offset of the memory region addressed by [TTBR1_EL1](#). The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL1](#).

TG0	Meaning
0b00	4KB
0b01	64KB
0b10	16KB

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

SH0	Meaning
0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0_EL1](#). The encoding of this bit is:

EPD0	Meaning
0b0	Perform translation table walks using TTBR0_EL1 .
0b1	A TLB miss on an address that is translated using TTBR0_EL1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL1](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TCR_EL1 or TCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then

The TCR_EL2 characteristics are:

Purpose

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of [HCR_EL2.E2H](#) is 0, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using [TTBR0_EL2](#).
- When the value of [HCR_EL2.E2H](#) is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
 - A lower VA range, translated using [TTBR0_EL2](#).
 - A higher VA range, translated using [TTBR1_EL2](#).

Configuration

AArch64 System register TCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HTCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TCR_EL2 is a 64-bit register.

Field descriptions

When HCR_EL2.E2H == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34			
RES0																																M
RES1	TCMA	TBID	HWU62	HWU61	HWU60	HWU59	HPD	RES1	HD	HA	TBI	RES0	PS	TG0	SH0	ORGN0	IRGN0	RES0	TOS													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2			

Any of the bits in TCR_EL2, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

Bits [63:34~~33~~]

Reserved, RES0.

MTX, bit [33]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and tag checking when EL2 is using AArch64 where the data address would be translated by tables pointed to by [TTBRO EL2](#).

This control has an effect regardless of whether stage 1 of the EL2 translation regime is enabled or not.

MTX	Meaning
0b0	This control has no effect on the PE.
0b1	Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: <ul style="list-style-type: none"> Bits[59:56] are treated as 0b0000 when checking if the address is out of range. If FEAT_PAAuth is implemented, bits[59:56] are not part of the PAC field. A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [32]

When FEAT_LPA2 is implemented:

This field affects whether a 52-bit output address addressing can when be using described 4KB by and the 16KB translation tables granules in stage 1 of the 4KBEL2 or 16KB translation granules regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of TCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p>
0b1	<p>Output address[51:48] is 0b0000.</p> <p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of Translation table descriptors hold output address[51:50].</p> <p>The shareability information of Block and Page descriptors for cacheable locations is determined by TCR_EL2.SH0.</p> <p>The minimum value of TCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of TTBRO_EL2 are used to hold bits[51:48] of the output address in all cases.</p>

Note

As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.T0SZ field is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.

Note

This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

TCMA, bit [30]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL2 when address [59:56] = 0b0000.

TCMA	Meaning
0b0	This control has no effect on the generation of Unchecked accesses.
0b1	All accesses are Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

TBID	Meaning
0b0	TCR_EL2.TBI applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL2](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]**When FEAT_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBRO_EL2](#).

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

Note	
In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE and are no longer reserved, allowing them to be used by software.	

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]**When FEAT_HAFDBS is implemented:**

Hardware management of dirty state in stage 1 translations from EL2.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]**When FEAT_HAFDBS is implemented:**

Hardware Access flag update in stage 1 translations from EL2.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL2](#) region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

TBI	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID is 1, then this field only applies to Data accesses.

If the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

PS	Meaning	Applies when
0b000	32 bits, 4GB.	
0b001	36 bits, 64GB.	
0b010	40 bits, 1TB.	
0b011	42 bits, 4TB.	
0b100	44 bits, 16TB.	
0b101	48 bits, 256TB.	
0b110	52 bits, 4PB.	
0b111	56 bits, 64PB.	When FEAT_D128 is implemented

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

~~If in an implementation that supports 52-bit PAs, if the value of this field is not~~ [ID_AA64MMFR0_EL1.PARange](#) is 0b0110, and the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL2](#).

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_VHE is implemented and HCR_EL2.E2H == 1:

Any of the bits in TCR_EL2 are permitted to be cached in a TLB.

Bits [63:6260]

Reserved, RES0.

MTX1, bit [61]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and tag checking when EL0 and EL2 are using AArch64 where the data address would be translated by tables pointed to by [TTBRI_EL2](#).

This control has an effect regardless of whether stage 1 of the EL2&0 translation regime is enabled or not.

MTX1	Meaning
0b0	This control has no effect on the PE.
0b1	Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: <ul style="list-style-type: none">Bits[59:56] are treated as 0b1111 when checking if the address is out of range.If FEAT_PAAuth is implemented, bits[59:56] are not part of the PAC field.A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTX0, bit [60]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and tag checking when EL0 and EL2 are using AArch64 where the data address would be translated by tables pointed to by [TTBRO_EL2](#).

This control has an effect regardless of whether stage 1 of the EL2&0 translation regime is enabled or not.

MTX0	Meaning
0b0	This control has no effect on the PE.
0b1	Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: <ul style="list-style-type: none"> Bits[59:56] are treated as 0b0000 when checking if the address is out of range. If FEAT_PAAuth is implemented, bits[59:56] are not part of the PAC field. A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [59]

When FEAT_LPA2 is implemented:

This field affects whether a 52-bit output address addressing can when be using described 4KB by and the 16KB translation tables granules in stage 1 of the 4KB EL2&0 or 16KB translation granules regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p>
0b1	<p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of Translation table descriptors hold output address[51:50].</p> <p>The shareability information of Block and Page descriptors for cacheable locations is determined by:</p> <ul style="list-style-type: none"> • TCR_EL2.SH0 if the VA is an address that is translated using tables pointed to by TTBR0_EL2. • TCR_EL2.SH1 if the VA is an address that is translated using tables pointed to by TTBR1_EL2. <p>The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 16 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of TTBR0_EL2 or TTBR1_EL2 are used to hold bits[51:48] of the output address in all cases.</p> <hr/> <p>Note</p> <p>As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12, as determined by that extension.</p> <hr/> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p> <hr/> <p>Note</p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p> <hr/>

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA1, bit [58]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b11111.

TCMA1	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL2 or EL0.
0b1	All accesses are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b00000.

TCMA0	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL2 or EL0.
0b1	All accesses are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD1, bit [56]

When FEAT_EOPD is implemented:

Faulting control for Unprivileged access to any address translated by [TTBR1_EL2](#).

EOPD1	Meaning
0b0	Unprivileged access to any address translated by TTBR1_EL2 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR1_EL2 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD0, bit [55]**When FEAT_EOPD is implemented:**

Faulting control for Unprivileged access to any address translated by [TTBR0_EL2](#).

EOPD0	Meaning
0b0	Unprivileged access to any address translated by TTBR0_EL2 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR0_EL2 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]**When FEAT_SVE is implemented or FEAT_TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR1_EL2](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR1_EL2](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

NFD1	Meaning
0b0	Does not disable stage 1 translation table walks using TTBR1_EL2 .
0b1	A TLB miss on a virtual address that is translated using TTBR1_EL2 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]**When FEAT_SVE is implemented or FEAT_TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR0_EL2](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR0_EL2](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

NFD0	Meaning
0b0	Does not disable stage 1 translation table walks using TTBR0_EL2 .
0b1	A TLB miss on a virtual address that is translated using TTBR0_EL2 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]**When FEAT_PAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

TBID1	Meaning
0b0	TCR_EL2.TBI1 applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR1_EL2](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]**When FEAT_PAAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

For more information, see 'Address tagging in AArch64 state'.

TBID0	Meaning
0b0	TCR_EL2.TBI0 applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL2](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

HWU162	Meaning
0b0	For translations using TTBR1_EL2 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [49]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

HWU161	Meaning
0b0	For translations using TTBR1_EL2 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [48]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

HWU160	Meaning
0b0	For translations using TTBR1_EL2 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [47]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

HWU159	Meaning
0b0	For translations using TTBR1_EL2 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU062	Meaning
0b0	For translations using TTBR0_EL1 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU061	Meaning
0b0	For translations using TTBR0_EL1 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [44]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU060	Meaning
0b0	For translations using TTBR0_EL1 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [43]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU059	Meaning
0b0	For translations using TTBR0_EL1 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR1_EL2](#).

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]**When FEAT_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL2](#).

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]**When FEAT_HAFDBS is implemented:**

Hardware management of dirty state in stage 1 translations from EL2.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]**When FEAT_HAFDBS is implemented:**

Hardware Access flag update in stage 1 translations from EL2.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR1_EL2](#) region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

TBI1	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR1_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID1 is 1, then this field only applies to Data accesses.

If the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TBI0, bit [37]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL2](#) region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

TBI0	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID0 is 1, then this field only applies to Data accesses.

If the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

ASID Size.

AS	Meaning
0b0	8 bit - the upper 8 bits of TTBR0_EL2 and TTBR1_EL2 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
0b1	16 bit - the upper 16 bits of TTBR0_EL2 and TTBR1_EL2 are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

IPS	Meaning	Applies when
0b000	32 bits, 4GB.	
0b001	36 bits, 64GB.	
0b010	40 bits, 1TB.	
0b011	42 bits, 4TB.	
0b100	44 bits, 16TB.	
0b101	48 bits, 256TB.	
0b110	52 bits, 4PB.	When FEAT_LPA is implemented

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

If in an implementation that supports 52-bit PAs, if the value of this field is not [ID_AA64MMFR0_EL1.PARange](#) is 0b0110, and the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the [TTBR1_EL2](#).

TG1	Meaning
0b01	16KB.
0b10	4KB.
0b11	64KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1_EL2](#). The encoding of this bit is:

EPD1	Meaning
0b0	Perform translation table walks using TTBR1_EL2 .
0b1	A TLB miss on an address that is translated using TTBR1_EL2 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether [TTBR0_EL2](#) or [TTBR1_EL2](#) defines the ASID. The encoding of this bit is:

A1	Meaning
0b0	TTBR0_EL2 .ASID defines the ASID.
0b1	TTBR1_EL2 .ASID defines the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

The size offset of the memory region addressed by [TTBR1_EL2](#). The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL2](#).

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGNO, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

ORGNO	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGNO, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

IRGNO	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0_EL2](#). The encoding of this bit is:

EPD0	Meaning
0b0	Perform translation table walks using TTBR0_EL2 .
0b1	A TLB miss on an address that is translated using TTBR0_EL2 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for TOSZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TCR_EL2 or TCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    X[t, 64] = TCR_EL2;
elsif PSTATE.EL == EL3 then
    X[t, 64] = TCR_EL2;

```

MSR TCR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TCR_EL2 = X[t, 64];
elsif PSTATE.EL == EL3 then
    TCR_EL2 = X[t, 64];

```

MRS <Xt>, TCR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1')
    && HFGTR_EL2.TCR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then

The TCR EL3 characteristics are:

Purpose

The control register for stage 1 of the EL3 translation regime.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to TCR_EL3 are UNDEFINED.

Attributes

TCR EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39					
RES0																				DisCH0DS		HAFT		PTTWI		RES0		D	
RES1	TCMAT	TBID	HWU62	HWU61	HWU60	HWU59	HPD	RES1	HD	HA	TBI	RES0	PS	TG0	SH0	ORGNO			IRGNO			RE							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7					

Unless stated otherwise, any of the bits in TCR EL3 are permitted to be cached in a TLB.

Bits [63:4433]

Reserved, RES0.

DisCH0, bit [43]

When FEAT D128 is implemented and TCR EL3.D128 == 1:

Disable Contiguous Hint for Start Table.

DisCH0	Meaning
0b0	Contiguous Hint of Block or Page descriptors of the Start Table are not affected by this field.
0b1	Contiguous Hint of Block or Page descriptors of the Start Table are disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HAFT, bit [42]

When FEAT HAFT is implemented:

Hardware managed Access Flag for Tables.

Enables the Hardware managed Access Flag for Tables.

HAFT	Meaning
0b0	Hardware managed Access Flag for Tables is disabled.
0b1	Hardware managed Access Flag for Tables is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [41]

When FEAT_TTE is implemented:

Permit Translation table walk Incoherence.

Permits RCWS instructions to have Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS at EL3 do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS at EL3 have the Reduced Coherence property.

This bit is permitted to be built as a read-only bit with a fixed value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [40:39]

Reserved, RES0.

D128, bit [38]

When FEAT_D128 is implemented:

Enable 128-bit Page Table Descriptors.

Enables VMSAv9-128 translation system for the Stage 1 EL3 Translation Process.

D128	Meaning
0b0	Translation system follows VMSA-64 translation process.
0b1	Translation system follows VMSAv9-128 translation process.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIE, bit [37]**When FEAT_AIE is implemented:**

Enable Attribute Indexing Extension. Control for Attribute Indexing Extension for Stage 1 EL3 Translation Process.

AIE	Meaning
0b0	Attribute Indexing Extension Disabled.
0b1	Attribute Indexing Extension Enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [36]**When FEAT_S1POE is implemented:**

POE. Controls setting of permission overlay for EL3 accesses in stage 1 of the EL3 translation regime.

POE	Meaning
0b0	Permission overlay disabled for EL3 access in stage 1 of EL3 translation regime..
0b1	Permission overlay enabled for EL3 access in stage 1 of EL3 translation regime.

This bit is not permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIE, bit [35]**When FEAT_S1PIE is implemented:**

Select Permission Model. Controls setting of indirect permission model in Stage 1 EL3 Translation Process.

PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

This field is RES1 when TCR_EL3.D128 is set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [34]**When FEAT_TTE is implemented:**

Protected attribute enable. Indicates use of bit[52] of the stage 1 translation table entry for translations using [TTBR0_EL3](#).

PnCH	Meaning
0b0	For translations using TTBR0_EL3 , bit[52] of each stage 1 translation table entry does not indicate protected attribute.
0b1	For translations using TTBR0_EL3 , bit[52] of each stage 1 translation table entry indicates protected attribute.

This field is RES1 when TCR_EL3.D128 is set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTX, bit [33]**When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:**

Extended memory tag checking.

This field controls address generation and tag checking when EL3 is using AArch64 where the data address would be translated by tables pointed to by [TTBR0_EL3](#).

This control has an effect regardless of whether stage 1 of the EL3 translation regime is enabled or not.

MTX	Meaning
0b0	This control has no effect on the PE.
0b1	Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: <ul style="list-style-type: none"> Bits[59:56] are treated as 0b0000 when checking if the address is out of range. If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [32]**When FEAT_LPA2 is implemented:**

This field affects whether a 52-bit output address addressing can when be using described 4KB by and the 16KB translation tables granules in stage 1 of the 4KB EL3 or 16KB translation granules regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in Table descriptors are ignored by hardware.</p> <p>The minimum value of TCR_EL3.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p>
0b1	<p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of table translation descriptors hold output address[51:50].</p> <p>The shareability information of Block and Page descriptors for cacheable locations is determined by TCR_EL3.SH0.</p> <p>The minimum value of TCR_EL3.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of TTBR0_EL3 are used to hold bits[51:48] of the output address in all cases.</p> <hr/> <p>Note</p> <p>As FEAT_LVA must be implemented if TCR_EL3.DS == 1, the minimum value of the TCR_EL3.T0SZ field is 12, as determined by that extension.</p> <hr/> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p> <hr/> <p>Note</p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p> <hr/>

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

TCMA, bit [30]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL3 when address [59:56] = 0b0000.

TCMA	Meaning
0b0	This control has no effect on the generation of Unchecked accesses.
0b1	All accesses are Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]**When FEAT_PAAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

TBID	Meaning
0b0	TCR_EL3.TBI applies to Instruction and Data accesses.
0b1	TCR_EL3.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL3](#).

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]**When FEAT_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBRO_EL3](#).

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

Note
In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]**When FEAT_HAFDBS is implemented:**

Hardware management of dirty state in stage 1 translations from EL3.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]**When FEAT_HAFDBS is implemented:**

Hardware Access flag update in stage 1 translations from EL3.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL3](#) region, or ignored and used for tagged addresses.

TBI	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL3](#). It has an effect whether the EL3 translation regime is enabled or not.

If FEAT_PAAuth is implemented and TCR_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

For more information, see 'Address tagging in AArch64 state'.

Note

This control determines the scope of address tagging. It never causes an exception to be generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

PS	Meaning	Applies when
0b000	32 bits, 4GB.	
0b001	36 bits, 64GB.	
0b010	40 bits, 1TB.	
0b011	42 bits, 4TB.	
0b100	44 bits, 16TB.	
0b101	48 bits, 256TB.	
0b110	52 bits, 4PB.	
0b111	56 bits, 64PB.	When FEAT_D128 is implemented

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

If in an implementation that supports 52-bit PAs, if the value of this field is not ID_AA64MMFR0_EL1.PARange is 0b0110, and the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL3 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL3](#).

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL3](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL3](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL3](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

TOSZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL3](#). The region size is $2^{(64-TOSZ)}$ bytes.

The maximum and minimum possible values for TOSZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = TCR_EL3;

```

MSR_TCR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TCR EL3 = X[t, 64];

```

3005/0907/2022 1517:5707; 21c5a6dd0fdaf10a712e2f2d6fffbdbd66d4d96fb0421fa9a8865165f9b91af9b4a566111f866305

TLBI ASIDE1, TLBI ASIDE1NXS, TLB Invalidate by ASID, EL1

The TLBI ASIDE1, TLBI ASIDE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI ASIDE1, TLBI ASIDE1NXS is a 64-bit System instruction.

TLBI ASIDE1IS, TLBI ASIDE1ISNXS, TLB Invalidate by ASID, EL1, Inner Shareable

The TLBI ASIDE1IS, TLBI ASIDE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

TLBI IPAS2E1, TLBI IPAS2E1NXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI IPAS2E1, TLBI IPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 2 only translation table entry, from any level of the translation table walk.
Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI IPAS2E1, TLBI IPAS2E1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
NS	RES0														TTL			RES0			IPA[51:48]				IPA[47:12]									
IPA[47:12]																																		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

When FEAT_LPA is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

If ID_AA64MMFR0_EL1.PARange is 0b0110, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2E1, TLBI IPAS2E1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI IPAS2E1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b001

```

TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 2 only translation table entry, from any level of the translation table walk.
Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

When FEAT_LPA is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

If ID_AA64MMFR0_EL1.PARange is 0b0110, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```

if PSTATE.EL == EL0 then
    UNDEFINED;

TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 2 only translation table entry, from any level of the translation table walk.
Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS are UNDEFINED.

Attributes

TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS is a 64-bit System instruction.

Field descriptions

NS, bit [63] When FEAT_RME is implemented:

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44] When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

Extension to IPA[47:12]. For more information, see IPA[47:12].

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

If ID_AA64MMFR0_EL1.PARange is 0b0110, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI IPAS2E1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b000

op0	op1	CRn	CRm	op2
0b01	0b100	0b1001	0b0100	0b000

```

if !IsFeatureImplemented(FEAT_XS) then
    UNDEFINED;
elseif PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    AArch64.TLBI_IPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_OSH,
        TLBILevel_Any, TLBI_ExcludeXS, X[t, 64]);
elseif PSTATE.EL == EL3 then
    if !EL2Enabled() then
        return;
    else
        AArch64.TLBI_IPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_OSH,
            TLBILevel_Any, TLBI_ExcludeXS, X[t, 64]);

TLBI IPAS2LE1, TLBI IPAS2LE1NXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI IPAS2LE1, TLBI IPAS2LE1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 2 only translation table entry, from the final level of the translation table walk.
Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI IPAS2LE1, TLBI IPAS2LE1NXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

When FEAT_LPA is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

If ID_AA64MMFR0_EL1.PARange is 0b0110, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2LE1, TLBI IPAS2LE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI IPAS2LE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    AArch64.TLBI_IPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_NSH,

TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 2 only translation table entry, from the final level of the translation table walk.
Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]
When FEAT_LPA is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 2 only translation table entry, from the final level of the translation table walk.
Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

Extension to IPA[47:12]. For more information, see IPA[47:12].

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

If ID_AA64MMFR0_EL1.PARange is 0b0110, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI IPAS2LE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b100

TLBI RIPAS2E1, TLBI RIPAS2E1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI RIPAS2E1, TLBI RIPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint. ~~walk.~~

Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is 0b00.

- If FEAT_RME is implemented, one of the following applies:
 - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
 - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the ~~The~~ range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseAddr[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseAddr[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseAddr[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseAddr[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseAddr[28:16] is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2E1, TLBI RIPAS2E1NXS are UNDEFINED.

Attributes

TLBI RIPAS2E1, TLBI RIPAS2E1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NS	RES0														TG	SCALE	NUM					TTL	BaseADDR									
BaseADDR																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

NS, bit [63] When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- **Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- **Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The All TTL entries hint to indicate invalidate level are 1. Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The All TTL entries hint to indicate invalidate level are 2. Level 2 translation table entries.
0b11	The All TTL entries hint to indicate invalidate level are 3. Level 3 translation table entries.

BaseADDR, bits [36:0]**When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint. walk.

Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is 0b00.

- If FEAT_RME is implemented, one of the following applies:
 - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
 - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseAddr[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseAddr[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseAddr[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseAddr[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseAddr[28:16] is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS are UNDEFINED.

Attributes

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS is a 64-bit System instruction.

NS, bit [63] When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- **Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- **Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The All TTL entries hint to indicate invalidate level are 1. Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The All TTL entries hint to indicate invalidate level are 2. Level 2 translation table entries.
0b11	The All TTL entries hint to indicate invalidate level are 3. Level 3 translation table entries.

BaseADDR, bits [36:0]
When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint. ~~walk.~~

Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is 0b00.

- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the ~~The~~ range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS are UNDEFINED.

Attributes

TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NS	RES0														TG	SCALE	NUM					TTL	BaseADDR									
BaseADDR																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

NS, bit [63] When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- **Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- **Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The All TTL entries hint to indicate level 1. Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The All TTL entries hint to indicate level 2. Level 2 translation table entries.
0b11	The All TTL entries hint to indicate level 3. Level 3 translation table entries.

BaseADDR, bits [36:0]
When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 2 only translation table entry, from the leaf~~final~~ level of the translation table walk, indicated by the TTL hint~~walk~~.
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

For 64-bit translation table entry, the~~The~~ range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NS	RES0														TG	SCALE	NUM					TTL	BaseADDR									
BaseADDR																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

NS, bit [63] When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- **Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- **Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The All TTL entries hint to indicate invalidate level are 1. Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The All TTL entries hint to indicate invalidate level are 2. Level 2 translation table entries.
0b11	The All TTL entries hint to indicate invalidate level are 3. Level 3 translation table entries.

BaseADDR, bits [36:0]
When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RIPAS2LE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b110

TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 2 only translation table entry, from the leaf~~final~~ level of the translation table walk, indicated by the TTL hint~~walk~~.
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the~~The~~ range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS is a 64-bit System instruction.

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 2 only translation table entry, from the leaf~~final~~ level of the translation table walk, indicated by the TTL hint walk.
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
 - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS is a 64-bit System instruction.

Field descriptions

NS, bit [63] When FEAT_RME is implemented:

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- **Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- **Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The All TTL entries hint to indicate level 1. Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The All TTL entries hint to indicate level 2. Level 2 translation table entries.
0b11	The All TTL entries hint to indicate level 3. Level 3 translation table entries.

BaseADDR, bits [36:0]
When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVAAE1, TLBI RVAAE1NXS, TLB Range Invalidate by VA, All ASID, EL1

The TLBI RVAAE1, TLBI RVAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint. walk.
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAAE1, TLBI RVAAE1NXS are UNDEFINED.

Attributes

TLBI RVAAE1, TLBI RVAAE1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

TLBI RVAAE1IS, TLBI RVAAE1ISNXS, TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI RVAAE1IS, TLBI RVAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint. walk.
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
 - A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:

- If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
- If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAAE1IS, TLBI RVAAE1ISNXS are UNDEFINED.

Attributes

TLBI RVAAE1IS, TLBI RVAAE1ISNXS is a 64-bit System instruction.

TLBI RVAAE1OS, TLBI RVAAE1OSNXS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI RVAAE1OS, TLBI RVAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint. walk.
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
 - A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:

TLBI RVAAE1OS, TLBI RVAAE1OSNXS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

- If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
 - For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAAE1OS, TLBI RVAAE1OSNXS are UNDEFINED.

Attributes

TLBI RVAAE1OS, TLBI RVAAE1OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TG	SCALE	NUM					TTL		BaseADDR						
																BaseADDR															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- **Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- **Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The All TTL entries hint to indicate invalidate level are 1. Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The All TTL entries hint to indicate invalidate level are 2. Level 2 translation table entries.
0b11	The All TTL entries hint to indicate invalidate level are 3. Level 3 translation table entries.

BaseADDR, bits [36:0]
When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAAE1OS, TLBI RVAAE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAALE1, TLBI RVAALE1NXS, TLB Range Invalidate by VA, All ASID, Last level, EL1

The TLBI RVAALE1, TLBI RVAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from the leaf~~final~~ level of the translation table walk, indicated by the TTL hint.~~walk~~.
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAALE1, TLBI RVAALE1NXS are UNDEFINED.

Attributes

TLBI RVAALE1, TLBI RVAALE1NXS is a 64-bit System instruction.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	TheAll TTLentries hintto indicatesinvalidate levelare 1.Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	TheAll TTLentries hintto indicatesinvalidate levelare 2.Level 2 translation table entries.
0b11	TheAll TTLentries hintto indicatesinvalidate levelare 3.Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAALE1, TLBI RVAALE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

-------	----------------	-------

TLBI RVAALE1IS, TLBI RVAALE1ISNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI RVAALE1IS, TLBI RVAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from the leaf~~final~~ level of the translation table ~~walk~~, indicated by the TTL hint.~~walk~~.
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAALE1IS, TLBI RVAALE1ISNXS are UNDEFINED.

Attributes

TLBI RVAALE1IS, TLBI RVAALE1ISNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- **Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- **Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The All TTL entries hint to indicate level 1. Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The All TTL entries hint to indicate level 2. Level 2 translation table entries.
0b11	The All TTL entries hint to indicate level 3. Level 3 translation table entries.

BaseADDR, bits [36:0]
When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAALE1IS, TLBI RVAALE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAALE1IS{, <Xt>}

TLBI RVAALE1OS, TLBI RVAALE1OSNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI RVAALE1OS, TLBI RVAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from the leaf~~final~~ level of the translation table walk, indicated by the TTL hint.~~walk~~.
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAALE1OS, TLBI RVAALE1OSNXS are UNDEFINED.

Attributes

TLBI RVAALE1OS, TLBI RVAALE1OSNXS is a 64-bit System instruction.

TLBI RVAE1, TLBI RVAE1NXS, TLB Range Invalidate by VA, EL1

The TLBI RVAE1, TLBI RVAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint. ~~entry.~~
- Or, if FEAT_D128 is implemented, and the entry is 128-bit a stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the ~~The~~ range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE1, TLBI RVAE1NXS are UNDEFINED.

Attributes

TLBI RVAE1, TLBI RVAE1NXS is a 64-bit System instruction.

Field descriptions

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- **Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- **Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	TheAll TTLentries hintto indicatesinvalidate levelare 1.Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	TheAll TTLentries hintto indicatesinvalidate levelare 2.Level 2 translation table entries.
0b11	TheAll TTLentries hintto indicatesinvalidate levelare 3.Level 3 translation table entries.

BaseADDR, bits [36:0]**When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE1, TLBI RVAE1NXS instruction

TLBI RVAE1IS, TLBI RVAE1ISNXS, TLB Range Invalidate by VA, EL1, Inner Shareable

The TLBI RVAE1IS, TLBI RVAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.~~entry.~~
- Or, if FEAT_D128 is implemented, and the entry is 128-bit a stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
 - A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE1IS, TLBI RVAE1ISNXS are UNDEFINED.

Attributes

TLBI RVAE1IS, TLBI RVAE1ISNXS is a 64-bit System instruction.

Field descriptions

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

- TTL Level hint. The TTL hint is only guaranteed to invalidate: entries in the range that match the level described by the TTL hint.
- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
 - Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The All TTL entries hint to indicate invalidate level are 1. Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The All TTL entries hint to indicate invalidate level are 2. Level 2 translation table entries.
0b11	The All TTL entries hint to indicate invalidate level are 3. Level 3 translation table entries.

BaseADDR, bits [36:0]
When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVAE1OS, TLBI RVAE1OSNXS, TLB Range Invalidate by VA, EL1, Outer Shareable

The TLBI RVAE1OS, TLBI RVAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.~~entry.~~
Or, if FEAT_D128 is implemented, and the entry is 128-bit a stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000000.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE1OS, TLBI RVAE1OSNXS are UNDEFINED.

Attributes

TLBI RVAE1OS, TLBI RVAE1OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TG	SCALE	NUM				TTL		BaseADDR									
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- **Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- **Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The All TTL entries hint to indicate invalidate level are 1. Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The All TTL entries hint to indicate invalidate level are 2. Level 2 translation table entries.
0b11	The All TTL entries hint to indicate invalidate level are 3. Level 3 translation table entries.

BaseADDR, bits [36:0]**When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE1OS, TLBI RVAE1OSNXS instruction

TLBI RVAE2, TLBI RVAE2NXS, TLB Range Invalidate by VA, EL2

The TLBI RVAE2, TLBI RVAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.~~entry.~~
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any VA in the range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$ using the EL2 or EL2&0 translation regime, as determined by the current value of the HCR_EL2.E2H bit, for the Security state.
- If HCR_EL2.E2H == 0, the entry is from any level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE2, TLBI RVAE2NXS are UNDEFINED.

Attributes

TLBI RVAE2, TLBI RVAE2NXS is a 64-bit System instruction.

Field descriptions

ASID, bits [63:48]
When HCR_EL2.E2H == 1:

- ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
- Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
- If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate **entries in the range that match the level described by the TTL hint.**

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	TheAll TTLentries hintto indicatesinvalidate levelare 1.Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	TheAll TTLentries hintto indicatesinvalidate levelare 2.Level 2 translation table entries.
0b11	TheAll TTLentries hintto indicatesinvalidate levelare 3.Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE2, TLBI RVAE2NXS instruction

TLBI RVAE2IS, TLBI RVAE2ISNXS, TLB Range Invalidate by VA, EL2, Inner Shareable

The TLBI RVAE2IS, TLBI RVAE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.~~entry.~~
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any VA in the range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$ using the EL2 or EL2&0 translation regime, as determined by the current value of the HCR_EL2.E2H bit, for the Security state.
- If HCR_EL2.E2H == 0, the entry is from any level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00.
 - If TTL==10 and BaseADDR[28:16] is not equal to 00.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE2IS, TLBI RVAE2ISNXXS are UNDEFINED.

Attributes

TLBI RVAE2IS, TLBI RVAE2ISNXXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASID, bits [63:48]
When HCR_EL2.E2H == 1:

- ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
- Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
- If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate **entries in the range that match the level described by the TTL hint.**

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	TheAll TTLentries hintto indicatesinvalidate levelare 1.Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	TheAll TTLentries hintto indicatesinvalidate levelare 2.Level 2 translation table entries.
0b11	TheAll TTLentries hintto indicatesinvalidate levelare 3.Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE2IS, TLBI RVAE2ISNXS instruction

TLBI RVAE2OS, TLBI RVAE2OSNXS, TLB Range Invalidate by VA, EL2, Outer Shareable

The TLBI RVAE2OS, TLBI RVAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint entry.
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any VA in the range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$ using the EL2 or EL2&0 translation regime, as determined by the current value of the HCR_EL2.E2H bit, for the Security state.
- If HCR_EL2.E2H == 0, the entry is from any level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00.
 - If TTL==10 and BaseADDR[28:16] is not equal to 00.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE2OS, TLBI RVAE2OSNXS are UNDEFINED.

Attributes

TLBI RVAE2OS, TLBI RVAE2OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate **entries in the range that match the level described by the TTL hint.**

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	TheAll TTLentries hintto indicatesinvalidate levelare 1.Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	TheAll TTLentries hintto indicatesinvalidate levelare 2.Level 2 translation table entries.
0b11	TheAll TTLentries hintto indicatesinvalidate levelare 3.Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE2OS, TLBI RVAE2OSNXS instruction

TLBI RVAE3, TLBI RVAE3NXS, TLB Range Invalidate by VA, EL3

The TLBI RVAE3, TLBI RVAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.~~walk.~~
- Or, if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the~~The~~ range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE3, TLBI RVAE3NXS are UNDEFINED.

Attributes

TLBI RVAE3, TLBI RVAE3NXS is a 64-bit System instruction.

Field descriptions

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: entries in the range that match the level described by the TTL hint.

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	TheAll TTLentries hintto indicatesinvalidate levelare 1.Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	TheAll TTLentries hintto indicatesinvalidate levelare 2.Level 2 translation table entries.
0b11	TheAll TTLentries hintto indicatesinvalidate levelare 3.Level 3 translation table entries.

BaseADDR, bits [36:0]
When FEAT_LPA2 is implemented and TCR_EL3.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE3, TLBI RVAE3NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE3{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0110	0b001

TLBI RVAE3IS, TLBI RVAE3ISNXS, TLB Range Invalidate by VA, EL3, Inner Shareable

The TLBI RVAE3IS, TLBI RVAE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.~~walk.~~
Or, if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If $TTL == 01$ and $BaseAddr[29:12]$ is not equal to 00000000000000000000.
 - If $TTL == 10$ and $BaseAddr[20:12]$ is not equal to 000000000.
- For the 16K translation granule:
 - If $TTL == 10$ and $BaseAddr[24:14]$ is not equal to 000000000000.
- For the 64K translation granule:
 - If $TTL == 01$ and $BaseAddr[41:16]$ is not equal to 00000000000000000000000000000000.
 - If $TTL == 10$ and $BaseAddr[28:16]$ is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE3IS, TLBI RVAE3ISNXS are UNDEFINED.

Attributes

TLBI RVAE3IS, TLBI RVAE3ISNXS is a 64-bit System instruction.

Field descriptions

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: entries in the range that match the level described by the TTL hint.

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The All TTL entries hint to indicate invalidate level are 1. Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The All TTL entries hint to indicate invalidate level are 2. Level 2 translation table entries.
0b11	The All TTL entries hint to indicate invalidate level are 3. Level 3 translation table entries.

BaseADDR, bits [36:0]
When FEAT_LPA2 is implemented and TCR_EL3.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE3IS{, <Xt>}

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    AArch64.TLBI_RVA(SecurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_ISH, TLBIlevel_Any,
    TLBI AllAttr, X[t, 64]);

```

TLBI RVAE3ISNXS{, <Xt>}

```

if !IsFeatureImplemented(FEAT_XS) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    AArch64.TLBI_RVA(SecurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_ISH, TLBIlevel_Any,
    TLBI_ExcludeXS, X[t, 64]);

TLBI RVAE3OS, TLBI RVAE3OSNXS, TLB Range Invalidate by VA, EL3, Outer Shareable

The TLBI RVAE3OS, TLBI RVAE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.~~walk.~~
Or, if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If $TTL == 01$ and $BaseAddr[29:12]$ is not equal to 00000000000000000000.
 - If $TTL == 10$ and $BaseAddr[20:12]$ is not equal to 0000000000.
- For the 16K translation granule:
 - If $TTL == 10$ and $BaseAddr[24:14]$ is not equal to 000000000000.
- For the 64K translation granule:
 - If $TTL == 01$ and $BaseAddr[41:16]$ is not equal to 00000000000000000000000000000000.
 - If $TTL == 10$ and $BaseAddr[28:16]$ is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE3OS, TLBI RVAE3OSNXS are UNDEFINED.

Attributes

TLBI RVAE3OS, TLBI RVAE3OSNXS is a 64-bit System instruction.

TLBI RVALE1, TLBI RVALE1NXS, TLB Range Invalidate by VA, Last level, EL1

The TLBI RVALE1, TLBI RVALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint. ~~entry.~~
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the ~~The~~ range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE1, TLBI RVALE1NXS are UNDEFINED.

Attributes

TLBI RVALE1, TLBI RVALE1NXS is a 64-bit System instruction.

Field descriptions

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- **Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**

- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	TheAll TTLentries hintto indicatesinvalidate levelare 1.Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	TheAll TTLentries hintto indicatesinvalidate levelare 2.Level 2 translation table entries.
0b11	TheAll TTLentries hintto indicatesinvalidate levelare 3.Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE1, TLBI RVALE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE1IS, TLBI RVALE1ISNXS, TLB Range Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI RVALE1IS, TLBI RVALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.~~entry.~~
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:

TLBI RVALE1IS, TLBI RVALE1ISNXS, TLB Range Invalidate by VA, Last level, EL1, Inner Shareable

- If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
 - For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE1IS, TLBI RVALE1ISNXS are UNDEFINED.

Attributes

TLBI RVALE1IS, TLBI RVALE1ISNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- **Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- **Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The All TTL entries hint to indicate invalidate level are 1. Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The All TTL entries hint to indicate invalidate level are 2. Level 2 translation table entries.
0b11	The All TTL entries hint to indicate invalidate level are 3. Level 3 translation table entries.

BaseADDR, bits [36:0]**When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE1IS, TLBI RVALE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0010	0b101

TLBI RVALE1OS, TLBI RVALE1OSNXS, TLB Range Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI RVALE1OS, TLBI RVALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.~~entry.~~
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

For 64-bit translation table entry, the~~The~~ range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:

TLBI RVALE1OS, TLBI RVALE1OSNXS, TLB Range Invalidate by VA, Last level, EL1, Outer Shareable

- If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
 - For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE1OS, TLBI RVALE1OSNXS are UNDEFINED.

Attributes

TLBI RVALE1OS, TLBI RVALE1OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

																BaseADDR															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- **Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- **Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The All TTL entries hint to indicate invalidate level are 1. Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The All TTL entries hint to indicate invalidate level are 2. Level 2 translation table entries.
0b11	The All TTL entries hint to indicate invalidate level are 3. Level 3 translation table entries.

BaseADDR, bits [36:0]**When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVALE2, TLBI RVALE2NXS, TLB Range Invalidate by VA, Last level, EL2

The TLBI RVALE2, TLBI RVALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.~~entry.~~
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any VA in the range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1)} * \text{Translation_Granule_Size})]$ using the EL2 or EL2&0 translation regime, as determined by the current value of the HCR_EL2.E2H bit, for the Security state.
- If HCR_EL2.E2H == 0, the entry is from the final level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE2, TLBI RVALE2NXS are UNDEFINED.

Attributes

TLBI RVALE2, TLBI RVALE2NXS is a 64-bit System instruction.

Field descriptions

ASID, bits [63:48]
When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	TheAll TTLentries hintto indicatesinvalidate levelare 1.Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	TheAll TTLentries hintto indicatesinvalidate levelare 2.Level 2 translation table entries.
0b11	TheAll TTLentries hintto indicatesinvalidate levelare 3.Level 3 translation table entries.

BaseADDR, bits [36:0]**When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE2, TLBI RVALE2NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE2IS, TLBI RVALE2ISNXS, TLB Range Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI RVALE2IS, TLBI RVALE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint entry.
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any VA in the range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$ using the EL2 or EL2&0 translation regime, as determined by the current value of the HCR_EL2.E2H bit, for the Security state.
- If HCR_EL2.E2H == 0, the entry is from the final level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE2IS, TLBI RVALE2ISNXS are UNDEFINED.

Attributes

TLBI RVALE2IS, TLBI RVALE2ISNXS is a 64-bit System instruction.

TLBI RVALE2OS, TLBI RVALE2OSNXS, TLB Range Invalidate by VA, Last level, EL2, Outer Shareable

The TLBI RVALE2OS, TLBI RVALE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.~~entry.~~
Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any VA in the range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation_Granule_Size})]$ using the EL2 or EL2&0 translation regime, as determined by the current value of the HCR_EL2.E2H bit, for the Security state.
- If HCR_EL2.E2H == 0, the entry is from the final level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE2OS, TLBI RVALE2OSNXS are UNDEFINED.

Attributes

TLBI RVALE2OS, TLBI RVALE2OSNXS is a 64-bit System instruction.

Field descriptions

ASID, bits [63:48]
When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	TheAll TTLentries hintto indicatesinvalidate levelare 1.Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	TheAll TTLentries hintto indicatesinvalidate levelare 2.Level 2 translation table entries.
0b11	TheAll TTLentries hintto indicatesinvalidate levelare 3.Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE2OS, TLBI RVALE2OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE2OS{, <Xt>}

op0	op1	CRn	CRm	op2

TLBI RVALE3, TLBI RVALE3NXS, TLB Range Invalidate by VA, Last level, EL3

The TLBI RVALE3, TLBI RVALE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint.~~walk.~~
Or, if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If $TTL == 01$ and $BaseADDR[29:12]$ is not equal to 00000000000000000000.
 - If $TTL == 10$ and $BaseADDR[20:12]$ is not equal to 0000000000.
- For the 16K translation granule:
 - If $TTL == 10$ and $BaseADDR[24:14]$ is not equal to 000000000000.
- For the 64K translation granule:
 - If $TTL == 01$ and $BaseADDR[41:16]$ is not equal to 00000000000000000000000000000000.
 - If $TTL == 10$ and $BaseADDR[28:16]$ is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE3, TLBI RVALE3NXS are UNDEFINED.

Attributes

TLBI RVALE3, TLBI RVALE3NXS is a 64-bit System instruction.

Field descriptions

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate: **entries in the range that match the level described by the TTL hint.**

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.**
- Leaf-level entries in the range that match the level described by the TTL hint.**

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The All TTL entries hint to indicate invalidate level are 1. Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The All TTL entries hint to indicate invalidate level are 2. Level 2 translation table entries.
0b11	The All TTL entries hint to indicate invalidate level are 3. Level 3 translation table entries.

BaseADDR, bits [36:0]
When FEAT_LPA2 is implemented and TCR_EL3.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE3, TLBI RVALE3NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE3{, <Xt>}

TLBI RVALE3IS, TLBI RVALE3ISNXS, TLB Range Invalidate by VA, Last level, EL3, Inner Shareable

The TLBI RVALE3IS, TLBI RVALE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint.~~walk.~~
Or, if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If $TTL == 01$ and $BaseAddr[29:12]$ is not equal to 00000000000000000000.
 - If $TTL == 10$ and $BaseAddr[20:12]$ is not equal to 000000000.
- For the 16K translation granule:
 - If $TTL == 10$ and $BaseAddr[24:14]$ is not equal to 000000000000.
- For the 64K translation granule:
 - If $TTL == 01$ and $BaseAddr[41:16]$ is not equal to 00000000000000000000000000000000.
 - If $TTL == 10$ and $BaseAddr[28:16]$ is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE3IS, TLBI RVALE3ISNXS are UNDEFINED.

TLBI VAAE1, TLBI VAAE1NXS, TLB Invalidate by VA, All ASID, EL1

The TLBI VAAE1, TLBI VAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a **64-bit** stage 1 translation table entry, from any level of the translation table walk.

Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.

- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAAE1, TLBI VAAE1NXS is a 64-bit System instruction.

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAAE1, TLBI VAAE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAAE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0111	0b011

TLBI VAAE1IS, TLBI VAAE1ISNXS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAAE1IS, TLBI VAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a **64-bit** stage 1 translation table entry, from any level of the translation table walk.

Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.

- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAAE1IS, TLBI VAAE1ISNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																TTL				VA[55:12]													
VA[55:12]																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAAE1IS, TLBI VAAE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAAE1IS{, <Xt>}

TLBI VAAE1OS, TLBI VAAE1OSNXS, TLB Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI VAAE1OS, TLBI VAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a **64-bit** stage 1 translation table entry, from any level of the translation table walk.

Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.

- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAAE1OS, TLBI VAAE1OSNXS are UNDEFINED.

Attributes

TLBI VAAE1OS, TLBI VAAE1OSNXS is a 64-bit System instruction.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAAE1OS, TLBI VAAE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAAE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0001	0b011

```

TLBI VAALE1, TLBI VAALE1NXS, TLB Invalidate by VA, All ASID, Last level, EL1

The TLBI VAALE1, TLBI VAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a **64-bit** stage 1 translation table entry, from the final level of the translation table walk.
Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAALE1, TLBI VAALE1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAALE1, TLBI VAALE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAALE1{, <Xt>}

TLBI VAALE1IS, TLBI VAALE1ISNXS, TLB Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI VAALE1IS, TLBI VAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a **64-bit** stage 1 translation table entry, from the final level of the translation table walk.
Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAALE1IS, TLBI VAALE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAALE1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0011	0b111

```

TLBI VAALE1OS, TLBI VAALE1OSNXS, TLB Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI VAALE1OS, TLBI VAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a **64-bit** stage 1 translation table entry, from the final level of the translation table walk.
Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAALE1OS, TLBI VAALE1OSNXS are UNDEFINED.

Attributes

TLBI VAALE1OS, TLBI VAALE1OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TTL				VA[55:12]											
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAALE1OS, TLBI VAALE1OSNXS instruction

TLBI VAE1, TLBI VAE1NXS, TLB Invalidate by VA, EL1

The TLBI VAE1, TLBI VAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry.
Or, if FEAT_D128 is implemented, and the entry is 128-bit a stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAE1, TLBI VAE1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL				VA[55:12]											
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE1, TLBI VAE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE1{, <Xt>}

op0	op1	CRn	CRm	op2

TLBI VAE1IS, TLBI VAE1ISNXS, TLB Invalidate by VA, EL1, Inner Shareable

The TLBI VAE1IS, TLBI VAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry.
- Or, if FEAT_D128 is implemented, and the entry is 128-bit a stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
 - A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAE1IS, TLBI VAE1ISNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TTL				VA[55:12]													
VA[55:12]																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE1IS, TLBI VAE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0011	0b001

TLBI VAE1OS, TLBI VAE1OSNXS, TLB Invalidate by VA, EL1, Outer Shareable

The TLBI VAE1OS, TLBI VAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry.
Or, if FEAT_D128 is implemented, and the entry is 128-bit a stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
 - A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAE1OS, TLBI VAE1OSNXS are UNDEFINED.

Attributes

TLBI VAE1OS, TLBI VAE1OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TTL				VA[55:12]													
VA[55:12]																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE1OS, TLBI VAE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE2, TLBI VAE2NXS, TLB Invalidate by VA, EL2

The TLBI VAE2, TLBI VAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry.

Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.

- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the current value of the [HCR_EL2.E2H](#) bit, for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from any level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAE2, TLBI VAE2NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL				VA[55:12]											
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE2, TLBI VAE2NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE2{, <Xt>}

op0	op1	CRn	CRm	op2

TLBI VAE2IS, TLBI VAE2ISNXS, TLB Invalidate by VA, EL2, Inner Shareable

The TLBI VAE2IS, TLBI VAE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry.

Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.

- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the current value of the HCR_EL2.E2H bit, for the Security state.
- If HCR_EL2.E2H == 0, the entry is from any level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAE2IS, TLBI VAE2ISNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

TLBI VAE2OS, TLBI VAE2OSNXS, TLB Invalidate by VA, EL2, Outer Shareable

The TLBI VAE2OS, TLBI VAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry.

Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.

- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the current value of the HCR_EL2.E2H bit, for the Security state.
- If HCR_EL2.E2H == 0, the entry is from any level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAE2OS, TLBI VAE2OSNXS are UNDEFINED.

Attributes

TLBI VAE2OS, TLBI VAE2OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TTL				VA[55:12]													
VA[55:12]																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE2OS, TLBI VAE2OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE3, TLBI VAE3NXS, TLB Invalidate by VA, EL3

The TLBI VAE3, TLBI VAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk.

Or, if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.

- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAE3, TLBI VAE3NXS is a 64-bit System instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE3OS, TLBI VAE3OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE1, TLBI VALE1NXS, TLB Invalidate by VA, Last level, EL1

The TLBI VALE1, TLBI VALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry.
Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VALE1, TLBI VALE1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL				VA[55:12]											
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE1, TLBI VALE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0111	0b101

```

TLBI VALE1IS, TLBI VALE1ISNXS, TLB Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI VALE1IS, TLBI VALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry.
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
 - A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VALE1IS, TLBI VALE1ISNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TTL				VA[55:12]													
VA[55:12]																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44] When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE1IS, TLBI VALE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE1IS{, <Xt>}

TLBI VALE1OS, TLBI VALE1OSNXS, TLB Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI VALE1OS, TLBI VALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry.
- Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
 - A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VALE1OS, TLBI VALE1OSNXS are UNDEFINED.

Attributes

TLBI VALE1OS, TLBI VALE1OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL				VA[55:12]											
																VA[55:12]															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE1OS, TLBI VALE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0001	0b101

TLBI VALE2, TLBI VALE2NXS, TLB Invalidate by VA, Last level, EL2

The TLBI VALE2, TLBI VALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry.

Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.

- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the current value of the HCR_EL2.E2H bit, for the Security state.
- If HCR_EL2.E2H == 0, the entry is from the final level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VALE2, TLBI VALE2NXS is a 64-bit System instruction.

Field descriptions

ASID																TTL				VA[55:12]											
																VA[55:12]															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASID, bits [63:48]**When HCR_EL2.E2H == 1:**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VALE2IS, TLBI VALE2ISNXS, TLB Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI VALE2IS, TLBI VALE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry.

Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.

- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the current value of the HCR_EL2.E2H bit, for the Security state.
- If HCR_EL2.E2H == 0, the entry is from the final level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VALE2IS, TLBI VALE2ISNXS is a 64-bit System instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE2IS, TLBI VALE2ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE2IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0011	0b101

```

TLBI VALE2OS, TLBI VALE2OSNXS, TLB Invalidate by VA, Last level, EL2, Outer Shareable

The TLBI VALE2OS, TLBI VALE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry.

Or if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.

- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the current value of the HCR_EL2.E2H bit, for the Security state.
- If HCR_EL2.E2H == 0, the entry is from the final level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VALE2OS, TLBI VALE2OSNXS are UNDEFINED.

Attributes

TLBI VALE2OS, TLBI VALE2OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE3IS, TLBI VALE3ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE3IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0011	0b101

```

TLBI VALE3OS, TLBI VALE3OSNXS, TLB Invalidate by VA, Last level, EL3, Outer Shareable

The TLBI VALE3OS, TLBI VALE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from the final level of the translation table walk.

Or, if FEAT_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.

- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VALE3OS, TLBI VALE3OSNXS are UNDEFINED.

Attributes

TLBI VALE3OS, TLBI VALE3OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TTL				VA[55:12]											
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VMALLE1, TLBI VMALLE1NXS, TLB Invalidate by VMID, All at stage 1, EL1

The TLBI VMALLE1, TLBI VMALLE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VMALLE1, TLBI VMALLE1NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI VMALLE1, TLBI VMALLE1NXS instruction

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VMALLE1{, <Xt>}

op0	op1	CRn	CRm	op2

TLBI VMALLE1IS, TLBI VMALLE1ISNXS, TLB Invalidate by VMID, All at stage 1, EL1, Inner Shareable

The TLBI VMALLE1IS, TLBI VMALLE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

TLBI VMALLE1OS, TLBI VMALLE1OSNXS, TLB Invalidate by VMID, All at stage 1, EL1, Outer Shareable

The TLBI VMALLE1OS, TLBI VMALLE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VMALLE1OS, TLBI VMALLE1OSNXS are UNDEFINED.

Attributes

TLBI VMALLE1OS, TLBI VMALLE1OSNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI VMALLE1OS, TLBI VMALLE1OSNXS instruction

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VMALLE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0001	0b000

```

TLBIP IPAS2E1, TLBIP IPAS2E1NXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, EL1

The TLBIP IPAS2E1, TLBIP IPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 2 only translation table entry, from any level of the translation table walk.
- Or the entry is a 64-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP IPAS2E1, TLBIP IPAS2E1NXS are UNDEFINED.

Attributes

TLBIP IPAS2E1, TLBIP IPAS2E1NXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96	
RES0																IPA[55:12]																
IPA[55:12]																																
NS	RES0															TTL					RES0											
RES0																																

Bits [127:108]

Reserved, RES0.

IPA[55:12], bits [107:64]

Bits[55:12] of the intermediate physical address to match.

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP IPAS2E1IS, TLBIP IPAS2E1ISNXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBIP IPAS2E1IS, TLBIP IPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 2 only translation table entry, from any level of the translation table walk.
Or the entry is a 64-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP IPAS2E1IS, TLBIP IPAS2E1ISNXS are UNDEFINED.

Attributes

TLBIP IPAS2E1IS, TLBIP IPAS2E1ISNXS is a 128-bit System instruction.

TLBIP IPAS2E1OS, TLBIP IPAS2E1OSNXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBIP IPAS2E1OS, TLBIP IPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 2 only translation table entry, from any level of the translation table walk.
Or the entry is a 64-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP IPAS2E1OS, TLBIP IPAS2E1OSNXS are UNDEFINED.

Attributes

TLBIP IPAS2E1OS, TLBIP IPAS2E1OSNXS is a 128-bit System instruction.

Field descriptions

12712612512412312212112011911811711611511411311211111010910810710610510410310210110099989796	
RES0	IPA[51:48]
IPA[51:48]	
NS	RES0TTLRES0
RES0	

Bits [127:108]

Reserved, RES0.

IPA[51:48], bits [107:64]

Bits[55:12] of the intermediate physical address to match.

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP IPAS2LE1IS, TLBIP IPAS2LE1ISNXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBIP IPAS2LE1IS, TLBIP IPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 2 only translation table entry, from the final level of the translation table walk.
Or the entry is a 64-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

TLBIP IPAS2LE1OS, TLBIP IPAS2LE1OSNXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBIP IPAS2LE1OS, TLBIP IPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 2 only translation table entry, from the final level of the translation table walk.
Or the entry is a 64-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP IPAS2LE1OS, TLBIP IPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBIP IPAS2LE1OS, TLBIP IPAS2LE1OSNXS is a 128-bit System instruction.

Field descriptions

12712612512412312212112011911811711611511411311211111010910810710610510410310210110099989796	
RES0	IPA[51:48]
IPA[51:48]	
NS	RES0TTLRES0
RES0	

Bits [127:108]

Reserved, RES0.

IPA[51:48], bits [107:64]

Bits[55:12] of the intermediate physical address to match.

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP RIPAS2E1, TLBIP RIPAS2E1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBIP RIPAS2E1, TLBIP RIPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
- Or the entry is a 64-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RIPAS2E1, TLBIP RIPAS2E1NXS are UNDEFINED.

Attributes

TLBIP RIPAS2E1, TLBIP RIPAS2E1NXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96				
RES0																		BaseADDR[55:12]																	
BaseADDR[55:12]																																			
NS	RES0														TG	SCALE	NUM				TTL	RES0													
RES0																																			

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RIPAS2E1IS, TLBIP RIPAS2E1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBIP RIPAS2E1IS, TLBIP RIPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
- Or the entry is a 64-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RIPAS2E1IS, TLBIP RIPAS2E1ISNXS are UNDEFINED.

Attributes

TLBIP RIPAS2E1IS, TLBIP RIPAS2E1ISNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96				
RES0																		BaseADDR[55:12]																	
BaseADDR[55:12]																																			
NS	RES0															TG	SCALE	NUM				TTL	RES0												
RES0																																			

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

NS, bit [63] When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

```

TLBIP RIPAS2E1OS, TLBIP RIPAS2E1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBIP RIPAS2E1OS, TLBIP RIPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
- Or the entry is a 64-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RIPAS2E1OS, TLBIP RIPAS2E1OSNXS are UNDEFINED.

Attributes

TLBIP RIPAS2E1OS, TLBIP RIPAS2E1OSNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96				
RES0																		BaseADDR[55:12]																	
BaseADDR[55:12]																																			
NS	RES0														TG	SCALE	NUM				TTL		RES0												
RES0																																			

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

NS, bit [63] When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

Executing TLBIP RIPAS2E1OS, TLBIP RIPAS2E1OSNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP RIPAS2E1OS{, <Xt>, <Xt2>}

op0	op1	CRn	CRm	op2

TLBIP RIPAS2LE1, TLBIP RIPAS2LE1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBIP RIPAS2LE1, TLBIP RIPAS2LE1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
- Or if FEAT_D128 is implemented, and the entry is a 64-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RIPAS2LE1, TLBIP RIPAS2LE1NXS are UNDEFINED.

Attributes

TLBIP RIPAS2LE1, TLBIP RIPAS2LE1NXS is a 128-bit System instruction.

TLBIP RIPAS2LE1IS, TLBIP RIPAS2LE1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBIP RIPAS2LE1IS, TLBIP RIPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.

Or if FEAT_D128 is implemented, and the entry is a 64-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.

- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RIPAS2LE1IS, TLBIP RIPAS2LE1ISNXS are UNDEFINED.

Attributes

TLBIP RIPAS2LE1IS, TLBIP RIPAS2LE1ISNXS is a 128-bit System instruction.

TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
- Or if FEAT_D128 is implemented, and the entry is a 64-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
- A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96				
RES0																		BaseADDR[55:12]																	
BaseADDR[55:12]																																			
NS	RES0													TG	SCALE	NUM					TTL			RES0											
RES0																																			

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

NS, bit [63] When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

Executing TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP RIPAS2LE1OS{, <Xt>, <Xt2>}

    TLBIlevel_Last, TLBI_ExcludeXS, X[t2, 64]:X[t, 64]);
```

TLBIP RVAAE1, TLBIP RVAAE1NXS, TLB Range Invalidate by VA, All ASID, EL1

The TLBIP RVAAE1, TLBIP RVAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
- Or the entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVAAE1, TLBIP RVAAE1NXS are UNDEFINED.

Attributes

TLBIP RVAAE1, TLBIP RVAAE1NXS is a 128-bit System instruction.

TLBIP RVAAE1IS, TLBIP RVAAE1ISNXS, TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBIP RVAAE1IS, TLBIP RVAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
- Or the entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVAAE1IS, TLBIP RVAAE1ISNXS are UNDEFINED.

Attributes

TLBIP RVAAE1IS, TLBIP RVAAE1ISNXS is a 128-bit System instruction.

TLBIP RVAAE1OS, TLBIP RVAAE1OSNXS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBIP RVAAE1OS, TLBIP RVAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
- Or the entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVAAE1OS, TLBIP RVAAE1OSNXS are UNDEFINED.

Attributes

TLBIP RVAAE1OS, TLBIP RVAAE1OSNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
RES0																BaseADDR[55:12]															
BaseADDR[55:12]																															
RES0																TG	SCALE	NUM				TTL	RES0								
RES0																															

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAALE1IS, TLBIP RVAALE1ISNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBIP RVAALE1IS, TLBIP RVAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
Or the entry is a 64-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

TLBIP RVAALE1IS, TLBIP RVAALE1ISNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVAALE1IS, TLBIP RVAALE1ISNXS are UNDEFINED.

Attributes

TLBIP RVAALE1IS, TLBIP RVAALE1ISNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96				
RES0																		BaseADDR[55:12]																	
BaseADDR[55:12]																																			
RES0																TG	SCALE	NUM				TTL		RES0											
RES0																																			

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
Or the entry is a 64-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS are UNDEFINED.

Attributes

TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS is a 128-bit System instruction.

TLBIP RVAE1, TLBIP RVAE1NXS, TLB Range Invalidate by VA, EL1

The TLBIP RVAE1, TLBIP RVAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
- Or the entry is a 64-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVAE1, TLBIP RVAE1NXS are UNDEFINED.

Attributes

TLBIP RVAE1, TLBIP RVAE1NXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
RES0																BaseADDR[55:12]															
BaseADDR[55:12]																															
ASID																TG	SCALE	NUM				TTL		RES0							
RES0																															

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

Executing TLBIP RVAE1, TLBIP RVAE1NXS

TLBIP RVAE1IS, TLBIP RVAE1ISNXS, TLB Range Invalidate by VA, EL1, Inner Shareable

The TLBIP RVAE1IS, TLBIP RVAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
- Or the entry is a 64-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVAE1IS, TLBIP RVAE1ISNXS are UNDEFINED.

TLBIP RVAE1OS, TLBIP RVAE1OSNXS, TLB Range Invalidate by VA, EL1, Outer Shareable

The TLBIP RVAE1OS, TLBIP RVAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
- Or the entry is a 64-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVAE1OS, TLBIP RVAE1OSNXS are UNDEFINED.

Attributes

TLBIP RVAE1OS, TLBIP RVAE1OSNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96				
RES0																		BaseADDR[55:12]																	
BaseADDR[55:12]																																			
ASID														TG	SCALE	NUM						TTL	RES0												
RES0																																			

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAE2, TLBIP RVAE2NXS, TLB Range Invalidate by VA, EL2

The TLBIP RVAE2, TLBIP RVAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.

Or the entry is a 64-bit stage 1 translation table entry, if TTL is 0b00.

- The entry would be used to translate any VA in the range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$ using the EL2 or EL2&0 translation regime, as determined by the current value of the [HCR_EL2.E2H](#) bit, for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from any level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVAE2, TLBIP RVAE2NXS are UNDEFINED.

Attributes

TLBIP RVAE2, TLBIP RVAE2NXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96				
RES0																		BaseADDR[55:12]																	
BaseADDR[55:12]																																			
ASID														TG	SCALE	NUM				TTL	RES0														
RES0																																			

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAE2IS, TLBIP RVAE2ISNXS, TLB Range Invalidate by VA, EL2, Inner Shareable

The TLBIP RVAE2IS, TLBIP RVAE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.

Or the entry is a 64-bit stage 1 translation table entry, if TTL is 0b00.

- The entry would be used to translate any VA in the range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1)} * \text{Translation_Granule_Size})]$ using the EL2 or EL2&0 translation regime, as determined by the current value of the [HCR_EL2.E2H](#) bit, for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from any level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVAE2IS, TLBIP RVAE2ISNXS are UNDEFINED.

Attributes

TLBIP RVAE2IS, TLBIP RVAE2ISNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
RES0																BaseADDR[55:12]															
BaseADDR[55:12]																															
ASID																TG	SCALE	NUM				TTL		RES0							
RES0																															

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAE2OS, TLBIP RVAE2OSNXS, TLB Range Invalidate by VA, EL2, Outer Shareable

The TLBIP RVAE2OS, TLBIP RVAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.

Or the entry is a 64-bit stage 1 translation table entry, if TTL is 0b00.

- The entry would be used to translate any VA in the range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$ using the EL2 or EL2&0 translation regime, as determined by the current value of the [HCR_EL2.E2H](#) bit, for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from any level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

TLBIP RVAE3IS, TLBIP RVAE3ISNXS, TLB Range Invalidate by VA, EL3, Inner Shareable

The TLBIP RVAE3IS, TLBIP RVAE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
Or the entry is 64-bit a stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVAE3IS, TLBIP RVAE3ISNXS are UNDEFINED.

Attributes

TLBIP RVAE3IS, TLBIP RVAE3ISNXS is a 128-bit System instruction.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAE3OS, TLBIP RVAE3OSNXS, TLB Range Invalidate by VA, EL3, Outer Shareable

The TLBIP RVAE3OS, TLBIP RVAE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
Or the entry is 64-bit a stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVAE3OS, TLBIP RVAE3OSNXS are UNDEFINED.

Attributes

TLBIP RVAE3OS, TLBIP RVAE3OSNXS is a 128-bit System instruction.

TLBIP RVALE1, TLBIP RVALE1NXS, TLB Range Invalidate by VA, Last level, EL1

The TLBIP RVALE1, TLBIP RVALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
- Or the entry is a 64-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVALE1, TLBIP RVALE1NXS are UNDEFINED.

Attributes

TLBIP RVALE1, TLBIP RVALE1NXS is a 128-bit System instruction.

RES0																															

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

TLBIP RVALE1IS, TLBIP RVALE1ISNXS, TLB Range Invalidate by VA, Last level, EL1, Inner Shareable

The TLBIP RVALE1IS, TLBIP RVALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
- Or the entry is a 64-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVALE1IS, TLBIP RVALE1ISNXS are UNDEFINED.

Attributes

TLBIP RVALE1IS, TLBIP RVALE1ISNXS is a 128-bit System instruction.

Field descriptions

ASID																TG	SCALE	NUM				TTL		RES0							
RES0																															

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVALE1OS, TLBIP RVALE1OSNXS, TLB Range Invalidate by VA, Last level, EL1, Outer Shareable

The TLBIP RVALE1OS, TLBIP RVALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
- Or the entry is a 64-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVALE1OS, TLBIP RVALE1OSNXS are UNDEFINED.

Attributes

TLBIP RVALE1OS, TLBIP RVALE1OSNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
RES0																BaseADDR[55:12]															
BaseADDR[55:12]																															
ASID																TG	SCALE	NUM				TTL		RES0							
RES0																															

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVALE2, TLBIP RVALE2NXS, TLB Range Invalidate by VA, Last level, EL2

The TLBIP RVALE2, TLBIP RVALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.

Or the entry is a 64-bit stage 1 translation table entry, if TTL is 0b00.

- The entry would be used to translate any VA in the range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1)} * \text{Translation_Granule_Size})]$ using the EL2 or EL2&0 translation regime, as determined by the current value of the [HCR_EL2.E2H](#) bit, for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from the final level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVALE2, TLBIP RVALE2NXS are UNDEFINED.

Attributes

TLBIP RVALE2, TLBIP RVALE2NXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96				
RES0																		BaseADDR[55:12]																	
BaseADDR[55:12]

RES0																																			

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]
When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVALE2IS, TLBIP RVALE2ISNXS, TLB Range Invalidate by VA, Last level, EL2, Inner Shareable

The TLBIP RVALE2IS, TLBIP RVALE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.

Or the entry is a 64-bit stage 1 translation table entry, if TTL is 0b00.

- The entry would be used to translate any VA in the range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$ using the EL2 or EL2&0 translation regime, as determined by the current value of the [HCR_EL2.E2H](#) bit, for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from the final level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVALE2IS, TLBIP RVALE2ISNXS are UNDEFINED.

Attributes

TLBIP RVALE2IS, TLBIP RVALE2ISNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96	
RES0																BaseADDR[55:12]																
BaseADDR[55:12]																																
ASID																TG	SCALE	NUM				TTL	RES0									
RES0																																

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

Executing TLBIP RVALE2IS, TLBIP RVALE2ISNXS

TLBIP RVALE3, TLBIP RVALE3NXS, TLB Range Invalidate by VA, Last level, EL3

The TLBIP RVALE3, TLBIP RVALE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint.
Or the entry is 64-bit a stage 1 translation table entry, from the final level of the translation table walk, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVALE3, TLBIP RVALE3NXS are UNDEFINED.

Attributes

TLBIP RVALE3, TLBIP RVALE3NXS is a 128-bit System instruction.

TLBIP RVALE3IS, TLBIP RVALE3ISNXS, TLB Range Invalidate by VA, Last level, EL3, Inner Shareable

The TLBIP RVALE3IS, TLBIP RVALE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint.
Or the entry is 64-bit a stage 1 translation table entry, from the final level of the translation table walk, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP RVALE3IS, TLBIP RVALE3ISNXS are UNDEFINED.

Attributes

TLBIP RVALE3IS, TLBIP RVALE3ISNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
RES0																BaseADDR[55:12]															
BaseADDR[55:12]																															
RES0																TG	SCALE	NUM				TTL		RES0							
RES0																															

Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

Executing TLBIP RVALE3IS, TLBIP RVALE3ISNXXS

TLBIP VAAE1, TLBIP VAAE1NXS, TLB Invalidate Pair by VA, All ASID, EL1

The TLBIP VAAE1, TLBIP VAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk.
- Or the entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VAAE1, TLBIP VAAE1NXS are UNDEFINED.

Attributes

TLBIP VAAE1, TLBIP VAAE1NXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
RES0																VA[55:12]															
VA[55:12]																															
RES0																TTL				RES0											
RES0																															

Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level.
0b01xx	In this case, TTL<1:0> is RES0. The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

Executing TLBIP VAAE1, TLBIP VAAE1NXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP VAAE1{, <Xt>, <Xt2>}

TLBIP VAAE1IS, TLBIP VAAE1ISNXS, TLB Invalidate Pair by VA, All ASID, EL1, Inner Shareable

The TLBIP VAAE1IS, TLBIP VAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk.
- Or the entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VAAE1IS, TLBIP VAAE1ISNXS are UNDEFINED.

Attributes

TLBIP VAAE1IS, TLBIP VAAE1ISNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96				
RES0																		VA[55:12]																	
VA[55:12]																																			
RES0																		TTL				RES0													
RES0																																			

Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VAAE1OS, TLBIP VAAE1OSNXS, TLB Invalidate Pair by VA, All ASID, EL1, Outer Shareable

The TLBIP VAAE1OS, TLBIP VAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk.
- Or the entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VAAE1OS, TLBIP VAAE1OSNXS are UNDEFINED.

Attributes

TLBIP VAAE1OS, TLBIP VAAE1OSNXS is a 128-bit System instruction.

TLBIP VAALE1, TLBIP VAALE1NXS, TLB Invalidate Pair by VA, All ASID, Last level, EL1

The TLBIP VAALE1, TLBIP VAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from the final level of the translation table walk.
Or the entry is a 64-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VAALE1, TLBIP VAALE1NXS are UNDEFINED.

Attributes

TLBIP VAALE1, TLBIP VAALE1NXS is a 128-bit System instruction.

RES0																VA[55:12]															
VA[55:12]																															
RES0																TTL				RES0											
RES0																															

Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level.
0b01xx	In this case, TTL<1:0> is RES0. The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VAALE1IS, TLBIP VAALE1ISNXS, TLB Invalidate Pair by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBIP VAALE1IS, TLBIP VAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from the final level of the translation table walk.
Or the entry is a 64-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VAALE1IS, TLBIP VAALE1ISNXS are UNDEFINED.

Attributes

TLBIP VAALE1IS, TLBIP VAALE1ISNXS is a 128-bit System instruction.

Field descriptions

VA[55:12]																															
RES0																TTL				RES0											
RES0																															

Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

TLBIP VAALE1OS, TLBIP VAALE1OSNXS, TLB Invalidate Pair by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBIP VAALE1OS, TLBIP VAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from the final level of the translation table walk.
Or the entry is a 64-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VAALE1OS, TLBIP VAALE1OSNXS are UNDEFINED.

Attributes

TLBIP VAALE1OS, TLBIP VAALE1OSNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96				
RES0																		VA[55:12]																	
VA[55:12]																																			
RES0																		TTL				RES0													
RES0																																			

Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VAE1, TLBIP VAE1NXS, TLB Invalidate Pair by VA, EL1

The TLBIP VAE1, TLBIP VAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry.
Or the entry is a 64-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VAE1, TLBIP VAE1NXS are UNDEFINED.

Attributes

TLBIP VAE1, TLBIP VAE1NXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
RES0																VA[55:12]															
VA[55:12]																															
ASID																TTL				RES0											
RES0																															

Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VAE1IS, TLBIP VAE1ISNXS, TLB Invalidate Pair by VA, EL1, Inner Shareable

The TLBIP VAE1IS, TLBIP VAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry.
Or the entry is a 64-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VAE1IS, TLBIP VAE1ISNXS are UNDEFINED.

Attributes

TLBIP VAE1IS, TLBIP VAE1ISNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96				
RES0																		VA[55:12]																	
VA[55:12]																																			
ASID																TTL				RES0															
RES0																																			

Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

Executing TLBIP VAE1IS, TLBIP VAE1ISNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP VAE1IS{, <Xt>, <Xt2>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0011	0b001

TLBIP VAE1OS, TLBIP VAE1OSNXS, TLB Invalidate Pair by VA, EL1, Outer Shareable

The TLBIP VAE1OS, TLBIP VAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry.
Or the entry is a 64-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VAE1OS, TLBIP VAE1OSNXS are UNDEFINED.

Attributes

TLBIP VAE1OS, TLBIP VAE1OSNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96

RES0																																			

Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

TLBIP VAE2, TLBIP VAE2NXS, TLB Invalidate Pair by VA, EL2

The TLBIP VAE2, TLBIP VAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry.
- Or the entry is a 64-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the current value of the [HCR_EL2.E2H](#) bit, for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from any level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VAE2, TLBIP VAE2NXS are UNDEFINED.

Attributes

TLBIP VAE2, TLBIP VAE2NXS is a 128-bit System instruction.

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

Executing TLBIP VAE2, TLBIP VAE2NXS

TLBIP VAE2IS, TLBIP VAE2ISNXS, TLB Invalidate Pair by VA, EL2, Inner Shareable

The TLBIP VAE2IS, TLBIP VAE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry.
- Or the entry is a 64-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the current value of the [HCR_EL2.E2H](#) bit, for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from any level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VAE2IS, TLBIP VAE2ISNXS are UNDEFINED.

Attributes

TLBIP VAE2IS, TLBIP VAE2ISNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
RES0																VA[55:12]															
VA[55:12]																															
ASID																TTL				RES0											
RES0																															

Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

TLBIP VAE3, TLBIP VAE3NXS, TLB Invalidate Pair by VA, EL3

The TLBIP VAE3, TLBIP VAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk.
Or the entry is 64-bit a stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VAE3, TLBIP VAE3NXS are UNDEFINED.

Attributes

TLBIP VAE3, TLBIP VAE3NXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
RES0																VA[55:12]															
VA[55:12]																															
RES0																TTL				RES0											
RES0																															

Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VAE3IS, TLBIP VAE3ISNXS, TLB Invalidate Pair by VA, EL3, Inner Shareable

The TLBIP VAE3IS, TLBIP VAE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk.
Or the entry is 64-bit a stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VAE3IS, TLBIP VAE3ISNXS are UNDEFINED.

Attributes

TLBIP VAE3IS, TLBIP VAE3ISNXS is a 128-bit System instruction.

TLBIP VALE1, TLBIP VALE1NXS, TLB Invalidate Pair by VA, Last level, EL1

The TLBIP VALE1, TLBIP VALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry.
Or the entry is a 64-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VALE1, TLBIP VALE1NXS are UNDEFINED.

Attributes

TLBIP VALE1, TLBIP VALE1NXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
RES0																VA[55:12]															
VA[55:12]																															
ASID																TTL				RES0											
RES0																															

Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

TLBIP VALE1IS, TLBIP VALE1ISNXS, TLB Invalidate Pair by VA, Last level, EL1, Inner Shareable

The TLBIP VALE1IS, TLBIP VALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry.
Or the entry is a 64-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VALE1IS, TLBIP VALE1ISNXS are UNDEFINED.

Attributes

TLBIP VALE1IS, TLBIP VALE1ISNXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
RES0																VA[55:12]															
VA[55:12]																															
ASID																TTL				RES0											
RES0																															

Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

TLBIP VALE1OS, TLBIP VALE1OSNXS, TLB Invalidate Pair by VA, Last level, EL1, Outer Shareable

The TLBIP VALE1OS, TLBIP VALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry.
Or the entry is a 64-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

TLBIP VALE2, TLBIP VALE2NXS, TLB Invalidate Pair by VA, Last level, EL2

The TLBIP VALE2, TLBIP VALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry.
Or the entry is a 64-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the current value of the [HCR_EL2.E2H](#) bit, for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from the final level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VALE2, TLBIP VALE2NXS are UNDEFINED.

Attributes

TLBIP VALE2, TLBIP VALE2NXS is a 128-bit System instruction.

Field descriptions

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
RES0																VA[55:12]															
VA[55:12]																															
ASID																TTL				RES0											
RES0																RES0															

Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]**When HCR_EL2.E2H == 1:**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]**When HCR_EL2.E2H == 1:**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

Executing TLBIP VALE2OS, TLBIP VALE2OSNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP VALE2OS{, <Xt>, <Xt2>}

TLBIP VALE3, TLBIP VALE3NXS, TLB Invalidate Pair by VA, Last level, EL3

The TLBIP VALE3, TLBIP VALE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 128-bit stage 1 translation table entry, from the final level of the translation table walk.
Or the entry is 64-bit a stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented. Otherwise, direct accesses to TLBIP VALE3, TLBIP VALE3NXS are UNDEFINED.

Attributes

TLBIP VALE3, TLBIP VALE3NXS is a 128-bit System instruction.

TPIDR2_EL0, EL0 Read/Write Software Thread ID Register 2

The TPIDR2_EL0 characteristics are:

Purpose

Provides a location where SME-aware software executing at EL0 can store thread identifying information, for context management purposes.

The PE makes no use of this register.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to TPIDR2_EL0 are UNDEFINED.

Attributes

TPIDR2_EL0 is a 64-bit register.

Field descriptions

Bits [63:0]

Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDR2_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TPIDR2_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0000	0b101

TPIDR_EL0, EL0 Read/Write Software Thread ID Register

The TPIDR_EL0 characteristics are:

Purpose

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

Configuration

AArch64 System register TPIDR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [TPIDRURW\[31:0\]](#).

Attributes

TPIDR_EL0 is a 64-bit register.

Field descriptions

Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TPIDR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0000	0b010

```

if PSTATE.EL == EL0 then
    if EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && IsFeatureImplemented(FEAT_FGT) &&

TPIDRRO_EL0, EL0 Read-Only Software Thread ID Register

The TPIDRRO_EL0 characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configuration

AArch64 System register TPIDRRO_EL0 bits [31:0] are architecturally mapped to AArch32 System register [TPIDRURO\[31:0\]](#).

Attributes

TPIDRRO_EL0 is a 64-bit register.

Field descriptions

Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

Accessing TPIDRRO_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TPIDRRO_EL0

op0	op1	CRn	CRm	op2

The TRBBASER_EL1 characteristics are:

Purpose

Defines the base address for the trace buffer.

Configuration

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBBASER_EL1 are UNDEFINED.

Attributes

TRBBASER_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																BASE															
BASE																RES0															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

BASE, bits [63:12]

Trace Buffer Base pointer address. (TRBBASER_EL1.BASE < 12) is the address of the first byte in the trace buffer. Bits [11:0] of the Base pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBBASER_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value $\text{Log}_2(\text{smallest implemented translation granule})$.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing TRBBASER_EL1

The PE might ignore a direct write to `TRBBASER_EL1` if `TRBLIMITR_EL1.E == 1`.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBBASER_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b010

```

TRBIDR_EL1, Trace Buffer ID Register

The TRBIDR_EL1 characteristics are:

Purpose

Describes constraints on using the Trace Buffer Unit to software, including whether the Trace Buffer Unit can be programmed at the current Exception level.

Configuration

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBIDR_EL1 are UNDEFINED.

Attributes

TRBIDR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																EA				RES0		F	P	Align							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:12]

Reserved, RES0.

EA, bits [11:8] From Armv9.3:

External Abort handling. Describes how the PE manages External aborts on writes made by the Trace Buffer Unit to the trace buffer.

EA	Meaning
0b0000	Not described.
0b0001	The PE ignores External aborts on writes made by the Trace Buffer Unit.
0b0010	The External abort generates an SError interrupt at the PE.

All other values are reserved.

From Armv9.3, the value 0b0000 is not permitted.

[TRBIDR_EL1](#).EA describes only External aborts generated by the write to memory. External aborts on a translation table walk made by the Trace Buffer Unit generate trace buffer management events reported as MMU faults using [TRBSR_EL1](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [7:6]

Reserved, RES0.

F, bit [5]

Flag updates. Describes how address translations performed by the Trace Buffer Unit manage the Access flag and dirty state.

F	Meaning
0b0	Hardware management of the Access flag and dirty state for accesses made by the Trace Buffer Unit is always disabled for all translation stages.
0b1	Hardware management of the Access flag and dirty state for accesses made by the Trace Buffer Unit is controlled in the same way as explicit memory accesses in the trace buffer owning translation regime.

Note

If hardware management of the Access flag is disabled for a stage of translation, an access to a Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor and might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

From Armv9.3, the value 0 is not permitted.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

P, bit [4]

Programming not allowed. When read at EL3, this field reads as zero. Otherwise, indicates that the trace buffer is owned by a higher Exception level or another Security state. Defined values are:

P	Meaning
0b0	Programming is allowed.
0b1	Programming not allowed.

The value read from this field depends on the current Exception level and the Effective values of [MDCR_EL3.NSTB](#), [MDCR_EL3.NSTBE](#), and [MDCR_EL2.E2TB](#):

- If EL3 is implemented, and the owning Security state is Secure state, this field reads as one from:
 - Non-secure EL1 and Non-secure EL2.
 - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
 - If Secure EL2 is implemented and enabled, and [MDCR_EL2.E2TB](#) is 0b00, Secure EL1.
- If EL3 is implemented, and the owning Security state is Non-secure state, this field reads as one from:
 - Secure EL1.
 - If Secure EL2 is implemented, Secure EL2.
 - If EL2 is implemented and [MDCR_EL2.E2TB](#) is 0b00, Non-secure EL1.
 - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
- If FEAT_RME is implemented, and the owning Security state is Realm state, this field reads as one from:
 - Non-secure EL1 and Non-secure EL2.
 - Secure EL1 and Secure EL2.
 - If [MDCR_EL2.E2TB](#) is 0b00, Realm EL1.

- If EL3 is not implemented, EL2 is implemented, and [MDCR_EL2.E2TB](#) is 0b00, this field reads as one from EL1.
- Otherwise, this field reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for writes to [TRBPTR_EL1](#) and [TRBTRG_EL1](#). Defined values are:

Align	Meaning
0b0000	Byte.
0b0001	Halfword.
0b0010	Word.
0b0011	Doubleword.
0b0100	16 bytes.
0b0101	32 bytes.
0b0110	64 bytes.
0b0111	128 bytes.
0b1000	256 bytes.
0b1001	512 bytes.
0b1010	1KB.
0b1011	2KB.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRBIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HDFGRTR_EL2.TRBIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = TRBIDR_EL1;
elsif PSTATE.EL == EL2 then
    X[t, 64] = TRBIDR_EL1;
elsif PSTATE.EL == EL3 then
    X[t, 64] = TRBIDR_EL1;

```

TRBLIMITR_EL1, Trace Buffer Limit Address Register

The TRBLIMITR_EL1 characteristics are:

Purpose

Defines the top address for the trace buffer, and controls the trace buffer modes and enable.

Configuration

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBLIMITR_EL1 are UNDEFINED.

Attributes

TRBLIMITR_EL1 is a 64-bit register.

Field descriptions

LIMIT, bits [63:12]

Trace Buffer Limit pointer address. (TRBLIMITR_EL1.LIMIT << 12) is the address of the last byte in the trace buffer plus one. Bits [11:0] of the Limit pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBLIMITR_EL1[N-1:12] are TRBLIMITR_EL1.LIMIT << 12) is the address of the last byte in the trace buffer plus one. Bits [11:0] of the Limit pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBLIMITR_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log2(smallest implemented translation granule).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

XE, bit [6] When FEAT_TRBE_EXT is implemented:

Trace Buffer Unit External mode enable. Used for save/restore of TRBLIMITR_EL1.XE.

XE	Meaning
0b0	Trace Buffer Unit is not enabled by this control.
0b1	If SelfHostedTraceEnabled() is FALSE, the Trace Buffer Unit is enabled.

Software must treat this field as UNK/SBZP when the OS Lock is unlocked.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When !OSLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

nVM, bit [5]

Address mode.

nVM	Meaning
0b0	The trace buffer pointers are virtual addresses.
0b1	The trace buffer pointers are: <ul style="list-style-type: none"> Physical address in the owning security state if the owning translation regime has no stage 2 translation. Intermediate physical addresses in the owning security state if the owning translation regime has stage 2 translations.

When FEAT_TRBE_EXT is implemented and SelfHostedTraceEnabled() == FALSE, the trace buffer pointers are always physical addresses.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- AccessOn is a Cold reset, this field resets to an architecturally **RES1UNKNOWN** if all of the following are true:
 - FEAT_TRBE_EXT is implemented
 - !SelfHostedTraceEnabled()
- Otherwise, access to this field is **RW**.

TM, bits [4:3]

Trigger mode.

TM	Meaning
0b00	Stop on trigger. Flush then stop collection and raise maintenance interrupt on Trigger Event.
0b01	IRQ on trigger. Continue collection and raise maintenance interrupt on Trigger Event.
0b11	Ignore trigger. Continue collection and do not raise maintenance interrupt on Trigger Event.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

FM, bits [2:1]

Trace buffer mode.

FM	Meaning
0b00	Fill mode. Stop collection and raise maintenance interrupt on current write pointer wrap.
0b01	Wrap mode. Continue collection and raise maintenance interrupt on current write pointer wrap.
0b11	Circular Buffer mode. Continue collection and do not raise maintenance interrupt on current write pointer wrap.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Trace Buffer Unit enable. Controls whether the Trace Buffer Unit is enabled when SelfHostedTraceEnabled() == TRUE.

E	Meaning
0b0	Trace Buffer Unit is not enabled by this control. disabled.
0b1	If SelfHostedTraceEnabled() is TRUE, the Trace Buffer Unit is enabled enabled by this control.

If Regardless of the value of this field, the Trace Buffer Unit is disabled when SelfHostedTraceEnabled() == FALSE. All output is discarded by the Trace Buffer Unit when it is disabled. FEAT_TRBE_EXT is implemented and SelfHostedTraceEnabled() == FALSE, then TRBLIMITR_EL1.XE controls whether the Trace Buffer Unit is enabled.

If FEAT_TRBE_EXT is not implemented, then the Trace Buffer Unit is disabled when SelfHostedTraceEnabled() == FALSE.

All output is discarded by the Trace Buffer Unit when the Trace Buffer Unit is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing TRBLIMITR_EL1

The PE might ignore a direct write to TRBLIMITR_EL1, other than a direct write that modifies TRBLIMITR_EL1.E, if TRBLIMITR_EL1.E == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBLIMITR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b000

TRBMAR_EL1, Trace Buffer Memory Attribute Register

The TRBMAR_EL1 characteristics are:

Purpose

Controls Trace Buffer Unit accesses to memory.

If the trace buffer pointers specify virtual addresses, the address properties are defined by the translation tables and this register is ignored.

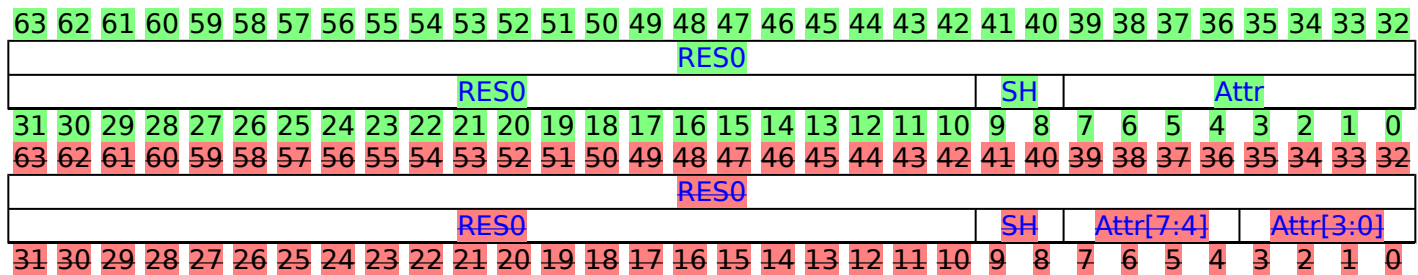

Configuration

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBMAR_EL1 are UNDEFINED.

Attributes

TRBMAR_EL1 is a 64-bit register.

Field descriptions

Bits [63:10]

Reserved, RES0.

SH, bits [9:8]

Trace buffer shareability domain. Defines the shareability domain for Normal memory used by the trace buffer.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when [TRBMAR_EL1.Attr](#) specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On a ColdWarm reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

Attr, [7:4], bits [7:04]

When TRBMAR_EL1.Attr[3:0] == 0bxxxx00000b0000:

Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the cacheability attributes, for memory addressed by the trace buffer.

Attr[7:4]	Meaning	Applies when
0x000b0000	Device-nGnRnE memory.	
0x400b0100	Normal memory, Inner Non-cacheable, Outer Non-cacheable with the XS attribute set to 0.	When FEAT_XS is implemented
0xA00b1010	Normal memory, Inner Write-through Cacheable, Outer Write-through Cacheable, Non-transient, Read-Allocate with the XS attribute set to 0.	When FEAT_XS is implemented
0xF00b1111	Tagged Normal memory, Outer Write-Back Non-transient, Read-allocate Write-allocate.	When FEAT_MTE2 is implemented

All other values are reserved.

The reset behavior of this field is:

- On a ColdWarm reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

When TRBMAR_EL1.Attr == 0b0000xxxx and TRBMAR_EL1.Attr != 0b00000000:

Trace buffer memory attributes. Defines the Device memory attributes for memory addressed by the trace buffer.

Attr	Meaning	Applies when
0x04	Device-nGnRE memory.	
0x08	Device-nGRE memory.	
0x0C	Device-GRE memory.	
0x01	Device-nGnRnE memory with the XS attribute set to 0.	When FEAT_XS is implemented
0x05	Device-nGnRE memory with the XS attribute set to 0.	When FEAT_XS is implemented
0x09	Device-nGRE memory with the XS attribute set to 0.	When FEAT_XS is implemented
0x0D	Device-GRE memory with the XS attribute set to 0.	When FEAT_XS is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

When TRBMAR_EL1.Attr != 0bxxxx0000 and TRBMAR_EL1.Attr != 0b0000xxxx:

Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the Outer and Inner cacheability attributes, for memory addressed by the trace buffer.

Attr	Meaning
0b0001xxxx	Normal memory, Outer Write-Through Transient, Write-allocate.
0b0010xxxx	Normal memory, Outer Write-Through Transient, Read-allocate.
0b0011xxxx	Normal memory, Outer Write-Through Transient, Read-allocate Write-allocate.
0b0100xxxx	Normal memory, Outer Non-cacheable.
0b0101xxxx	Normal memory, Outer Write-Back Transient, Write-allocate.
0b0110xxxx	Normal memory, Outer Write-Back Transient, Read-allocate.
0b0111xxxx	Normal memory, Outer Write-Back Transient, Read-allocate Write-allocate.
0b1000xxxx	Normal memory, Outer Write-Through Non-transient, No allocate.
0b1001xxxx	Normal memory, Outer Write-Through Non-transient, Write-allocate.
0b1010xxxx	Normal memory, Outer Write-Through Non-transient, Read-allocate.
0b1011xxxx	Normal memory, Outer Write-Through Non-transient, Read-allocate Write-allocate.
0b1100xxxx	Normal memory, Outer Write-Back Non-transient, No allocate.
0b1101xxxx	Normal memory, Outer Write-Back Non-transient, Write-allocate.
0b1110xxxx	Normal memory, Outer Write-Back Non-transient, Read-allocate.
0b1111xxxx	Normal memory, Outer Write-Back Non-transient, Read-allocate Write-allocate.
0bxxxx0001	Normal memory, Inner Write-Through Transient, Write-allocate.
0bxxxx0010	Normal memory, Inner Write-Through Transient, Read-allocate.
0bxxxx0011	Normal memory, Inner Write-Through Transient, Read-allocate Write-allocate.
0bxxxx0100	Normal memory, Inner Non-cacheable.
0bxxxx0101	Normal memory, Inner Write-Back Transient, Write-allocate.
0bxxxx0110	Normal memory, Inner Write-Back Transient, Read-allocate.
0bxxxx0111	Normal memory, Inner Write-Back Transient, Read-allocate Write-allocate.
0bxxxx1000	Normal memory, Inner Write-Through Non-transient, No allocate.
0bxxxx1001	Normal memory, Inner Write-Through Non-transient, Write-allocate.
